Summary of Results: From the literature, 69 terms were identified. These terms were curated to a final set of 36 items. The focus group of ten students ranked their top 20 of the 36 items and were invited to contribute additional items. No items were added. After three rounds of student voting five items were discarded, 28 items kept and three items' importance remained uncertain.

Discussion and Conclusions: Discussion and voting on the literature-derived items of educational app quality confirmed the majority of the items were important to students when deciding if an app would be useful. Ongoing work is refining the checklist, testing it on clinical skills apps, and developing a feasible and acceptable method for use of the checklist to evaluate app usefulness to support learning.

Take-home Messages: While the majority of research measuring app quality has relied on experts in education and technology to develop appropriate methods for determining quality, the user voice is an important triangulation method. This work gives student users input in the development of methods for app evaluation. This is important, not only to increase the rigour of any evaluation method, but also to give the user ownership of the means to evaluate quality and usefulness of the technology they will be using.

Listening to the learner - self-perceived learning needs-based hepatology symposium for primary healthcare physicians

AUTHOR(S):

- Chee-Kiat Tan, Dept of Gastroenterology & Hepatology, Singapore General Hospital, Singapore (Presenter)
- Chang-Chuen Mark Cheah, Dept of Gastroenterology & Hepatology, Singapore General Hospital, Singapore
- Jin-Yang Terence Tan, Dept of Gastroenterology & Hepatology, Singapore General Hospital, Singapore
- Mien-Choo Ruth Lim, SingHealth Family Medicine, Singapore
- Hui-Min Joanne Quah, SingHealth Polyclinics, Singapore
- Pik-Eu Chang, Dept of Gastroenterology & Hepatology, Singapore General Hospital, Singapore

ABSTRACT

Background: Symposia topics are often decided by the organisers. A learning needs-based symposium is more learner-centric. We conducted such a symposium in hepatology for our primary healthcare physicians (PHPs).

Summary of Work: We did an online survey on different groups of PHP (general practitioners, general practitioner trainees and internal medicine trainees) for their self-perceived learning needs in hepatology. We then organised a symposium based on the overall top 3 needs. A 4th topic was added based on feedback from our department. We informed the PHPs of the 4 topics for the symposium and encouraged them to submit questions and to indicate what they hope to learn. Their submissions were disseminated to the respective speakers to help them plan their teaching content. We ensured active learning with a case-based discussion format and an audience response system. Feedback using a Likert scale was obtained from the attendees during the symposium.

Summary of Results: 268 PHPs responded with indication of their learning needs in order of importance. The PHPs submitted 39 questions pre-symposium. There were 81 attendees. The feedback (88.0% response rate) was as follows:

Feedback question Agree/Strongly agree

Has gained new knowledge/skills 96.5%

Able to apply new knowledge/skills 96.4%

Symposium was different from others 83.2%

Useful to submit questions pre-symposium 55.8%

Will attend another such learning needs-based symposium 93.3%

Will encourage peers to attend such a symposium 93.3%.

Discussion and Conclusions: Based on the feedback, a self-perceived learning needs-based symposium is effective in educating PHPs as more than 96% has gained new knowledge/skills that they can apply and more than 93% will attend again and bring their peers. The submission of questions pre-symposium appeared not very useful. We did not elucidate the reason(s) but a main reason could be the speakers not addressing in their session all the questions submitted. A solution to this shortcoming is to incorporate live question and answer sessions during the symposium.

Take-home Messages: A learning needs-based symposium although more laborious to organise is effective in educating PHPs and is welcomed by them.

Medical students develop online audiovisual patient education in cooperation with patients and communication students

AUTHOR(S):

- **Melanie Kalee, University Medical Center Utrecht, The Netherlands (Presenter)**
- Charlotte Eijkelboom, University Medical Center Utrecht, The Netherlands
- Jacqueline van Wijngaarden, University Medical Center Utrecht, The Netherlands
- Willemijn Schot, Utrecht University, The Netherlands
- Joost Frenkel, University Medical Center Utrecht, The Netherlands

ABSTRACT

Background: Due to the rise of the internet, medical information is more accessible than ever before. Having access to health information can make patients feel more empowered and confident in making decisions about their health and treatment. However, the reliability of online health information is difficult to assess, and the amount can be overwhelming. Physicians need new communication skills, to be able to educate and inform patients, both in- and outside the doctor's office.

Summary of Work: We developed a new educational course called CLIKCS: Co-creating onLine Information Knowledge Clips for Society. During the course medical students design, in pairs, an online knowledge clip in cooperation with a patient and a student Communication and Information Sciences (CIS). The aim of this project is to teach medical students to inform patients through written and audiovisual information and to collaborate with patients in making this information. This research explores which aspects of the course contribute to the development of the communication skills of medical students, needed to inform and educate patients.

Summary of Results: In February 2019 twelve 6th year medical students, six patients and three CIS students will be enrolled in this study. How and if medical students improve their communication skills during the course will be evaluated using the following methods: (1) observation of the meetings between the medical students, the patients, and the CIS students, (2) analysis of the storyboards and knowledge clips the students create during the course, and (3) semi-structured interviews with medical students. Full results will be presented and discussed in conference.

Discussion and Conclusions: This study aims to determine if and how designing knowledge clips in cooperation with a patient and CIS student improves the communication skills of medical students.

Take-home Messages: Doctors need to learn how to participate in this world of increasing online health information, by learning how to effectively inform patients outside of the doctor's office.

Medical Students' understanding of placebo and nocebo effects (PNEs). Implications for future practice

AUTHOR(S):

- Mark Arnold, University of Sydney School of Rural Health (Dubbo/Orange), Australia (Presenter)
- Damien Finnis, Northern Clinical School Pain Management & Research Institute, Australia
- Georgina Luscombe, University of Sydney School of Rural Health Orange Campus, Australia
- Ian Kerridge, Sydney Health Ethics, University of Sydney, Australia

ABSTRACT

Background: The Sydney Graduate Medical Program (SMP) accepts approximately 300 students yearly with appropriate undergraduate or postgraduate humanities or science entry qualifications from diverse ethnic and cultural backgrounds (20% International (IS), 80% Domestic (DS)). Students must be aware of PNEs and their effect on patient-doctor interactions, as they affect patient physician engagement, trust, adherence to therapeutic regimens and outcomes of treatment

Summary of Work: A web-based questionnaire assessed the knowledge and attitudes of students to PNEs at the commencement of their two (clinically immersive) years of the SMP. Correlations and associations between responses and student demographics (age, gender, UG versus PG qualifications, cultural background and IS versus DS) were investigated statistically. Null hypotheses: There would be no differences in knowledge and values regarding PNEs based on age, gender, IS/DS, Caucasian (C)/Non-Caucasian (NC) ethnicity or entry qualification (UG/PG). HREC/IRB approval was granted.

Summary of Results: There were 35 respondents from the year cohort of 288. The following differences were statistically significant ($p < 0.05$): Males and IS felt that placebo responses could differentiate organic from non-organic disease; UG recognised placebo administration in practice; DS designated placebo administration as deceptive; NCs felt that if a doctor told them a medication was a placebo they would think it 'useless'; IS felt that placebos work better in patients who are anxious or complain, prescribing a placebo is unscientific and did not identify anticipation responses.

Discussion and Conclusions: Students displayed highly normative and generally unsophisticated beliefs regarding PNEs potentially correlated with demographics. Students' identification of and reflection upon these beliefs may be necessary to optimise their appreciations their effect as actors when beginning clinical interactions.

Take-home Messages: Appreciating ones agency in clinical interactions is critical for the development of ones professional identity. An understanding of how ones behaviour may have intrinsically positive or negative (placebo or nocebo) context effects and how these affect patient outcomes is a key concept in the development of professional identity.

Implementing Global Health Education in the Medical Curriculum. Challenges and opportunities of a student led initiative

AUTHOR(S):

- Behrouz Nezafat Maldonado, University of Liverpool, UK (Presenter)

ABSTRACT

Background: Medicine is a global profession, therefore future doctors need to be prepared to work in a globalized world. There is a lack of uniform guidelines for comprehensive global health education (GHE), for example the University of Liverpool MBChB program did not have an explicit component focused on global health.

Summary of Work: A review of the literature was performed and medical students from across all UK medical schools were contacted via the network Students for Global Health. Students were asked to complete a survey on how global health education was delivered in their schools. After this, student-led advocacy efforts resulted in a global health day being introduced in the curriculum. A 'Global Health Day' was the most suitable method and it was aimed at Year 5 students. Feedback from this day was collected to explore students' perception of global health.

Summary of Results: The methodology used to deliver GHE varied across schools, from one day of teaching to a 'Global Health Week'. The student society Medsin Liverpool led an advocacy effort to implement concrete global health education at the University of Liverpool. A total of 43 students attended the Global Health Day. On average the day was rated 7 out of 10. 80% of students considered that global health should be discussed earlier in the curriculum especially prior to electives or intercalation opportunities.

Discussion and Conclusions: Medical students have an interest in global health. Global health education should be included earlier in the curriculum. The time available for GHE within the medical curriculum is limited and from our experience medical school faculty can be reluctant to teaching global health at the expense of other subjects. Standardisation of GHE is necessary across UK medical schools. A strong student-led initiative can help deliver medical education that addresses the needs of medical students. Student-led organizations are a huge opportunity when advocating for changes in the medical curriculum.

Take-home Messages: Student-led advocacy efforts to improve the curriculum can be successful. Overall, global health teaching is regarded as important by medical students especially in preparation for their elective abroad.

Encouraging Medical Student Involvement in Clinical Research: Using a Novel Online Platform to Pair Students with Clinicians

AUTHOR(S):

- **Munaib Din, King's College London Medical School, UK (Presenter)**
- Faisal Jamshaid, KCL Medical School, UK
- Natalia Jankowska, KCL Medical School, UK
- Thariq Farook, KCL, UK
- Asfandyar Ghauri, KCL, UK
- Anne McKee, KCL, UK

ABSTRACT

Background: In recent years, the need to develop doctors with a firm foundation in research principles and processes has become apparent. In order to improve accessibility of medical students to clinical researchers, a solution was created to connect clinicians with live research projects to medical students keen for experience.

Summary of Work: A new society at a London medical school created a system to find available projects from clinicians in nearby trusts. These research projects were then advertised to medical students and applied for through an online platform: 'YoungAcademics'. Successful students were paired with their supervisor(s) to begin their projects. Small focus-group interviews were held in order to collect feedback about the positive aspects of the scheme as well as challenges faced. Gate keeper approval for the scheme was granted by the university's 'Curriculum Innovation Group'.

Summary of Results: Since our formation in October 2018, YoungAcademics has 150+ paid members (annual society memberships), 180+ written applications and 45+ student-clinician pairings. The platform has received widespread positive feedback in providing an innovative and streamlined route for students to get involved in academic research.

Discussion and Conclusions: YoungAcademics is a new initiative which has established the following: there is student demand for named authorship on academic publications and students are willing to apply and pay for the opportunity, even if a successful project application is not guaranteed. We argue that this has merit. It is an administrative tool that facilitates medical students to volunteer for research projects that interest them. We are currently developing YoungAcademics to provide 'research support articles' and a 'student support forum' to aid students with any projects they may be working on.

Take-home Messages: YoungAcademics is a platform that: offers numerous projects for students to select from; provides a fair and mediated project collaboration; offers faster project turnover for the clinician by selecting committed students. More work needs to be done to widen participation in academic medicine and to provide a better holistic academic experience.

Flipped classroom versus traditional lecture to achieve and improve knowledge retention in generation Y medical students

AUTHOR(S):

- Maleechat Sripipattanakul, Obstetrics and Gynecology Department, Khon Kaen Hospital, Thailand (Presenter)
- Thumwadee Tangsiriwatthana, Obstetrics and Gynecology Department, Khon Kaen Hospital, Thailand

ABSTRACT

Background: The character of generation Y medical students is life-long and active learning style, which traditional lecture is not conform to this learning style. Flipped classroom is an instructional strategy that reverses the traditional learning activities by conducting instructional content and can enhance active learning and critical thinking. Flipped classroom was introduced to used in medical student compared with traditional lecture to evaluate achievement and retention of knowledge.

Summary of Work: Thirty four of fourth year medical students who attended in pelvic floor dysfunction class were divided into two groups, traditional lecture and flipped classroom. Both groups received the online reading module and reference papers. Flipped classroom group received pre-class activity using study guide before class then participated in in-class activity using questions and case discussion follow the study guide. Pretest and posttest were performed before and after class to evaluate knowledge achievement. Multiple choice question (MCQ) and multiple essay question (MEQ) were performed at tenth week after class to evaluate retention of knowledge. Focus group was used to evaluate benefit and satisfaction in the flipped classroom.

Summary of Results: Flipped classroom groups had significant higher pretest and post test score than traditional lecture groups, mean (sd) 8.9 (1.6) vs 4.7 (1.2) and 10.6 (0.6) vs 8.4 (1.8) $p < 0.001$. Flipped classroom groups had significant higher score than traditional lecture groups in MCQ and MEQ score, mean (sd) 9.1(1.0) vs 7.7 (1.6) and 26.9 (3.2) vs 19.9 (4.6) $p < 0.001$. The student in flipped classroom satisfied in learning style and reported enhanced active learning and increase understanding than traditional lecture.

Discussion and Conclusions: Flipped classroom is a learning style for active generation Y student to enhance the achievement and improve knowledge retention. Pre-class and in-class activities following study guide were the key of success. Flipped classroom is more effective learning style to achieve and improve knowledge retention.

Take-home Messages: Flipped classroom should be promoted to enhance the active and life-long learning style.

Flipped classroom increased engagement amongst medical students but did not increase performance

AUTHOR(S):

- Paul-Alexandre Nordlund, Norwegian University of Science and Technology (NTNU), Norway (Presenter)
- Tobias S Slørdahl, Norwegian University of Science and Technology, Norway
- Susanne Skjervold Smeby, Norwegian University of Science and Technology, Norway
- Henriette Fagertun, Norwegian University of Science and Technology, Norway
- Børge Lillebo, Norwegian University of Science and Technology, Norway
- Anders Waagø, Norwegian University of Science and Technology, Norway

ABSTRACT

Background: In the flipped classroom model, students acquire knowledge outside of the classroom and the formal teaching time is devoted to student-driven discussions with a focus on active learning. In this study, we compared the effects of flipped classroom with case-based learning to lectures in two topics - vascular surgery and hematology.

Summary of Work: 61 third-year medical students enrolled in a 2x2 cross-over study. The students attended a total of two classes, where one was held as a lecture and the other as an active case-based learning session. They attended one class in each topic and read written material as preparation. The Student Self-Report of Engagement Measure and four Likert-type items assessed student engagement and perceptions. A multiple-choice question test was administered six weeks after to evaluate learning outcomes based on the teaching method.

Summary of Results: Average scores on the topic learned in a flipped classroom was marginally higher compared with the scores achieved in a topic taught in a lecture, but did not differ significantly (59.7% vs 57.1%, $t(24) = 0.510$, $p = 0.615$). Students reported higher levels of engagement in the flipped classroom (3.94 vs. 2.78, $U = 310$, $p < 0.001$) and were more satisfied with the flipped classroom (3.92 vs 3.53, $U = 718$, $p = 0.042$). Moreover, students reported increased feedback on knowledge when learning in a flipped classroom. 25 (40%) of all students enrolled in this study completed all parts of this study.

Discussion and Conclusions: In medical education, studies have shown both increased and equal student performance when comparing flipped classroom to lectures. The lack of differences in performance in this study could be explained by the decline in attendance, the small intervention or the choice of in-class activity. Flipped classroom incorporating active learning showed increased student engagement which is in line with previous studies. Students reported high levels of engagement during the case-based learning and increased feedback on their knowledge in the flipped classroom, but it did not lead to increased student performances.

Take-home Messages: Flipped classroom engages students and it stands as a valid alternative to the traditional lecture in medical education and promotes active learning and increase student engagement.

Students' perspectives on the design of flipped classroom in pre-clinical setting: a qualitative study

AUTHOR(S):

- Jo Yu Tsai, China Medical University, Taiwan (Presenter)
- Fremen Chihchen Chou, China Medical University, Taiwan
- Sheng Chang Yang, China Medical University Hospital, Taiwan

ABSTRACT

Background: In recent years, technology has been increasingly used to assist teaching and to enrich students' learning experience. Innovative educational models, such as the flipped classroom (FC), could lead to a greater academic achievement in certain contexts; however, there is no clear consensus on the curriculum design of FC. This study aimed to explore an applicable FC design, and moreover, by using the FC environment, also to explore students' assertions about applying new educational model with technology to assist pre-clinical learning.

Summary of Work: Thirty-one medical students who had experienced both flipped learning and traditional curriculum participated in this research. Semi-structured interviews and qualitative content analysis with conventional approach were adopted to reveal students' assertions of the FC design and educational model of using technology to assist pre-clinical learning.

Summary of Results: For the FC design, there were three factors including content and learning objectives, learning load, and instructional design. The learning objectives should focus on applying knowledge and problem-solving activities in order to extend the knowledge connection between what have learned and future application. For the instructional design, providing structural materials with visual images, such as video and animation, can simplify the process of understanding. About students' learning loads, the difficulty level of learning content, students' competency, the length of online video and the balance between different courses are essential issues. Students' assertions regarding applying new educational model includes the need of matching the goal, learning content, technology and strategy, the need of effective engagement of learning activities, and the consideration of the transitional impact of new educational models between generations.

Discussion and Conclusions: Literature reveal that FC may lead to a better academic achievement than traditional teaching; however, the change of study behavior need to consider several important facets. Designing curriculum with a consistent logic, considering the transitional impact toward students' behavior between generations, and corresponding to students' expectation of learning are needed.

Take-home Messages: Adopting new educational model with technology needs thoughtful curriculum design and consideration of its impact to the whole curriculum blueprint as well as the learning culture.

The flipped classroom is effective for medical students to improve fundoscopic examination skills: A mixed methods study

AUTHOR(S):

- Kiyoshi Shikino, Chiba University Hospital, Japan (Presenter)
- Katsumi Nishiya, Kansai Medical University, Japan
- Shingo Suzuki, Chiba University Hospital, Japan
- Tomoko Tsukamoto, Chiba University Hospital, Japan
- Daniel Salcedo, Chiba University Hospital, Japan
- Masatomi Ikusaka, Chiba University Hospital, Japan

ABSTRACT

Background: Fundoscopic examination is an essential skill for primary care physicians. However, it is challenging to provide training in fundoscopy by the traditional teaching methods. The flipped classroom approach has demonstrated to be effective in optimizing the use of live teaching time. The objective of this research is to investigate the effectiveness of the flipped classroom teaching methodology compared to traditional teaching method for training medical students in fundoscopy.

Summary of Work: A controlled trial was designed to compare the effects of the two practical guidance methods on student performance during the fundoscopic examination. The study population consisted of 75 medical students participating in a general medicine clerkship rotation. Participants were randomly assigned to either a flipped classroom group (intervention group: n=39) or a traditional teaching group (control group: n=36). The participants examined the fundus on a simulator (EYE®, Kyoto Kagaku Co) before and after the intervention and presented their findings (3 findings each before and after the training session). The quantitative outcome measures were the diagnostic accuracy of fundoscopic findings and the duration of the examination procedure. The qualitative component consisted of a post-training questionnaire and semi-structured focused group interviews.

Summary of Results: Diagnostic accuracy was significantly higher using the flipped classroom teaching method (intervention group: $42.7 \pm 0.45\%$ to $66.0 \pm 0.49\%$, control group: $31.2 \pm 0.46\%$ to $41.9 \pm 0.53\%$, $F(1,223) = 24.2$, $p < .001$). The duration of fundoscopic examination was significantly shorter using the flipped classroom teaching method (intervention group: 85.5 ± 10.7 s to 65.9 ± 21.5 s, control group: 85.6 ± 10.6 s to 74.7 ± 23.1 s, $F(1,223) = 6.72$, $p = .01$). Twelve semi-structured focused group interviews were conducted (n=75). Students reported higher learning motivation with the flipped classroom approach.

Discussion and Conclusions: Teaching medical students fundoscopic examination using the flipped classroom methodology leads to improved diagnostic accuracy while reducing total examination time.

Take-home Messages: The flipped classroom is an effective and efficient method for teaching the fundoscopic examination technique leading to improved competency outcomes in medical students.

Application of Flip Learning Approach on The Respiratory Therapy

AUTHOR(S):

- Szu-I Yu, Tungs' Taichung MetroHarbor Hospital, Taichung, Taiwan (Presenter)
- Hueng-Chuen Fan, Tungs' Taichung MetroHarbor Hospital, Taichung, Taiwan
- Ya-Hui Hsu, Tungs' Taichung Metro Harbor Hospital, Taichung, Taiwan

ABSTRACT

Background: The purpose of this study was increased to quality of clinical work on the respiratory therapists (RT). The teaching and learning time of clinical and trainees trained in RT have been severely reduced. Therefore, how to make RT really learn, to save times and effective teach, Flip Learning (FL) teaching approach can stimulate RT motivation in learning, upgrading their knowledge and increased to quality of clinical work.

Summary of Work: This study was conducted at a teaching hospital in the middle of Taiwan. Subjects included 12 RT in the period from 1st Sep 2016 to 1st Sep 2017. The intervention was applying a FL approach, which included a web-film demonstrating how to set up a FL leaning course and Q & A. RT were required to take a post-course test and questionnaire.

Summary of Results: This study collected 12 after-course test results and questionnaires. All RT showed a high score (4.5/5) in the items of the questionnaires including "increased to quality of clinical work", and "communication with clinicians (4/5) in improving knowledge in the respiratory care", and a low score (3/5) in communication with patients/family.

Discussion and Conclusions: FL can encourage RT in self-learning, full of confidence, and increased to quality of clinical work, stimulate RT motivation in learning, upgrading their knowledge.

Take-home Messages: Flip Learning (FL) teaching approach can stimulate RT motivation in learning, upgrading their knowledge and increased to quality of clinical work.

New module on teaching “Septic Shock” for medical students

AUTHOR(S):

- Chutima Cheranakhorn, Hatyai Medical Education Centre, Thailand (Presenter)
- Komsai Suwanno, Hatyai Medical Education Centre, Thailand
- Lucksamee Haura, Hatyai Medical Education Centre, Thailand

ABSTRACT

Background: Teaching septic shock in medical student is challenge. An international survey from junior doctors found problems on diagnosis and treatment of sepsis. One of most common barriers is lack of clinical skill and experience. A novel approach on teaching use combination of flipped classroom and enhance learning through ICU bedside teaching. This study objective was to explore the students knowledge gain and perspective on a new module.

Summary of Work: Forty-one of 5th-year medical students were divided in to 4 groups. The students were assigned to complete a study guide before attending the class. In class, students were taught about basic knowledge of shock and sepsis about 10 minutes then moved to apply the knowledge with real patient in ICU. Bedside teaching based on Cox’s 2-cycle model was applied, which focus on clinical reasoning and decision making on management septic shock. Pre-and post test were used to assess the knowledge. Students’ perspective were evaluated by using the five-point Likert scale questionnaires.

Summary of Results: According to knowledge, there was statistically significant improvement in post-test score (5.1 ± 1.8 vs 8.2 ± 1.1 , $p < 0.001$). All of students rated strongly or very strongly agreement that new module was more effective and interactive than traditional lecture. Bedside teaching in ICU provided very useful experience of septic shock learning with a different points of view from ward or emergency department situation. The majority (88%) of student felt this class improved their own confidence.

Discussion and Conclusions: The new teaching approach revealed to be an effective module, which the unique learning experience is a bedside teaching in ICU. Learning environment in ICU provided the impression moment which enhanced the students maintained more attention. Furthermore, the students also learned the doctor-patient relationship from the attending during the bedside teaching which other techniques could not provide.

Take-home Messages: Unique experience of learning septic shock is teaching in real environment in ICU.

Learning by Doing in a Supporting Environment: Curricular Effectiveness of a Medical Literature Reading Course in Early College Years

AUTHOR(S):

- Pai-Chuan Huang, College of Medicine, National Cheng Kung University, Taiwan (Presenter)
- Jer-Hao Chang, College of Medicine, National Cheng Kung University, Taiwan

ABSTRACT

Background: Being able to read scientific papers efficiently is fundamental to evidence-based practice (EBP), considering how little time a healthcare practitioner has in clinic, and how rapid the new findings are being published nowadays. Thus, a course was dedicatedly designed to introduce the logic and structure of scientific papers in medical field under a supporting environment for students in early college years. We examined the curricular effectiveness by comparing the self-perception on reading scientific papers before and after the course.

Summary of Work: Students filled out a survey, composed of 13 statements rated on a 10-point Likert scale, prior and after the “Occupational Therapy Literature Reading (OTLR)” course. A series of paired t-tests were used to compare students’ pre- and post-course self-perception on 5 curricular goals: confidence in searching literature, an understanding of papers’ elements and structure, ability in evaluating face validity, confidence in reading scientific papers efficiently, and feeling comfortable in reading papers. The schedule of the OTLR course was 50 minutes per session, 1 session per week, for 15 sessions. Each session included 20 minutes of lecture, 20 minutes of hands-on exercise, and 10 minutes of discussion.

Summary of Results: A total of 84 students enrolled the course across three academic years. Sixty seven students (67/84=80%) responded to all questions prior and after the course. Perception on 5 curricular goals were all statistically improved after completing the course (means of pre- vs. post-course: 3.8~5.3 vs. 6.5~8.2; $p < .0001$). “An understanding of the elements and structure of a scientific paper” had the lowest score among the 5 domains prior to the course, and showed the greatest improvement in post-course evaluation (3.8 vs. 8.0).

Discussion and Conclusions: The results demonstrated that effectiveness of a curricular to improve literature reading competence in early college years could be achieved through a supporting environment with relatively limited hours distributed across a 15-week span.

Take-home Messages: Students would be much more prepared for upcoming EBP courses after a course such as the OTLR demonstrated here.

A case-based interactive lecture on pathological sonographic findings

AUTHOR(S):

- Sabine Schneidewind, Hannover Medical School, Germany (Presenter)
- Philip Bintaro, Hannover Medical School, Germany

ABSTRACT

Background: Curricular practical ultrasound classes become increasingly common in medical schools. These resource-intensive small group classes rely on healthy subjects performing ultrasound on each other and therefore often do not include any pathological findings. But it is the pathological findings that many young physicians are expected to recognize from early on in their residency which indicates the need to address these topics in undergraduate medical education.

Summary of Work: We conceived a lecture format addressing recognition and precise description of pathological sonographic findings. The topics of kidney cysts, liver cirrhosis as well as urinary obstruction were moulded into one case each with patient history and findings of physical examination, laboratory tests as well as abdominal ultrasound. 44 fifth-year undergraduate medical students attended this four-hour interactive case-based lecture session including 1. live demonstration of finding and measuring liver and kidneys, 2. describing and interpreting pathological findings together as well as 3. clinical decision making by integrating information from all available sources. Orientation and recognition of pathological findings were assessed via a short written test before and after the lecture.

Summary of Results: After the lecture, students scored significantly higher in correctly identifying 1. the liver (1 versus 0,52 out of one point), 2. the section level in a sagittal transhepatic image of the right kidney (0,9 versus 0,29 out of one point), the sonographic criteria 3. for cysts (3,26 versus 0,86 out of five points) as well as 4. for liver cirrhosis (2,5 versus 0,55 out of five points) after the lecture.

Discussion and Conclusions: Our results show that students' orientation and recognition regarding sonographic findings can be increased by an interactive, case-based class resembling every-day physician routines. During evaluation students emphasized that particularly the integration of pathophysiological knowledge into the process of clinical reasoning was helpful. We plan assessing long-term retention of acquired skills after three months.

Take-home Messages: Recognition of pathological findings can be taught effectively in a resource-sparing lecture format. Regularly and repeatedly including the pathophysiological background in clinical cases may contribute relevantly to students' understanding of the underlying disease.

The efficacy of teaching methods for direct ophthalmoscopy comparing between video-based and traditional lecture-based learning in 4th year medical students: A prospective randomized controlled study

AUTHOR(S):

- **Nathaya Panyowatkul, Lampang Hospital, Thailand (Presenter)**
- Thanin Lokeskrawee, Lampang Hospital, Thailand
- Kittiya Sinthana, Lampang Hospital, Thailand

ABSTRACT

Background: To evaluate the pre- and post-test results of direct ophthalmoscopic teaching methods between video-based and lecture-based learning in 4th year medical students. The skill to use a direct ophthalmoscope is crucial in detecting increased intracranial pressure. There are various methods of teaching this skill such as traditional lecture-based, asynchronous e-learning (video, CD-ROM), synchronous e-learning (live online training), blended, and instructor-led learning. Currently, there is no consensus on the best method.

Summary of Work: A prospective randomized study was conducted in forty 4th year medical students. Two teaching methods were compared between lecture-based and video-based learning. The same teacher taught the same content to both groups. The teaching time for the lecture-based method was 30 minutes, and 15 minutes for the video-based learning. The OSCE was used to measure the results. To assign a balanced number of students to the two groups, we used blocked randomization with a block size of four. A stratified blocked randomization was used in the treatment allocation to equally distribute confounders including grade point average (GPA) and side of eyes. Generalized estimating equation (GEE) analysis was used instead of paired-t-test because two students withdrew after randomization. GEE adjusted all remaining confounding factors.

Summary of Results: Forty 4th year medical students were included. Two were excluded in video-based group owing to emergency on-call duty. Therefore, 38 students remained for analysis. The result showed that the video-based group had a trend for better post-test results. The mean pre-test and post-test in video-based group were 34.4 ± 6.1 and 63.9 ± 9.2 points and in lectured-based group were 35.0 ± 5.1 and 56.5 ± 8.1 . The p-value was 0.053.

Discussion and Conclusions: The video-based teaching method tended to get better post-test results. It was also more interesting, timesaving, and the students could repeat the study with self-learning. An insignificance of the p-value may result from inadequate power of the study. Increasing the study size may help to see the difference. This was the prospective randomized controlled study to evaluate the efficacy of different teaching methods.

Take-home Messages: A video-based teaching method tend to have better results than the traditional lectured-based method.

Learning paediatrics respiratory disease through clinically-based and customized micro-modules: an emphasis of both sound and vision

AUTHOR(S):

- Isabel Hwang, Faculty of Medicine, The Chinese University of Hong Kong, China (Presenter)
- Kate Chan (co-first author), Faculty of Medicine, The Chinese University of Hong Kong, China
- Albert Martin Li, Faculty of Medicine, The Chinese University of Hong Kong, China
- Yan Jin, Faculty of Medicine, The Chinese University of Hong Kong, China
- Chun Ting Au, Faculty of Medicine, The Chinese University of Hong Kong, China
- Sophie Yau, Faculty of Medicine, The Chinese University of Hong Kong, China

ABSTRACT

Background: In our six-year medical curriculum, students get exposure to paediatrics in penultimate year. The whole class is divided into four groups with groups of 55-60 students rotating through four clinical disciplines (paediatrics, obstetrics & gynaecology, family medicine and psychiatry) and spending 8 weeks in each. Large group size and limited time per rotation make it difficult to deliver effective teaching in one of the most important sub-specialties in paediatrics, namely respiratory medicine. Student-initiated learning and “flipped classroom” concept are recommended in modern days’ education. Micro-module learning aims to enhance students’ understanding to ensure better preparation for more fruitful discussions during bedside and class tutorials.

Summary of Work: Numerous customised and narrated e-learning micro-modules were created: (1) to allow students to familiarise themselves with the symptoms of stridor and its causes; (2) to instruct how reliable volume-time curve and flow-volume loop are ascertained via spirometry; “Bad examples” were included to emphasise common errors seen in paediatric subjects; (3) Guided case studies offer instant review on analytical skills. Upon usage, students were given an online survey to evaluate the micro-modules.

Summary of Results: Based on the current teaching schedule, two subgroups of a rotation (7-8 students per sub-group) attempted the micro-modules. 40% and 46.7% students agreed and strongly agreed that they enjoyed using the micro-modules respectively. 73.3% students agreed they would recommend the micro-modules to other classmates. Some students expressed that materials provided directly reflect the knowledge they need in the actual clinical environment. Open-ended comments informed us of a strong demand to expand similar micro-modules to other paediatric sub-specialties particularly on disease states that require more precise sound and visual analysis.

Discussion and Conclusions: Despite availability of online learning resources, in-house and customised micro-modules provided by the teaching hospital offers more confidence and certainty to students on the accuracy and usefulness of clinical skills and knowledge. This ongoing project allows us to refine our project direction to provide more audio and visual aids on respiratory and other symptoms in the near future.

Take-home Messages: When suitable cases with distinct symptoms are not readily available in wards, customised visual teaching aids provide reliable and confident source of information to students in clinical years.

