TABLE OF CONTENTS

Introduction	1
 Papers	
Accumulation as a tool towards blending reasoning about quantity and rate of change in physics contexts	
<i>Charlotte Zimmerman and Suzanne White Brahmia</i>	7
 An Analysis of Covariational Reasoning for the Conceptual Introduction of Derivative in US and Chinese Calculus Textbooks	
<i>Yixiong Chen</i>	12
 An unexpected construct toward the fundamental theorem	
<i>Gilat Falach, Anatoli Kouropatov and Tommy Dreyfus</i>	17
 Basic Mental Models of the Integral: A Didactical Approach for Lecturers of Thermodynamics	
<i>Christian Heinz, Michael Kunz, Stefan Müller and Hans-Stefan Siller</i>	22
 Calculus quantities and conservation laws in physics	
<i>Suzanne White Brahmia</i>	27
 Chemistry contexts for introducing derivative and integral	
<i>Tommy Dreyfus and Anatoli Kouropatov</i>	32
 Connecting Mathematics and Medicine in a Calculus Course in Biomedical Engineering Degrees through SRPs	
<i>Lidia Serrano and Catarina Lucas</i>	37
 Differentials across disciplines: Conceptions used in economics, physics, and chemistry	
<i>Mathilde Hitier, Frank Feudel and Ida Landgärds-Tarvoll</i>	42

Integrating Computational Thinking into Undergraduate Calculus in Mechanics: Insights from Educators and Communities of Practice	
<i>Johan Lie, Stian Hirth and Tobias Eiksund</i>	47
Interpreting simulations of a physical phenomenon: insights from an eye-tracking study	
<i>Sara Bagossi, Osama Swidan and Yotam Vaknin</i>	52
LLMs as world builders for authentic problems in calculus for STEM students	
<i>Ottavio G. Rizzo</i>	57
Maple learn: investigation of students' experience in learning the Calculus course in Toronto	
<i>Asia Majeed and Alexandre Cavalcante</i>	62
Math-chiavelli: Designing a calculus card game	
<i>Giulia Bini and Maura Salvatori</i>	67
Multivariable limits in different university degrees. A first approach through textbook analysis	
<i>Mónica Arnal-Palacián, Ignacio González-Ruiz and Antonio M. Oller-Marcén</i>	72
On doing and undoing in general and applied precalculus-calculus tracks	
<i>Haile Gilroy and Isabel Harris</i>	77
On engineering students' challenges with the delta function	
<i>Brian Faulkner, Imène Ghedamsi and Thomas Lecorre</i>	82
On Narratives of the Definite Integral in Biocalculus	
<i>Melinda Lanius</i>	87
On students' perception of explorative, translation, and example generation tasks for understanding Calculus in one variable	
<i>Alice Barana, Mats Brunström, Maria Fahlgren, Marina Marchisio Conte, Fabio Roman, Matteo Sacchet, Mirela Vinerean and Yosief Wondmagegne</i>	92

Partial Derivatives in Thermodynamics

Corinne Manogue, Tevian Dray and Paul Emigh 97

Partitioning Physical Attributes for Riemann Sum Approximations

Andrew Izsák, Olha Sus, Emmanuel Daring and Mathias Lopez 102

Potential and limitations of resources for supporting students using mathematics in physics: a case study about differential equations

Pauline Hellio 107

Reexamining calculus practice in introductory physics

Michael Loverude, David Robles and Maxwell Ichinose 112

Reflections on a Master Class in Teaching Modelling to Life Science Majors

Jennifer A. Czocher, Brendan Kelly, Steve Bennoun and Alan Garfinkel 117

Role of some referents of Mathematics education in teachers' reflections on the causes of students' errors in university mathematics

Henry Alexander Ramírez Bernal 122

Should the Cauchy-Riemann equations be named after d'Alembert?

Ricardo Karam 127

STEM majors perceived value of an introductory calculus course-based research experience

Rebecca Dibbs and Mehmet Celik 132

Students Concept Mapping the Derivative & Novel Tools for Analysis

Devin Hensley 137

Students' reasoning in visualized dynamic rate of change situations

Shaista Kanwal and Mahboubah Nedaei 142

Teaching Multivariable Calculus to Biology Students	
<i>Steve Bennoun</i>	147
The evolution of the concept of infinitesimal and differential in physics through the analysis of university textbooks	
<i>Domenico Galli, Barbara Gadani and Olivia Levrini</i>	152
Using an economics model to introduce systems of differential equations	
<i>María Trigueros and Rafael Martínez-Planell</i>	157
Using Differentials in Thermodynamics	
<i>Tevian Dray, Corinne Manogue and Elizabeth Gire</i>	162

Keywords: artifacts, tangent, derivative/antiderivative, Theory of Semiotic Mediation.

A HISTORY-BASED ARTIFACT

This paper proposes incorporating history and historical artifacts into hands-on activities on infinitesimal calculus, aligning with Italian research on workshop activities involving “mathematical machines” (Bartolini Bussi & Maschietto, 2006). We have utilized a new device rooted in historical concepts related to the mechanical implementation of solutions for inverse tangent problems (Bos, 1988). Beyond their historical importance in the development of calculus, these ideas maintain a strong connection with material implementations, implying the creation of scientific instruments for demonstration, education, and practical application (Tournès, 2009).

Our artifact (Fig. 1), realized with FabLab tools (<https://www.machines4math.com/>), can be assembled in various configurations (Crippa & Milici, 2023): to introduce the concept of the tangent and inverse tangent problems (<https://www.youtube.com/watch?v=LMLt90R8zHA>), to trace exponential and parabola (<https://www.youtube.com/watch?v=kqtU9GpcN78>), and to construct derivatives and antiderivatives (<https://www.youtube.com/watch?v=TyxCAR317HE>).

Figure 1. Components of the artifact.

THEORETICAL BACKGROUND

This study examines our new artifact from a semiotic perspective, emphasizing the crucial role of signs and representations in mathematics. The main theoretical component is the Theory of Semiotic Mediation (Bartolini Bussi & Mariotti, 2008); it applies a Vygotskian perspective to mathematics education, suggesting that teachers use specific artifacts to mediate mathematical meanings. A relevant theoretical tool is

the analysis of the semiotic potential of an artifact, which is crucial for designing student tasks and guiding teacher actions.

FIRST RESULTS AND FURTHER PERSPECTIVES

Our in-progress research project aims to evaluate our artifact for teaching calculus, focusing on its use, constraints, and manipulation to create effective tasks. We analyzed how a secondary school teacher explores this artifact from a semiotic perspective (Maschietto & Milici, 2024) and we identified different configurations and crucial elements for task design by analyzing its semiotic potential. In its most straightforward configuration, our artifact offers a material representation of the tangent line; in other configurations, the tangent is mechanically guided to generate curves.

We will start to test tasks to bring out the meanings embedded in the artifact. On the one hand, we plan to explore the artifact to consolidate mathematical meanings with university students. On the other hand, we are designing a teaching experiment to mediate calculus meanings; it will be carried out with high secondary school students. Additionally, the historical and epistemological aspects are essential for maintaining student interest: the artifact allows the integration of historical experiences and original manuscripts to enhance learning.