New technologies in teaching “Cell biology” for medical students enrolled in the program of basic education

AUTHOR(S):

- Galina Kukharchik, Almazov National Medical Research Centre, Russia (Presenter)
- Olga Kalinina, Almazov National Medical Research Centre, Russia
- Elena Parmon, FSBI - Almazov National Medical Research Centre, Russia
- Evgeny Shlyakhto, FSBI - Almazov National Medical Research Centre, Russia
- Pavel Dokshin, Almazov National Medical Research Centre, Russia
- Stanislava Prikhodko, Almazov National Medical Research Centre, Russia

ABSTRACT

Background: One of the key questions in the education of medical students is to gain in-depth professional knowledge in fundamental disciplines such as cell biology, cytology, molecular biology, biochemistry, biophysics, chemistry. Innovative teaching technologies are extremely important for improving the quality of medical education.

Summary of Work: Development of educational theory and strategy, didactic materials, study schedule and the introduction of innovative teaching technologies into practice for the “Cell” module, based on a methodically reasonable synthesis of fundamental disciplines.

Summary of Results: During the implementation, a problem-oriented “Cell” module was created. This module based on cellular biology integrates sections of fundamental disciplines that allow to deep discover the physical-chemical processes in the different cell compartment, the effect of enzyme kinetics on metabolic pathways, the membrane potential, the key ions of the cell signaling, the regulation of gene expression, and to find out the cell as a holistic biological complex. Program is conducted by researchers and leading experts in the field of cell biology, cell physiology, biochemistry, biophysics, molecular biology. A special role is given to the visual materials and the innovative educational technologies. Also, active learning involves role-playing games with specific didactic materials according to a specially developed scenario. For example, role-playing game, when each of the students has a special role in the presentation of a cellular damaging or protective agent, the goal is to save and restore the vital activity of the cell.

Discussion and Conclusions: These approaches increase students motivation, improve the education of the medical student, teach to work in a team to solve different tasks, teach to be ready for subsequent study of the functioning of organs and systems, the clinical problems and to perform research work. In the same time, there is a focus on stimulating the development of leadership qualities in students.

Take-home Messages: We present the developed technology for teaching medical students, a logical structure and a plan of which can be transferred to other modules to improve the quality of medical education.

Comparative Study of Learning Outcomes Between in-Class Didactic and Self-Directed Learning in Sixth Year Medical Students During Pediatric Rotation at Phramongkutklo Hospital and College of Medicine

AUTHOR(S):

- Chanchai Traivaree, Phramongkutklo Hospital and College of Medicine, Thailand (Presenter)
- Chalinee Monsereenusorn, Phramongkutklo Hospital and College of Medicine, Thailand
- Piya Rujkijyanont, Phramongkutklo Hospital and College of Medicine, Thailand

ABSTRACT

Background: Traditional teaching method for medical students is in-class didactic. However, attending in class would prevent medical students from being with patients and exposing real clinical environment. Self-directed learning is an alternative method to help students to spend their time with patients and to self-research in specific topic that they are interested. However, it is still unclear on which learning method is superior to another.

Summary of Work: Objective To investigate the most effective teaching method in sixth (final) year medical students in order to strengthen their competency before becoming certified physicians. Methods Two-hundred and seven of the 6th year medical students participated in this study during their pediatric rotations. One-hundred and six students in 2016 class attended in-class didactic during pediatric rotation and 101 students in 2017 class were assigned to have self-directed learning during the rotation without lectures. Learning outcomes were measured using modified essay question (MEQ) examination and compared between 2 groups.

Summary of Results: Among 207 medical students participated in this study, students who attended in-class didactic (N=106) had significantly higher scores in modified essay question (MEQ) examination than those who had self-directed learning (SDL) (N=101) particularly in the areas of hematology/oncology ($p=0.014$), dermatology ($p<0.001$), cardiology ($p=0.003$) and infectious disease ($p=0.012$). However, students who had self-directed learning (SDL) could achieve significantly higher scores in modified essay question (MEQ) examination than those who attended in-class didactic in the areas of pulmonary ($p<0.001$), neonatology ($p<0.001$), gastroenterology ($p<0.001$) and genetics ($p<0.001$).

Discussion and Conclusions: The most suitable methods to deliver knowledge either in-class didactic or self-directed learning among medical students would entirely depend on specific subjects. Further exploration on the reasons for these significant differences is required in order to identified the best learning technique for medical students.

Take-home Messages: If each individual student should be taught differently, each subject should also deliver using different methods.

Impact of audio files on students' academic performance and scientific awareness

AUTHOR(S):

- **Nikhil Kumar, European University, Georgia (Presenter)**
- Yugdeep Singh Dudi, European University, Georgia
- Adarshpal Singh, European University, Georgia
- Maia Advadze, European University, Georgia
- Irine Sakhelashvili, European University, Georgia
- Natia Jojua, European University, Georgia

ABSTRACT

Background: complexity and volume of medical content make medical studies difficult. This regards mostly biomedical subjects at the beginning of the educational program. These fields of science are constantly updated with new research results. It is difficult for students to navigate in a huge amount of information within the textbooks. Combination of different forms of teaching facilitates achievement of learning outcomes. The aim of the survey was evaluation of the impact of audio files on the acquisition of knowledge of medical students. Audio files were provided to improve learning and deliver scientific information easily.

Summary of Work: 89 participants were first year students of the Medical Faculty. The study was conducted in March-July, 2018. After selection the participants signed informed consent. Two questionnaires were developed: for the assessment of students' needs and students' satisfaction. We prepared 3 different types of audio files (Biochemistry): a) short summary - 10 min; b) detailed explanation - 25 min; c) additional scientific data - 15 min.

Summary of Results: Preliminary findings: 59±26 participants supposed audio files to be helpful; 76±5 participants prefer to have audio lectures in the library, among them 60±18 participants requested audio files for the topics beyond the syllabus. The preferable time was 25 minutes (44 participants). Final results: 60 participants assumed that audio files had a positive impact on their academic performance. 30 students indicated 10 minutes as the best duration for the audio lectures, while number of the students preferring 25 minutes files were decreased from 44 to 21. 62 participants liked files with scientific information, while 16 were not interested in it. Finally 84 students indicated that they wanted audio lectures in other subjects.

Discussion and Conclusions: According to our results most of the students found audio lectures useful in improvement academic performance. We suppose that audio files are accessible for delivering scientific information to the students.

Take-home Messages: 1. Short audio lectures have positive impact on students' achievements. 2. Audio files promote facilitation of scientific awareness in medical students. 3. Innovated teaching strategies promote achievement of learning outcomes.

Flipping a Biochemistry Class within a Medical Curriculum: Impacts on Perception, Engagement and Attainment

AUTHOR(S):

- Sara Kayali, Alfaisal University, Saudi Arabia (Presenter)
- Hanaa Fatoum, Alfaisal University, Saudi Arabia
- MHD Amer Aldeiry, Alfaisal University, Saudi Arabia
- Hawazen Alahmad, Alfaisal University, Saudi Arabia
- Yahya Bawahab, Alfaisal University, Saudi Arabia
- Joud Enabi, Alfaisal University, Saudi Arabia

ABSTRACT

Background: The flipped classroom has recently gained popularity in higher education, which can be attributed to the various advantages it offers, ranging from increased student enthusiasm, encouraging but little has been written about its application in the middle east or in the biosciences. The aim of this study was to assess the feasibility, acceptability and impact of flipping biochemistry classes in comparison to the traditional didactic program.

Summary of Work: The study was conducted on first year medical students taking the biochemistry course at a University in Saudi Arabia (n+247). A series of short pre-recorded videos was created and used to replace traditional lectures for half of the course. The freed lecture time was replaced by problem solving and discussion sessions to encourage student engagement and participation in the learning process. To gather their evaluation, conception and attitude towards this learning approach, participants completed an online survey which was adapted and modified and then verified by two experts in the field. To study the effect of the learning approach on exam performance, the scores of the participants were compared in questions taught using flipped classroom versus traditional approach.

Summary of Results: Participants noted that although the effort needed for the course was similar regardless of the learning approach, the flipped method made it easier to get more engaged and motivated to study, in addition to a huge improvement towards a subject that's considered challenging as first years. Moreover, examination performance measured using single best answer multiple choice questions showed similar results between teaching methods. The participants did however express significantly better perception of the flipped classroom compared to the traditional approach

Discussion and Conclusions: Although achieving overall similar results regardless of the approach used by the instructor, the participants significantly favored the flipped classroom over traditional lectures. This study has demonstrated that the flipped classroom can be used in the teaching of the biosciences within a middle eastern setting, resulting in an improvement in student satisfaction, autonomy and engagement in the course materials.

Take-home Messages: Shifting the educational approach from passive to active through using the flipped classroom can impact the way learning is perceived and the attitude, engagement of students dramatically

The Impacts of Integrating Standardized Patients in Problem-based Learning Tutorial in Taiwan

AUTHOR(S):

- Ching-Chih Chang, National Yang-Ming University School of Medicine, Taiwan (Presenter)
- Jiing-Feng Lirng, National Yang-Ming University School of Medicine, Taiwan
- Pei-Ning Wang, National Yang-Ming University School of Medicine, Taiwan
- Shuu-Jiun Wang, National Yang-Ming University School of Medicine, Taiwan
- Chen-Huan Chen, National Yang-Ming University School of Medicine, Taiwan
- Hui-Chun Huang, National Yang-Ming University School of Medicine, Taiwan

ABSTRACT

Background: Problem-based learning (PBL) has been widely adopted in medical education. The skepticism about PBL comes from lacking of interaction with a real patient since most PBL cases are paper cases. Using a standardized patient (SP) might solve this problem. Herein, we tested the impact of integration of SP in the PBL tutorial and evaluated the response and feedbacks from students, SPs and facilitators in such curricula.

Summary of Work: In 2017, a total of 313 students, 66 facilitators and 36 SPs in the National Yang-Ming University, Taipei, Taiwan were enrolled. The SPs presented the symptoms/signs of the cases at the beginning of the brainstorming then the students interviewed them to obtain the detail history. All students, facilitators and SPs were invited to complete the questionnaires before and after this program.

Summary of Results: Most SPs considered that both the 2nd year dental medical student and 3rd year medical students participated actively and were competent enough but students and facilitators considered that the 4th year medical students might be more prepared. Overall, the participated students admired the interaction with SP and only about one fifth of them felt that this design caused unnecessary pressure among the students and facilitators. They agreed that this program significantly inspired the student's learning motivation (pre- vs. post-course: 4.1 ± 0.7 vs. 4.3 ± 0.7 , $P < 0.001$), increased their confidence level in interviewing patients (4.0 ± 0.8 vs. 4.2 ± 0.7 , $P < 0.001$) and encouraging critical thinking (4.0 ± 0.7 vs. 4.2 ± 0.7 , $P < 0.001$).

Discussion and Conclusions: There were different viewpoints of integration of SP in the PBL tutorial from SPs, facilitators and students. We conclude that the integration of SPs in PBL tutorial can improve the authenticity of PBL case and inspire the learning motivation of students.

Take-home Messages: In this study, a majority of students enjoyed interacting with SP in the PBL tutorial and agreed that such an intervention enhanced the depth of discussion in PBL tutorial. More than 85% of students, SPs and facilitators agreed that this program is worthy of continuing in the future.

Patient-centeredness of problem-based learning cases

AUTHOR(S):

- Scott Kinkade, University of Missouri, USA (Presenter)

ABSTRACT

Background: Medicine has changed from a physician-centric model to a patient-centered model of care. While patient-centeredness is an espoused virtue in the curriculum, there may be components of the curriculum (unintended, informal, or hidden) that do not reflect patient-centeredness. The purpose of this study was to assess the degree of patient-centeredness within the problem-based learning cases used in the curriculum.

Summary of Work: An entire cohort of PBL cases was analyzed using qualitative content analysis. A patient-centeredness theoretical framework proposed by Krupat (Krupat, Yeager, & Putnam, 2000) was adapted and applied. Patient-centeredness was categorized along two dimensions: sharing behaviors and caring behaviors. Sharing behaviors are typified by sharing information with the patient and shared decision making. Caring behaviors relate to knowing about the patient and providing treatment that is tailored to a patient's unique situation.

Summary of Results: A total of 62 PBL cases were analyzed. Patient-centeredness was coded along two axes: sharing and caring behaviors. The cases exemplify caring behaviors (knowing the patient and knowing about the patient) well. Sharing behaviors, such as shared decision making, were not well modeled in the cases. A coding schema illustrated with quotations from the cases is provided.

Discussion and Conclusions: This qualitative analysis of PBL cases demonstrates that the patients are described in ways that identify their uniqueness as people. This role-models to students that we are treating an individual. However, instances of the physicians knowing how a patient was experiencing a medical problem, which is a more advanced level of caring, were rare. The studied PBL cases are lacking in description of sharing information with patients, shared-decision making, and obtaining consent for procedures. Understandably, PBL cases are written to convey the essential medical information, so all details and conversations are not included. However, the example quotes show how easily a few sentences can enrich the patient-centeredness of patient cases.

Take-home Messages: Problem-based learning cases used at this medical school do not reflect patient-centered care as well as they could. A simple coding framework can be applied to curricular materials to analyze their patient-centeredness and simple details added to written patient cases can help model the patient-centered care we strive to role-model.

Students' Perspective on Critical Incidents in the Base Group in Problem-based Learning

AUTHOR(S):

- Viktor Sharan, Orebro University, Sweden (Presenter)
- Marie Lidskog, Orebro University, Sweden

ABSTRACT

Background: Central to problem-based learning (PBL) is work in small groups where students actively engage in discussion on cases. A crucial aspect of the group's productivity is group dynamics. In all groups, events occur that adversely affect group dynamics and reduces the productivity. Previous studies show that frequency and impact of critical incidents increases along the course of medical school. In Sweden, PBL is a common educational approach in medical education. This study investigates critical incidents in base groups in a Swedish context.

Summary of Work: The purpose was to examine students' perception of frequency and severity of critical incidents in group work and to what extent the incidents occur along the medical education. A questionnaire was distributed to all students at one medical programme in Sweden. Totally 201 replies were received. The students were divided into four groups depending on which semester they attended. The analytical method used was the analysis of variance and post hoc Bonferroni.

Summary of Results: Lack of elaboration, lack of interaction and uneven participation were factors that students experienced most frequently. For the majority of the factors examined, a significant increase was observed between the semesters. Unevenly participation, difficult personalities, lack of motivation were the factors of the students experienced the greatest in terms of severity. No significant difference was seen between the semesters.

Discussion and Conclusions: The result of this study suggests that the number of critical incidents increases with increasing semesters. This can be explained by the students expecting more from the base group in the higher terms and therefore provides even minor incidents high score. The results also show which concrete situations are perceived as problematic. By knowing this information, it is possible to put in measures to stop this from happening. One way would be to educate students and supervisors and give them tools for managing the critical incidents.

Take-home Messages: Critical incidents can contribute to an inefficient base group. A reduction of critical incidents would lead to an improvement in the depth of the discussions and in the group's cohesion. These factors would directly increase the group's productivity.

Medical Students' Attitudes toward Implementation of Problem-based Learning: Do Attitudes Differ Depending on Students' Age, Sex and Grade Point Average?

AUTHOR(S):

- Roko Žaja, University of Zagreb, School of Medicine, Croatia (Presenter)
- Jasna Vuk, University of Arkansas for Medical Sciences, USA
- Milan Milošević, University of Zagreb, School of Medicine, Croatia

ABSTRACT

Background: The introduction of problem-based learning (PBL), conducted on Occupational and Sports medicine (OSM) classes, was a part of the new approach to students' education in academic year 2018-2019. All students in the class were solving team problems based on previously assigned individual tasks by looking for articles they were obligated to read at home. After solving problems in small groups, students presented findings to the class.

Summary of Work: After finishing OSM classes, 126 final year students (83 females and 43 males) of School of Medicine, University of Zagreb were surveyed by specially designed questionnaire for the purposes of this research. There were 26 questions divided in 3 parts considering students attitudes toward efficiency of PBL (first part); toward own preparation and presentation (second part) and toward professors work and received instructions (third part). For each part, received data and calculated scores were processed by nonparametric statistical tests afterwards.

Summary of Results: Response rate was 80.8%. On the scale 1-5, participants grade point average (GPA) was 4.1 ± 0.5 . The age was 24.5 ± 1.6 years. PBL was considered as a valuable teaching method among 91.9% of participants with 85.6% of them who considered PBL applicable to the OSM classes. Regarding the parts of the questionnaire, no significant differences were found between males and females, except third part where females had significantly higher score compared to males: median [IQR]=8.0 [7.0-9.0] vs. 7.0 [5.0-9.0]; $P=0.034$. Among all participants, no significant relationship was found between any of three partial scores of the questionnaire, respectively, with age or GPA.

Discussion and Conclusions: Since the PBL was implemented in the OSM classes for the first time, positive students attitudes have been encouraging to continue with this way of teaching. Though females had more positive attitude toward professors engagement, all participants, regardless of their GPA and age, have considered PBL as an efficient teaching method suitable for every medical student.

Take-home Messages: PBL has been well accepted and appropriate teaching method for the final year medical students that indicates an importance of critical thinking and making decisions according to requirements of their future work.

Feedback in problem-based learning in Saudi Arabia: student perceptions

AUTHOR(S):

- **Abdulmohsen Alomair, The University of Sheffield, UK (Presenter)**
- Michelle Marshall, The University of Sheffield, UK
- Pirashanthie Vivekananda-Schmidt, The University of Sheffield, UK
- Deborah Murdoch-Eaton, The University of Sheffield, UK

ABSTRACT

Background: PBL focuses on the presentation of problems in small groups as a way to stimulate student learning. Even though feedback is central to educational processes currently there is a dearth of research investigating feedback processes within PBL settings in Saudi Arabian educational environments.

Summary of Work: The research question is 'How do different medical schools in Saudi Arabia experience the PBL feedback process?; specifically focusing on modes of feedback (i.e. written vs face to face), on sources (i.e. tutor vs peer) and levels of feedback experienced by students in Saudi Arabian medical schools. Twenty medical schools in Saudi Arabia were invited to complete an electronic survey if adopting problem-based learning in their curricula; and eleven responded positively.

Summary of Results: A total of 483 medical students responded; 96.5% of students receive feedback during PBL tutorials. Of these 48.5% receive it in both face-to-face and written forms, 46% face-to-face only and 3.7% only in written form. Respondents prefer face-to-face over written feedback (85% v 76%) and most receive feedback from both their tutor and peers (73.6%). With peer and tutor feedback, respondents received feedback that encompasses a number of aspects including what they are doing well, what they can do better and why this is important, and how to achieve this. With tutor feedback, 27.6% of the respondents reported they never or only rarely are told how to do better; with peer feedback this was reported by 35% of the respondents. With tutor feedback, 33% of the respondents never or only rarely are told why they need to do better and with peer feedback, 43.3% responded the same.

Discussion and Conclusions: Almost all students receive feedback in the Saudi medical schools that participated in this study. However, student experience is not always in line with good practice in feedback. These results will be further investigated through interviewing students and PBL tutors to identify how to improve current experience.

Take-home Messages: Effective feedback practice does not happen automatically but requires deliberate focused efforts including quality assurance as well as training and development for both students and tutors.

Problem-Based Learning in Pelvic mass Scenario

AUTHOR(S):

- Ladaporn Wongkunha, Buddhachinnaraj Hospital, Thailand (Presenter)

ABSTRACT

Background: Problem-based learning (PBL) is intended to enable students to work in groups to learn a topic in the context of real issues. PBL allows basic science knowledge to be made applicable to students' learning needs by relating it to a clinical problem. Instead, knowledge is gained and understood in order to apply it to the clinical scenario and ultimately serve the future patient.

Summary of Work: Following the ethical approval from Institutional Review Committee of our institute, the study was conducted on 35 students from a batch of 60 students of the fourth-year medical students at Buddhachinnaraj Hospital, Phitsanulok, Thailand. The medical students had learned PBL in the title of pelvic mass in a woman at the obstetrics and gynecology department rotation. The study aims are an evaluation of the satisfaction to learn PBL. The three questionnaires included the self-evaluation of medical students, the medical student evaluate a teacher, and the teacher evaluates the medical students. The questionnaire scores included 2,4,6,8,10 which were mean the level of very less, less, moderate, good, excellent pleasure.

Summary of Results: The 35 of the fourth-year medical students were enrollment to learn PBL when they had rotated to the obstetrics and gynecology department. The three questionnaires included the self-evaluation of medical students, the medical students evaluate a teacher, and the teachers evaluate the medical students. The questionnaire score was 8/10 which means the good satisfaction of the learning issues. Most topics display a pleasure score of 8/10 in the self-evaluation of medical students. The medical students had a score of 6/10, moderate satisfaction for the application of basic science knowledge to PBL. The medical students had good satisfaction to the teachers with the level score of 8/10. The teachers had evaluated the medical students to be good satisfaction, 8/10 of the score level.

Discussion and Conclusions: The PBL is to help students become intrinsically motivated. Intrinsic motivation occurs when learners work on a task motivated by their interests, challenges, or sense of satisfaction.

Take-home Messages: Students are also more motivated when they believe that the outcome of learning is under their control.

The challenges of introducing standardized patients in Problem-based learning curriculum

AUTHOR(S):

- Tsang-En Wang, Mackay Memorial Hospital, Taiwan (Presenter)
- Min-Shu Wang, Mackay Memorial Hospital, Taiwan
- Yat-Pang Chau, MacKay Medical College, Taiwan
- Yih-Jer Wu, MacKay Medical College, Taiwan
- Chien-Yuan Hung, Mackay Memorial Hospital, Taiwan

ABSTRACT

Background: Problem-based learning (PBL) is the major learning program in modern medical education. There is a tendency to move from text-based cases to video or web-based virtual patients. Some PBL course tried using standardized patients (SPs) as a problems representation. We introduced SPs in PBL two years ago. Here, we report our experience about the SPs in PBL curriculum.

Summary of Work: Our department of medicine is a six-year system. PBL is implemented in the 3rd-grade and 4th-grades. We usually used text-based cases for PBL. We introduced SPs to replace text-based patient in one of 4th-grade PBL case since 2017. The interaction between the SPs and the students are mainly on medical history, clinical symptoms, and laboratory tests, but do not involve the physical examinations. We get feedback after the course.

Summary of Results: In these two years of experience, tutors were easy to get into the activity. More than 90% of students liked the course and said learning became more interesting. However, they felt anxiety in unfamiliar clinical condition inquiry. Our SPs had been OSCE SPs and did not have difficulty to play patients in PBL. SPs felt the responses of those students were very enthusiastic, but students sometimes asked questions without clinically logical. As for the preparation of the case drama, it is more complex for the author and different to write text-based case. The writers also need to train SPs hard.

Discussion and Conclusions: SPs may promote more effective self-directed constructive learning than text-based or virtual-based cases. SPs may become the backbone of undergraduate medical education. Based on our limited experience, we found that incorporating SPs into the classroom is more effective for learning communication. The students, teachers, and SPs were quite satisfied with the course methods and wanted more similar courses. However, the preparation of SPs PBL is more complexity. The case writer needs to be trained. SPs also spend at least twice more than three hours to prepare and practice. So time and cost are quite high.

Take-home Messages: Compared with the traditional methods, PBL introduces SPs to have better learning benefits. The high costs are issues that must be overcome in the future.

Picture Archiving and Communication Systems incorporated PBL curriculum to improve understanding for musculoskeletal diseases teaching in China

AUTHOR(S):

- **Keng Chen, The Eighth Affiliated Hospital, Sun-Yat-Sen University, China (Presenter)**
- Fan Lian, Dept of Rheumatology & Clinical Immunology, the First Affiliated Hospital of Sun Yat-sen University, China
- Chunhai Li, Dept. of Orthopaedics, Sun Yat-sen Memorial Hospital, China
- Huiyong Shen, Dept. of Orthopaedics, the Eighth Affiliated Hospital of Sun Yat-sen University, China

ABSTRACT

Background: The traditional method of teaching musculoskeletal diseases with PBL is inadequate to transfer the spatial relation of musculoskeletal diseases with sporadic images. Picture Archiving and Communication Systems (PACS) is a platform providing dynamic access to images from multiple modalities (1). This study aims to evaluate how PACS incorporated PBL curriculum improves students' acquisition of knowledge and clinical skills.

Summary of Work: Interactive, dynamic radiological cases in PACS were offered to a series of year 5 medical undergraduate students in a problem-based learning curriculum. Multiple choice question (MCQ) tests, clinical skill performance and anonymous evaluation questionnaire for the course were completed before and after the course. Results were compared between users and non-users of PACS. Student's perceptions of the teaching method were evaluated using Likert scale-based items.

Summary of Results: There were no baseline differences in MCQ scores and clinical skill performance between the users of PACS and non-users. MCQ results after course were not associated with PACS teaching. Students using PACS certified better clinical skills and higher spatial imagination. PACS users rated their experiences very positively, with 92% of them expressed a wish for more radiology material involved in the future. The challenge of PACS teaching included teaching incentives and collaboration of teachers with radiological and nonradiological (medical and surgical) backgrounds.

Discussion and Conclusions: The present study is the first to integrate PACS to PBL curriculum in China, which showed a positive effect of PACS incorporated learning approach. In contrast, sporadic, single plain film images as supplementary tool imbedded in the courses were not actively related to the better outcome of student learning. The participant students using the incorporated learning PBL curriculum were much more satisfied with the learning experience and more confident about the elements they have learned. PACS incorporated curriculum demonstrated the value of interactive, dynamic radiological material on musculoskeletal diseases teaching. PACS helped to increase medical students' clinical competency and manage real patients.

Take-home Messages: PACS is a far better way for musculoskeletal diseases teaching than traditional methods. Teachers with radiological and nonradiological backgrounds should work together to develop the PACS incorporated PBL cases.

Rabbit Holes and Case Based Learning: Dive In or Avoid?

AUTHOR(S):

- Simon Atkinson, University of Bristol, UK (Presenter)
- Zarabeth Newton, University of Cardiff, UK

ABSTRACT

Background: Cardiff and Bristol Universities have both used a Case Based Learning (CBL) approach to teach undergraduate medicine, and collaboratively developed case and training materials. In training facilitators attention was paid to the role of the facilitator in maintaining group focus towards the case learning objectives: the possibility of topic drift - going down a rabbit hole - worried both staff and students. This study explores whether rabbit holes outside the learning objectives should actually be a worry, and whether students and facilitators had in fact gained from these discussions.

Summary of Work: With ethical approval we developed a questionnaire to survey the experiences and opinions of facilitators and students. Our questions aimed to explore the topics of the rabbit holes which groups had encountered, as well as how long the group had spent on the topic. We asked how the rabbit hole had been created, who had driven its exploration and whether all group members had participated. We also asked respondents to rate the educational value of the rabbit hole, whether it had contributed to their learning on the case, or to their general education.

Summary of Results: Although rabbit holes were created by both students and staff, it was group facilitators who were more likely to develop and drive groups into rabbit holes. The nature of the holes was predominantly clinically related, and linked to the material of the case, although different facilitators with more diverse backgrounds were inclined to create rabbit holes with more tangential clinical links. Students and facilitators rated the educational value of rabbit holes differently, especially where the topic was less obviously clinically relevant.

Discussion and Conclusions: The diversity and richness of material revealed in the rabbit holes adds a novel depth and breadth to a medical degree. It could be argued that rabbit holes are an important part of the holistic development of clinicians, and that the use of non-expert, non-clinician facilitators provides a valuable opportunity to add new learning, as well as fostering the attitude of curiosity we would like to encourage in our students.

Take-home Messages: Rabbit holes can be valuable learning opportunities. Whether students appreciate that they are is variable.

Learning outcome in Radiology after integrated TBL and interactive lectures for fourth year medical students

AUTHOR(S):

- Siriporn Jeamwongsa, Ratchaburi Hospital, Thailand (Presenter)

ABSTRACT

Background: Radiology in clinical practice requires interpreting skill. The medical students who have no experience in clinical imaging presentation are usually anxiety about knowledge content. Our previous teaching-learning method consisted only of lecture in preparing the student for comprehensive knowledge transfer. However, the students had little chance to interact and poor communicate. The idea was to change teacher-learning method from lecture only to integrating some topics in TBL and interactive lecture formats, to improve student attention, participations and interpreting skill.

Summary of Work: Objective: to evaluate the result of integrated TBL and interactive lectures as teaching-learning methods for the fourth year medical students. Duration of study is 6 years (since 2014-2019), included 192 students. Each year contained 32 students which divided into 6 groups. Each group took a topic of TBL and interactive lectures with 1 week preparation time before presentation and classroom discussion. Students were challenged to self study and prepare the information from web-based for interactive presentation within 180 minutes time frame. Students were asked to evaluate this study method as compared to previous lecture-based learning method. Data collection included 6 years duration. Teachers evaluated the student in the area of knowledge outcome, communicating and interpreting skills, compared with previous scores of medical student in the last 6 years.

Summary of Results: We found that students gained not only knowledge, develop communication skills and participate in teacher-student interactions. This also improved the enthusiasm, problem solving and leadership skill of learners. Impressive results of the student presentations were more than expectation. There was also no recall of student after final examination for re-examination. In the past 6 years, average 12.5 percents of students were called for re-examination in each year. But after changing the learning methods were no recalled.

Discussion and Conclusions: The teaching methods by integrated TBL and interactive lectures can improve the learning outcome and higher problem solving and leadership skills of learners.

Take-home Messages: After followed outcomes since 2014-2019, in the time of disruptive technology, continuous learning from big data sources and included problem solving, communicating skills are important than only interpreting skill, which computer can do.

Team-based learning in Inter-Professional Education (IPE) for Patient Safety Course

AUTHOR(S):

- Thitima Suntharasaj, Department of Obstetrics and Gynecology, Faculty of Medicine, Prince of Songkla University, Thailand (Presenter)
- Chitkasaem Suwanrath, Department of Obstetrics and Gynecology, Faculty of Medicine, Prince of Songkla University, Thailand
- Pratyanan Thiangchanya, Faculty of Nursing, Prince of Songkla University, Thailand
- Nattasiri Thanawuth, Faculty of Pharmaceutical Sciences, Prince of Songkla University, Thailand
- Boonyarat Warachit, Medical Education Center, Hatyai Hospital, Thailand
- Arnuparp Lekhakula, Department of Medicine, Faculty of Medicine, Prince of Songkla University, Thailand

ABSTRACT

Background: An “Inter-Professional Education for Patient Safety” was arranged for the 6th year medical students, the 4th year nursing students and the 5th year pharmaceutical students. Groups of 13-15 students and 3-4 faculty staff were set. The activities composed of a full-day workshop including team-based learning (TBL). The contents were based on the WHO Patient Safety Curriculum Guide, Thai Patient Safety Goals, and Rational Drug Use Handbook.

Summary of Work: Objective: To evaluate the student’s understanding and learning by TBL in the IPE for Patient Safety. Methods: The TBL was designed in 3 steps; the first one was a pre-class preparation, the second one was an individual readiness assurance testing (iRAT) and the third one was a team readiness assurance testing (tRAT) with the same questions. On the full-day workshop, a 90 minutes period was conducted. The test composed of 5 multiple choices questions (MCQs) and 10 situational judgement tests (SJTs). Two points were given for the correct answer of each MCQ. Each SJT had 5 choices for ranking from 1= least appropriate action to 5= most appropriate action and two points were given for the correct match with 1 or 5 ranking.

Summary of Results: A total twenty groups of 280 students (31.8% medical students, 39.3% nursing students and 28.9% pharmaceutical students) completed the test. The mean MCQ score in iRAT was statistical difference among the faculties (4.65, 4.69 and 3.62 for medical, pharmaceutical and nursing students, respectively). Moreover, nursing students showed the lowest mean SJT iRAT score (16.13, 16.86 and 13.80 for medical, pharmaceutical and nursing students, respectively). After group working, the mean tRAT scores were significantly higher compared with the mean iRAT scores in both MCQs and SJTs (6.70 vs 4.25 for MCQs and 20.30 vs 15.40 for SJTs, respectively).

Discussion and Conclusions: TBL is one of the teaching method that enhances students’ engagement and active learning especially in IPE. The process of TBL promotes self-directed learning, problem-solving, inter-personal and team work skills. Using SJTs can assess the individual and team decision making in various scenario that related to clinical practices.

Take-home Messages: TBL is the effective teaching method in IPE for patient safety course.

Team-based Learning in physical examination skills, student perception and preference: a follow-up study

AUTHOR(S):

- Jiska Patiwael, Amsterdam UMC, VUmc School of Medical Sciences, The Netherlands (Presenter)
- Natalia Bezakova, Amsterdam UMC, VUmc School of Medical Sciences, The Netherlands
- Franciska Koens, Amsterdam UMC, VUmc School of Medical Sciences, The Netherlands
- Hester Daelmans, Amsterdam UMC, VUmc School of Medical Sciences, The Netherlands

ABSTRACT

Background: A TBL teaching format (Burgess 2014), designed to actively engage students in the theoretical part of a physical examination training, was evaluated positively by students in a recent pilot study (Patiwael AMEE 2018). Therefore the TBL format was extended and more TBL trainings were included. The aim of this follow-up study is to investigate student perception of the TBL format and of the traditional teaching format and their preference.

Summary of Work: From June to September 2018, medical students at VU University Medical Center School of Medical Sciences, Amsterdam, the Netherlands, attended seven physical examination trainings at the start of their Master's program. Three trainings in TBL format, the other four in traditional format. Students were asked to evaluate both formats in writing, answering open-ended questions and rating statements (2 items; using a 5-point Likert scale.) Analysis: The open answers were open coded and through iterative discussion among 4 members of the research team consensus was reached on themes. Data were collected and analysed until sufficiency was reached. The ratings on the statements were measured by frequency distribution.

Summary of Results: The feedback forms were filled out by 113 students. 107 forms (95%) could be analysed, 6 forms were filled out incorrectly and excluded. Emerging TBL format themes were: 'interaction', 'thinking for themselves', 'active participation'. 'Interaction' and 'active participation' were most frequently mentioned. These themes were mainly positively evaluated by students. Traditional format themes were: 'the teacher explaining', 'listening', 'posing questions', 'structure', 'tedious'. 'The teacher explaining' was most frequently mentioned. Students evaluate this theme both positively and negatively. 59 students (55 %) preferred the TBL format over the traditional format. 18 students (17 %) preferred the traditional format over the TBL format.

Discussion and Conclusions: The main TBL format themes 'interaction' and 'active participation' are positively evaluated by students. The main traditional format theme 'the teacher explaining' is evaluated both positively and negatively. Students reported a preference for the TBL format in the theoretical part of the physical examination training.

Take-home Messages: TBL principles stimulate interaction and active participation during physical examination trainings. Student perception is positive.

“Kampo-sommelier practice”: A trial for an active learning program in Kampo (Japanese traditional) medicine

AUTHOR(S):

- **Makoto Arai, Department of Kampo Medicine, Tokai University School of Medicine, Japan (Presenter)**
- Yoshinobu Nakada, Department of Kampo Medicine, Tokai University School of Medicine, Japan
- Kagemasa Kajiwara, Division of Basic Molecular Science and Molecular Medicine, Tokai University School of Medicine, Japan
- Takaaki Kinoue, Department of Community Health, Tokai University School of Medicine, Japan
- Shun-ichiro Izumi, Division of Postgraduate Education, Tokai University School of Medicine, Japan

ABSTRACT

Background: Kampo terminology is newly described in the coming ICD-11, and Kampo medicine is now globally recognized. However, Japanese medical schools provide only limited classes in Kampo education. Considering that each Kampo formula consists of several kinds of crude drugs (medicinal plants), it is important for medical students to become familiar with crude materials to motivate them to learn Kampo medicine. Therefore, this study aimed to assess the effectiveness of an active learning program on crude drugs proposed for such limited undergraduate environments.

Summary of Work: Fourth-year Tokai University School of Medicine students as of 2017 participated in the program. Eighteen teams (6 to 7 students each) attended a 20-minute Kampo-sommelier practice. Teams were provided 10 kinds of crude drugs (Licorice, Cinnamon, Ginger, Perilla, Jujube, Citrus Peel, Peach Kernel, Ginseng, Pinellia, Moutan) in three forms, original, cut, and powdered, while blinded to the type of substance. Each team distinguished each crude drug in terms of form, scent, taste, and color with reference to characteristics descriptions. Participation involved a sense of game-playing among teams. To evaluate the learning effect, an exam consisting of 10 questions to match the names of the 10 kinds of crude drugs with their descriptions was administered one month after the practice, without notice. The same questions were answered by liberal arts students of “A” university and medical students of “B” university, having no prior education on crude drugs, and pharmacy students of “C” university, with professional education in the field.

Summary of Results: The average score of 117 Tokai University students was 6.2 out of 10, significantly higher than that of 97 students from university “A” (3.4), and 85 from “B,” (3.1), and significantly lower than 135 from “C” (8.4) ($p < 0.01$ for all).

Discussion and Conclusions: Even without knowledge of crude drugs, scores of >3 points were gleaned from the descriptions. The fact that Tokai University students obtained significantly higher average score of 6.2 after 20 minutes’ practice suggests that this team-based learning is effective.

Take-home Messages: Kampo-sommelier practice is a useful active learning program to enhance the learning of Kampo medicine in a short time.

Checking For Understanding: Exploring a teaching methods gap between K-12 and medical education

AUTHOR(S):

- Holly Meyer, USUHS, USA (Presenter)
- Eric Meyer, USUHS, USA

ABSTRACT

Background: Checking for understanding is defined extensively in the USA K-12 literature as the explicit use of short, directed learner assessments during instruction to provide an immediate needs assessment of learner(s) progression to guide further instruction. Checking for understanding have been shown to build trust, improve future instruction, and help learners self-regulate their learning. Despite these benefits, checking for understanding is often overlooked or employed ineffectively in medical education, as seen with the ubiquitous “Does this make sense?” or “Any questions?” We set out to better understand if there are barriers to their use by medical educators.

Summary of Work: We developed a workshop for medical educators on incorporating checks for understanding. Over the course of two years, we completed 12, 1-hour workshops each with roughly 5-6 medical educators. The workshop started with a needs assessment related to understanding and comfort using checking for understanding. Next, participants reviewed a list of research supported (K-12) checking for understanding methods. They choose two methods to use in simulated teaching activity. After the session, participants were sent a brief 6-question post-evaluation.

Summary of Results: Prior to the session, participants reported low confidence in utilizing checks for understanding. Post workshop, respondents (46%, 23/50) reported increased confidence in incorporating checking for understanding (91%, 21/23), but several (32%, 15/46) reported that they were unsure if the methods for checking for understanding where applicable to medical education. Specifically, “time constraints” and “stressors of teaching in a clinical setting” were described as barriers to implementation.

Discussion and Conclusions: Our brief workshop improved the confidence medical educators have in implementing checking for understanding and their awareness of methods to check for understanding. The perceived barriers in utilizing checks for understanding in a clinical setting require further exploration so that strategies for use can be tailored to medical educators.

Take-home Messages: • Our brief workshop improved awareness and confidence in incorporating checking for understanding in a clinical setting. • There may be important differences in clinical education as compared to K-12 education that impacts the effectiveness of checking for understanding.

The Core Educator Initiative: Numbers and Implementation in Four Frames

AUTHOR(S):

- Sara Lamb, University of Utah School of Medicine, USA (Presenter)
- Kerri Shaffer, University of Utah School of Medicine, USA
- Candace Chow, University of Utah School of Medicine, USA

ABSTRACT

Background: The traditional “Parade of Stars” faculty model presents significant obstacles for undergraduate medical education. We use Bolman and Deal’s Four Frame model to describe the implementation of a new model in terms of structural, political, human resource, and symbolic challenges and successes.

Summary of Work: The University of Utah School of Medicine (UUSOM) implemented a Core Educator initiative, which arose from a school-wide education retreat in 2016, was proposed to the Curriculum Committee in 2016, gained institutional support during 2017-18, and fully launched July 2018.

Summary of Results: The Core Educator model is comprised of course/clerkship directors, learning community faculty, small group facilitators, and a group of clinical and science domain experts who are responsible for designing and delivering all four years of curriculum in their content areas. Prior to AY 2017-18, ~370 unique faculty interfaced with the students in large group and small group settings. Our current model has 177 unique faculty amounting to ~30 full time equivalents supported for their education effort. Faculty represent 19 departments. The majority (60%) have MD or DO degrees, followed by faculty with PhD or DPhil degrees (37%). Most faculty (51%) are early-career. Finally, 59% of faculty serve as small group instructors while 41% are engaged in course and content design.

Discussion and Conclusions: This model allows us to focus our attention on a manageable number of faculty who dedicate a significant amount of time to education. The model is a vehicle for the UUSOM to address structural barriers around effective faculty development and curriculum design and to tackle political obstacles around education funding. It affords the opportunity to address human resource challenges, capitalizing on faculty strengths and building faculty capacity. Furthermore, the model attends to symbolic issues by overtly placing value on faculty as educators and role models.

Take-home Messages: This model is innovative for it prioritizes student learning over the traditional faculty structure. While not a quick fix, it has the potential to transform teaching, curricular development, and faculty development such that students become engaged learners and faculty discover renewed meaning and purpose in their careers.

The teaching skills that enhance a happy-classroom from students' perspective versus reality

AUTHOR(S):

- Direk Ekbawornwong, Suratthani Medical Education Center, Thailand (Presenter)
- Arunee Tipwong, Suratthani Medical Education Center, Thailand
- Thanita Somton, Suratthani Medical Education Center, Thailand

ABSTRACT

Background: Burnout among medical students is increasing. Happy-classroom is one of the simple ways that may help reduce the incidence. This study aimed to determine the teaching skills that can contribute happy-classroom comparing between what student expected and what they experienced in reality.

Summary of Work: A cross-sectional study was conducted in 84 medical students at Surat-Thani medical educational center. List of 15 factors in effective teaching skills was selected after literature reviews, and was added in an online questionnaire asking the students to rate its impact on happy-classroom from their own preferences comparing to what they experienced in reality. The gap between expectation scale and reality scale was defined as "gap of disappointment." Descriptive statistics was used.

Summary of Results: The students rated top three most effective teaching skills for building happy-classroom as 1) an ability to teach them knowledge application 2) an ability to create relaxing learning atmosphere, and 3) an ability to explain learning contents clearly. Top three least impact factors in student's perspective were 1) pretest-posttest designs 2) promoting students' self-reflection, and 3) ethical integration in teaching. Top three most widen "gap of disappointment" were about 1) creating relaxing learning atmosphere 2) teaching knowledge application, and 3) providing enough learning resources and references.

Discussion and Conclusions: Each "effective" teaching skills had different degrees of impact. It may cause from various learning style of the students and the context of training program. In this study, it showed that our students expected not only knowledge transferring skills, but also facilitating skills for making the learning atmosphere more relaxing and safe. In the setting of service-based hospital, the faculty staffs probably had limited time to focus on building up effective learning environment, which consequently causing the students felt disappointed with the classroom. However, promoting the continuing professional development in medical education, especially student-centered education, among faculty staffs may needed to help them balance the roles between care-provider and teacher.

Take-home Messages: Enhancing student-centered approach in faculty members could be a solution to help tailoring the different needs and build up more of the happier-classroom.

Educating Medical Students: Are We Doing It Right?

AUTHOR(S):

- Jill Cheng Sim Lee, KK Women's and Children's Hospital, Singapore (Presenter)
- Mingyue Li, KK Women's and Children's Hospital, Singapore
- Rajeswari Kathirvel, KK Women's and Children's Hospital, Singapore
- Limin Kam, KK Women's and Children's Hospital, Singapore
- Tan Heng Hao, KK Women's and Children's Hospital

ABSTRACT

Background: KK Women's and Children's Hospital (KKH) is a tertiary hospital in Singapore catering specifically to women and children. We train medical students from all three medical schools in Singapore. We conducted this survey to find out the students' preferred methods of teaching to be able to tailor our curriculum delivery to meet our students' needs and preferences.

Summary of Work: We surveyed a total of 83 Year 4 medical students; 53 from Lee Kong Chian School of Medicine (LKC) and 30 Year 4 medical students from Yong Loo Lin School of Medicine on their first day of Obstetrics and Gynaecology (O&G) postings in KKH to find out their preferred teaching methods and settings. We repeated the survey at the end of their postings with the same questionnaire to find out if their preferences had changed after experiencing the current curriculum delivery methods.

Summary of Results: At the start of their postings, 88.9% chose small group setting and 9.9% chose one-to-one setting as compared to 87.0% and 10.4% respectively at the end of their postings. The top 3 preferred methods of teaching at the start of postings were bedside teaching/direct observation, case-based discussion and lectures. At the end of their postings, the first two remained the same. However, e-learning was preferred over didactic lectures among the LKC students. It was felt that bedside teaching/direct observation and case-based discussions prepared the students best for clinical learning in O&G and this did not change at the end of their postings.

Discussion and Conclusions: According to the survey, medical students preferred small group settings for clinical teaching and their preferred methods of teaching were bedside tutorials/direct observation, case-based discussions and e-learning. We uploaded voiceover Power Points on common topics in O&G in their online learning platform to give them an overview of the topic prior to their postings. This helps them to be better prepared for their clinical postings and allows more time for smaller group discussions/bedside tutorials during their short posting.

Take-home Messages: It is important find out the medical students' preferred methods of teaching to maximize their learning experience.

Students organizing a large-scale teaching week to close the academic year - dealing with freedom and responsibility

AUTHOR(S):

- Gert Olthuis, Radboud University Medical Center, The Netherlands (Presenter)
- Anke Oerlemans, Radboud University Medical Center, The Netherlands
- Marc Vorstenbosch, Radboud University Medical Center, The Netherlands
- Bas Schouwenberg, Radboud University Medical Center, The Netherlands
- Esther Tanck, Radboud University Medical Center, The Netherlands

ABSTRACT

Background: Students of the bachelor curricula Medicine and Biomedical Sciences of the Radboudumc largely follow the same teaching program. To stimulate integration and improve cohesion between the years and studies, every academic year closes with a large-scale teaching week for 1200 students: the Radboud Student Conference (RSC).

Summary of Work: The RSC is organized by a group of 5-8 dedicated (bio)medical students, supervised by three faculty members. These students have to apply for team membership and receive 4EC for their efforts. The RSC includes presentations of projects, a conference day on biomedical sciences, and a sports day. The program closes with a 'Generation day', where students bring family members to get acquainted with their study. In order to explore the experiences of students on the organizing committee, we held four focus group interviews. Main question: what is it like to organize a large-scale educational event for fellow students?

Summary of Results: Analysis of the focus group interviews brought forward four main themes. 1) The motivation to join the organizing team; no informal committee but serious teamwork to organize an event for peers. 2) Organizing the RSC gave students both a sense of freedom and the responsibility to succeed. 3) Students experienced positive and negative aspects of collaboration with peers and faculty members. 4) Organizing the RSC was an educational experience and contributed to personal development.

Discussion and Conclusions: It is worthwhile to understand the process of organizing The RSC from the perspective of the 'zone of proximal development'. Students' learning process is stimulated by tasks that are too hard for them to do on their own, but simple enough to do with assistance. In a nutshell, students learned the importance of trusting co-organizers and enjoyed the final result: a well-organized week. Several students indicated: 'By organizing this event we have learned so much more than in regular courses'.

Take-home Messages: (Bio)medical students are capable of bearing the responsibility to organize a large-scale educational event. Supervision of faculty members seems a prerequisite, and tends to be supportive rather than guiding.

Medical Sciences Undergraduate Students' Perception on the Use of Problematization as an Active Methodology for the Medical Internship in Public Health

AUTHOR(S):

- **Rogerio Vaz, Faculdades Pequeno Príncipe, Brazil (Presenter)**
- Marcelo Rodrigo Caporal, Faculdades Pequeno Príncipe - PECS, Brazil
- Patricia Rauli, Faculdades Pequeno Príncipe - PECS, Brazil
- Izabel Coelho, Faculdades Pequeno Príncipe PECS, Brazil
- Giseli Rodacoski, Escola de Saúde Pública do Paraná - SESA-PR, Brazil

ABSTRACT

Background: The training of students in health has been based on passive methodologies of teaching, where students assume the role of passive individuals, without questioning, and internalize the concepts and repeat them mechanically.

Summary of Work: To analyze the participants' perception of the methodology of the internship in the medical school of a HEI with a traditional teaching background, and to introduce problematic practices in the public health seminars, to identify the participants perceptions about the use of the active methodology and their opinions regarding the method used, and recognize the difficulties and potentialities in the implementation of the problem-solving practice in the seminars. This work consists of a case study, with qualitative and exploratory research, based on the Collective Subject Discourse method (Lefevre & Lefevre). The study took place in the classroom during the weekly public health seminars, in which they were applied to 14 participants. After a week of interval for theorizing, they returned to finish the arch (Magueréz), with the elaboration in the classroom of the hypotheses of solution and application to reality, through written record. At the end of the training, a semi-structured individual interview was conducted, with four questions, with participants.

Summary of Results: The results demonstrate the combination of mostly positive and negative impressions regarding the use of the proposed methodology. The understanding of the majority of the students of the importance of the socialization of the process of teaching and learning of the lecturer with the student was obtained; in addition, they believe that the early use of this methodology would be better for learning

Discussion and Conclusions: the use of the active methodology was well accepted by the study participants, it is concluded that the use of this methodology in undergraduate courses in traditional teaching medicine can serve as an alternative to train more human, ethical, critical and reflexive professionals.

Take-home Messages: This study does not exhaust the discussion about the insertion of active methodologies in traditional HEI. For this reason, it is believed that new work perspectives may help to sensitize other lecturers to a curricular change, and attitude towards their students and the educational institution.

Involvement Helps Medical Students Feel Communication Skills, Attitudes, and Ethics: Multivariable Analyses at Chiba University, Japan

AUTHOR(S):

- Yohei Matsumoto, Chiba University, Japan (Presenter)
- Satoshi Okada, Chiba University, Japan
- Shoichi Ito, Chiba University, Japan
- Kazuyo Yamauchi, Tokyo Womens Medical University, Japan
- Misaki Onodera, Chiba University, Japan
- Mayumi Asahina, Chiba University, Japan

ABSTRACT

Background: This study examines what kind of medical students thoughts or behavior stipulates the sense of acquisition of the communication skills, attitude, and ethics for medical doctors, by multivariate analysis, with the data obtained from the questionnaire survey at Chiba University School of Medicine, Japan. Concerning students' learning outcome, the prior study clarified that the enthusiasm for curricular work powerfully influences students grade point average (GPA); however, it did not consider of other academic achievements such as communication skills, attitudes, and ethics.

Summary of Work: Referring to the competencies formulated by Chiba University School of Medicine, this study carries out multivariable regression analyses with the data for institutional research (IR) collected from medical students who graduated from 2013 to 2016 (n=379). The investigation sets some dependent variables related to the sense of acquisition of the communication skills, attitudes, and ethics. It applies several independent variables; for instance, the involvement with others such as the faculty and mates, enthusiasm for curricular/extra-curricular work and activities, students career-consideration, and socio-economic status.

Summary of Results: Analyses indicate that the involvement with others has a significant impact on dependent variables (R-squared value=0.295-0.314). Regarding communication skills, both of the involvement with the faculty and mates affect. On the other hand, concerning attitudes and ethics, the involvement not with the faculty but with mates is effective. Besides, the zeal for national licensing examination has a substantial effect. While the eagerness for clinical clerkship and academic research is partially valid, that for lectures of medicine or general education is not. There is also no effect of extra-curricular activities.

Discussion and Conclusions: It is evident as expected that more learning by students is essential to acquire the competencies, given that the preparation for national licensing examination regulates the sense of acquisition of communication skills, attitudes, and ethics. However, the effect of involvement with the faculty and mates indicates that it is difficult to acquire some particular competency by individual learning only.

Take-home Messages: Not only encouraging medical students to learn autonomously but also the involvement with the faculty and mates help them feel communication skills, attitudes, and ethics.

Medical students' perceptions of learning and the relation between Metacognitive Awareness and Motivation to Learn: a qualitative and quantitative analysis

AUTHOR(S):

- **Marina Alves Siqueira, University of Sao Paulo Medical School (FMUSP), Brazil (Presenter)**
- Johnatan Padovez Gonçalves, University of Sao Paulo Medical School (FMUSP), Brazil
- Vitor Silva Mendonça, University of Sao Paulo Medical School (FMUSP), Brazil
- Fernanda Magalhães Arantes-Costa, University of Sao Paulo Medical School (FMUSP), Brazil
- Patrícia Zen Tempski, University of Sao Paulo Medical School (FMUSP), Brazil
- Milton de Arruda Martins, University of Sao Paulo Medical School (FMUSP), Brazil

ABSTRACT

Background: Medical school is highly competitive and students are constantly assessed and expected to meet rigorous academic requirements. Thus, it is crucial to understand student's demands and encourage adaptive learning strategies. Self-regulated learning is a comprehensive and holistic approach, consisting of metacognitive awareness, intrinsic motivation and strategic action.

Summary of Work: A cross-sectional study was performed with undergraduate students from University of Sao Paulo Medical School, to evaluate self-reported Metacognitive Awareness (MAI) and Motivation to Learn (Baranik, Barron, and Finney's 2x2 achievement goals instrument) through a quantitative analysis. A qualitative analysis about Motivation was performed through an open-ended question attached to questionnaires.

Summary of Results: One hundred and eighty five students (53%) accomplished the survey. A positive correlation was found between higher scores for Metacognitive Awareness and mastery-approach goal orientation ($p= 0.003$) plus lower scores for MAI and mastery-avoidance goal orientation ($p= 0.034$). One hundred and fifty three (83%) students endorsed mastery-avoidance goals. There was no significant correlation between scores of MAI and performance-oriented goals. The open-ended question disclosed altruism, personal satisfaction, financial feedback, personal and supportive networks and graduating as motivation factors.

Discussion and Conclusions: The results reinforce that learning process includes not only one's cognitive ability, but metacognitive, behavioral, motivational, and emotional/affective aspects. Analysis indicate that the large majority of students endorse mastery-avoidance goal orientation, which is significantly associated with lower metacognitive awareness as well as poor psychological well-being and inadequate coping and learning strategies, according to literature. The open-ended question demonstrated motivation to learn either depends only on the curricular structure, as it is influenced also by social responsibility, perception of educational environment, personal relations and psychological aspects.

Take-home Messages: As educational institutions, faculties must be aware of students' demands in order to provide a welcoming and salubrious environment that enhances capabilities, promotes well-being and potentializes effective learning strategies in order to ensure that they are able to cope with future challenges in their professional careers, besides providing the society with well-trained doctors.

Exploring practical tips to teach structural competency - A lesson from experience to develop an introductory session for family physicians and residents in Japan

AUTHOR(S):

- Junichiro Miyachi, Hokkaido Centre for Family Medicine, Japan (Presenter)
- Yoshinori Matsui, Hokkaido Centre for Family Medicine, Japan
- Kazuki Matsushima, Kansai-FM/Kanai Hospital, Japan
- Yuka Miyachi, Kyoto University, Japan
- Yumi Nomura, Doshisha University, Japan
- Makoto Nishi, Graduate School of Asian and African Area Studies, Kyoto University, Japan

ABSTRACT

Background: Structural competency (SC) is a novel educational approach which recommends clinicians to recognize structural factors beyond doctor-patient relationship when addressing stigma and inequalities. This presentation aims to share our strategies and experience of introducing SC to family physicians and residents in Japan.

Summary of Work: First, we noticed the relative scarcity of scholarly debate regarding the limitation of cultural competency approach which is a common primer of SC in the US context. Given this point, we assumed that it would be better to contextualize SC as a complement of Bio-Psycho-Social model which is widely accepted among family physicians in Japan. Next, to identify cases suitable for introducing SC and practical tips to gather and analyze structural information, the first and second authors reflected clinical experience and conducted interviews with two health professionals who frequently manage structural issues. Based on these points, our preliminary workshop consists of three parts; a brief introduction of SC, a case presentation illustrating clinical strategies based on SC, and reflection on the participants' past clinical experience.

Summary of Results: We performed the first pilot in Jan 2019 with a post-workshop discussion to receive feedback. The second and third workshops will be performed in February and May 2019. Observation of the discussion during the workshops and a questionnaire will be performed to evaluate the workshops.

Discussion and Conclusions: The preliminary reflection on the pilot suggests that emerging interest among family physicians in social aspects of health such as Social Determinant of Health and the emphasis on a contextualized understanding of patients in the postgraduate family medicine curriculum seems to facilitate their learning. Meanwhile, learners' inexperience in reasoning processes in social sciences (abduction and comparative analysis) requires caution in selecting tasks during the workshop. Another suggested barrier is difficulty in preparing appropriate cases which are complex enough to reflect the entanglement between structures and health but not too complicated to cause excessive cognitive load. An explicit explanation of different modes of reasoning and continuous revision of educational cases would be keys to overcome the barriers.

Take-home Messages: Developing case scenarios relevant to learners and explicit explanation about reasoning modes would be the key to organizing teaching sessions of SC.

Improving graduate attributes by implementing an experiential learning teaching approach: a case study in recreation education

AUTHOR(S):

- Cornelia Schreck, North-West University, PhASRec, South Africa (Presenter)
- Theron Weilbach, North-West University, PhASRec, South Africa
- Gerda Reisma, North-West University, CHPE, South Africa

ABSTRACT

Background: Recreation students lack some skills and competencies at the beginning of their careers. This may be related to passive learning settings with limited or no exposure to practical experiences during training. To gain the required competencies, student need to be exposed to active learning processes.

Summary of Work: The focus on this study was to establish if an experiential learning teaching approach, implemented in a recreation degree programme, can develop students' graduate attributes (employability skills and competencies). A holistic single-case, case study design employing a convergent parallel mixed method pre-post test design was used. An adaption of Kolb's experiential learning principles were applied in a final year recreation module at a higher education institution. The ROPELOC questionnaire (measuring personal effectiveness) and a self-report competency assessment survey were completed by 28 students at the beginning and end of the semester. Qualitative data included student reflections and focus group interviews. Data were analysed using descriptive statistics and inductive coding.

Summary of Results: The ROPELOC revealed statistical significant improvement in the student's leadership skills and their overall effectiveness. Research skills, adaptability, technical and computer skills, problem solving and knowledge of the profession were competencies that increased significantly over the semester. From the qualitative data several categories, linked to needed graduate attributes, emerged. Knowledge of the profession was the most mentioned category.

Discussion and Conclusions: Exposure to experiential learning situations improved graduate attributes of recreation students during their training. Kolb's revised experiential learning formed the basis of the teaching approach. This active learning approach is valuable in preparing recreation students for the world of work.

Take-home Messages: These results support the view that an experiential learning teaching approach are beneficial in the preparation of recreation graduates, and should form the teaching foundation for recreation in higher education. Further research on how Kolb's experiential learning can be further implemented in recreation studies is needed.

Using educational analytics to produce a dashboard for success

AUTHOR(S):

- Andrew Vaughan, University of Manchester, UK (Presenter)
- Hilary Dexter, University of Manchester, UK
- Colin Lumsden, University of Manchester, UK

ABSTRACT

Background: To provide students with appropriate and timely support for their learning, a better understanding of the key factors which influence outcomes is needed. An educational analytics approach was taken to producing an individualised dashboard, designed to ‘nudge’ students towards relevant learning activities and provide indicators of support needs.

Summary of Work: Data, collected over two years from medical students in the first of their three clinical years, describing learning activities, behaviours and key end of year assessment outcomes, was analysed by both supervised and unsupervised learning methods, to identify the variables pertinent to student performance. The findings were used to create an individualised student dashboard, to be accessed via their online system. Here we present the data exploration and initial dashboard design.

Summary of Results: Principal Component, Random Forest and Discriminant Function analyses all identified the same set of variables as relevant to student learning outcomes. There were two key variable groupings, determined by their relative influence: one encompassing learning engagement (LE) and the other welfare and attendance (WA). Five sets of student assessment and progression outcomes were overlaid on to a scatterplot displaying student ‘scores’ calculated from the variable groupings. These all showed that those students in the ‘higher LE and lower WA’ quadrant had better outcomes, on average, than those in the ‘lower LE and higher WA’ quadrant. The initial dashboard design presented the student’s learning characterisation ‘position’ and provided suggestions for improving their learning.

Discussion and Conclusions: Clear groupings of variables were identified as indicators of individual student performance. This suggests that individualised dashboards for students may be based on educational analytics which combine both behavioural and learning data. Characterisation of an individual’s learning journey has the potential to facilitate timely support and provide nudges towards better learning behaviours. Evaluation by students and teachers will determine the dashboard’s usability and usefulness. To assess the effectiveness of this approach, analysis of changes in student learning activities will be carried out following implementation of the dashboard.

Take-home Messages: Providing support and guidance based on educational analytics and delivered through individualised dashboards has the potential to enhance student learning.

Knowledge management: out of semantic swamp

AUTHOR(S):

- Snor Bayazidi, School of Medical Sciences, Shahid Beheshti University of Medical Sciences, Tehran, Iran (Presenter)
- Shahram Yazdani, School of Medical Sciences, Shahid Beheshti University of Medical Sciences, Tehran, Iran

ABSTRACT

Background: There is a lack of consensus on elementary issues in KM. While disagreements on theoretical, and rather philosophical, concepts are present in every domain, the KM community has failed to agree on the core concepts that could act as foundations for the field's further development. Authors disagree on KM approaches, on terminology and even on the main elements and processes of a KM. Due to this issue despite numerous researches, those who intend to work in this area face the difficulty in understanding concepts. By this reason, the purpose of this study is clarify the boundary between concepts, identify the definition attributes, and define the theoretical definition on the known concepts, and ultimately identify their position and application in the KM process.

Summary of Work: The methodology used in this study was based on Walker and Avant's concept synthesis. At the beginning, focal concepts in the field of knowledge management were identified, a list of meanings and concepts was developed, and by literature review and recognizing definitional attributes the boundary between concepts was clarified. Then Based on known attributes, theoretical definitions were provided. Finally, the relationship between the concepts was identified and presented in a semantic anthology including seventy-five concepts.

Summary of Results: There are numerous and complex concepts in this field, the boundaries between which are unclear and used interchangeably, the main reason for this matter is the lack of familiarity of people involved in knowledge management and their ability to distinguish between the core concepts and the main steps that take place in knowledge management.

Discussion and Conclusions: In this study we were able to clarify the boundary between concepts based on defining characteristics, to express relations between concepts in a hierarchical manner, to define theoretical definition for some concepts, and to redefine some of the terms. But there is a need for research that can, based on our results, locate these concepts in a comprehensive model and establish a proper relationship between concepts.

Take-home Messages: Our result is the semantic structure presented in the form of concept tree, this is the beginning for rational and correct placement of concepts in the knowledge management process.

Articulation of the Counterfactual - Unravelling the homogeneous student group to make the invisible visible

AUTHOR(S):

- Catherine Hardie, University of Toronto, Canada (Presenter)

ABSTRACT

Background: The “imagined identity” of the health professional spills over to assumptions of a homogeneous student who share perspectives that quite seamlessly match the dominant discourses in health care. The reality of the human environment in clinical settings is that it is the site for the interface of remarkable diversity of identities - of students, patients, staff and clinical teachers. Perception and reception of individuals with “different identities” in this context is not typically overtly problematized but issues of power, hierarchies, definitions of “difference” (which “differences” make a difference and for whom) and the traditional roots of health care delivery remain unexamined. In a deliberately provocative challenge, some authors suggest that one of the key (and unacknowledged) functions of clinical teachers is to teach the “different” student how to adapt to expectations or practices associated with the dominant group perspective, values and beliefs.

Summary of Work: The importance of challenging these taken-for-granted assumptions and understandings related to the construction of “difference” in health professional groups logically should be part of the responsibility of the clinical teacher. Experiences in clinical supervision, facilitation of workshops and a certificate course for instructors in clinical contexts have highlighted the importance of attention to defining evidence based teaching practice within a framework of critical pedagogy.

Summary of Results: Two models provide utility in analysis of the experience of marginalized students in health professional programs. According to Lukes (1974) the effects of invisible power generally escape awareness of the people involved. Explication of the counterfactual means attempting to understand power processes where no grievances are expressed (through the ideological shaping of subordinates belief) and to envision what subordinates would have done in the absence of the power group.

Discussion and Conclusions: The Butin Conceptual Model (2005), developed for service learning programs, has relevance where service and clinical learning situations share essential elements related to equity, diversity, and attitudes towards the ‘Other’.

Take-home Messages: The models encourage development of goals to improve educational practices informed by critical social theory. Relevance will be demonstrated in terms of Butin’s four lenses - the technical, cultural, political and postmodern, shaped by an overarching construction of an imagined counterfactual reality.

Application of Mastery Learning Theory through the use of a narrative-based educational instrument in respiratory therapy

AUTHOR(S):

- Yun-ting Tseng, National Taiwan University Hospital, Taipei City, Taiwan (Presenter)

ABSTRACT

Background: Respiratory Therapy is a highly skill-driven specialty. In medical school, we had several workshops to help students develop competency in essential skills. We designed a small-group instruction program to demonstrate, teach and let them practice the skills of respiratory therapy. Students were assessed using a checklist upon completion of the workshop. We observed that they tend to follow memorized steps that emulate the techniques demonstrated by the instructors without achieving a deeper understanding. The objective of our project was to redesign the workshop of respiratory skills following the mastery learning framework, to encourage self-reflection and improvement of learning in skills.

Summary of Work: We designed the reflection report in each class to encourage deeper learning. Each paperwork contains questions pertaining to the applications of each device included in the curriculum. Students asked to read the questions and consider them as they think about the skills they are practicing. After the skills demonstration and practice, learners are instructed to reflect on the specific learning objectives and provide a narrative answer to each of the questions. The use of narration encourages deeper thinking that enhances cognitive and psychomotor learning.

Summary of Results: According to the result, students performed better in the third course (lung expansion therapy) than in the first course (oxygen therapy).

Discussion and Conclusions: The results of the evaluation highlighted that students find the reflection report enjoyable, and strongly agree that it helps them reflect and improve their psychomotor skills. We also perceived better learner engagement and educational outcomes with the use of the reflection report.

Take-home Messages: Application of narrative-based educational instrument in respiratory therapy may enhance psychomotor and cognitive learning. In contrast, the ability of professional field may be promoted.

Exploring 'Lightbulb Moments' in Medical Student Simulation Teaching: A Threshold Concept Analysis

AUTHOR(S):

- Philip Davidson, Brighton and Sussex Medical School, UK (Presenter)
- Ceri Butler, Brighton and Sussex Medical School, UK
- Sarah Rafferty, East Surrey Hospital, UK

ABSTRACT

Background: Threshold Concepts (TCs) represent transformative moments during which learners are challenged and pass through a metaphorical gateway having gained new insights (Meyer & Land, 2003). They are increasingly being explored in medical education. This study seeks to build on Hokstad's research (Hokstad & Gundrosen, 2016) on medical student simulation teaching to identify new TCs in this field.

Summary of Work: Following the adoption of the interpretative phenomenological analysis (IPA) approach (Smith, Flowers, & Larkin, 2009), 11 penultimate and final year medical students were interviewed after simulation teaching using a semi-structured interview protocol. Interview data was audio recorded, transcribed and analysed using open, inductive coding to identify emergent themes related to TCs in simulation.

Summary of Results: 7 key themes related to TCs were identified. These included three novel TCs: escalation to senior colleagues; effective delegation and communication with nurses; and the use and application of resources in practice. Other themes - identified by previous studies - include: 'becoming a professional' (Neve et al, 2016) and 'transforming learning into reality' (Wright et al, 2016).

Discussion and Conclusions: Applying learning to practice can be challenging when students step into the shoes of the medical practitioner, such as during simulation teaching. This is often a transformative time during which learning is challenged and previously unseen or unknown practical difficulties in real-world medicine, such as communicating with colleagues, are revealed. This can have implications for when students start working as junior doctors and are found to lack certain proficiencies. The identification of these emergent TCs in simulation teaching provides us with new ideas to develop curricula, adopt new teaching methods and support medical students as they are prepared for clinical practice.

Take-home Messages: The Threshold Concept Framework has enabled us to identify three new TCs in medical simulation teaching: escalating to seniors, communication with nurses and utilisation of resources. These TCs offer medical educators new ways of developing learning outcomes, teaching methods and curricula to prepare students for clinical practice.

Does simulated video creation get more memory retention for medical students?

AUTHOR(S):

- Watchara Rattanachaisit, Medical Education Center Chiangrai Prachanukroh Hospital, Thailand (Presenter)
- Vich Thampanya, Medical Educational Center Chiangrai Prachanukroh Hospital, Thailand

ABSTRACT

Background: The Learning Pyramid suggests that “Lecture” is one of the most ineffective methods for learning and retaining information because they only retain 5% of the information. Using different methods and strategies of presenting material to students, or students presenting material to each other, results in differing average rates of retention and more learning.

Summary of Work: To confirm the statement that “the more you teach, the more you know” for medical students by using a tutorial process. The 30 fourth year medical students were assigned to take their pretest examination about Alopecia areata and scabies before watching a dermatology video made by teachers and after that a post-test examination. Then they were divided into 3 groups, small group discussion (n=10), making teaching video instruction (n=10) and Self-Directed Learning ;SDL (n=10). The primary endpoint is a composite score by using a comprehensive test one month later to compare learning retention. The secondary endpoint is students’ satisfaction by using group discussion with a teacher.

Summary of Results: Demographic data was not different among groups in terms of age, sex, GPA., pretest and post-test scores. After 1 month of intervention, the group which made the teaching video had a significant statistical improvement beyond that of the other two groups, (p = 0.03).

Discussion and Conclusions: The highest score of the comprehensive test in the teaching video creating group was observed. This result might come from the more information gathered from reading, listening, demonstrations and discussions within the group. In conclusion, encouraging medical students to teach others before graduation is a helpful method for learning. They will have longer term memory retention of knowledge than those students learning solely from the previous methods such as lecture by attending staff.

Take-home Messages: The phrase “The more you teach, the more knowledge you know” is true. Additionally, new beneficial relationships are built during the process.

The comparison of mechanical ventilation learning outcomes between bedside interactive learning and conventional lecture learning in fifth year medical students, Phrae medical education center

AUTHOR(S):

- Parichat Niyomthong, Phrae Medical Education Center, Naresuan University, Thailand (Presenter)

ABSTRACT

Background: Mechanical ventilation learning is one part of medical education learning for medical students. It is quite challenging topic for teachers to make them clearly understand because it is complicated learning content. This study was conducted to find the better way for this learning in terms of better knowledge and more satisfaction outcome for medical students.

Summary of Work: Objectives: The primary aim was to compare knowledge improvement outcome between bedside interactive learning and conventional lecture learning in fifth year medical students. The secondary aim was to compare satisfaction outcome between each group. Study Design and methods: Randomized controlled trial was conducted at Phrae medical education center, Naresuan University, Thailand. All fifth year medical students were randomized into 2 groups, group A for bedside interactive learning and group B for conventional lecture learning. Before learning all students were evaluated pretest with total scores 100% and after learning students in each group were evaluated posttest and satisfaction questionnaires.

Summary of Results: Baseline characteristic of medical students were similar in both bedside interactive learning group and conventional lecture learning group. All medical students had significant knowledge improvement after learning in both groups when compared with baseline knowledge (p-value 0.021,0.005 respectively). When compared between two groups, students in bedside interactive learning group had more knowledge improvement and more satisfaction outcome than conventional lecture learning with statistically significant (p-value 0.011,0.001 respectively).

Discussion and Conclusions: Bedside interactive learning for mechanical ventilation learning course had statistically significant knowledge improvement and more satisfaction outcome than conventional lecture learning. Most medical student preferred to learn mechanical ventilation with this learning type because they participated in one part of the learning and can clearly understand by practice themselves and acted as the real situation.

Take-home Messages: Bedside interactive learning is a better choice for mechanical ventilation learning in terms of knowledge improvement and satisfaction outcome for medical students.

The willingness to perform bystander cardiopulmonary resuscitation in out-of-hospital cardiac arrest victims of Thai clinical-year medical students

AUTHOR(S):

- Wachiraporn Phooripoom, Surin Medical Education Center, Suranaree University of Technology, Thailand (Presenter)
- Pakarat Sangkla, Surin Medical Education Center, Suranaree University of Technology, Thailand

ABSTRACT

Background: Cardiopulmonary resuscitation (CPR) is a life-saving first aid as it increases the chance of survival of the patients if started immediately after cardiac arrested. The purpose of this study was to know the willingness of Thai clinical-year medical students to perform bystander CPR in out-of-hospital cardiac arrest victims.

Summary of Work: The descriptive cross sectional study was conducted in the Surin Medical Education Center, Thailand. Ninety-six clinical-year medical students (4th, 5th and 6th year) were enrolled. The frequency of in-hospital CPR that the medical students had experienced was analyzed, then they were asked to rate their willingness to perform bystander CPR under twelve hypothetical scenarios by using a 4-point Likert scale including "Walk away," "Offer to call ambulance but do not CPR," "Chest compression only (CC)," and "Chest compression with mouth-to-mouth ventilation (CC + MMV)". "CC" and "CC + MMV" were recorded as a positive response.

Summary of Results: The frequency of being a member in the real in-hospital CPR of the medical students was 14-26 times in the entire clinical year. From the hypothetical scenarios, all students had positive responses for out-of-hospital cardiac arrest victims who were their own family members or friends but only 22.6% of the 4th year, 90.1% of the 5th year and 88.2% of last year medical students were willing to perform CPR in the other unknown victims scenarios.

Discussion and Conclusions: Fourth-year medical students were less willing to perform CPR compared with the senior years. One important reason was the lesser knowledge of BLS and ACLS as they will be taught in the 5th and 6th year. Lack of basic skills and knowledge further affected the confidence in handling victims. Furthermore, we also found that gender, a fear of disease transmission as well as panic and fear of causing further harm were determinants of the willingness to perform CPR.

Take-home Messages: This study shows that there were multiple factors that contributed to the reluctance of Thai medical students to perform out-of-hospital CPR, most of them were modifiable, therefore, effort should be put into correcting these factors to improve the willingness to perform CPR.

Understanding Continuum of Care for Stroke Patients: Teaching Medical Students using Intermediate Care Model

AUTHOR(S):

- Taweesak Sutpasanon, Department of Rehabilitation Medicine, Sawanpracharak Medical Education Center, Thailand (Presenter)
- Apijaree Choosakde, Department of Rehabilitation Medicine, Sawanpracharak Medical Education Center, Thailand
- Boonta Vititsiri, Department of Rehabilitation Medicine, Sawanpracharak Medical Education Center, Thailand
- Nongnuch Junsri, Department of Social Medicine, Sawanpracharak Medical Education Center, Thailand
- Tassanee Tabthimthai, Department of Social Medicine, Sawanpracharak Medical Education Center, Thailand
- Patcharin Intamad, Department of Social Medicine, Sawanpracharak Medical Education Center, Thailand

ABSTRACT

Background: Lack of a continuum of stroke patient care is an obstacle to navigate the rehabilitation process. Intermediate care, as a transitional phase between discharge and returning home, ensures the continuity in treatment and rehabilitation, aiming to reduce disabilities for the patients with remaining impairments. Teaching medical students using intermediate care model should help them understand the chain of care for stroke patients.

Summary of Work: In the Rehabilitation Medicine course of the Sawanpracharak Medical Education Center, after learning stroke rehabilitation in the tertiary hospital, the fifth year medical students experience intermediate care learning through two learning activities: 1) studying the stroke cases that have been referred from the tertiary hospital to enroll intensive rehabilitation program at the community hospital, and 2) visiting the discharged cases after returning home. They experience patient care along with the multidisciplinary team throughout the activities, and reflect their learning issues at the end.

Summary of Results: Learning outcome is measured by the questionnaires. Sixteen medical students answered. The first section is an open-ended question to express opinions about what they received. Most of them gave positive comments as followings: learning in real situation provides a venue to gain practical knowledge and skill, competency to work as a team, understanding the chain of care and comprehensive holistic care, becoming more empathetic and more attentive in caring and helping patients. Another section consists of three 5-point Likert scale questions (5 = highest, 1 = lowest) according to the learning design: 1) compatibility with learning objectives 4.75 ± 0.43 points, 2) practical and applicable use 4.81 ± 0.53 points, and 3) attractive style 4.75 ± 0.56 points.

Discussion and Conclusions: Teaching intermediate care model enhances medical students to understand the chain of care for stroke patients, activates their learning through authentic holistic patient approach with the multidisciplinary team, and adjusts the attitudes of humanization and beneficence. The learning design is applicable, attractive, and compatible with the learning objectives.

Take-home Messages: Intermediate care learning helps medical students to understand the continuum of stroke patient care.

The effectiveness of video-assisted self-assessment after flipped classroom in teaching cardiovascular examination to medical students: a pilot teaching program

AUTHOR(S):

- Chun-Wei Lee, MaKay Memorial Hospital, Taiwan (Presenter)

ABSTRACT

Background: Teaching and learning cardiovascular examination for medical students is always a challenging issue. We conducted a pilot teaching program for comparing the effectiveness of conventional didactic lecture and video-assisted self-assessment after Flipped classroom(VSFC).

Summary of Work: We divided the fifth year students into 2 groups, one is the conventional control group and the other is the VSFC group. The conventional control group will receive a didactic lecture first then we will bring them to see a real patient. On the other hand the VSFC groups we will provide the same learning material in advance, and then we will first bring them to see a patient, we used video to record the whole process of the physical examination following group discussion. Every student will review their own video and try to teach another student about cardiovascular examination. We compared the learning results of both groups. A clinical teacher monitored the tasks. The students gave feedback anonymously. Knowledge on an implementation of cardiovascular examination was assessed in the final examination.

Summary of Results: The feedback was positive, emphasizing the benefits of VSFC in combining theory and practical steps to approach cardiovascular examination. The results of the written summative examination item were better and excellent in the VSFC group.

Discussion and Conclusions: VSFC seems to be a suitable method to combine theoretical understanding and practical steps to approach cardiovascular examination. During the process of reviewing their own video and teaching another student, students could learn things in a different way. Compared to conventional didactic lectures, medical students felt that VSFC is effective as a teaching tool. They also felt more impressive and confident in future cardiovascular examination. VSFC is shown to be better than the conventional didactic lecture in this pilot program in teaching cardiovascular examination. Medical students felt more satisfied and confident in dealing with cardiovascular examination.

Take-home Messages: VSFC has shown to be successful as a novel tool for teaching cardiovascular examination. It was well received by medical students as a teaching method and effective in learning physical examination. It can be incorporated into routine teaching if proven successful in a larger cohort.

The reflections on the health equity of migrant workers in Taiwan by medical students participating in service learning

AUTHOR(S):

- Hsin-Tien Lee, National Defense Medical Center, Taiwan (Presenter)
- Shih-Chung Huang, Kaohsiung Armed Force General Hospital, Taiwan
- Yan-Di Chang, National Defense Medical Center, Taiwan
- Yaw-Wen Chang, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Wen-Hui Fang, Tri-Service General Hospital, National Defense medical Center, Taiwan

ABSTRACT

Background: Migrant workers in Taiwan, mostly from Southeast Asia and China, are changing the society in many different ways including medical system and medical service. They are at high risk of experiencing health inequity and injustice which should be addressed in medical education. The purpose of this study was to explore the reflections that medical students developed while participating in migrant worker issue (MWI) volunteering activities.

Summary of Work: The content of the MWI volunteer group included weekly basis of Indonesian language lessons, reading groups, issue-oriented speeches, visiting migrant workers and providing books for migrant workers. The members of MWI volunteer group ranged from year one to year six and the duration of participation ranged from one to three years. Six clinical and preclinical students from the migrant issue volunteer group were invited. A semi-structured interview was used to collect their experiences with migrant workers and reflections on these issues. A general inductive method was used to identify themes from interview data.

Summary of Results: Six major themes emerged. 1) Health equity should be addressed in medical education. 2) Service-learning should be accompanied by more autonomy and critical thinking. 3) Medical services are often unmet with immigrant workers' needs. 4) Broadened imagination on future planning. 5) Reflections on health care system. 6) Established personal identity and value with developing sensitivity to understand others'.

Discussion and Conclusions: Participation in MWI allowed medical students to understand the situation of migrant workers in Taiwan, identified the barriers between migrant workers and our existing health care system, find solutions to tackle the overlook and often unmet needs of migrants workers, and realize that the education and awareness of health equity in Taiwan should be improved. The participation of MWI also inspired students to identify and reflect on the value and defect of our medical education, service-learning program, health care system and our own mindset.

Take-home Messages: Educators need to consider health equity as an important lesson that all medical students should learn and practice. Creating an environment for students to do social participation with autonomy exercises a powerful influence on students' learning process.

Factors influencing the nursing core competencies of students at clinical practice

AUTHOR(S):

- Shiah Lian Chen, National Taichung University of Science and Technology, Taiwan (Presenter)
- Jui Yu Jao, Cheng Ching General Hospital, Taiwan

ABSTRACT

Background: Nursing practicum is an essential link allowing students to apply what they have learned in the classroom to clinical real situations. The purpose of this study was to investigate the factors affecting the core competence of nursing students.

Summary of Work: The study was a cross-sectional and correlation research design. The structural questionnaires, including the Competency Inventory of Nursing Students, the Teaching Competence of Nursing Instructor, the Student Evaluation of Clinical Education Environment and the Level of Reflective Thinking, were used for data collection. A purposive sample was recruited from two universities in central Taiwan. Those senior students who had completed their last internship were invited to participate in the study. A total of 270 samples completed the questionnaires.

Summary of Results: The highest rated competencies included, in order, ethical responsibility, caring, lifelong learning, general clinical skills, critical thinking reasoning and clinical biomedical science.. The score percentage of the total core competence was 85.13%, and the subscale scores ranged between 79% and 89%. Statistically significant differences were noted between program type, career planning and the total score of core competency. Core competency was significantly and positively correlated with clinical teaching, teaching environment, reflective thinking, and grade of the last semeste ($r= 0.24-0.39$). The findings of multiple regression analysis showed that the factors that could predict core competence were habitual action, reflection, learning opportunity, teaching commitment and interest. The five variables can explain 31% of the total variance of core competence. Factors could predict the subscale competencies were learning opportunities, followed by reflection, habitual activities, facilitating learning, and understanding. These variables could explain 21 to 32% of the total variance of the competency subscale scores.

Discussion and Conclusions: The results of the study revealed the significant influence of clinical teaching environment and the teaching behavior on students learning outcomes.

Take-home Messages: Factors consistently affecting the core competence and its subscale scores were learning opportunity and levels of reflective thinking. These imply nursing as a practice-based and reflective profession. Planning various learning activities and facilitating student learning in clinical settings may help students developing competencies meeting future challenges.

Exposure and perception of 6th year Portuguese medical students to core clinical skills

AUTHOR(S):

- Carolina Caminata, ANEM- Associação Nacional de Estudantes de Medicina, Portugal (Presenter)
- Fátia Freitas, Medical Students' National Association, Portugal
- Carlos Mendonça, ANEM- Associação Nacional de Estudantes de Medicina, Portugal
- Vasco Mendes, ANEM- Associação Nacional de Estudantes de Medicina, Portugal
- José Rodrigues, Faculty of Medicine of Lisbon Students' Association, Portugal
- António Velha, Faculty of Medicine of Lisbon Students' Association, Portugal

ABSTRACT

Background: A growing number of graduated doctors in Portugal are providing general healthcare without having completed their postgraduate training, although there's no evidence of adequate preparation for that purpose. Our objective was to analyse core skills of portuguese medical students in their final year of studies regarding their exposure and perception amongst six domains of clinical practice and learning outcomes, thus assessing their fitness for clinical practice.

Summary of Work: Seventy-one clinical skills were grouped in six domains based on required specialities in Transition Year, national and international bibliography and portuguese Medical Schools' curricula: Transversal Skills, Internal Medicine, Surgery, Pediatrics, General and Familiar Medicine and Administrative Procedures' Skills. We asked 563 students about their Exposure and Perception (Perceived Competence) Level for each skill using a crescent Likert scale (0 to 4) and their answers were weighted accordingly to the students population of each Medical School.

Summary of Results: The Transversal Skills display the highest Level of Exposure ($\bar{u}=3,39$) and Perception ($\bar{u}=3,23$). Pediatrics Skills are moderately high concerning both Exposure ($\bar{u}=2,98$) and Perception ($\bar{u}=2,88$) levels.

Internal Medicine has the lowest Level of Exposure ($\bar{u}=2,11$) and Perception ($\bar{u}=1,67$). Surgical Skills express low Level of Exposure ($\bar{u}=2,26$) and Perception ($\bar{u}=2,03$). Skills related to Administrative Procedures show reduced Level of Exposure ($\bar{u}=2,41$) and Perception ($\bar{u}=2,29$).

General and Familiar Medicine Skills show a high Level of Exposure ($\bar{u}=3,05$), but exhibit the second lowest Level of Perception ($\bar{u}=2,01$).

Discussion and Conclusions: Portuguese Medical Students have high performances in Pediatrics and Transversal Skills, unlike Internal Medicine, Surgery, Administrative Procedures and General and Familiar Medicine Skills. Furthermore, Transversal Skills, Internal Medicine and General and Familiar Medicine represent the majority of general healthcare providing skills while Administrative Procedures are related to every medical practice and Medical Students appear to have a severe lack of these.

Take-home Messages: Not all Medical Schools are providing training in clinical skills at a sufficient level of exposure, and medical students are not perceiving them adequately. Portuguese Medical Education Institutions and the portuguese Government ought to reshape and rethink medical teaching in order for their learning outcomes to meet the portuguese healthcare system demands.

Comparing the Clinical Skills of Medical Students between Different Training Programs in China

AUTHOR(S):

- Shih-Chieh Liao, China Medical University, China (Presenter)
- Gui-Chang Pan, The Sixth Affiliated Hospital of Guangzhou Medical University, China

ABSTRACT

Background: In 2009, China proposed a medical reform policy aiming to strengthen grassroots medical care and reduce waste of and shortages in medical resources. The policy aims to provide community hospitals with well-qualified general practitioners rather than primarily staffing these medical facilities with early-career physicians. To do so, China improve their primary physician training systems: a three-year program to train general practitioners at community hospitals and a five-year degree to train medical specialists at medical centres. In 2011, China began to implement stronger their medical postgraduate training programs. This study examines differences in clinical skills among postgraduate trainee from the two major physician training systems.

Summary of Work: Participants included 57 postgraduate year 2 trainee (PGY-2) physicians from the Sixth Affiliated Hospital of Guangzhou Medical University in 2017. Twenty-two (38.6%) were general practitioners and 35 (61.4%) were specialist doctors. This assessment includes four stations: abdominocentesis, tracheal intubation, debridement suturing, and thoracentesis. Each station is graded using a checklist and global rating scales.

Summary of Results: In global scores, general practitioners had significantly higher scores in abdominocentesis (4.32 vs. 3.29, $p < 0.01$) and tracheal intubation (3.27 vs. 2.34, $p < 0.01$) than specialist doctors, but specialist doctors had a significantly higher score was in debridement suturing (3.57 vs. 2.50, $p < 0.01$) than general practitioners. In checklist scores, general practitioners had significantly higher scores in tracheal intubation (75.33 vs. 58.82, $p < 0.01$) than specialist doctors.

Discussion and Conclusions: This study has two major findings: (1) general practitioners are familiar with basic and commonly used clinical skills while specialist doctors are more familiar with relatively complex clinical procedures; And, (2) general practitioners have excellent basic skills and are more than capable of improving the efficiency of grassroots medical services.

Take-home Messages: According to the theory of adult learning, general practitioners and specialist doctors are independent and self-directed in their learning, focusing on study integrated with their daily work needs and real-time application of knowledge, and their learning tends to be centred around clinical problems. The results indicates that and clinical need affects learning motivation and then the physician's learning outcomes.

Effectiveness of Blended Learning Approach on Risk Management for Nursing Students

AUTHOR(S):

- **Zarina Begum Abdul Rahman, Tan Tock Seng Hospital, Singapore (Presenter)**
- Hnin Nwe Oo, Tan Tock Seng Hospital, Singapore

ABSTRACT

Background: Tan Tock Seng Hospital (TTSH) Clinical Education Department is a stalwart user of conventional teaching pedagogies involving didactic classroom teaching of nursing students. Clinical Educators developed a blended learning orientation programme catering to digital-age nursing students' learning styles and real contexts.

Summary of Work: A blended learning pedagogy aimed at creating instructional strategies for nursing students during their clinical practicum orientation was adopted. Nursing students who underwent their clinical practicum in TTSH for the first time had to undergo the "New Nursing Student Orientation" programme. The programme consists of five modules classified under risk management. Examples of risk management topics includes pressure ulcer, fall and oral hygiene. It is mandatory for all nursing students to complete the e-learning prior their clinical practicum. A four-hour workshop facilitated by the clinical educators was conducted on the first day of the clinical practicum. This workshop was conducted to evaluate the students' understanding and application of theory to practice. Upon completion of each e-learning module, a compulsory post module quiz was conducted to evaluate the students' understanding. At the end of clinical practicum, the students complete a survey comprising of 14 likert scale questions, to elicit their feedback on the effectiveness of this blended programme.

Summary of Results: A total of 173 nursing students participated in this survey. 98.8% students agreed that the course was effective in reaching their learning objectives; 98.3% agreed that the content covered was sufficient; and 98.3% agreed that the quizzes effectively tested the material presented in the programme.

Discussion and Conclusions: This blended learning approach provided nursing students with the learning context that caters to their various learning styles. At the end of the clinical practicum, the approach of applying blended learning proved to be an effective learning pedagogy, offering a learning that is scalable for a greater number of learners. Blended learning offers digital-age learners with streamlined and interactive learning options as compared to traditional teaching pedagogies.

Take-home Messages: Clinical Educators should incorporate up to date and evidence-based teaching pedagogies for nursing students, catering to various learning styles.

Learning obstacles in handling Psychiatric patients

AUTHOR(S):

- Chonakarn Niyomthong, Surin Medical Education Center, Suranaree University of Technology, Thailand (Presenter)
- Pakarat Sangkla, Surin Medical Education Center, Suranaree University of Technology, Thailand
- Mantapond Ittarat, Surin Medical Education Center, Suranaree University of Technology, Thailand

ABSTRACT

Background: During the clinical years in Surin Hospital, medical students especially extern and intern are experienced many psychiatric patients. However, management by either post grad or undergrad are hesitated. The purpose of this study was to acknowledge factors affect psychiatric patients' management's confidence.

Summary of Work: The descriptive-cross sectional study was conducted in the Surin Medical Education Center, Thailand. Thirty-five medical students and twenty-two interns were included. Research questionnaire consist of 20 multiple checklist questions. This study was analyzed frequency of psychiatric patients they were experienced, confidence in handling patients and factors that affect their management's confidence.

Summary of Results: The average amount of psychiatric patients they were experienced were 1- 3 people in a week, which found the most in Emergency Room, Internal medicine ward and Surgery ward, 43.8%, 35.08%, 14.3% respectively. The top confidence in handling patients was alcohol related disorder (45.4%), however, the least was anxiety disorder (25.7%) for extern group and Mood disorder (41.4%) for intern group. Finally, factors that affects their management's confidence, 92.1% of participants had difficulty to make a diagnosis and treatment, 84.0% hardly managed patients by themselves and 58.2% had no encouragement toward psychiatric patients.

Discussion and Conclusions: Although psychiatric patients found very common in Surin Hospital, that both extern and intern were frequently experience many cases. However, basic Psychiatry they had learnt during fourth year or fifth year were missed. Lack of basic skills and knowledge were altered the confidence in handling psychiatric patients. Furthermore, attitude toward psychiatric patients was also an important factor that block the students to keen on learning.

Take-home Messages: Restoring, recollecting basic Psychiatry and recreating good attitude toward patients are likely to be helpful for post grad and undergrad. Moreover, integrating the knowledge in other major wards is probably brought advantages also.

The Effect of Using Standardization Lesson Plans with Multiple Teaching Strategies for Post Cardiac Surgery Nursing Care

AUTHOR(S):

- Cian-Huei Shih, Buddhist Tzu Chi General Hospital, Taiwan (Presenter)
- Siao-Ya Su, Buddhist Tzu Chi General Hospital, Taiwan
- Wen-Jun Chen, Buddhist Tzu Chi General Hospital, Taiwan
- Shu-Min Peng, Buddhist Tzu Chi General Hospital, Taiwan

ABSTRACT

Background: The nurse post graduate year 2 (NPGY2) staffs begin to care the cardiac surgery patients in a surgical critical care unit. Researchers investigated the care capacity in the unit. The ability of postoperative critical care of the cardiac surgical patient nursing care showed the worst learning outcome by self-evaluation of NPGY2 staff, owing to ambiguous learning objective and evaluation method.

Summary of Work: A total of 20 NPGY2 surgical critical care unit staffs were enrolled. They were randomized to two groups (standardization group N=10, and traditional group N=10). We used the standardization lesson plans with multiple teaching strategies for standardization group for 6 weeks. And traditional group use clinical teaching for 6 weeks. All of participants finished the post cardiac critical care knowledge and skill examination.

Summary of Results: Compared with the standardization group and traditional group, the knowledge ability (92.2 vs. 79.7) and skill ability (87.5 vs. 78.0) of post cardiac surgery nursing care were significantly higher in standardization group ($p < .05$).

Discussion and Conclusions: The standardization lesson plans with multiple teaching strategies can enhance learning effectiveness of the postoperative cardiac surgery nursing care ($p < .05$). Such teaching strategies can enhance learning effectiveness of postoperative critical care of the cardiac surgical nursing care. Still, it offers a teaching strategy for clinical nursing teachers.

Take-home Messages: Be a faculty, How to produce standardization lesson plans about post cardiac surgery critical care? Be an instructor, how to use to the standardization lesson plans and teaching strategies about post cardiac surgery critical care?

Effectiveness of Using Multiple Teaching Strategies to Decreasing the Clotting Rate of Artificial Kidney

AUTHOR(S):

- Yu-Hui Liu, Department of Nursing, En Chu Kong Hospital, Taiwan (Presenter)
- Yu-Fen Chiu, Department of Nursing, En Chu Kong Hospital, Taiwan
- Pi-Tuan Chan, Department of Nursing, En Chu Kong Hospital, Taiwan

ABSTRACT

Background: Hemodialysis is the major therapeutic method for uremic patients. In the process of hemodialysis, if coagulation of artificial kidney occurs, it will not only aggravate the patients anemia, reduce the quality of dialysis, but also increase the cost of hospital and waste of manpower. Our unit is hemodialysis room in a regional teaching hospital. The most common accident in our center is that coagulation of artificial kidney. The incidence rate increased from 0.79% in 2015 to 1.99% in 2016.

Summary of Work: The targets of the program are 25 nursing staff in the dialysis center, we want to explore whether it is possible to stimulate learning motivation and enhance learning outcomes by multiple teaching strategies, thereby improving ability of nursing care. This study took sample and observe by cross-sectional research, we used multiple teaching strategies, including (1) planning real-machine operation and simulation of clinical situation, and designing memory pithy formula (2) holding a series of courses for 3 hours and clinical case discussion (3) revising technical operation standards of hemodialysis (4) making digital learning video disc of heparin-free hemodialysis (5) implementing audit and monitoring.

Summary of Results: Regarding these strategies, we gained effective outcomes as follows: (1) After the implement of this program, the incidence dropped from 1.99% to 0.62% and remained at 0.52% in 2018, and the expense that we saved was 70,545NT dollars; (2) The correct rate of care recognition to hemodialysis increased from 66.5% to 91.0%; the correct rate of technical operation increased from 69.4% to 91.3%, and the overall teaching satisfaction rate reached 93.7%.

Discussion and Conclusions: Hence, using the model of multi teaching strategies enhances quality of dialysis and nursing services, that can be used as a reference for the education and training of nursing staff in the future.

Implementation of bilingual large-scale basic life support training for medical, nursing and healthcare students in partnership with regional fire department

AUTHOR(S):

- Gen Kobayashi, School of Medicine, International University of Health and Welfare, Japan (Presenter)
- Toshiyuki Naka, School of Medicine, International University of Health and Welfare, Japan
- Ryota Sakurai, School of Medicine, International University of Health and Welfare, Japan
- Kazunobu Ishikawa, School of Medicine, International University of Health and Welfare, Japan

ABSTRACT

Background: Basic Life Support (BLS) is one of the fundamental skills for students in healthcare. Our school located near the Narita International Airport has opened the departments of medicine, nursing and healthcare in 2017. We have installed a huge Simulation Center for Outstanding Professional Education (SCOPE), which spaces over 5,300 m², as our central feature.

Summary of Work: Our open space training room for BLS has 450 m², in which we can run trainings with 48 CPR (cardiac pulmonary resuscitation) training mannequins (3x16 row). To secure a sufficient space for CPR training, we assign three learners to each mannequin, which enable to train 144 learners at a time. To care for a cardiac arrest victim in an international airport or abroad, we utilize an AED (automated external defibrillator) trainer with both English and Japanese languages.

Summary of Results: In our first year, we had bilingual BLS training for all of the medical students. We also held training sessions for students in other departments and faculties on weekends. We made three BLS courses: 1. Half day for adult BLS, 2. All-day for adult and pediatric BLS, 3. Three days for BLS instructor. Up to the present, 616 students and 33 teachers finished either half day or all-day courses. We have 93 BLS instructors on campus.

Discussion and Conclusions: We have established BLS training system, in which almost all students acquire BLS skills in early school year in partnership with regional fire department. To fulfill these activities, we have planned to have an excellent simulation center, sufficient numbers of CPR training mannequins and AED trainers with multiple languages. We have also build a cooperative framework of the teachers in three departments.

Take-home Messages: We have implemented of bilingual large-scale BLS training for medical, nursing and healthcare students in partnership with regional fire department.

The Iceberg Model of Blood and Body Fluid Exposure Reporting Among the Medical Students

AUTHOR(S):

- Pornpimon Kasemsook, Buddhachinaraj Hospital Medical Education Center, Thailand (Presenter)
- Orawan Chaiyamahapruk, Buddhachinaraj Hospital Medical Education Center, Thailand

ABSTRACT

Background: Percutaneous and mucocutaneous exposures to blood and other body fluids (BBF) are not only occupational hazards of health care workers but also the medical students who have underdeveloped practical skills. These injuries take them at risk of blood-borne infections including HBV, HCV and HIV. Since simulation-based training program was used to promote student's knowledge and skills, the number of BBF exposures reported to hospital infection control service (HICS) between academic year 2016 and 2017 was 21 cases, decreased almost twice compared with previous years. This study aimed to determine whether a simulation-based training reduced exposures or exposures were underreported.

Summary of Work: A cross-sectional study, questionnaire-based, the 4th - 6th year clinical medical students from Buddhachinaraj hospital in academic year 2018 were surveyed histories of needlestick or sharp injuries and non-percutaneous exposure to BBF. The number of reportings and non-reportings to HICS including reasons was explored during past twelve months.

Summary of Results: 118(78.1%) questionnaires were completed. 78(66.1%) respondents were non-percutaneous exposed to blood, 51(43.2%) were exposed to other body fluid and 23(19.4%) experienced blood percutaneous exposures during the previous twelve months. However, there was only 19.1% reported to HICS after injuries while 80.9% did not. Self-considered low risk of transmission (71.5%) was the most common reason for non-reporting.

Discussion and Conclusions: The number of our surveyed BBF exposures was greatly higher than the HICS's report, moreover, the underreported BBF exposures were extremely higher than the reported ones. It was as if "tip of the iceberg" seen only a small part of what is really a bigger problem. From this point, the underreporting should be solved immediately so that the repeated BBF exposures will reduce if the unexplored causes, the hidden part of the iceberg, are explored and corrected.

Take-home Messages: The more underreporting happens, the more missed opportunity for post-exposure prophylaxis and cause of injuries identification occurs. For this reason, antibody status awareness and complete coverage of hepatitis B vaccination should be achieved early in medical training while a culture of BBF exposure reporting should be created.

Social accountability of medical students at Vachira Phuket Medical Center after participation in social activities

AUTHOR(S):

- Pornpirun Leeyangyuen, Vachira Phuket Medical Education Center, Walailak University, Thailand (Presenter)
- Akkawan Tanthien, Vachira Phuket Medical Education Center, Walailak University, Thailand
- Pimchanok Taweesuwan, Vachira Phuket Medical Education Center, Walailak University, Thailand
- Porntip Leeyangyuen, Vachira Phuket Medical Education Center, Walailak University, Thailand
- Alisa Limpakanont, Vachira Phuket Medical Education Center, Walailak University, Thailand
- Supachai Saingtong, Vachira Phuket Medical Education Center, Walailak University, Thailand

ABSTRACT

Background: One of the moral values in which every person especially health care professionals ought to possess is social accountability. For medical students, it is important to understand and help deal with social problems. As one of the major health problems in Thailand is teenage pregnancy, this study aims to find out whether a project on educating high school students on teenage pregnancy prevention has effects on medical students level of appreciation, self-value, and social accountability.

Summary of Work: Questionnaires were distributed to 20 students studying in 4th and 5th year at Vachiraphuket education center. The participants were asked to provide information on their past social participation during high school as well as preclinic and clinic. They were also asked to provide their level of social accountability before and after conducting educational project on teenage pregnancy prevention. To conduct the project, 20 medical students were divided into small groups so that they could effectively approach 500 students in 8th Grade at Satee Phuket School. Personal data were then collected and analysed by adopting one-way ANOVA ($p = .05$).

Summary of Results: Results showed that 85% of the participants were involved in social activities during high school while all of the participants were engaged in social activities during preclinic and clinic (100%). However, participants who were leaders in social activities during high school, preclinic, and clinic comprised of only 10, 25, and 10% respectively. After conducting the educational project on teenage pregnancy prevention, all participants conveyed that they wished to join other social activities (100%). The group which portrayed to be prospective leaders in other social activities were female medical students (<0.01) studying in 4th year (<0.05). In addition, the educational project positively affects participants' level of appreciation ($p < 0.01$), self-value ($p < 0.05$), and social accountability (<0.05).

Discussion and Conclusions: The medical students' participation in teenage pregnancy prevention in high school students project increased medical students level of appreciation, self-value, and social accountability. The project also encouraged medical students to join the other social activities as both common participants and leaders.

Take-home Messages: Cultivation of morality and social accountability in medical students is important to develop students' mindset to be generous physicians in the future.

Correlation between medical knowledge and belief in alternative medicine

AUTHOR(S):

- Erich Eder, Sigmund Freud University, Medical School, Austria (Presenter)
- Stephanie J. Eder, University of Vienna, Department of Basic Psychological Research and Research Methods, Austria
- Sebastian G. Mustafa, Sigmund Freud University, Medical School, Austria
- Krista Federspiel, Gesellschaft für kritisches Denken, Austria

ABSTRACT

Background: The market for homeopathic and anthroposophic medicine in the EU is valued at € 1.24 billion per year, and growing by 6.5% a year. The reasons for this success are still unresolved. Based on previous work, we hypothesised that individuals with less scientific education are more likely to believe in alternative medicine and paranormal claims.

Summary of Work: We examined 650 high school students aged 14 to 19 before their university entrance diploma in Vienna. Students were given a questionnaire with 42 statements on a seven-point Likert scale. The randomly mixed statements included the revised paranormal belief scale and 21 statements on different areas of alternative medicine. 15 additional questions on bio-medical knowledge were related to the secondary school curriculum, on physiology, pathology, functional anatomy, sex education, health-related behaviour, and genetics. The questionnaire was pre-tested in 47 students aged 16 to 17, and modified according to results and students' feedback. Additionally, we provided the same questionnaire to a cohort we assumed to have a more naturalistic worldview: 400 university freshmen committed to study medicine, at the beginning of the first undergraduate course. Correlation and regression analyses were used to test the relationships between different variables. Differences between the two cohorts were tested with ANOVA.

Summary of Results: Medical students showed lower belief in alternative medicine and paranormal claims than high school students. Medical knowledge correlated significantly negatively with belief in alternative medicine in high school students, but not in medical students. In both cohorts, belief in alternative medicine correlates significantly positively with paranormal belief.

Discussion and Conclusions: Belief in alternative medicine seems to be conceptually close to paranormal belief, which is plausible as the effects of alternative medicine are usually explained by supernatural mechanisms. It seems that their intrinsic interest of medical students in science reduces their belief in alternative medicine and the paranormal, as compared to high school students. Scientific thinking and biological knowledge are important resources to counter alternative medicine claims, and education to sceptical thinking should start long before career decisions are made.

Take-home Messages: (1) Bio-medical knowledge correlates negatively with belief in alternative medicine. (2) Paranormal belief correlates positively with belief in alternative medicine.

A Novel Medic to Physician Assistant Pathway

AUTHOR(S):

- Gail Curtis, Wake Forest School of Medicine, Department of PA Studies, USA (Presenter)
- Carol Hildebrandt, Wake Forest School of Medicine, Department of PA Studies, USA
- Ian Smith, Wake Forest School of Medicine, Department of PA Studies, USA

ABSTRACT

Background: The Physician Assistant (PA) profession in the USA was birthed from the military and created to help alleviate the shortage of primary care providers. Using fast-track training curriculum developed to increase supply of physicians during WWII, military medics with skills but no credentials to practice in civilian life were recruited as the first PAs. US Special Operations Command (SOCM) medics are a subset of highly trained and specialized individuals who are extremely valuable to the military. Our pilot program centered on two goals, create active duty PA training opportunities and retain SOCM in the military.

Summary of Work: The Medic to PA program (MPAP) was developed by Wake Forest PA Program in conjunction with Carolinas Health Center. MPAP is designed to accommodate participation in the PA program while the SCOM remains on active duty military. The didactic year of training remains unchanged, but the clinical phase is extended to allow interspersed deployments. Upon completion of the MPAP, the SOCM returns to military service. When service obligation is complete the SOCM can seamlessly transition to civilian PA practice.

Summary of Results: This pilot program was presented to the Department of Defense and approved with funding in the 2019 budget cycle. DOD approval and funding allows for expansion of the program to other PA schools and more SOCM. This program can now be expanded to other PA programs across the USA.

Discussion and Conclusions: MPAP enhances the SOCM skills while retaining these senior operators in service. Further, MPAP should be explored for translation to other forms of higher medical education programs around the globe. Medical personnel from across Europe, who have specialized training in battlefield medicine, are perfect candidates for such programs.

Take-home Messages: Medical programs such as MPAP: - make generalist medical training available to currently active military - provide critical support to SOCM teams in the field - support military in their search for a post-service career - increase the worldwide number of general practitioners.

An approach to complexity at the intersection of education and health care

AUTHOR(S):

- Lisa Graves, Western Michigan University Homer Stryker M.D. School of Medicine, USA (Presenter)
- Karen Horneffer-Gintner, Western Michigan University Homer Stryker M.D. School of Medicine, USA
- Rich Daudert, Western Michigan University Homer Stryker M.D. School of Medicine, USA

ABSTRACT

Background: Medical education leaders face challenges in multiple settings and at various levels of complexity. Medical education is situated at the intersection of two complex systems-education and healthcare. Human System Dynamics (HSD) is an approach to complex systems focusing on applying principles of complexity science and chaos theory to cope with volatile, uncertain, complex, and ambiguous (VUCA) situations. Through defining sticky issues and wicked problems, HSD approaches focuses on praxis - the intersection of theory and practice of leadership.

Summary of Work: Using a case study approach, we will share the curriculum of an institutional training program using HSD approaches over the course of 12 months.

Summary of Results: Applying HSD processes including inquiry and adaptive action were used to address medical education challenges at multiple levels of the learning continuum. Examples specific to undergraduate medical education, faculty governance and faculty development are described.

Discussion and Conclusions: Education and healthcare are both complex systems. Medical education straddles these two complex systems. New paradigms such as HSD are required to address the challenges in medical education and specifically in faculty affairs. This case study provides an introduction to a new approach and practical tools aligned with the challenges of medical education.

Take-home Messages: This case study will describe how the use of complexity science and chaos can inform the challenges in medical education.

How effective is Helping Babies Breathe training for practitioners delivering babies in non-facility settings?

AUTHOR(S):

- Grace Mupanemunda, University of Bristol, UK (Presenter)

ABSTRACT

Background: Birth asphyxia before, during or immediately after birth is a leading cause of early neonatal mortality worldwide. In addition to the high number of stillbirths due to birth asphyxia, many preventable neonatal deaths occur in babies presumed dead at birth who may have survived with clinical intervention. Neonatal resuscitation is a simple and effective intervention that can reduce neonatal mortality in asphyxiated newborns. Helping Babies Breathe is a training programme developed by the American Association of Paediatrics that teaches the theory and skills required to deliver effective neonatal resuscitation and essential newborn care especially in low resource environments. This programme has been shown to improve neonatal outcomes, specifically reducing neonatal mortality and stillbirth rates.

Summary of Work: Data was obtained from a mixed questionnaire completed by eleven practitioners. These practitioners and trainers were recruited via email and participant selection was made on an opt-in basis. The respondents' details were obtained from a register of HBB practitioners. Data from five participants out of the 16 who responded was not used as their data did not meet the criteria. The qualitative data obtained was organised into themes and then analysed in order to determine how far the training in non-facility settings was beneficial.

Summary of Results: Questionnaire results from 11 respondents were included in this study. All respondents reported a benefit to implementing the training for non-facility deliveries. Where outcomes were measured, improvement was seen, both in obstetric practices and neonatal outcomes. Trained practitioners reported increased knowledge and improved confidence in initiating neonatal resuscitation, including keeping the baby dry and warm.

Discussion and Conclusions: Many women in low income countries still choose to give birth outside of medical facilities, but still require birth attendants that can provide adequate obstetric care and effective resuscitation if required. Helping Babies Breathe training is beneficial for non-facility births in low income countries and should be advocated for in these settings, as it allows women to deliver safely outside of facility environments.

Take-home Messages: Training birth attendants in neonatal resuscitation is an effective way to improve obstetric practice and see better neonatal outcomes in low income countries.

Preferred Learning Approaches and Teaching Methodologies of Medical Students from Different Admission Channels

AUTHOR(S):

- Hin Ching Chow, Faculty of Medicine, The Chinese University of Hong Kong, China (Presenter)
- Constance Scarlett Yim, Faculty of Medicine, The Chinese University of Hong Kong, China
- Shui Shan Isabel Hwang, School of Biomedical Sciences, The Chinese University of Hong Kong, China

ABSTRACT

Background: The Hong Kong Diploma and Secondary Education ('DSE') and the International Baccalaureate ('IB') represent the two predominant secondary education curricula taken by undergraduate medical students at the Chinese University of Hong Kong (CUHK). Dissimilarities in pre-university educational experience between these two groups of students have long posed significant challenges for teaching staff to formulate effective teaching methodologies catering for both groups.

Summary of Work: A survey was conducted to collect information on students' studying methods and opinions on medical learning, as well as evaluation of specific teaching strategies employed by particular lecturers at CUHK. As Year 2 students ourselves, the learning experiences inquired were restricted to Year 2 courses for better context and comparison. 102 valid responses were received; 52 were students admitted from DSE and 32 were from IB, with the rest from various relatively minor admission channels.

Summary of Results: Our analysis suggests that students admitted from DSE generally prefer lecture information to be presented in a linear sequence. They also tend to spend more time revisiting class contents before joining group-based dissection practicals. Students from IB, on the other hand, prefer thinking out loud with their peers as part of their learning process. For both groups, clear explanation of the clinical significance of the knowledge taught provides greater incentives to learn, and this holds especially among students from DSE. Regarding knowledge delivery, the majority of either group considers lectures the most direct and effective way of doing so. Also, lecturers who introduce interactive elements in their classes are welcomed by students regardless, as students can more easily recall the contents during revision.

Discussion and Conclusions: Systematic effort to investigate learning tendencies of students from different admission channels has been lacking, partly owing to concerns over aggravating segregations between DSE and IB students. With that in mind, in our study we examined not only intergroup differences, but more importantly, similarities in the teaching strategies favoured by both groups. Here, we shed light on the development of CUHK's medical curriculum by identifying viable directions to undertake, including stronger emphasis on clinical relevance and interactivity.

Take-home Messages: Exploration of diversity in students tendencies and preferences is imperative in pursuing student-centred learning.

Students' participation in Educational Spaces: Is Diversity Really Valued?

AUTHOR(S):

- **Olga Matus, University of Concepcion, Chile (Presenter)**
- Sebastian Gonzalez-Brevis, University of Concepcion, Chile
- Cristhian Perez-Villalobos, University of Concepcion, Chile
- Camila Espinoza-Parcet, University of Concepcion, Chile
- Peter McColl-Calvo, University Andres Bello, Chile
- Nancy Navarro-Hernandez, University La Frontera, Chile

ABSTRACT

Background: According to studies, in recent years Higher Education in Chile has been focused on guaranteeing access to students, which has resulted in heterogeneous income profiles. This means that current challenges for institutions include adapting to diverse contexts, ensuring that all students successfully complete their studies. For this, it is important that educational environment guarantees good relations among students, specifically in Health Careers, where interdisciplinary teamwork is important. **Objectives:** to analyze the relationship between students in contexts of diversity, in health careers. **Financed by** FONDECYT-CONICYT 1170525.

Summary of Work: Qualitative study, based on Strauss&Corbins Grounded Theory(2002). Participants: 10 teachers, 23 students of health careers. Two group-interviews and thirteen semi-structured interviews were conducted. **Analysis:** constant comparison method, up to axial coding level, using Atlas-ti 7.5.2.

Summary of Results: According to interviewees, the relationship between students considers: background (evaluation of the ex-group, characterization of the student), intervening-factors (formative level, type of diversity, instances of participation, privileged positions), action-strategies (adhesion to homogeneous groups, teaching support, institutional support, concealment of diversity), consequences (participation in academic instances, participation in university activities, academic performance, invisibility of diversity), context (situation of diversity and inclusion in Chile and in universities, cultural schemes of discrimination, academic competitiveness, academic demands).

Discussion and Conclusions: Health careers are not prepared to address diversity, as they fail to provide learning and participation to all their students. The relationship between students in health careers does not escape this situation. Although in the discourse, students often show themselves to be tolerant of diversity, there are practices that suggest discriminatory treatment of peers who consider themselves to be different. This would lead to various problems of inclusion in the educational context, mainly reducing academic participation, participation in other university instances and academic performance.

Take-home Messages: It is important to demystify that educational inclusion is only the work of institutions and teachers. Reflective spaces should be generated that encourage students to analyze their own beliefs and practices towards diversity in health career contexts. This is essential if we consider the impact of the training process on subsequent performance with users, patients and other diverse professionals.

Spatial distribution of 1-year international medical students as a marker of intergroup relationships management

AUTHOR(S):

- Dmitry Vishniakov, International University of Kyrgyzstan, International School of Medicine, Kyrgyzstan (Presenter)
- Arsen Aidaraliev, International University of Kyrgyzstan, Kyrgyzstan
- Elena Savchenko, International University of Kyrgyzstan, Kyrgyzstan

ABSTRACT

Background: The social environment in university plays crucial role for adaptation process in first year international medical students. The main goal of the study was to assess students' spatial distribution in a lecture hall as an instrument and tool for intergroup (interethnic/intersex) relationships management.

Summary of Work: Design: prospective cohort study. Settings: International University of Kyrgyzstan, International School of Medicine. The spatial distribution of 198 students was recorded, examined visually and measured using aggregation index during the first semester. Social school environment was assessed as amount of intergroup spatial interactions and questionnaire. Perception of spatial segregation was identified using focus groups.

Summary of Results: Out of all 56% were Pakistani students, 35% Indian students, 5% students from Maldives and 4% students from other Southeast Asian countries. By the end of the first month of study 3 main ethnic groups and 12 subgroups were formed on the ethnic/geographic, sex and religious ground and had firmed spatial boundaries in a lecture hall. The effect of interventions that targeted different forms of segregation had gradual positive correlation with changes in spatial student's distribution and interaction. However, sudden negative changes in index coincided with a conflict between groups and, on the contrary, two statistically significant sustainable positive changes marked with dissolution of spatial boundaries of 3 main ethnic groups by the end of 3 month and 12 subgroups by the end of 4 month of study that followed by significant amount of interactions and changes in perception of spatial segregation.

Discussion and Conclusions: The spatial distribution of students in a lecture hall allowed following the development of intergroup relations in real time, assessed the effect of interventions that targeted different form of segregation, identified unreported conflict between groups and marked threshold of interethnic/intersex group relations among international students

Take-home Messages: The development in spatial student's distribution in a lecture hall can be considered as a marker of intergroup relationship management.

Residents and physicians hold implicit bias associating ambition with men

AUTHOR(S):

- Maud Kramer, Maastricht University, the Netherlands (Presenter)
- Karen Könings, Maastricht University, the Netherlands
- Ide Heyligers, Maastricht University, the Netherlands

ABSTRACT

Background: An intense feminisation process of the medical profession is taking place. However, women stay underrepresented in academic (leadership) positions and in certain prestigious disciplines (such as surgical fields). Historically stereotyped gender-related prejudices might still influence career aspirations in female residents and physicians. This study investigated gender differences in residents' and physicians' implicit attitudes (unconscious associations or bias) regarding ambition and gender.

Summary of Work: Dutch residents (trainees, N = 117) and physicians (supervisors, N = 133), working in residency training settings in seven health care institutions in the South-East of the Netherlands participated in this study. Participants completed an online questionnaire including demographic characteristics and an online Implicit Association Test (IAT), measuring residents' and physicians' implicit attitudes regarding ambition (defined as career and family) and gender (female, male). IAT D-scores range from -2 to +2: positive values indicate a stronger association of ambition with male; negative values indicate a stronger association of ambition with female. We used analysis of variance to test gender differences in residents' and physicians' implicit attitudes.

Summary of Results: Both residents and physicians held implicit bias regarding ambition and gender: male gender was associated to career while female gender was associated to family. Gender was weakly related to implicit attitudes: females, mainly female residents, showed a higher implicit bias associating ambition with men compared to their male colleagues.

Discussion and Conclusions: We found implicit attitudes, associating ambition with men, in both male and female residents and physicians. Surprisingly, female residents starting their careers during the feminisation process were most strongly biased in associating ambition with men. This might be caused by the predominantly masculine work culture in hospitals, in which female residents' needs might not be fulfilled. As the feminisation process continues, females might need more support during postgraduate medical education (PGME) and their further career aspirations.

Take-home Messages: 1. This study creates awareness of residents' and physicians' implicit attitudes associating ambition with men. 2. Supporting female residents in PGME and their further career aspirations is of vital importance, as especially young females experience the highest implicit bias associating ambition with men.

A Qualitative Study on Medical Students' Development of Cross-cultural Competence and IFMSA Exchange Programs

AUTHOR(S):

- Hsiang Yun Ko, Kaohsiung Medical University, Taiwan (Presenter)
- Peih Ying Lu, Kaohsiung Medical University, Taiwan
- Jia Suan Chong, Kaohsiung Medical University, Taiwan

ABSTRACT

Background: International Federation of Medical Students Association (IFMSA) has run exchange programs for medical students for decades, but few studies have investigated the effectiveness on students' development of cross-cultural competence (CCC) that prepares culturally competent physicians. In this study, we explored Taiwanese medical students' perspectives on their development of CCC through IFMSA exchange.

Summary of Work: We designed semi-structure interviews and invited 10 Taiwanese medical students who had completed four-week IFMSA exchange programs (SCOPE for professional and SCORE for research) in the past five years. We explored their perspectives of exchange programs regarding the impact on their understandings of CCC and their career development. The data were collected and transcribed verbatim and analyzed with the inductive approach.

Summary of Results: Four themes from the data were identified: 1. Students' deficiency in preparation in their professional exchange, limited language proficiency of both students and their colleagues of the host institution, and loosely-arranged courses of IFMSA programs would have impact on the academic quality of an exchange experience. 2. People whom students encountered and worked with was essential in their cultural experiences. 3. Length of the time spending on interacting with other exchange students and the degree of cultural diversity of their exchange settings had impact on their learning experiences. 4. The student receiving experiences of and support from the local student unit might affect their learning.

Discussion and Conclusions: Although students expressed some concerns, these self-perceived obstacles and challenges encouraged students to interact among exchange students of diverse backgrounds through discussing about their clinical studies and therefore get to know different medical education programs and lifestyle in general. A well-organized program also reply on the arrangement made by the host institution in terms of learning and opportunities to mix with local people. The students' mindset also determines the success of the exchange programs and their development of CCC. Therefore, how to prepare students for such exchange programs also deserves further attention.

Take-home Messages: IFMSA medical student exchange programs provided students with the valuable CCC experiences, but better preparation is required for host institutions and students to facilitate better learning experiences.

Thai students' decision to study in Doctor of Medicine Program in China

AUTHOR(S):

- Woralak Bunpramuk, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand (Presenter)
- Worasit Charoensin, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand

ABSTRACT

Background: As the competition of education business increase worldwide, the affected medical school business in China try to target a new customer group, especially Thai students who were interested to join Doctor of Medicine Program in China. According to the data gathered from The Medical Council of Thailand since 2008 - 2018, there were about 1,542 students studying Doctor of Medicine Program in China, which is the highest ranking number of the Thai medical student studying abroad. Therefore, this research aim to study influencing factors on Thai students decision to choose their medical school in China.

Summary of Work: This research is the survey study using quantitative method. Instrumentations are online questionnaires by likert scale on 5 levels. The data was collected from 70 Thai medical students who had at least 2 years experiences studying in Doctor of Medicine Program in China. The results were presented by mean (X) and SD as a statistical description.

Summary of Results: This research found that there are more female (62.86%) than male (25.72%) students. Most of the students are from Bangkok (40.00%) and study in Government University (97.14%). The factors influencing Thai students decision to choose their medical school in China were divided into 3 factors: (1) Image factor at a highest level (X=4.41), (2) Curriculum factor at a high level (X=4.05) and (3) Personal factor at a low level (X=2.23).

Discussion and Conclusions: Medical school image is the core factors affecting to Thai students' preferences for medical school in China. So, medical school should also advocate for image factor in order to encourage students' engagement.

Take-home Messages: Although, image factors will be the most important factor but other factors such as curriculum factor is also crucial as it may contribute and reinforce to long-term success as well as image of medical schools.

Internationalization of Medical Education - An International Partnership of 12 Universities in 4 Continents to Promote Cultural Awareness and Early Networking

AUTHOR(S):

- **Anette Wu, Columbia University, USA (Presenter)**
- Geoffroy Noel, McGill University, Canada
- Heike Kielstein, Martin Luther University, Germany
- Takeshi Sakurai, Kyoto University, Japan
- Chung-Liang Chien, National Taiwan University, Taiwan
- Suvi Viranta-Kovanen, University of Helsinki, Finland

ABSTRACT

Background: In a globally interconnected world, internationalization of medical education (IoME) can enhance students' understanding of social, cultural, and ethical differences and can prepare future physician leaders to practice with a better understanding and awareness of cultural differences. The overall objective of this program is to prepare preclinical medical students for international leadership roles and global collaborative problem solving in healthcare via early networking, small group collaborative work and international research abroad.

Summary of Work: The program is a 12 school collaboration between Australia, Austria, Canada, Denmark, Finland, Germany, Japan, Taiwan, the UK, and the USA. The students meet online for one semester to work in small groups (n=3-4) during several structured sessions. Topics include comparison of Anatomy courses/curricula, differences in international healthcare education and delivery, Global/Public Health challenges, and differences in health ethics and health law. Students reflect on the topic of body donation and death, work on a collaborative small group paper, and create a video and slide presentation together. The small group work culminates in two large international virtual conferences, with all students and faculty participating, where students present their work. Following the conferences, the students travel to the partner countries for short-term basic sciences research internships and to socialize with their peers in the host country.

Summary of Results: The voluntary program enrolls about 200 students per year (60 small groups). The majority of students selected Public Health topics and health law/ethics for their final small group papers and conference presentations. The students felt that they learned from each other. We observed a level of appreciation of what they have at home and cultural awareness. Results also demonstrate that the travels help with building research techniques skills, cultural competency and social connections. In 2019, about 100 students will participate in the exchange research travels to their partner schools.

Discussion and Conclusions: Our program aims to provide students with an early acquisition of international and cultural experience, basic sciences skills, as well as professional scientific networking opportunities. This early bonding of future healthcare leaders may facilitate international collaborations going forward.

Take-home Messages: Early IoME can enhance students education and can be introduced early in medical education.

Relationship between emotional distance and psychological stress in medical studies

AUTHOR(S):

- **Angelika Taetz-Harrer, Universität Witten/Herdecke, Germany (Presenter)**
- Arndt Büssing, Universität Witten/Herdecke, Germany
- Michaela Zupanic, Universität Witten/Herdecke, Germany
- Jan Ehlers, Universität Witten/Herdecke, Germany

ABSTRACT

Background: Does emotional distance support coping with stressful situations? Studying human medicine is a discipline associated with great stress, and high risk of burnout among medical doctors. To cope with it, emotional distancing is often used as an adaptive strategy. The beginning of the clinical part in particular is associated with a significant decrease in student satisfaction, and at the same time students report an increased prevalence of psychosomatic complaints. A longitudinal research project at Witten/Herdecke University (W/HU) will investigate where and in which areas medical students need special support in order to develop effective stress-management strategies.

Summary of Work: Prior to the start of the model curriculum 2018+ at the W/HU, the project was piloted using cross-sectional analyses to collect To data and validate the test battery. Through pseudonymized surveys among students during their medical studies (1.- 9. term), standardized questionnaire modules were used to identify different study and quality-of-life-associated dimensions.

Summary of Results: The sample included 329 medical students. The study explores potential variations between semesters in wellbeing (WHO5) and emotional distance (Cool Down, CDI) during clinical activity. Results indicate that in early clinical phase, those students with significant psychological stress and well-being deficits (WHO5 <13) demonstrated greater emotional distance (CDI) than the psychologically inconspicuous group. After the first clinical semester, however, the observed effects are inverted.

Discussion and Conclusions: Results may indicate that a high emotional distancing between students and patients before clinical activity can be an indicator of emotional exhaustion and depression. However, the establishment of a 'professional emotional distance' during clinical activity is also a 'healthy' strategy for the physicians ability to perform. To exclude cohort effects, a longitudinal study is necessary. The results can be used as an anonymous 'traffic light' system to derive the need for measures addressing specific study phases.

Take-home Messages: The objective is an advanced identification of stress reactions and stressors to promote the development of coping strategies in stressful study phases during medical school.

Moral Distress Among Medical Students: A Systematic Review of Its Causes, Impact and Response

AUTHOR(S):

- Susan Glick, Rush University, USA (Presenter)
- Jacob Schulman, Rush Medical College, USA
- Max Harris, Rush Medical College, USA
- Daniel Pohlman, Rush University, USA

ABSTRACT

Background: Moral distress occurs when one knows the moral and ethical course of action, yet is constrained from performing it. Lack of resources and futile care are some of the many reported causes of moral distress among healthcare professionals, and may result in frustration, anger, a sense of powerlessness, job dissatisfaction and intent to leave the profession. These symptoms are strikingly similar to those of burnout syndrome and may be confused with it. Medical students may disproportionately experience moral distress, as they are well trained in the ideals to which the profession aspires, yet wield little power in the health care system.

Summary of Work: We systematically reviewed the literature to assess studies that described and evaluated moral distress among medical students. We searched OVID, CINAHL, PsycINFO, and ERIC through October 2018. We reviewed titles and abstracts to determine eligibility. Eligible studies had to represent an original study; present data about the causes, impact, or response to moral distress; measure and report outcomes in medical students; and report findings in English. Following full text review, those articles that did not meet all inclusion criteria were excluded.

Summary of Results: The search yielded 63 articles; 6 were included. Five addressed situations that result in moral distress; two addressed its impact. None addressed the response to moral distress. Narrative synthesis was performed due to data heterogeneity. Studies differed in their conclusions about which situations resulted in the greatest moral distress, including those with immediate potential to cause harm; verbal abuse; communication issues, resource allocation, and access to care. Role modeling was inversely correlated with student distress, as was action-taking. One study found moral distress can result in either emotional desensitization or worsening distress.

Discussion and Conclusions: Little is known about the situations that result in moral distress among medical students or about the experiences with the potential to result in the greatest distress. The impact of moral distress on medical students is largely unknown. The literature is silent on the response to medical students' moral distress.

Take-home Messages: As medical educators and others strive to promote student wellness, deepening understanding of the causes, impact and response to moral distress among medical students is imperative.

Anxiety analysis during the first clinical encounters: simulation in undergraduate medicine

AUTHOR(S):

- Nancy Segura-Azuara, Tec de Monterrey, Mexico (Presenter)
- Irma Eraña Rojas, Tec de Monterrey, Mexico
- Mildred López Cabrera, Tec de Monterrey, Mexico
- Melissa Valeria Luna-de-la-Garza, Tec de Monterrey, Mexico
- Javier Ibarra-Castorena, Tec de Monterrey, Mexico

ABSTRACT

Background: First clinical encounters trigger strong feelings in medical students, as they face complex illnesses or guilty feelings about “using patients suffering” for learning purposes. Clinical simulation allows experiencing anxiety in a safe environment before becoming involved with patients’ in the hospital. The objective of this research was to assess the level of anxiety during medical students’ first clinical encounters, as they start to experience clinical simulation; by the use of the Clinical Simulation Scenarios’ Anxiety Inventory.

Summary of Work: A sample of 49 students coursing the fifth semester in med school in a private school in North of Mexico. A voluntary, anonymous, on-line 25-item survey, grouped into seven factors, was obtained from several other assessment instruments related to exam anxiety, self-esteem, life satisfaction. This survey has a 5-level Likert scale; 1 meaning completely disagree; and 5, completely agree. The analysis was carried out using descriptive statistics, item tendencies, and factors of the proposed theoretical model. Descriptive statistics analyze the factors integrating the proposed theoretical model, standard deviation and confidence interval of 95% for each of these, ANOVA and single-factor variance analysis, and item tendencies.

Summary of Results: We found an overall average of 2.67 for the level of anxiety. The gender factor showed a significant difference by ANOVA (p-value = 0.016). The trends’ results by factor show significant differences in corporal expressions (p-value = 0.003), concern about how others perceive me (p-value = 0.007) and worries about self-image (p-value = 0.019).

Discussion and Conclusions: Assessment is very important for professional training. Since anxiety frequently follows new learning, assessing this issue is mandatory. This research has high transferability to other levels of medical training and other fields, in undergraduate and postgraduate studies. We advice giving the participants precise instructions regarding the way to address the survey, as being related to exams, specific courses or semester in their career.

Take-home Messages: Anxiety is present during the first clinical encounters in medical students. The main factors associated with anxiety in undergraduate students were: gender, corporal expressions, others perception about oneself and worries about self-image.

The Estimation of the prevalence and causes of anxiety and depression among students in a Caribbean medical school and its correlation with academic performance

AUTHOR(S):

- Yuliya Modna, Trinity School of Medicine, Saint Vincent and the Grenadines (Presenter)
- Bernadette Scott, Trinity School of Medicine, Saint Vincent and the Grenadines

ABSTRACT

Background: Students are exposed to many stressful experiences during their training and often must cope on their own (Ediz B et al., 2017). Constant stress leads to emotional outbreaks, which have a negative impact on academic performance and well-being (Ahmed I et al., 2009).

Summary of Work: **PURPOSE:** to estimate the prevalence and causes of anxiety and depression among students of TSOM and its correlation with academic performance. **METHODS:** 56 student-volunteers of TSOM with a similar academic load answered the Beck Anxiety Inventory and the Beck Depression Inventory and rated factors which can have an effect on their emotional condition.

Summary of Results: Prevalence of anxiety showed: 94.4% students had a very low anxiety level and 5.6% - moderate level. The depression prevalence was: 77.7% students without depression, 11% had mild mood disturbance, 5.56% - borderline clinical depression, and 5.56% - moderate depression. The correlation ($R = -0.58$) between anxiety and GPA was significant ($P < 0.005$), showing a lower GPA in students with moderate anxiety and also the correlation ($R = -0.61$) existed between the GPA and depression ($p < 0.001$), supporting the link between negative impact of moderate and clinical depression on academic performance. The common factors which increased students' stress levels included: financial factors (51%), academic stress (32%), lack of support and personal stress (22%).

Discussion and Conclusions: Only 20% of the TSOM students had some form of depression and 5.6% - moderate anxiety level caused by previously described factors.

Take-home Messages: Suggestions: provide more institutional services to the students such as: open dialogs, support group/community options, academic counselling, and health professionals.

Stress, anxiety, and depression among third year medical students at Chulalongkorn University

AUTHOR(S):

- Nichaphat Bovornsethanant, Faculty of Medicine, Chulalongkorn University, Thailand (Presenter)
- Siwat Techavoranant, Faculty of Medicine, Chulalongkorn University, Thailand
- Sittisak Honsawek, Faculty of Medicine, Chulalongkorn University, Thailand

ABSTRACT

Background: Nowadays, mental health problems are progressively increased worldwide. Medical students are at higher risk as they have more intense factors, for instances, the curriculum, higher expectation, and social standard. The purpose of this cross-sectional descriptive study was to investigate mental health of medical students in 3 axes - depression, anxiety, stress - and its associations such as gender and study programs.

Summary of Work: The participants in this study included 205 3rd year medical students, 101 males (49.27%) and 104 females (50.73%), in academic year of 2018 at the Faculty of Medicine, Chulalongkorn university. The research instrument was a survey which was a set of questionnaires that contained 3 parts: basic information, Depression Anxiety and Stress Scales (DASS-21), and tow questions.

Summary of Results: Our data indicated that the students had 29.76% depression, 29.76% anxiety, and 22.93% stress (by means of moderate to extremely severe levels in each axis). The students' study programs appeared to affect their anxiety: students who studied in the consortium of Thai medical school program were more likely to have anxiety than the others ($p < 0.05$). The causes of depression in 3rd year medical students were most likely to be studying subjects (49.76%), friends (14.63%), and relationship (12.68%), while they were studying subjects and friends in anxiety (68.29% and 10.73%), and stress (77.07% and 5.85%), respectively. There were neither significant correlation between causes of mental problems and gender nor causes of the problems and the students' study programs. The students would consult their friends, family, and not consulting anybody when they were facing depression (41.46%, 31.71%, and 23.90%), anxiety (45.37%, 30.73%, and 20.98%), and stress (42.44%, 36.10%, and 19.02%), respectively. The correlations between the consultants and gender or the study programs were not significantly defined.

Discussion and Conclusions: The medical study programs in which the students are studying seem to influence their mental health which might be affected by their primary base and expectation. Furthermore, there are factors such as national license examination and the more intense curriculum.

Take-home Messages: The 3rd year medical students are at higher risk for mental health problems. Thus, these results may help devising prevention strategies and early detection for them.

Coping with stress, fatigue, and sleepiness during medical studies: Experience of the French military medical school

AUTHOR(S):

- **Olivier Coste, Ecole de santé des armées, France (Presenter)**
- Léa Ruelle, Ecole de santé des armées, France
- Rémy Chapelle, Ecole de santé des armées, France
- Marion Trousselard, Institut de recherche biomédicale des armées, France

ABSTRACT

Background: French military medical students have to pass high selective exams during their first academic year. Cadets are submitted to a high amount of stress and chronic sleep restriction, generating anxiety, fatigue, and sleepiness. A “NO-STRESS” program was built four years ago in order to cope with these problems.

Summary of Work: The Program has several components with repeated psychometric evaluations by validated questionnaires along the year, group measures (information about sleep and circadian hygiene including light therapy) and individual measures (relaxation, self-hypnosis, and sleep medicine intervention).

Summary of Results: Iterative psychometric evaluations help to detect vulnerable students. The involvement in the prevention program remains based on freely participation of the students. We observed stable achievement in academic results. The benefit on light therapy is currently under evaluation. Statistical results will be presented during the congress.

Discussion and Conclusions: We expect a positive impact of the NO-STRESS program and we are very impatient to verify the efficiency of the chronobiologic measures we have taken, as we have previously shown that a seasonal factor seemed to be more pregnant than other individual factors of vulnerability on psychological stress patterns. This program is the response of our school to fight against student stress and academic failure. It has the advantage to take into account the whole group of students and vulnerable subjects at the same time.

Take-home Messages: Our results underline the underestimated importance of chronobiologic factors in coping strategies. These aspects question the temporal organization of the medical training course. Chronobiologic interventions may be more systematically present in medical student mental health prevention programs.

Does previous experience of performing affect anxiety levels and attainment in medical students during their first face to face assessment?

AUTHOR(S):

- Laura MacKenzie, University of Sheffield, UK (Presenter)
- Philip Chan, University of Sheffield, UK
- Emma Wynne, University of Sheffield, UK
- Alice O'Regan, University of Sheffield, UK

ABSTRACT

Background: Performance anxiety can detrimentally affect attainment in face to face examinations. When required to perform under the direct scrutiny of an audience or examiner, composure and required technical ability can suffer. How does previous experience in an activity of performance relate to the reported anxiety levels of medical students during their first face to face assessment of clinical skills at medical school?

Summary of Work: Second year medical students sitting their first ever face to face assessment of practical skills in simulation will be sampled, and interviewed using a structured approach. We will construct a scale of experience and successful adaptation to performance anxiety. Using logistic regression statistic techniques this scale will be correlated to self reported anxiety in their first face to face assessment of clinical skills . We will compare data from students who successfully passed their assessment with students who had to repeat their assessment.

Summary of Results: Analysis of data might produce one of three results; that previous experience and adaptation to performance in pressure situations is significantly more likely in pass students than repeaters, significantly less likely, or not significantly different.

Discussion and Conclusions: Our experimental hypothesis is that students who have had experience in performance activities will report both lower anxiety levels and suggest how they have overcome performance anxiety at assessment. Students who have not partaken in performance activities are expected to report higher anxiety levels owing to lack of experience of pressured performance. Showing benefit of experience in performance activities has implications for not only selection of medical students but the potential design of examination preparation activities within medical schools.

Take-home Messages: How experience of performance can be beneficial to medical school attainment. How medical schools could use performance-based activities to aid subsequent exam performance.

Anxiety Among Health Professions Undergraduate Students: Experience Report from a Center for Psychological and Educational Support

AUTHOR(S):

- **Rodrigo Flauzino, Ribeirao Preto Medical School, University of Sao Paulo, Brazil (Presenter)**
- Karolina Murakami, Ribeirao Preto Medical School - University of SAo Paulo, Brazil
- Maria Paula Panúncio-Pinto, Ribeirao Preto Medical School, University of Sao Paulo, Brazil
- Victor Ferraz, Ribeirao Preto Medical School, University of Sao Paulo, Brazil

ABSTRACT

Background: Anxiety is defined as a psychic state of apprehension due to the prediction of future situations or at presence of threatening conditions. During undergraduate time, students face challenges and demands that lead to situations that generate this state, which can compromise motivation, academic achievement and even lead to school dropout. Considering this, is very important to offer students listening spaces, exchange of experiences and reflections, in order to help them in the management of anxiety, and thus promote quality of life and health.

Summary of Work: This work reports the experience on developing workshops for health professions undergraduate students, coordinated by professionals from the Center for Psychological and Educational Support of a Brazilian public university. Based on the exchange of experiences among peers, in welcoming and listening, the workshops aimed to contribute on the development of strategies to deal with school anxiety. At meetings, theoretical concepts, dynamics and experiences exchanges between students and professionals were alternated.

Summary of Results: The main anxiety causes reported by the students were on seminars presentation, competitiveness and study routine organization. Workshop evaluations by students refer to the acquisition of knowledge about anxiety and ways of dealing with it. Workshops were recognized by students as a place of bonds building, a protected trust environment, where participants reports were able to circulate freely and serve as a mutual support to each participant.

Discussion and Conclusions: Considering that anxiety affects motivation and learning, the offer of group spaces can positively impact the students well-being, being a support to academic everyday life and contributing to decrease vulnerability to evasion.

Take-home Messages: The need to cope with school anxiety is one of the reasons that lead students walk into this workshop. In addition to initiatives of this type, the articulation of other undergraduate students support networks remains necessary.

Literature review to identify the attitudes and beliefs and prevalence of sexual harassment relevant to delivering healthcare, for nurses and medical trainees in a Singapore academic hospital

AUTHOR(S):

- Kaushal Sanghvi, Tan Tock Seng Hospital, Singapore (Presenter)
- Terence Huey, Tan Tock Seng Hospital, Singapore
- Sarah Lu, Tan Tock Seng Hospital, Singapore

ABSTRACT

Background: Sexual Harassment (SH) in the workplace has received increasing attention over the past year in the national, international press and within Medicine. We are not aware of any such studies done in the Singapore Hospital context.

Summary of Work: A detailed literature search was conducted on the topic using the terms “Sexual Harassment”, “workshop or training or education”, “Hospital”, “Nursing”, “medical training”, “residency”, “healthcare” in the Databases of PubMed, MGH oneseach , CINAHL, Ovid, Google Scholar from the year 1980 to 2018. From the search above, there has been no literature published about sexual harassment in a Singapore hospital.

Summary of Results: As part of its Research Study on Workplace Sexual Harassment published in 2008 (“2008 Study”), AWARE undertook a public opinion survey to find out the level of awareness, opinions and attitudes on this issue in Singapore. This is one of the largest surveys done in Singapore. Komaromy et al published on sexual harassment in medical training. 41 % suffered as medical students and the rest 43% suffered as residents. Cook et al published in 1996 a survey done on sexual harassment on a group of Canadian residents from seven different residency programs. Significantly more female respondents than male respondents stated that they had reported events of sexual harassment. An article by Shu Li and Song Mei Lee-Wong in the Journal of Applied Psychology shows that different ethnic groups perceived the cues differently; that ethnicity affects the interpretation of a single English phrase; and that English, as used by Singaporeans, is a high context language, which complicates the understanding of victims’ coping responses.

Discussion and Conclusions: There is evidence to show that within Singapore itself, there’s a difference of attitude to sexual harassment in different ethnicities! Singapore being a developed Asian nation should be no different to the prevalence of sexual harassment in a hospital relevant to delivering healthcare, for trainees and nurses.

Take-home Messages: This is a study which does not have a previous precedent in Singapore. The prescriptive literature search shows me data and findings that may not be applicable to my hospital or Singapore. Hence it gives me an idea to the research methodology to apply.

The Political Stress of Postgraduate Medical Students

AUTHOR(S):

- Pattana Poopattanakul, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand (Presenter)
- Wannida Jitkaroon, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand
- Worasit Charoensin, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand

ABSTRACT

Background: Since 2014, the coup in Thailand has been an important factor which encourages Thai people to be more interested in the politics. As observed by Mental Health Department, Ministry of Public Health, it can be found that a quarter of Thai population has experienced Political Stress Syndrome: PSS. Thai medical students who are also a part of citizen may have been affected by this situation. Therefore, this study aims to examine the level of Political Stress Syndrome in medical students to give suggestions and recommendations for preventing the PSS in the students.

Summary of Work: This study is quantitative survey research. The population consists of 135 postgraduate medical students at clinic level of Faculty of Medicine, Naresuan University, academic year of 2018. The research instrument is PSS assessment form designed by Mental Health Department. Descriptive statistics, the mean and S.D. are used for data analysis.

Summary of Results: There were 110 assessment respondents (81.48% of the total population). Most of the respondents were female (60%). The average age of the respondents was 30.19. The frequency of accessing the political news was some days (61.82%). Facebook was reported as the most popular for accessing the political news (96.36%). The result shows that most of the assessed students are bored to follow political news (69.10%). In addition, the political situation doesn't affect to the student's family relationship (89.09%) and colleague relationship (65.45%). According to the PSS assessment, it can be found that the assessed students have political stress at normal level, moderate level and high level at 67.27%, 23.64% and 9.09% respectively.

Discussion and Conclusions: The result shows that there are 9.09% of respondents who have a high level of political stress. It can be concluded that environmental factors, including political situation and related news exposure, are associated with mental health of the medical students. Moreover, the political stress may have negative effects on the academic and practical performance of students in the future.

Take-home Messages: This study suggests that the medical schools should provide social and psychological activities to improve medical students' quality of lives. At the same time, instructors and the students should be trained for stress management as extra-curricular activities.

The fatigue paradox: A grounded theory study exploring nurses', physicians' and residents' perceptions of physician fatigue

AUTHOR(S):

- Taryn Taylor, Schulich School of Medicine & Dentistry, Canada (Presenter)
- Emily Field, Schulich School of Medicine & Dentistry, Canada
- Sandy DeLuca, Western University, Canada
- Lorelei Lingard, Schulich School of Medicine & Dentistry, Canada
- Julie Ann VanKoughnett, Schulich School of Medicine & Dentistry, Canada

ABSTRACT

Background: Work hour regulation has failed to solve the problem of fatigued physicians. Organizations are turning to fatigue risk management (FRM) frameworks utilized in other highly reliable industries. However, these assume a shared understanding of fatigue as hazardous. Evidence suggests that physicians reliably recognize when they are tired; yet it remains unclear how they perceive the impact of their workplace fatigue. Thus, we set out to explore physician and nurse perspectives on the impact of physician fatigue on patient care.

Summary of Work: Using a constructivist grounded theory approach, we conducted 40 interviews with staff physicians (20), residents (8) and nurses (12) from the Departments of Emergency Medicine, Internal Medicine, Obstetrics and Gynecology, Surgery, Anesthesia and Radiology practicing in a tertiary academic centre or community hospital in Canada. Iterative data collection and analysis directed theoretical sampling. Constant comparative analysis raised our initial open coding to a more conceptual level, resulting in the final grounded theory.

Summary of Results: Participants held paradoxical views about physician fatigue. They described multiple manifestations of fatigue in clinical work (e.g. slowness, incorrect orders, poor communication) while also maintaining that fatigue has minimal impact on patient care. Our analysis revealed four main themes that reinforce this duality: (1) the idea of exceptional physicians (“My tired colleague wouldn’t be as good as tired me”), (2) the role of interception by nurses (“... I won’t leave it where it’s not safe”), (3) the absence of feedback or evidence (“I may not be picking up on all the errors I’m making when I’m sleep deprived”) and (4) the minimization of the significance of fatigue-related events (“So there are little things that get missed... it turns out we missed that the aorta got stabbed”).

Discussion and Conclusions: Healthcare providers are working within a complex framework that sustains contradictory perspectives about the significance of fatigue. This “fatigue paradox” will persist as long as we lack robust performance feedback mechanisms and transparent acknowledgement of nurses’ role in mitigating harm.

Take-home Messages: Left unchallenged and unexamined, paradoxical perceptions of physician fatigue will likely impede successful implementation of fatigue risk management strategies in clinical practice.

A randomized controlled trial of Balint groups to reduce burnout among residents in China

AUTHOR(S):

- **Lei Huang, Tongji Hospital of Tongji University, China (Presenter)**
- Jennifer Harsh, University of Nebraska Medical Center, USA
- Haisong Cui, Tongji Hospital of Tongji University, China
- Jiaxin Wu, Tongji University School of Medicine, China
- Liming Cheng, Tongji Hospital of Tongji University, China
- Wenyan Wu, Tongji Hospital of Tongji University, China

ABSTRACT

Background: Burnout is highly prevalent among residents, and is associated with negative outcomes for patients, organizations, and physicians. Balint groups have been shown to be an effective strategy to alleviate physicians' burnout. The purpose of this current study was to examine the effectiveness and feasibility of Balint groups in reducing burnout among residents in standardized training programs in China, by means of a randomized controlled trial design.

Summary of Work: 36 resident physicians in their first year of residency at a comprehensive hospital in China were randomly assigned to two groups. Physicians in the intervention group participated in 2 lectures and 10 Balint sessions in 6 months, while participants in the control group were placed on a waitlist. Participants completed burnout and job satisfaction measures pre and post intervention.

Summary of Results: Paired t-test results revealed that burnout subscale scores for emotional exhaustion ($P=0.013$) and depersonalization ($P=0.020$) for the intervention group were significantly decreased after Balint groups' participation compared to those of the control group. No significant differences were found in the scores for personal accomplishment ($p=0.318$) and job satisfaction ($p=0.716$), between groups. All 18 participants in the test group reported that Balint groups were helpful and that they would be willing to attend future Balint sessions. Overall satisfaction with the Balint groups program was over 80%.

Discussion and Conclusions: Balint groups are an efficacious and feasible strategy for alleviating resident physician burnout. Because of their effectiveness and standardized procedures, it may be beneficial for other residency programs in China to include Balint groups in their residency training programs.

Take-home Messages: 1. A randomized-controlled trial design to examine the effectiveness and feasibility of Balint groups in reducing burnout among Chinese residents in standardized training programs. 2. The Balint groups intervention in this study was a standardized training model introduced in Germany and modified by Tongji Hospital of Tongji University. 3. Balint groups participation showed to be efficient in relieving emotional exhaustion and depersonalization of burnout among Chinese residents.

Smartphones and social networks as determining factors of burnout in resident physicians

AUTHOR(S):

- Jessica Pallares Chavira, Universidad Autonoma de Chihuahua, Mexico (Presenter)
- Haydee Parra Acosta, Universidad Autonoma de Chihuahua, Mexico
- Jose Lopez Loya, CIFE, Mexico
- Diego Mendoza Enriquez, Universidad Autonoma de Chihuahua, Mexico

ABSTRACT

Background: There are information gaps regarding the relationship between the use of the Internet, mobile devices and Burnout in resident physicians, which is a growing problem.

Summary of Work: Multicentric cross-sectional study directed to a simple random sample of 212 residents of medical specialties offered by AMFEM, to whom an electronic questionnaire was applied. This instrument was previously validated by two techniques: 1) Expert Judgment. 2) Analysis of internal consistency, obtaining an α of Cronbach = 0.94. The instrument integrated 28 simple variables, organized into two complex variables: use of mobile devices and burnout. The analysis of the information was carried out through different statistical analyzes: descriptive, correlational (Pearson R) and T test; using SPSS v.22.

Summary of Results: It was observed that resident physicians very frequently use electronic devices during working hours (5.04), in addition, they frequently use social networks (3.97). Regarding the burnout, residents consider more frequently to be fatigued by their work. In the results of the T test, were found significant differences between men and women, with respect to feeling exhaustion in their work. Women are the ones who present it the most; however, they maintain a professional position with the patient. The correlational results ($p = <0.01$) showed a significant relationship between the use of smartphones, social networks and burnout.

Discussion and Conclusions: The relationship found among smartphones, social networks and burnout is similar to the results obtained by another study (Álvarez, R. B. & Mayo, I. C., 2015) However, the use of these also shows a relationship with the perception of self-efficacy in labor improvement.

Take-home Messages: Burnout syndrome is still a problem in health professionals. This study shows the importance of knowing the negative emotional experiences that can result from interactions with these technologies.

Comparison of burnout, emotional intelligence and resilience between faculty clinicians and emergency medicine residents

AUTHOR(S):

- Zulkarnain Ab Hamid, National University Hospital, Singapore (Presenter)
- Shirley Beng Suat Ooi, National University Hospital, Singapore

ABSTRACT

Background: Burnout starts early in residency and emergency medicine (EM) residents are known to be especially vulnerable. Studies have shown that Emotional intelligence (EI) and resilience help to reduce risk of burnout. We compared the burnout rate, emotional intelligence and resilience scores between faculty clinicians and EM residents.

Summary of Work: 42 faculty clinicians and 23 EM residents, participating in a coaching project, was asked to fill up The Resilience Scale (TRS), Trait Emotional Intelligence Questionnaire (TEIQue) and the Maslach Burnout Inventory - Human Services Survey (MBI-HSS). Burnout was defined as having high score on emotional exhaustion; and high depersonalisation or/and low personal achievement. The measures were compared between the faculty and residents to quantify the difference.

Summary of Results: The prevalence of burnout amongst residents is 39.13%, and 4.76% for faculty ($p = 0.0005$). This is associated with an equally-large difference in EI development. 78.26% of the resident score below average (BA) for the global EI, compared to just 33.33% of the faculty ($p=0.0005$). Along the same vein, 21.43% of faculty have above average (AA) EI, whereas 0% of the residents have AA scores ($p=0.037$). Similar patterns - for both BA and AA comparisons - are seen for all facets of EI except for emotional management (which are equal for both). Mean TRS scores are similar, with faculty scoring 141.6 and residents scoring 137.5 ($p = 0.1808$)

Discussion and Conclusions: This inverse relationship between EI and burnout is consistent with previous studies. EI is a competency that can be developed (over time), and improved scores are associated with markedly decreased burnout, suggesting the long-term protective nature of EI in curbing burnout and promoting career longevity. EI, thus, shouldn't be left as a "good-to-have" skill or one that should be honed naturally in the course of one's career. Efforts to accelerate EI competence through education and coaching - thus short-circuiting the development process - may help save residents from burnout. Similar moderate resilience levels suggest that resilience training - a common intervention - may not be as useful.

Take-home Messages: EI should be actively developed early in residency training, considering its importance in a doctor's work and its effects on long-term wellbeing.

The impact of Bullying in the Irish Postgraduate Medical context

AUTHOR(S):

- Janet O'Farrell, Medical Council of Ireland, Ireland (Presenter)
- Ciaran Carr, Medical Council of Ireland, Ireland
- Stephen Bance, Medical Council of Ireland, Ireland

ABSTRACT

Background: The Medical Council of Ireland is committed to regulating the quality of doctor's education, training and lifelong learning. The Council monitors trainees' experiences of the clinical learning environment. It has been observed consistently that Irish trainees have faced challenges relating to bullying and negative wellbeing outcomes.

Summary of Work: A survey was hosted online and all Irish doctors on the trainee specialist division of the register were sent an invitation and reminders to participate. The Short Depression-Happiness Scale (SDHS) was utilised to examine mental health and wellbeing and additional questions on the experience of bullying, the frequency of bullying and involvement in adverse clinical events were also included.

Summary of Results: A total of 759 Postgraduate trainees participated. Almost forty-one percent (40.9%) of trainees reported experiencing bullying and forty-one percent of those bullied were involved in an adverse event. Of those not bullied, 18.5% were involved in an adverse event. Just under half (47.8%) of respondents who recorded high scores on the SDHS had been involved in an adverse event, while less than thirty percent (29.6%) of those who recorded low scores on SDHS were involved in an adverse event. In addition, elevated SDHS scores ($\beta = -.1, p < .05$) and increased Bullying frequency ($\beta = -.3, p < .05$) were significant predictors of a trainee experiencing an adverse event.

Discussion and Conclusions: The results suggest that bullying is an increasingly reported issue for Irish trainees, with deleterious consequences from a well-being perspective. Those who experienced bullying were more likely to experience an adverse event. While those who reported a greater frequency of bullying and presented with higher SDHS scores were also more likely to experience an adverse event.

Take-home Messages: Wellbeing issues play a role in the likelihood of adverse events occurring. Furthermore, it could be argued that these factors may be predictors of trainees emigrating to practice medicine abroad. This evidence base mirrors concerns that the Medical Council is receiving from trainees at the coalface of hospital medicine. These findings establish an evidenced need for an increased policy focus on wellbeing from the Medical Council.

How much do doctors drink? - remembering the wellbeing of our workforce

AUTHOR(S):

- **Emily Savage, Chelsea and Westminster NHS Foundation Trust, UK (Presenter)**
- Luciana Sowole, Chelsea and Westminster NHS Foundation Trust, UK
- Shreena Shah, Chelsea and Westminster NHS Foundation Trust, UK
- Zulfiqar Mirza, West Middlesex University Hospital, Chelsea & Westminster NHS Foundation Trust, UK
- Christina Cotzias, Chelsea and Westminster NHS Foundation Trust, UK

ABSTRACT

Background: Doctors' wellbeing is crucial for a happy, motivated and productive workforce. In line with the UK government's drive to reduce physical and mental illness associated with alcohol consumption, we focused on this area of wellbeing for doctors.

Summary of Work: We surveyed doctors (Foundation Year to Consultant grade) in our trust about their alcohol intake, focusing on three key areas: I) Awareness of personal alcohol intake in relation to recommended guidelines II) Recognition of consuming detrimental levels of alcohol III) Knowledge of support services available This anonymous snapshot questionnaire was completed from 10th-21st December 2019 inclusive.

Summary of Results: Of 109 respondents, 15/109 (14%) drank no alcohol, 23/109 (21%) drank monthly or less, 34/109 (31%) 2-4 times/ month, 27/109 (25%) 2-3 times/ week and 10/109 (9%) > 4 times / week. On each intake occasion, the alcohol consumed was 1-2 units in 38/109 (35%) responses, 3-4 units in 29/109 (27%), 5 - 6 units in 19/109 (17%), 7-9 units in 7/109 (6%) and 10 or more units in 1/109 (1%). 10/109 (9%) reported that on at least one occasion in the last 2 years they could not do what was expected of them because of alcohol. 5/109 (5%) felt concerned about alcohol affecting their performance or judgement in the same timeframe. 20/109 (18%) wanted to reduce their alcohol consumption, 2/109 (2%) were annoyed by criticism of their drinking, 10/109 (9%) had guilty feelings about their drinking and 3/109 (3%) needed an eye opener. Pre Survey - 47/109 (43%) did not know where to seek help.

Discussion and Conclusions: Alcohol consumption is a problem for some doctors and a significant proportion did not know where to seek help. Almost a fifth of doctors want to reduce their alcohol intake.

Take-home Messages: There is a need to employ postgraduate medical education (PGME) resources to raise awareness about alcohol consumption and signpost support services for doctors. This should be in parallel with PGME programmes that focus on healthy and productive coping strategies for stress.

Resilience traits of Senior Paediatricians in a Tertiary Hospital in Singapore

AUTHOR(S):

- Jia Ming Low, National University Hospital of Singapore, Singapore (Presenter)
- Mae Yue Tan, National University Hospital of Singapore, Singapore
- Tammy Tsang, Institute of Mental Health, Singapore
- Marion Aw, National University Hospital of Singapore, Singapore

ABSTRACT

Background: Resilience is inversely related to burnout. A survey of the Maslach's Burnout inventory revealed that consultants in our paediatric department have less burnout than residents. We aimed to explore resilience mechanisms of senior physicians, with the focus of identifying traits and strategies, and identify what can be taught to residents.

Summary of Work: Thirty-one paediatricians (registrars and above) from the National University Hospital of Singapore, completed an anonymised survey including demographics and validated questionnaires- Connor Resilience Scale(CRS)- as a measure of resilience. Fifteen faculty (associate consultants and above) volunteered in one-to-one interviews with questions focused on traits and strategies, and their perceptions on teaching resilience to residents.

Summary of Results: Median age was 32(25-69)years, 77.4% were female. Median CRS score was 74(62-95), higher than population norms. In the interviews, a predominant theme that emerged was that adversity in the earlier years would better help develop resilience as opposed to later years in life. Traits of self-awareness, perseverance, optimism were the most predominant in contributing to resilience. Strategies such as seeking support (from colleagues and mentors), prioritisation, reflection and altering one's perspective were the top 3 strategies identified in our study group.

Discussion and Conclusions: While those interviewed felt resilience was in part innate to an individual, they all expressed that resilience is a skill that can be learned through self-reflection, and taught with the help of a mentor- through equipping the individual with the skills to manoeuvre through adversity and by cultivating traits and strategies described above as a framework for the young physician. Early adversity in residency training should be seen as an opportunity to develop resilience, while ensuring appropriate support and guidance to avoid burnout.

Take-home Messages: Resilience is a trait that can be taught and cultivated. Senior physicians have acquired skills which residents can learn from to build their own resilience and to retain job satisfaction without succumbing to burnout. Reflection was crucial in development of resilience where mentorship would be able to facilitate this process. Adversity in early training years can be used as an opportunity to train resilience.

Targeted remediation for Postgraduate Year 1s (PGY1) in difficulty: Our Experience

AUTHOR(S):

- Yong-Kwang Tay, Changi General Hospital, Singapore (Presenter)
- Yvonne Guat Keng Goh, Changi General Hospital, Singapore

ABSTRACT

Background: Postgraduate Year 1 (PGY1) forms the transitional year from undergraduate medical education to full medical registration. In 2014, the National PGY1 Training and Assessment Framework was formalized and adapted from the 6 ACGME competencies of patient care, medical knowledge, practice-based learning, interpersonal and communication skills, system based practice and professionalism.

Summary of Work: The aim of the study was to formulate better, targeted remediation plans for PGY1s in difficulty. During their three 4-monthly rotations, the PGY1s competencies in the 7 Entrustable Professional Activities (EPAs) were assessed by senior doctors (registrars and consultants), peers and other healthcare professionals in the team.

Summary of Results: From 2014 to 2017, 833 PGY1s passed through the departments of Internal Medicine (IM), General Surgery (GS) and Orthopaedics (Ortho). There were 9 PGY1s (8 males, 1 female) who failed during this period. Eight PGY1s who failed were foreign graduates while 1 was a local graduate. A common theme was a lack of medical knowledge which affected their patient care.

Discussion and Conclusions: Interventions have been put in place, including a job-shadowing stint (1 to 3 days), hospital orientation briefing (1/2 day) that covers topics like safe medication practice, and computer training. Foreign medical graduates are rotated to do 2 IM postings (instead of 1) and Ortho is not a compulsory rotation as some of them have limited undergraduate exposure to Ortho. At least 94% of the foreign graduates polled wanted a longer job-shadowing stint of at least 5 days. The main reasons identified by the PGY1s were a need to familiarise themselves to local hospital's systems-based practice and computer systems. The number of PGY1s who failed was small; most of them were males, and from foreign medical schools.

Take-home Messages: Foreign medical graduates may have gaps in medical knowledge due to their medical school exposure. Focus group discussions can be done to find out how we can better help them adapt and adjust to the local healthcare system.

Leading help-seeking practice in the hospital-based post-registration training environment

AUTHOR(S):

- **Nicole Jones de Rooy, Australian National University, Australia (Presenter)**
- Imogen Mitchell, Australian National University, Australia
- Gary Rogers, Griffith University, Australia
- Nicolas Glasgow, Australian National University, Australia

ABSTRACT

Background: Junior doctors' help-seeking is an important day-to-day occurrence in the hospital-based post-registration training environment, commonly described to involve the simple escalation of a problem to a more senior clinician. This research challenged this assumption by exploring what is essential to both junior doctors' help-seeking and the provision of support for help-seeking by senior doctors and nurses.

Summary of Work: Three studies were completed and then integrated to reveal what is essential for help-seeking practice, offering strategies to improve and lead help-seeking practice as key components of post-registration education into the future.

Summary of Results: The findings confirmed that help-seeking was often not merely a simple escalation, but involved several constituents that highlighted the complex social, cognitive and affective judgements and actions integral to seeking help. For help-seeking to be successful, it was important that junior doctors: recognise a problem with a patient; discern their own ability to manage the problem alone; and judge their professional 'safety' in seeking help. Additionally, to support junior doctors' help-seeking successfully, it was important that senior colleagues: gauge the junior doctor's priorities through clinical interactions; set expectations and tailor support specific to help-seeking; promote and guide the use of proactive tactics; and voice their intentions to support the junior doctor's help-seeking.

Discussion and Conclusions: There is limited research on help-seeking in the clinical training environment, therefore this study is a significant step towards acknowledging the importance of help-seeking practice and how help-seeking can be advanced into the future. Leaders in health professional education can improve help-seeking practice for junior doctors by employing the strategies that ensure junior doctors and senior clinicians take the time to reflect on their help-seeking practice experiences and have priority access to help-seeking practice training to ensure readiness for working and supervising in the post-registration training environment. Junior doctors' help-seeking and supporting junior doctors' help-seeking practice is important and will be one of the many phenomena needing advancement to ensure that practitioners are able to seek help and receive the best of it.

Take-home Messages: Help-seeking is important, discuss with your colleagues how best to support and lead help-seeking practice.

Evaluating Differences in Emotional Weaknesses between Intern Doctors and 6th Year Clerks in Taiwan through Emotional Competence Training Curriculum

AUTHOR(S):

- Chun-Lin Chu, National Taiwan University Hospital Yun Lin Branch, Taiwan (Presenter)
- Huei-Ming Yeh, National Taiwan University Hospital and National Taiwan University College of Medicine, Taiwan
- Shao-Yu Chang, Oriental Institute of Technology, Taiwan
- En-Chi Liao, National Taiwan University Hospital and National Taiwan University College of Medicine, Taiwan
- Fu-Chang Tsai, National Taiwan University College of Medicine, Taiwan

ABSTRACT

Background: As being clinical starters, medical students were known inevitably to face huge challenges caused by turbulent stressful clinical environment. There were so many teaching projects in medical education now focusing to lower medical students' burn out and help them overcome these stressful situations during this pivotal time. However, evaluating stressful emotions correctly and identifying deficits of emotional competence skills is crucial in medical education.

Summary of Work: We would like to evaluate the difference of stressful emotions and the deficits of emotional competence skills between intern doctors and 6th year clerks in Taiwan through Emotional Competence training curriculum. We conducted a comparative Emotional Competence training curriculum in medical school both for 8 6th Year clerks and 9 intern doctors in NTUH in Taiwan to evaluate stressful emotions they actually had in their clinical practice through analyzing oral diary they recorded in the curriculum in 2016 and 2018. And then we identified and categorized the emotional competence skill needs from the difficult emotional events according to Daniel Goleman's Emotional Competence framework (1995).

Summary of Results: We found significant differences of emotional competence skill deficits between these two groups of medical students. In total 46 oral diaries from 6th Year clerks, they apparently showed high deficits of self-management (35.2%) and self-awareness(31%) fields of emotional competence skills, both belonging to the personal competence category. However, the 20 oral diaries recorded by the intern doctors showed high deficits of relation-management (33.8%) and self-awareness (25.4%) fields of emotional competence skills, belonging to social competence and personal competence separately.

Discussion and Conclusions: The results demonstrate that 6th Year clerks need self-awareness and self-management skills most to cope with stressful emotions and they are burnt out for low self-confidence in clinical knowledge and low self-control in their practice environment. However, comparing to clerks, intern doctors usually felt highly stressful only when they communicated and collaborated with team members or patients, which belonging to relationship management field.

Take-home Messages: Medical education training projects should focus on different teaching goals to specifically target medical students' emotional competence skill needs corresponding to their specific clinical emotional disturbances, then can actually lower down medical students' burn out effectively in their clinical environment.

#9NN Meet the Experts – Patient as Educator

Date of Session Tuesday, 27 August 2019

Time of Clinic: 1600-1730

Location of Clinic: Suite E, Level 0

Experts:

- Susan E. Sheridan, Society to Improve Diagnosis in Medicine (SIDM), USA
- Suzanne Schrandt, Arthritis Foundation, USA

Summary: Talk with our two plenary speakers about the value of using patients in the education process, and what you need to think about if you are considering implement this into your curriculum.

Achieving Practice Change through Outcomes Based CPD

Presenters:

- Betsy White Williams, University of Kansas School of Medicine, Professional Renewal Center®, USA
- Mary Turco, Department of Medicine, Dartmouth-Hitchcock and Geisel School of Medicine, Lebanon, USA
- David Davis, Mohammed Bin Rashid University of Medicine and Health Sciences, Dubai, United Arab Emirates
- David Wiljer, Education Technology Innovation, University Health Network; Department of Psychiatry, University of Toronto, Canada
- Helena Filipe, Faculty of Medicine, University of Lisbon, Portugal
- Mila Kostic, Penn Medicine, USA
- Sanjeev Sockalingam, Department of Psychiatry, University of Toronto, Canada

Summary of theme and why it is important: Continuing professional development is critical to sustained life long learning and the delivery of effective and high quality care based on the best available evidence. Traditional methods of continuing professional development have not often resulted in sustained practice change. This has resulted in a renewed call for outcomes focused continuing professional education.

In this symposium we will highlight key principles and theories that inform scholarly, effective CME/CPD programs. Learners will have the opportunity to hear multiple different examples of scholarly CME/CPD activities that incorporate best practice in program design and outcome measurement. We will achieve this through rapid-fire short focused panellist examples from international experts in the field. Participants will have the opportunity to incorporate these principles and think about how they might start a process of incorporating these principles into their CME/CPD programming.

This symposium will focus on effective methods of outcomes based continuing education that lead to shifts and change in knowledge, skills and attitudes. The symposium will include discussion of the role of theory in driving practice change. We will explore the role of developing master and adaptive learners who can rapidly adapt to transformational change in the clinical and practice environment. We will offer practical approaches to incorporating practice improvement and quality improvement methods into continuing education. These examples may include the use of practice data, audit and feedback, morbidity and mortality rounds, communities of practice and information systems. The symposium will explore issues of feedback, mentorship and professionalism within the paradigm of life long learning in order to enable health professionals to adapt to new knowledge through shifts in skills and attitudes.

Symposium participants will be asked to think about how they might begin a process of designing CME/CPD outcomes based programming that follows the principles of a scholarly CME/CPD activity. They will discuss challenges and solutions to designing and implementing these approaches as part of CPD programming.

Who should participate in the symposium? This symposium will be applicable to all AMEE participants who are interested in outcomes based education and in particular outcomes based CPD. In addition, this will be of particular interest to attendees who are involved in the administration, delivery and research of continuing education activities. In addition, this will be important for students and learners as they are thinking and planning around life long learning.

What will they gain from participating? Participants will hear from a diverse group of world experts working in outcomes based education. This will result in a rich conversation around outcomes based education with practical examples and concrete tools and lessons to apply in their own contexts.

The 21st century medical undergraduate curriculum: What's in and what's out?

Presenters:

- Val Wass, Keele University UK
- Peter Dieter President AMSE, Germany
Neil Johnson, Chief Executive - Croi, The West of Ireland Cardiac & Stroke Foundation, Ireland
- Evangelos Papageorgiou, EMSA Medical Education Liaison Officer, Greece
- Harm Peters, Executive Committee, AMSE, Germany
- Trudie Roberts, President, AMEE, UK
- Catarina Pais Rodrigues, Medical Education Director in IFMSA, Portugal
- Fedde Scheele, Professor in Health Systems Innovation and Education, Netherlands

Summary of theme and why it is important: As highlighted in the Lancet report¹ “Health Professionals for a New Century” radical change is needed if we are to produce a workforce fit for purpose for the 21st century. The rapid changes we face in population needs and health care delivery are placing unacceptable pressure on the clinical workforce globally. The AMEE 2018 conference highlighted many areas where the undergraduate curriculum needs to adapt to encompass increasingly important areas: social accountability; public health, artificial intelligence, organisational management to name a few. At the same time medical students are bringing different approaches to learning which challenge traditional educators. We can no longer “add in” to the curriculum without “taking out”. Yet this in turn meets resistant from educators set in their established ways and can even threaten their job plans.

These issues must be tackled. This AMEE-AMSE-joint symposium will open transparent debate with all stakeholders interested in medical curricula development and delivery. Panel members will offer brief presentations raising questions to then fuel an interactive discussion session.

¹[https://www.thelancet.com/journals/lancet/article/PIIS0140-6736\(10\)61854-5/abstract](https://www.thelancet.com/journals/lancet/article/PIIS0140-6736(10)61854-5/abstract)

Who should participate in the symposium? All stakeholders: students, trainees and clinical educators. We hope to include the patient perspective on the panel. We believe this is a topic challenging many AMEE and AMSE members.

What will they gain from participating? A deeper understanding of evidence for change and how the medical curriculum can be revolutionised or evolved to follow the recommendations of the Lancet report. A topic essential given the current workforce crisis internationally.

#10C Symposia

Date of Presentation: Wednesday, 28 August 2019

Time of Presentation: 0830-1015

Location of Presentation: Hall N, Level 1

Case Based Blended Learning (CBBL) – a strategy to foster the transfer of declarative to procedural knowledge or more?

Presenters:

- Sebastian Ertl, Medical University Vienna, Austria
- Bela R. Turk, Medical University Vienna, Austria and Johns Hopkins University, Baltimore, USA
- Tamara Seitz, Dept. for Internal Medicine, General Hospital Vienna, Austria
- Monika Himmelbauer, Medical University Vienna, Austria
- Isabella Klaus, Dept. for Psychiatry, General Hospital Vienna, Austria
- Henriette Löffler-Stastka, Medical University Vienna, Austria

Summary of theme and why it is important: The close connection of theory and practice is a common aim of Case Based Learning courses, as is the development and fostering of the transfer from declarative to procedural knowledge. This transfer-learning in medical education has been highly advocated in the 2010 Lancet report.

The aim of the first study is to show how procedural knowledge, measured as students competence performing three procedural clinical reasoning skills could be improved by a case based blended curricular element, consisting of eLearning cases with interactive questioning format and clinical training seminars with standardized patients.

The aim of the second paper is to show, how a case-based, e-learning system influences the learning effectiveness and grades among medical students at the medical university of Vienna (and pharmacy students at the faculty of life science at the University of Vienna). This study was designed to measure and quantify the potential of e-learning as a new teaching technique.

The third paper reports the students' satisfaction and acceptance of the implemented case based eLearning program in the fields of psychiatry, microbiology and laboratory medicine and orthopedic surgery pointing on the value of autonomous motivation and affective involvement fostering efficient learning styles. Fourth, the clinical case/standardized patients (SP) - based training seminars and the importance of the quality of the SP's roleplay and feedback are presented as one part of the didactic efficiency. Another important aim while fostering procedural knowledge is the development of metacognitive reflecting functioning in clinical practice. Possibilities of implementation are show in the fifth paper. Last, an international comparison of case-based eLearning methods (Basel, Vienna), including the comparison of distant learning and blended learning (Vienna, London) is presented.

Who should participate in the symposium? Persons, who are interested in didactic considerations to foster international, multidisciplinary team work and new eLearning methods.

What will they gain from participating? Get insight into procedural skills training, its interdependence with learning surroundings and autonomous motivation

#10D Symposia

Date of Presentation: Wednesday, 28 August 2019

Time of Presentation: 0830-1015

Location of Presentation: Room L3, Level 1

XVII Ibero-American session - Highlighting differences in the way Primary Care is delivered on the American Continent: Impact of the Cartagena Declaration

Presenters:

- Geneviève Moineau, Canada
- Liliana Arias, Colombia
- Alison Whelan, USA
- Ricardo León, México
- Luis Felipe Abreu, México
- Pablo Pulido, Venezuela

Summary: Since the Declaration of Alma Ata 40 years ago, every country of the world has applied the recommendations regarding primary care (PC) delivery differently. The American Continent is no exception and the way PC is offered in North America, is dissimilar than in Central or South America, and the results vary independently of the investment each country makes.

At the end of the Pan-American Conference of Medical Education that took place in Colombia in April of this year, members of the Pan American Federation of Associations of Medical Schools (PAFAMS) signed the Cartagena Declaration. This Declaration emphasized their desire to contribute to the improvement of the continent's health by highlighting prevention and encouraging universal coverage of health services through increased access and quality. As envisioned in the Declaration, medical schools and hospitals should be part of a comprehensive model highlighting primary care, the necessity of quality measures, and the timely access to health interventions. The Declaration calls for an emphasis on population health that promotes prevention, a reduction of the disease burden, and a special focus on populations that have traditionally been marginalized or are especially vulnerable. Community engagement at every level is promoted. The Cartagena Declaration recognizes the critical role medical schools play in preparing physicians to achieve this vision and the need for them to fully embrace their community mission and assist in the development of high quality, accessible health systems.

Representatives of different American countries will discuss how PC delivery is changing in their countries, explore new concepts for implementing the Cartagena Declaration, and discuss the critical role of medical education in achieving this vision.

#10E Short Communications - Teaching and Learning: Self Directed Learning

Guided self-study in higher education - a literature review

AUTHOR(S):

- Slavko Rogan, Bern University of Applied Sciences, Department of Health, Switzerland (Presenter)
- Jan Taeymans, University of Applied Sciences, Department of Health, Switzerland
- Evert Zinzen, Vrije Universiteit Brussel, Faculty of Physical Education and Physiotherapy, Belgium

ABSTRACT

Background: Following the Bologna reform, higher education should offer evidence-based methods to foster self-directed learning processes to improve practical skills. To date, there have been but few recommendations of how a guided self-study method in undergraduate physiotherapy curricula should be built up and conducted.

Summary of Work: A systematic literature search performed in CINAHL, Embase, ERIC, PubMed and Web of Science. Additionally, a manual search was carried out in the reference lists of the surveyed studies.

Summary of Results: The literature search yielded 1076 articles. After deletion of 289 duplicates and exclusion of 889 articles, eleven articles were included in this analysis. All the included articles investigated the individual self-study method. Of these articles, two studies had a qualitative study design while nine had a quantitative study design.

Discussion and Conclusions: This literature review summarized the findings of published studies that evaluated the effectiveness of self-study units in medical education, health-professional education and physiotherapy education. Based on these results it seems that for a well-structured guided self-study in higher education curriculum provides a combination of individual learning, group learning and accompaniment by university teachers during the processing phase.

Take-home Messages: Guided self-study should be implemented in health professional education curriculum and medical education curriculum. The structure of guided-self study is based on a problem-based learning method on a flipped-classroom method. Guided self-study is summarized in five learning support phases: 1. preparation and initiation phase as group work, one week in advance, 2. realization phase: coaching, 3. realization phase: controlling, 4. presentation phase, and 5. assessment and feedback phase.

#10E Short Communications - Teaching and Learning: Self Directed Learning

Are task specific self-regulatory processes consistent across task and time? A study of physiotherapy students

AUTHOR(S):

- Raquel Irina Medina-Ramirez, Universidad De Las Palmas De Gran Canaria, Spain (Presenter)
- Felipe Rodríguez de Castro, University of Las Palmas De Gran Canaria, Spain
- David Álamo-Arce, University of Las Palmas De Gran Canaria, Spain
- Dario Cecilio-Fernandes, University of Groningen and University Medical Center Groningen, the Netherlands.
- John Sandars, Edge Hill University, UK
- Manuel João Costa, University of Minho, Portugal

ABSTRACT

Background: The Self-Regulated Learning Microanalysis method (SRL-microanalysis) differentiates self-regulatory profiles of poor performing students. In this study, we used SRL-microanalysis to evaluate the consistency of task specific regulatory profiles of physiotherapy students across two tasks -shoulder and ankle goniometry measures- at two specific time points, three months apart.

Summary of Work: Fifty-five out of 120 students were evaluated at time 1 and 37 (67%) of them at both time 1 and 2. Each student was evaluated by SRL-microanalysis protocol that elicited key SRL processes in the forethought, performance and self-evaluation phase of the task. We analyzed performance and the SRL profiles for each task at each particular point in time.

Summary of Results: The performance in shoulder and ankle goniometry, respectively, in both moments was correct for 71% and 43% and incorrect for 21% and 19% of the participants. 8% (shoulder) and 24% (ankle) improved from incorrect to correct. There were 14% of students who evolved from correct to incorrect in ankle measures. The self-regulatory profiles of successful students in both moments for both tasks were sophisticated: an average of 89% planned, monitored and self-evaluated. These differed from students with incorrect performances: 74% planned the task, but self-monitoring changed from 40% in moment 1 to 60% in moment 2. Students who improved performances have increased their planning (66% to 94%) and self-monitoring (44% to 84%) over time. Also, students who showed worse ankle measurements were mostly unable to self-monitor in both moments (30%).

Discussion and Conclusions: Overall, students with correct performances showed greater self-monitoring as compared to low performing students. Improvement in performances was associated to improvement in SRL processes. Self-regulatory processes were consistent across tasks, although there were variations across time. This innovative study suggests associations between task specific performance of physiotherapy students across two tasks and self-regulated learning. The consistency across tasks advocates that students who improve self-regulation in one task may be able to transfer SRL to another task

Take-home Messages: Self-regulated microanalysis may assess and inform the development of self-regulated learning (SRL) skills of undergraduate students.

#10E Short Communications - Teaching and Learning: Self Directed Learning

Date of Presentation: Wednesday, 28 August 2019

Time of Presentation: 0900-0915

Location of Presentation: Hall M, Level 1

Using path analysis to develop a conceptual model that shows the interaction between conceptions of learning, self-regulated learning (SRL) and quality of e-learning experience in online e-learning

AUTHOR(S):

- Enjy Abouzeid, Faculty of Medicine- Suez Canal University, Egypt (Presenter)
- Rebecca O'Rourke, University of Leeds, UK
- Rabab Abdel Raouf, Faculty of Medicine- Suez Canal University, Egypt
- Nahla Hassan, Faculty of Medicine- Suez Canal University, Egypt
- Yasser El-Wazir, Faculty of Medicine- Suez Canal University, Egypt
- Trudie Roberts, University of Leeds, UK

ABSTRACT

Background: The use of online learning is increasing in Health Professions education nowadays. However, the full understanding of the pedagogy of learning in this unique learning context is still insufficient. This raised the need for exploring the relationships between different factors that may affect learning in this context.

Summary of Work: A cross sectional study was performed to develop a model that explains the relationships between external (Quality of e-learning experience and interactivity) and internal factors (learner's behaviors and beliefs) that are assumed to dynamically interplay for achievement in online e-learning. A non-probability convenience sample of 128 learners in a Health Professions Education program through distance learning were recruited in the study. Three self-reported questionnaires (online self-regulated learning questionnaire, e-learning experience questionnaire and Mental model of Inventory of Learning Styles) were used. While the interactivity was assessed by three independent raters using a scoring rubric. Person-moment correlation and path analysis were used to investigate the relationships between the variables.

Summary of Results: The path analysis revealed a generally accepted model. It showed good fitness indices and strong significant relations between the variables. Based on the Model, SRL was accounted for small portion of the change in academic achievement. Active conception of learning significantly affects the quality of e-learning experience that in turn has a significant relation with SRL. Online discussions directly and significantly affect the academic achievement.

Discussion and Conclusions: The conceptual link between the current study variables should be tracked to the role of conceptions of learning on learner-content interaction and satisfaction. The active conception of learning might lead to 'getting involved' in learning, which in turn had a positive effect on learning since it enabled a process of constructing meaning. Additionally, this active involvement and satisfaction also foster their self-regulation skills to control their learning environment to reach their goals. Conclusions: This combination of findings provides support for the conceptual premise that reinforces the relation between personal, environmental and behavioral aspects in online e-learning.

Take-home Messages: In online e-learning there are a significant dynamic interaction between active conception of learning, the learning experience and self-regulated learning skills.

Developing Effective Learning Strategies in Medical Education - A Mixed-Method Study

AUTHOR(S):

- Felicitas Biber, Maastricht University, the Netherlands (Presenter)
- Anique de Bruin, Maastricht University, the Netherlands
- Pauline Aalten, Maastricht University, the Netherlands
- Mirjam oude Egbrink, Maastricht University, the Netherlands

ABSTRACT

Background: In medical education, self-regulated learning is an important competence. Students need to be able to monitor and regulate their learning and to apply effective learning strategies that enable long-term learning. Cognitive research has shown that strategies that make the learning process more difficult ('desirable difficulties'), by stimulating retrieval of information from memory, enhance learning in the long term. However, 60-90% of the students regularly use ineffective strategies, such as rereading. Students are barely taught what strategies enhance long-term learning and struggle to use more effective, but also more effortful strategies.

Summary of Work: In this mixed-methods study, we examined the effect of a learning strategy training on metacognitive knowledge and use of effective learning strategies and explored barriers and facilitating factors in using effective learning strategies. Forty-seven medical, biomedical and health sciences students were randomly assigned either to three training sessions about awareness, reflection, and practice on learning strategies and desirable difficulties, or to a control condition. Knowledge and use were measured by pre- and post-questionnaires and vignettes. In follow-up focus group discussions, we examined experienced barriers and facilitating factors.

Summary of Results: Metacognitive knowledge improved after having attended the training. We found a discrepancy between knowledge and use. The training reduced this discrepancy with regard to the effective strategy 'quizzing'. Experienced barriers in using effective learning strategies were insecurity about the correct usage of specific strategies, sticking to old study habits and not acknowledging the benefits of investing more effort. Facilitating factors were the availability of practice questions and getting support in changing passive strategies into an active way of studying.

Discussion and Conclusions: This study stresses the importance of not only informing students about effective learning strategies and desirable difficulties, but also to offer support in adding active learning principles to old study habits. With regard to the challenge of becoming a self-regulated doctor, medical students need more support in developing the skills of becoming a self-regulated learner who can build up long-term knowledge.

Take-home Messages: The learning strategy training improved medical students' metacognitive knowledge accuracy and fostered the use of an effective learning strategy, i.e., quizzing.

The evaluation of a personalised electronic clinical skills passport (CSP): The medical student perspective

AUTHOR(S):

- Laura Smith, University of Leeds, UK (Presenter)
- Rebecca ORourke, University of Leeds, UK
- Jennifer Hallam, University of Leeds, UK

ABSTRACT

Background: Upon graduation, medical students must be able to evidence that they demonstrate the necessary knowledge, skills and attitudes to enable them to practice unsupervised (Ten Cate & Scheele, 2007). In 2016, the CSP was launched with a focus on engagement with mandatory clinical skills and to demonstrate proficiency and progression. Embedding this practice in the early stages of their education should enable them to develop strategies for lifelong learning.

Summary of Work: This evaluation focused on student engagement with the CSP and how this impacted on the development of self-regulated learning behaviours. The aim was to establish how students are using this innovative mobile application and how this influenced their workplace learning. Two hundred and sixty year three medical undergraduates, who had been using the CSP app for three years, were surveyed in order to identify usage patterns to gain a clearer understanding of how the innovation is supporting student education. Students were then followed up using 1:1 interviews to explore the narratives around the different engagement patterns.

Summary of Results: The factors that influenced engagement with the CSP were explored and it was identified that if the design of the assessment is less intuitive this prompts disengagement from supervisors and students and that supervisor attitude towards technology was found to be an influential factor. Students indicated that having knowledge of safe-practice limits and the immediate access to a complete clinical skills list provided them with the opportunity to plan their learning and gave them confidence to seek out feedback interactions.

Discussion and Conclusions: Students supported the use of mobile technology to record their clinical skills acquisition, seek out feedback opportunities and plan their learning opportunities. Assessment design, supervisor attitude towards technology and understanding assessment purpose were found to be influential factors in student engagement with the mobile app and can affect the quality of the assessment process.

Take-home Messages: Mobile technology is providing a valuable platform to monitor and support student learning and improve self-regulated learning behaviours. The ability to track clinical skills acquisition longitudinally has multiple benefits for student education, teaching quality and workplace learning.

Understanding Medical Students' Self-Directed Learning in Clinical Training: A Cross-Cultural Qualitative Study in the U.S. and Taiwan

AUTHOR(S):

- Tzu-Hung Liu, Harvard Medical School, USA (Presenter)
- Kai-Kuen Leung, National Taiwan University College of Medicine, Taiwan
- Amy Sullivan, Harvard Medical School, USA

ABSTRACT

Background: In most Asian countries, medical education reforms in recent decades have adopted a Western model that emphasizes an individualistic, student-centered model of education. The applicability of this model to education in Asian medical education setting has not been examined. Self-directed learning (SDL) in the clinical environments is a particularly important Western construct that may be difficult to translate in other cultural settings.

Summary of Work: We carried out a cross-cultural qualitative study for undergraduate medical students at Harvard Medical School (HMS) and National Taiwan University College of Medicine (NTUCM). Those who recently finished core clerkships were recruited for our study. We conducted a total of 30 semi-structured interviews with 15 HMS students and 15 NTUCM students representing all the affiliated hospitals where students had core clerkships. Using the thematic analysis, we identified the codes and emerging themes from the transcripts.

Summary of Results: Our findings indicate that there do exist differences in SDL, including the use of online resources, cognitive strategies, feedback seeking behaviors, and mindset assumptions, between the two groups of students. The study revealed that during the core clerkship, HMS students focus more on individual performance and put effort into impression management, while NTUCM students tend to learn more collaboratively, share resources with and support their peers.

Discussion and Conclusions: Our study delineates the essential components of SDL in core clerkship in the contexts of both the U.S. and Taiwan. We also found that hierarchies and working flows are present as regulators of roles and interactions in clinical practice and have impacts on the learning for both groups of students. A supportive environment with faculty development that helps novice students to navigate the learning experiences will contribute to students' overall strategies for SDL.

Take-home Messages: Comparing student perspectives of SDL in different settings may yield new insights into the Western model of SDL and allow schools in East Asian countries to formulate contextually- and culturally-appropriate adaptations.

Learning Preferences of Medical Students: International Similarities and Differences

AUTHOR(S):

- **Mike Elnicki, University of Pittsburgh, USA (Presenter)**
- Jonathan Berken, University of Pittsburgh, USA
- John Mahoney, University of Pittsburgh, USA
- Jumana Al-baghli, Kuwait University Faculty of Medicine, Kuwait

ABSTRACT

Background: While recent reforms in medical education favor active, self-directed learning, educators appreciate that students learn differently. Matching students to teaching methods is difficult, as individual approaches to mastery and competency vary. We sought to explore and categorize the learning preferences of students at two medical schools that differ in many respects but are both committed to diverse learning methods.

Summary of Work: Matriculating medical students at the University of Pittsburgh School of Medicine (UPSOM) and the Kuwait University Faculty of Medicine (KUFOM) completed anonymous questionnaires prior to beginning their respective curricula. Students rated 25 instructional methods with 1-5 Likert type scales (5= best). We asked students about their perceptions of learning. We chose 'the faculty is responsible for learning' as a marker of traditional learners, while preferring 'small-group learning' identified self-directed learners. Analyses were performed with Wilcoxon signed-rank test, Spearman's rho and linear regressions.

Summary of Results: We received responses from 92 UPSOM and 90 KUFOM (63% and 82%) students. UPSOM students most valued experiencing practical tasks (4.3, SD .9) and explaining tasks to others (4.3 SD .8). KUFOM students most valued watching educational videos (3.9, SD 1.3) and explaining tasks to others (3.8, SD 1.4). We noted several differences between schools. For example, UPSOM students more highly valued lectures (3.8 v. 3.4, $p=.03$), while KUFOM students valued workshops more highly (3.6 v. 3.1, $p<.01$). Traditional learners from both schools preferred lectures and asking faculty questions. Self-directed learners valued help from other students and asking questions in small groups (all $\rho >.2$ and $p<.05$).

Discussion and Conclusions: Although we found some differences between UPSOM and KUFOM students, both groups contained both traditional and self-directed learners. Traditional learners still prefer lectures and gaining information directly from faculty, while self-directed learners favor group interactions and peer support.

Take-home Messages: Incorporating a recognition of these differences may make instruction more effective and enjoyable for students. Curriculum construction could reflect students' learning preferences, and educators can guide students accordingly.

Exploring the validity of hegemonous competency frameworks for health professions education in the global south

AUTHOR(S):

- Francois Cilliers, University of Cape Town, South Africa (Presenter)
- Jose Frantz, University of the Western Cape, South Africa
- Lionel Green-Thompson, Sefako Makgatho Health Sciences University, South Africa
- Marykutty Mammen, University of Fort Hare, South Africa

ABSTRACT

Background: Competency-based frameworks developed in the global north have disseminated across the globe, just as problem-based learning and Tomorrow's Doctors were influential in shaping curricula in decades past. The purpose of this study was to explore competency requirements for graduates across health professional disciplines in a southern context, to offer a contextualised perspective on competency frameworks.

Summary of Work: A reference group experienced in health professions education (HPE) was established to identify core competencies that a newly-graduated South African health professional should exhibit. Individual, semi-structured interviews were undertaken with ten key informants, representative of the HPE sector, the health care sector (private and public) as well as national and provincial departments of health. Initial open coding by four researchers unconsciously tracked the roles of existing competency frameworks. Researchers had to consciously discard this unwitting bent to undertake a more critical inductive analysis of the data.

Summary of Results: Data analysis yielded constructs related to the self, others, the healthcare system and the societal context. Six constructs were identified in addition to foundational clinical skills. 'Capacitation for a messy reality' and 'the ability to survive and flourish' relate to working in under-resourced settings; the former relates to contextually-appropriate competence for such settings, transcending the idea of an effective, safe clinician; the latter encompasses a set of resilience-related competences. 'Social accountability' related to the responsible exercise by graduates of the privilege that accrues to them on graduation. 'Collaboration' entailed meaningful engagement with patients, communities and colleagues. 'System engagement' relates to not only serving but also improving the health system. 'The profession in context' emphasised professions' relations to other professions and society.

Discussion and Conclusions: While these constructs can be related to existing frameworks, such frameworks are not a good fit for our context, exposing potential gaps that could leave our graduates ill-equipped to meet the demands that will be made of them.

Take-home Messages: Researchers and practitioners in the global south should consciously adopt a critical stance towards frameworks developed elsewhere. Minor tweaking of such frameworks does not do justice to the needs of HPE, patients and communities in the global south.

Educational globalisation: implications of similarities and differences in cultural dimensions across medical students from fifteen different countries

AUTHOR(S):

- Young-Mee Lee, Korea University College of Medicine, South Korea (Presenter)
- Lynn Monrouxe, CG-MERC, Chang Gung Memorial Hospital, Taiwan
- Sze-Yuen Yau, CG-MERC, Chang Gung Memorial Hospital, Taiwan
- Mahwish Arooj, University of Lahore, Pakistan
- Teresa Pawlikowska, Royal College of Surgeons in Ireland, Ireland
- Orit Karnieli-Miller, Sackler School of Medicine, Tel Aviv University, Israel

ABSTRACT

Background: Curricula are never divorced from culture. However, established medical education programs are commonly transported into different cultures without sufficient consideration of student acceptance or local impact. Furthermore, today's globalisation era sees medical students seeking learning experiences worldwide. We therefore aimed to explore the cultural similarities and differences of participating medical students from different countries.

Summary of Work: We examined n=2,358 medical students' responses to Hofstede's (2013) cultural dimensions questionnaire across sixteen countries: Australia, Chile, China, Hong-Kong, India, Indonesia, Ireland, Israel, Japan, Pakistan, Malaysia, New Zealand, South Africa, South Korea, Sri-Lanka, Taiwan. Data were analysed following the VSM2013 manual by calculating country scores for Hofstede's six national cultural dimensions.

Summary of Results: A complex pattern was found across countries for Hofstede's dimensions. For example, for Long Term Orientation and Power Distance Indices, Australia and China were similar: Mean=27.71(SD53.29) vs 22.29(51.22), and 44.76(48.91) and 49.55(38.67) respectively. However, for Individualism and Uncertainty Avoidance Indices they differed: 66.0(48.68) vs 8.75(44.68) and 11.62(59.11) vs 64.96(51.28) respectively.

Discussion and Conclusions: Our results suggest that for certain cultural dimensions like Power Distance (i.e. acceptance of hierarchy), medical students across country cultures are similar, generally desiring justification for externally imposed hierarchies. But for dimensions where stark differences occur like Uncertainty Avoidance, implications should be considered for learning within the different curricula based in varying cultures. Within the context of multicultural educational settings, the transmission of ideas, values, and principles extend and intensify social relations. By understanding how different cultural groups converge but also differ, we can develop curricula to facilitate learning and local need, anticipating potential areas of cultural difficulty.

Take-home Messages: Medical schools need to consider the cultural make-up of their students in order to develop culturally-responsive educational programmes. In this era of educational globalisation, understanding the cultural contexts from which curricula are borrowed and into which they are implemented will ultimately facilitate student learning and patient care.

Peer observation of an online learning platform for undergraduates in Somaliland

AUTHOR(S):

- Rebecca Stout, University College London, UK (Presenter)
- Sarah Bennett, University College London, UK

ABSTRACT

Background: In 2013, there was a shortage of over seven million healthcare workers world wide. E-learning is increasingly recognised as a useful resource which has a global reach. The Kings Somaliland Partnership (KSP) works with universities in Somaliland to deliver undergraduate medical education. A growing area of this project is clinical reasoning tutorials delivered via an online, live and interactive platform. A pilot of peer observation of teaching (POT) was recently implemented for this setting. At present, there is little literature surrounding use of POT within the e-learning environment. The aim of this research was to evaluate the benefits and challenges that tutors perceive are associated with the peer evaluation of interactive e-learning to Somaliland undergraduates and how these may be overcome.

Summary of Work: Semi-structured interviews were conducted. Of nine people taking part in the POT pilot, five were interviewed. Interviews were stopped when data was believed to be saturated. Data was thematically analysed.

Summary of Results: Benefits associated with POT within an online setting included tutors reflecting on their own teaching, and seeing how other tutors delivered teaching within this innovative setting. Challenges included the difficulty in giving constructive feedback without receiving training on how to do this first, as well as the time commitment involved in the exercise. Some tutors described a community of teaching practice starting to be created through the ability to discuss issues with other tutors delivering similar teaching.

Discussion and Conclusions: This study is one of the first to examine POT within the e-learning medical education environment. It finds the use of POT within the e-learning environment can be a useful tool. The POT was carried out entirely electronically without tutors ever interacting orally or in person, however despite this tutors found it a beneficial exercise. It also suggests that POT within this environment can foster a teacher community, however also suggests that a further opportunity for tutors to discuss their teaching with each other would be required to fully create this.

Take-home Messages: POT may be used within the e-learning environment to foster a teacher community. Tutors should receive training in feedback prior to undertaking POT.

International & Digital Midwifery Workplace Learning Network: the first step in Rwanda

AUTHOR(S):

- **Mieke Embo, Artevelde University College Ghent Belgium, Belgium (Presenter)**
- Hilde De Grave, Artevelde University College Ghent Belgium, Belgium
- Donatilla Mukamana, University of Rwanda, Rwanda
- Olive Tengera, University of Rwanda, Rwanda
- Alice Muhayimana, University of Rwanda, Rwanda
- Josephine Murekezi, University of Rwanda, Rwanda

ABSTRACT

Background: Global disparities in the quantity, distribution and skills of health workers worldwide pose a threat to attainment of the Sustainable Development Goals by 2030 and deepens already existing global health inequities. Rwanda and other low-resource countries face a critical shortage of health professionals, particularly midwives.

Summary of Work: VLIR/UOS funded a two year project (2018-2019) between the University of Rwanda (UoR) and the Artevelde University College Ghent, Belgium (AUC). This project aims to contribute the government plans to increase capacity by improving the quality of midwifery clinical education. Design-based research methodologies are used to explore if the competency-based continuous workplace learning model (Embo et al., 2015) and the e-portfolio (Medbook) are feasible for clinical education in Rwanda.

Summary of Results: The model and e-portfolio appears applicable in the Rwanda context. Mentors and supervisors from Muhima and King Faisal hospitals and students from the UoR were trained. In 2018 mentors and supervisors from both hospitals supervised midwifery students from AUC (n=3). Students from UoR (n=6) started in January 2019. The research proposal was submitted to the Ethical Board of UoR. The study aims to investigate the perception of students, mentors and supervisors about the existing paper-based and the new online portfolio. The project was presented at 7 conferences and at the Belgian Embassy. Uganda joined the project and became the second country in the Network.

Discussion and Conclusions: The majority of intermediate results were attained. Nevertheless, the process shows that workplace learning is complex and that digitizing workplace learning encompasses all educational components. Furthermore, the team struggles with some barriers related to time, communication and administration. The sustainability of the project was an important issue that was addressed during the first year. Up to now, the design and method appears applicable in Rwanda but an evaluative study will give a more evidence-based answer.

Take-home Messages: By walking together, midwifery schools and hospitals in Belgium and Rwanda launched an International & Digital Midwifery Workplace Learning Network. This Network fits with the International Confederation of Midwives' mission: 'Strengthening Midwifery Globally by educating competent midwives who provide high quality, evidence-based health services for women, newborns, and childbearing families.'

A continuous learning approach to improving the quality of care for children in Lao district hospitals

AUTHOR(S):

- Amy Gray, The University of Melbourne/Royal Children's Hospital, Australia (Presenter)
- Penny Wittick, The University of Melbourne, Australia
- Marianne Safe, The University of Melbourne, Australia

ABSTRACT

Background: In low-and-middle income countries 10-20% percent of sick children seen in primary care need referral to hospital “ yet major gaps in the quality of care delivered in these facilities exist. There are existing resources and programs aimed at improving care in these setting. However they are often introduced in parallel, with different approaches to how the content is taught or learnt despite the fact they target the same learners, and/or rely on a similar pool of 'facilitators'.

Summary of Work: We developed a multifaceted intervention through which existing child health programs could be integrated in the way it they are delivered. We reviewed the literature on instructional design, choosing an education approach onto which content could be scaffolded over time based on learner's needs through repeated visits and flexible coaching modules. Coaching was delivered through 2 day visits to two hospitals 6-8 weeks apart also incorporating audit and feedback and collaborative curriculum design - with hospital staff prioritising their learning needs. We evaluated our approach using quantitative data on the quality of case management from medical records, and qualitative data from focus groups.

Summary of Results: Inpatient case management scores showed incremental improvement over time, from 50% at baseline to 80% at end-evaluation at Hospital A and 52% to 97% at Hospital B. Both hospitals demonstrated improvement in the proportion of cases in which weight was recorded, medication dosing by weight and recording of vital signs. Key themes which emerged qualitative data regarding the impact of the intervention were the effectiveness of the educational approach, social influences on practice change, increased staff belief in their capabilities and perceived changes in the quality of care delivered.

Discussion and Conclusions: A continuing education approach in district hospitals in Laos was successful in integrating the 'technical content' of existing child health programs and demonstrating improved care quality.

Take-home Messages: In delivering programmes in small hospitals with limited resources we should aiming to create a learning system for health facilities which can be built on over time as new programs and content are generated - rather than making implementation approaches programme-dependent.

Cultural considerations in teaching history-taking skills: Teaching bilingually is not a simple matter of translation

AUTHOR(S):

- **Mieko Ogino, International University of Health and Welfare, Japan (Presenter)**
- Tamerlan Babayev, International University of Health and Welfare, Japan
- Harumi Gomi, International University of Health and Welfare, Japan
- Motofumi Yoshida, International University of Health and Welfare, Japan
- Takayuki Oshimi, International University of Health and Welfare, Japan
- Haruko Akatsu, International University of Health and Welfare, Japan

ABSTRACT

Background: The English language has been broadly adopted internationally as a medium for medical education. Nonetheless, many institutions teach history-taking skills in their local native language. International University of Health and Welfare is the first new medical school to be approved in Japan in 38 years; and is committed to teaching bilingually in both Japanese and English. Here we report our experiences in developing a bilingual history-taking course for preclinical students.

Summary of Work: In the first and second year courses, we teach cohorts of 140 students medical interview skills in both Japanese and English in parallel; to prepare them for national medical licensing examinations in Japan and international medical practice. As Japanese medical practice has not historically focused on history-taking skills, the resources used to develop the course were primarily American in providence.

Summary of Results: We encountered multiple areas where differences in clinical practice meant translation would lead to culturally inappropriate history-taking behaviours. Sexual history and questions regarding illicit drug use are routine in US practice, but in Japanese practice are only asked when clinically warranted, and may otherwise be uncomfortable for typical Japanese patients. Similarly, the expectation to perform a full systems review in day-to-day US clinical practice is not shared in the Japanese setting. Indeed, a systems review is not explicitly required in Japanese national OSCE examinations undertaken prior to entry to clinical training.

Discussion and Conclusions: Teaching medical interview skills in two languages is not just a question of translating contents from one language to another; rather faculty needs to consider differences in the underlying social and clinical culture of each language environment. In order for Japan to accept foreigners from many countries increasingly in the future, due consideration is also needed in caring for patients from different cultural backgrounds.

Take-home Messages: **In international medical education, it is necessary to recognize that which is universal and that which is culturally determined and plan educational programs that are responsive to and considerate of both local and international demands.**

On Discontinuity and Learning: Investigations of Physicians' Responses to Transitions of Patient Care Responsibility

AUTHOR(S):

- Judith Bowen, Oregon Health & Science University, Portland, USA (Presenter)
- Bridget C. O'Brien, University of California San Francisco, San Francisco, CA, USA
- David M. Irby, University of California San Francisco, San Francisco, CA, USA
- Olle ten Cate, Center for Research and Development of Education, University Medical Center Utrecht, Utrecht, the Netherlands

ABSTRACT

Introduction: Physicians routinely transition responsibility for patients to other physicians. Such transitions occur when physicians reach the end of a scheduled service block or patients need more or less specialized care. Little is known about the impact of these transitions on learning. When scheduled transitions interrupt the natural clinical reasoning feedback loop that occurs in practice, physicians' opportunities to learn may be lost. The overarching goal of this doctoral research was to investigate physicians' responses to transitions of clinical responsibility. We addressed five research questions: (1) What motivates physicians to pursue follow up for patients previously under their care? (2) How do physicians track patients and what factors influence these tracking activities? (3) How do physicians react when they find confirming or disconfirming clinical feedback? (4) How do physicians receiving responsibility for patients perceive prior physicians' receptivity to clinical feedback and how might these perceptions affect feedback delivery? (5) How often and for what reasons do receiving physicians communicate (or not) with prior physicians about transitioned patients in actual practice?

Method: We used a constructivist grounded theory approach to explore the phenomenon of transitions of responsibility. We conducted 22 semi-structured interviews with internal medicine hospitalist and resident physicians. Using a critical incident technique (CIT), we elicited transition experiences under two conditions: (1) unfinished clinical reasoning with follow-up revealing others confirmed or disconfirmed provisional diagnoses, and (2) receiving patients in transition and disconfirming others' diagnoses. Additional questions probed for follow-up strategies, reactions to finding out, resulting changes to practice, and communication. For study one, we used motivation as a sensitizing concept to analyze interview data. For study two, we used activity theory to guide data interpretation from experiences under the first CIT condition. For study three, we used matrix analysis to analyze CIT cases under the first CIT condition, including emotional reactions and perceived practice changes. For study four, we used a sequential mixed methods design; we analyzed qualitative data from CIT cases under condition 2 to determine factors influencing follow-up communication followed by survey methods to determine associations of these factors with perceptions of receptivity to clinical feedback among 41 hospitalists in two established academic groups. For study five, we conducted structured interviews with 38 hospitalists about communication decisions related to 618 transitioned patients in actual practice.

Results: Curiosity about patients' outcomes determined whether or not follow-up occurred. Clinical uncertainty, personal attachment to patients, and/or concern for patient vulnerability motivated follow-up[1]. Physicians used electronic and paper lists to track patients. Activity theory highlighted tensions and work adaptations for tracking patients[2]. Physicians' experiences with post-transition clinical feedback were emotionally charged and primed them to adapt. Physicians on the receiving end of transitions were reluctant to provide clinical feedback to prior physicians. Clinical trustworthiness, hierarchy, physical proximity, and time on teaching services associated with perceptions of receptivity to clinical feedback. In practice, communication occurred in 17.3% of cases. Perceptions of prior physicians' uncertainty and requests for follow-up facilitated communication.

Discussion & Conclusions: Our research provides initial evidence that physicians are intrinsically motivated to overcome discontinuity, adapting patient tracking processes based on environmental constraints. Sending and receiving clinical feedback intended to close-the-loop about patients' outcomes is a complex, dynamic process influenced by social, material, and case contextual factors. This research provides insights that may help address barriers to learning in discontinuous practice environments.

Bridges over troubled water: understanding the identity development of medical educators

AUTHOR(S):

- Jo Horsburgh, Imperial College, London, UK (Presenter)
- Alan Cribb, King's College London, UK

ABSTRACT

Introduction: In recent years, the concept of professional identity development has gained traction within medical education in particular in relation to medical student and trainee doctor identity development. However, in contrast to the significant body of literature on teacher professional identity development, there is significantly less literature considering the professional identity of medical educators. This is despite the emphasis on the professionalisation of medical educators and specifically the significant increase in the number of medical doctors completing Master's level qualifications in education. This thesis aimed to explore the professional identity development of these individuals who work across the differing communities of practices (Wenger, 1998) of medicine and education. It explored the diverse nature of both the medical and educational practices that these participants engaged in and how this impacted on their identities as medical educators.

Methods: Drawing upon a social constructivist approach, 15 semi structured interviews were conducted with medically qualified educators, all of whom had completed, or nearly completed, a Master's in Education. The interviews were audio recorded and transcribed prior to being thematically analysed.

Results: The data suggested that whilst studying for a Master's in Education was ultimately positive for many of the participants, engaging with education as a new field of study was challenging for most. These challenges included engaging with new ways of thinking, carrying out research in a new methodological paradigm, and using new terminology. Furthermore, participants often experienced tensions in brokering between education and medicine communities, and these tensions ranged in type and complexity given the differences between and within these communities. Such tensions included the lower status of education experienced by some, but not all, participants, being unable to share new knowledge and understanding with colleagues, and a lack of identifiable career path within medical education.

Discussion: Inspired by Wenger- Trayner et al's (2015) metaphor of landscapes of practice, these findings therefore suggested that crossing between medicine and education involved navigating some 'troubled waters'. However, it appeared from the participants' interviews that there were some 'bridges' that facilitated these crossings and therefore helped participants to develop their identity as an educator. Such bridges included how integrated their education and medicine roles were, completion of their Master's level qualification in Education and how this was viewed by others, the role of the prestige economy within their workplaces, and the amount of identity capital they held.

Conclusion: This research showed how developing a professional identity as a medical educator is complex and challenging, but there are factors that act as facilitators to support identity development and boundary crossing.

Perceptions, discourses and values: Exploring how key stakeholders construct, negotiate and enact widening access to medical school

AUTHOR(S):

- Kirsty Alexander, University of Aberdeen, Aberdeen, UK (Presenter)

ABSTRACT

Introduction: ‘Widening access’ (WA) policies are implemented internationally to increase the participation of ‘non-traditional’ groups in Higher Education (HE). In the UK, there is a focus on encouraging those from lower socioeconomic backgrounds to consider medicine.⁽¹⁾ Although WA policies are widely applied, little is known about how they are specifically interpreted, negotiated and enacted by key stakeholders - medical schools, school teachers and potential applicants. In the UK, measurable progress in WA to medicine has been low - a fact starkly reflected in unequal application rates.⁽²⁾ This thesis argues that progress may be hindered by stakeholders’ conflicting ideologies and interests in relation to WA. It thus aims to explore, analyse and better understand the complex motivations, perceptions and values underlying key stakeholders’ behaviour in WA to medicine, and to investigate how these might be realigned to improve practice.

Methods: The thesis utilises an overarching framework of interpretivism and qualitative methodologies to explore the pathways of mutual influence and communication between stakeholders. The format is a ‘PhD with publications’ and includes four distinct studies. Data includes text from UK medical school webpages on WA, interviews with 11 teachers and focus groups with 71 pupils at high schools identified as eligible for WA initiatives (lower than average progression rates to HE and/or serving areas of socioeconomic deprivation). Website data was analysed using critical discourse analysis, with interpretations informed by Foucault’s concepts of discourse, positionality and subject positions, and theories of discursive framing. Interview and focus group data was analysed thematically, using template analysis, with conclusions enriched by conceptual frameworks drawing on the work of Sen, Bernstein and Bourdieu.

Results: Findings indicate that UK medical school webpages predominantly situate WA within ideas of social mobility for the individual rather than benefit to the workforce. Current discourses thus do not present non-traditional applicants as bringing additional gains to medicine through their diversity, and instead place these applicants in a position of ‘deficit’. Medical schools communicate distinct institutional stances by framing WA as a ‘requirement’, a ‘value’, or a ‘service’ on their webpages. High school teachers perceive medical applications as ‘risky’ for their pupils and this appears to limit their ability to act as advocates for WA to medicine. Their ‘hands-off’ approach privileges the choices and determination of the individual pupil, but may also allow structural inequalities to be reproduced rather than challenged. Non-traditional high school pupils perceive medicine as increasingly inclusive and were able to negotiate cultural differences through contact with role models in the profession. Pupils did not perceive that sociocultural differences deterred them from the career and some even identified their ‘different’ backgrounds as a benefit to the workforce and patient care.

Discussion and conclusion: This thesis demonstrates the benefit of including diverse stakeholders’ voices in WA research and provides practical recommendations for future research, policy and practice. Medical schools should reflect upon and critically evaluate their webpages, to ensure their material aligns with their values and does not disempower or deter potential applicants from non-traditional groups. Medical schools should work with high school teachers to reduce their perception of ‘risk’ surrounding medicine and thereby build teachers’ confidence to promote medicine as a competitive, but nonetheless viable, choice. Finally, knowledge and practice in WA must keep pace with pupils’ changing views of the profession to ensure these continue to address current barriers.

Reflection as purposeful, social activity: using cultural-historical activity theory (CHAT) to explore recent veterinary graduates' experiences

AUTHOR(S):

- Sheena Warman, University of Bristol, Bristol, UK (Presenter)
- Sue Timmis, University of Bristol, Bristol, UK

ABSTRACT

Introduction: In recent decades, reflection and reflective practice have become much-debated concepts in healthcare education. Generally, reflection is framed as a conduit for professional learning, with professionals required to demonstrate their ability to reflect through, for example, the use of written portfolios. Such formal activities derive from a concept of reflection as a solitary, individual activity, and a competence which can be assessed, and may bear little resemblance to the day-to-day reflective activities of qualified professionals within the workplace. Using Cultural-Historical Activity Theory (CHAT), this thesis explored the experiences of recently qualified veterinary surgeons as they engaged in reflective activity during the Royal College of Veterinary Surgeons' (RCVS) Professional Development Phase (PDP). The term "reflective activity" was employed to conceptualise reflection as an activity situated in a social, cultural and historical context.

Methods: Data collection comprised collation of RCVS documentation and semi-structured interviews with fifteen recent graduates. Analysis was undertaken in three stages, using a combination of inductive and deductive thematic analysis. Firstly, the system of reflective activity during the PDP was described and delineated using Engeström's triangle heuristic (Engeström 1987). Secondly, the Vygotskian concept of perezhivanie (Mahn and John-Steiner, 2002) was used to explore the experiences and feelings of individuals within the system. Finally, dialectic analysis (exploring the tensions within the system) was undertaken to identify conflicts experienced by participants, arising from system-level contradictions.

Results: Delineation of the system identified that language and interaction with others were key mediators in achieving outcomes of reflective activity, influenced by rules, community and hierarchy. Exploring perezhivanie highlighted the impact of affect on engagement in different reflective actions, and the influence of prior experience. Dialectic analysis identified system-level contradictions within two overarching themes. Firstly, the need for support for reflective activity was highlighted, with externally-oriented reflective actions such as talking and writing helping convert worry into purposeful reflection, the perceived attributes of other actors in the system impacting on the value of talk as a mediator of reflective activity, and workplace culture impacting on access to valued resources. Secondly, the formalisation of informal processes led to confusion regarding the purpose of reflective activity, conflict between participants' preferred reflective actions and the format of the online portfolio, and a risk of resentment and reduced engagement arising from rules associated with the PDP.

Discussion and Conclusions: Combining the theoretical perspective of CHAT with the related concept of perezhivanie has highlighted how experiences and perceptions of individuals engaging in reflective activity influence, and are influenced by, the wider system. The contradictions highlighted within the system may explain some of the confusion and uncertainty around understandings of reflective activity in the veterinary profession. If the potential outcomes of the PDP are to be fully realised, new graduates need opportunities to engage in social reflective activity with trusted colleagues with whom there is a shared understanding of the purpose of reflective activity. The findings of this study suggest that reconsideration of the formal expectations of new veterinary graduates and their employers would be warranted and timely, to help align the gap between reflective activity as proposed by the RCVS, and the reality of graduates' experiences in workplace contexts.

Swinging the Pendulum from Recipes to Relationships: Enhancing impact of feedback through transformation of institutional culture

AUTHOR(S):

- Subha Ramani, Harvard Medical School, Boston, USA (Presenter)
- Karen Könings, Maastricht University, Netherlands
- Shiphra Ginsburg, University of Toronto, Canada
- Cees P.M. van der Vleuten, Maastricht University, Netherlands

ABSTRACT

Introduction: Competency-based medical education requires that learners receive ongoing feedback to identify gaps between observed and expected performance and facilitate professional growth. Feedback is a complex encounter influenced by many sociocultural factors including interpersonal relationships, perceived credibility of the feedback provider and data, and institutional learning culture. To advance understanding of the sociocultural landscape of feedback, our research aimed to explore the following: 1. What institutional factors do residents believe influence the quality and impact of feedback? 2. How does departmental culture influence the quality of feedback conversations as perceived by residents and faculty? 3. Does self-awareness affect feedback seeking and receptivity? 4. What language and behaviors are observed during formal feedback conversations between faculty and residents who have longitudinal relationships in continuity clinics?

Methods: We conducted a series of qualitative studies. Questions 1 and 2 involved a grounded theory approach. For question 3, we used framework-analysis based on the Johari window model. For question 4, we used ethnography to explore behaviors during feedback conversations, supplemented by a video-reflexive interview for faculty to view and reflect on their behaviors. Interviews after the conversation allowed residents to further reflect on the effectiveness and impact of the exchange.

Results: Study 1: Learners perceived that institutional culture significantly impacted the quality of feedback exchanges. Specifically, the culture of politeness was perceived as a major barrier to honest feedback conversations. Study 2: We identified faculty and resident feedback characteristics that acted as facilitators or barriers to constructive feedback, feedback seeking and acceptance. Intersection of teacher and learner factors led to a four-quadrant model with 3 dominant existing cultures (culture of politeness with emphasis on learner self-efficacy, culture of politeness with focus on learner autonomy, culture of assumed excellence with avoidance of constructive feedback) and 1 aspirational culture that participants strongly recommended (culture of growth). Study 3: Participant narratives suggested that self-awareness could strongly influence the impact of feedback. We described strategies under each quadrant of the Johari window to assist learners, teachers and institutions in enhancing self-assessment, reflection, feedback seeking, self-disclosure and self-discovery. Study 4: Thematic analysis of resident-preceptor feedback conversations could be mapped onto a relationship-centered communication model consisting of three steps: establishment, development and engagement. Participants' strategies were categorized under each of these steps. Synthesizing all findings, we described twelve tips to promote a feedback culture with a growth mindset through multiple perspectives (providers, recipients, relationships and cultural context).

Discussion and conclusions: In this research, we have uncovered unique sociocultural factors that influence feedback conversations and impact learner growth. Medical education appears to value a polite culture with a congenial learning climate, yet learners continue to perceive a hierarchical culture which prevents bidirectional feedback. Though focus on learner self-efficacy reinforces good practice, avoidance of constructive feedback will not lead to behavior change or foster growth. We recommend that teachers as well as learners develop a learning goal-orientation, actively seek feedback, accept and incorporate reinforcing as well as constructive feedback, and develop a growth mind-set. We believe that co-creation of learning environments and teacher role-models are essential for mutual growth.

The 'Patient as Educator': What Motivates SPs?

AUTHOR(S):

- Gail Furman, National Board of Medical Examiners, USA (Presenter)
- Elizabeth Denton, Educational Commission for Foreign Medical Graduates, USA
- Kim Edward LeBlanc, National Board of Medical Examiners, USA
- John Repasch, Educational Commission for Foreign Medical Graduates, USA

ABSTRACT

Background: Standardized patients are used in the high-stakes examination required by the United States Medical Licensing Examination to assess clinical competence for medical licensure. These standardized patients (SPs) undergo extensive training to portray a patient in a standardized fashion and to provide accurate scores for components of the exam. A typical day in the life of an SP includes twelve 15-minute encounters being examined repeatedly by strangers (examinees), each followed by a 10-minute period for scoring. This makes for an intense seven-hour day. Despite this, the six testing centers boast a high retention rate. There is a paucity of literature describing the motivation of the people who are employed as SPs. As health professions expand their SP programs for teaching and assessment, an important question to ask is: What motivates people do this sort of work? The current study addresses this question with the data from a representative sampling of SPs who work for the USMLE Step 2 Clinical Skills exam.

Summary of Work: A focus group of 20 SPs was conducted. The participants reflected a sampling of the ages, ethnicity, and years of experience of the SPs from all centers.

Summary of Results: The themes identified included income, flexibility, interaction with diverse people, sense of belonging to a community, and helping to contribute to improving health care.

Discussion and Conclusions: Income is a small part of the motivation supporting SPs. SP work can be difficult, but the high retention rate may be related to finding meaning in the work, building a community with others in the program, and the flexibility of part-time work. SP Programs can address these issues by ensuring the mission of the program is highlighted, and providing opportunities for building a sense of community.

Take-home Messages: Working as an SP can be perceived as a rewarding job, with SPs valuing the SP community and sense of engaging in a mission to protect the health of the public.

Patients' attitude towards the involvement of medical students in obstetrics, gynecology and infertility outpatient clinics at Cairo university teaching hospital, a cross-sectional study

AUTHOR(S):

- Nadine Sherif, Faculty of Medicine- Cairo University, Egypt (Presenter)

ABSTRACT

Background: Medical students' contact with real patients is a crucial part of their learning experience which in turn requires cooperative patients willing to share in the teaching process. Patients' acceptance of students' involvement can be issue for a variety of reasons for instance privacy concerns. In obstetrics and gynecology, the intimate nature of the examination and procedures may negatively influence the patients' attitude. Thus, good knowledge of patients' attitude and understanding of the factors associated with that attitude are needed.

Summary of Work: A convenient sample of 450 females attending Kasr Al-Ainy obstetrics, gynecology and infertility outpatient clinics were interviewed using a structured questionnaire during a period of 2 month(from September 2016 to November 2016). Data were analyzed using IBM SPSS.

Summary of Results: 361 patients (80.2 %) accepted the involvement of medical students. The main reason for acceptance was to contribute to student learning process (69.3%) while the reasons for refusal (n=89, 19.8%) included primarily concerns about privacy during intimate examination (74.2%). Others thought there is no need for the presence of students at all (16.9%) and lastly, the need for privacy during discussing sensitive issues with the treating physician accounted for the minority (7.9%). Patients' attitude was significantly associated with the impact of a previous encounter with medical students ($P \leq 0.0001$). It is noticeable that, more patients are willing to accept a female compared to male students at different clinical situations especially during pelvic examination and discussion of sexual problems ($P > 0.0001$).

Discussion and Conclusions: Educators should be aware of gender bias and work to ensure equal learning opportunities for both male and female students by encouraging the patients' acceptance of students regardless of their gender and considering other methods for teaching clinical skills like simulated patients and mannequins whenever possible. Future studies are needed to provide a more comprehensive view about the attitude of the Egyptian women towards students' involvement addressing other possible associated factors.

Take-home Messages: The majority of women included in our study are willing to accept the involvement of medical students during their consultation however, a clear preference for female over male students exists. The impact of previous encounter with students is an important factor in determining patients' attitude.

Hearing patients' views of teaching and learning

AUTHOR(S):

- John Dockerty, Dunedin School of Medicine, University of Otago, New Zealand (Presenter)
- Sarah Harrison, Dunedin School of Medicine, University of Otago, New Zealand
- Lynley Anderson, Bioethics Centre, University of Otago, New Zealand
- Faafetai Sopoaga, University of Otago, New Zealand

ABSTRACT

Background: Schools of medicine regularly survey learners but don't often ask patients for their views of teaching and learning. We set out to find a routine way to obtain patients views.

Summary of Work: A survey questionnaire was designed and piloted, to assess patients views of teaching and learning. Surveys were given to patients in a variety of clinical learning environments. These included inpatients and outpatients in medicine, surgery, women's health, and children's health (age 12+), as well as people seeing their GPs. Twenty one medical students (in two groups) helped to finalise and deploy questionnaires in secondary care (phase I) and primary care (phase II). The students also conducted preliminary analyses for each phase. The questionnaires asked patients for their views of the student(s) and teacher(s); and for their tips for improvement. The questions included categorical choices, Likert scales and free text comments, similar to student surveys of teaching.

Summary of Results: Of 305 eligible patients in secondary and primary care settings, 187 (61%) completed questionnaires. Patients were very satisfied with interactions with their students: 84% rated them as 'excellent' or 'very good'. Negative comments were rare. They were also very positive about the teachers. Ratings of students and teachers were highest in primary care, followed by emergency and outpatients, then wards. In free text comments, patients generally gave encouragement, saying students should keep up their good work. Some said students should have a bit more confidence in their abilities. A few wanted students to introduce themselves, or be more empathetic, or more engaged. Patients affirmed teachers and said that they gave students good explanations, listened well and were helpful. Negative comments were rare.

Discussion and Conclusions: The patient feedback obtained in this study was positive. There were challenges in surveying diverse clinical learning environments and we learned a lot in doing so. Different approaches suited particular settings. This project was conceived as a pathway to regular feedback from patients; and not simply as a one-off.

Take-home Messages: Focusing students on patients views helps prepare them to serve their patients and communities well. We recommend that patient surveys in clinical learning environments should form a routine part of the quality process.

Can We Trust A Simulated Patient As An Evaluator?

AUTHOR(S):

- Huai Cheng, University of Virginia, USA (Presenter)

ABSTRACT

Background: Simulated Patients (SP, a pseudo-patient) are used to assess the students' skills in history taking, physical examination, and communication. However, the validity and reliability of such assessments was less reported. The goal of this study was to examine 1) reliability of senior medical students' skills performance in history taking, physical examination and communication assessed by SP; 2) whether SP assessment was associated with students' clinical practice behavior and final grades.

Summary of Work: A SP with chief complaint of fall was developed to assess students' skills in history taking, physical examination, clinical courtesy, and patient interaction within a fall prevention curriculum. The SP used checklists and rating scales to assess students' skills performance. Cronbach's alpha was used to measure reliability of skills performance assessed by the SP. Students' general clinical practice behavior included 16 items such as history taking and bedside manner, which were evaluated online by students' preceptors. Whether students asked fall history was used to measure students' specific clinical practice behavior via chart review. Students' final grades of geriatrics clerkship were used as a surrogate marker for better students. Pearson correlations were used to examine associations between students' skills performance assessed by the SP, students' clinical practice behavior, and final grade of geriatrics clerkship.

Summary of Results: 427 senior medical students from class 2015-2017 participated in this study. Cronbach's alpha for skills in history taking, physical examination, clinical courtesy, and patient interaction assessed by the SP were 0.593, 0.828, 0.135, and 0.762, respectively. Students' skills performance assessed by the SP was positively associated with final grades of geriatrics clerkship rotation, but not specific or general clinical practice behavior for 158 students of class 2017.

Discussion and Conclusions: Reliability of students' skills in physical examination and patient interaction but not history taking and clinical courtesy assessed by the SP was good. Better skills performance assessed by SP was positively associated with students' final grades, but not clinical practice behavior.

Take-home Messages: The SP quality was modest. Better skills performance assessed by the SP didn't predict better clinical practice behavior.

“I Felt Like a Privileged Vital Educational Instrument”: The Perspective of Simulated Patients as Educators

AUTHOR(S):

- Meghana Sudhir, Mohammed Bin Rashid University of Medicine And Health Sciences, United Arab Emirates (Presenter)
- Safeeja Abdul Rahuman, Mohammed Bin Rashid University of Medicine And Health Sciences, United Arab Emirates

ABSTRACT

Background: Simulated patients are valuable teaching resource and are intensively contributed to medical education for years. In our University SPs contribute towards Multiple Mini Interviews [MMI], OSCEs and Teaching sessions through various role portrayals. An integral part of an SP is to provide effective feedback.

Summary of Work: We have SP WhatsApp platform where a lot of productive discussions happen. On that, they were asked to share their perspective as educators. 24 SPs participated in the discussion.

Summary of Results: Here are some of the views of the SPs: - ”It has always been a practical and engaging activity where one serves as a learning instrument to give out what has been memorized earlier, though it is done with absolute carefulness and commitment which proves to be of immense help to the medical students.” – “I feel I am more actively engaged as educator contributing to the educational progression of medical students. This brings all my senses of mental reasoning to be fully engaged to ensure maximum fairness and accurate assessment.” – “Sometimes during the scenario I felt like an educator, assessor or teacher; but on some other occasions, I felt like a privileged vital educational instrument in medical learning process.” – “We are the first door of hesitation for the students in their practical life ... after opening us, they can easily go to other rooms.” – “I do feel as a trainer during some of the scenarios, example, when giving feedback and at other scenarios I feel like a support to the students learning process.” More views will be shared during presentation.

Discussion and Conclusions: Traditionally, patients have mainly served as objects in bedside teaching. However, in their more active role within medical education, they fulfil vital role as teachers. From ‘programmed patients’ to ‘simulated participants’, SPs are not just contributing to practical skill development but also to the development of student attitudes toward patients in a personal and professional capacity.

Take-home Messages: The role of patients as teachers of the biopsychosocial model of disease and lived experience of disease is unique to the patient. Help the students gain these experiences by incorporating patients in the learning process and through realistic case scenarios with simulated patients.

Simulated Patients' Perceptions of their Role and Contribution to Health Professions Education

AUTHOR(S):

- Clare Sullivan, RCSI, Ireland (Presenter)
- Laura O'Connor, RCSI, Ireland
- Simon Horne, RCSI, Ireland
- Erica Smyth, RCSI, Ireland
- Teresa Pawlikowska, RCSI, Ireland
- James Murray, RCSI, Ireland

ABSTRACT

Background: Studies have shown the effectiveness of simulated patient encounters for developing consultations skills while other research has shown that the expectations of faculty and patients differ when it comes to evaluating consultation skills. RCSI's 3,300 square meter expansion of simulation facilities in 2017, fueled an increase in demand for simulated patients. Few studies address the perspectives of simulated patients in regard to their role, therefore, this study aimed to explore the perspectives of simulated patients.

Summary of Work: A qualitative approach was taken. Simulated patients, actors and surface models involved in teaching in RCSI were invited to participate in one of four focus groups. Fifteen simulated patients participated and eight actors. Focus group discussions were audio recorded and transcribed verbatim. Inductive thematic analysis was carried out on transcriptions.

Summary of Results: A number of themes emerged from the data. Participants believed that they brought valuable life experience to the role both in terms of their past work and life experience and from their personal experiences as patients. Feedback emerged as a theme in terms of being a way to contribute but also a challenge to deliver well. There was a clear divide in the perspective of participants when discussing physical examination. Some participants felt that providing their bodies for examination was essential for student learning whereas other participants did not wish to get involved with physical examination. Simulated patients gained a better understanding of the healthcare system as a result of their role.

Discussion and Conclusions: Simulated Patients believe they have an important role to play in healthcare education, are eager to further develop their role, especially in giving feedback and learn about the healthcare system from being involved, which impacts on their own interactions.

Take-home Messages: Simulated patients are an engaged group of people who believe they have a valuable contribution to make by providing the students with an opportunity to practice and by giving feedback from the unique perspective of the patient. Ongoing training is required to support simulated patients to provide effective feedback to students. Simulated patients learn about healthcare from being involved.

Assessing the Impact of Increasing Exam Burden on Final Year Medical Students - an observational study

AUTHOR(S):

- Heather Keenan, East and North Herts Trust, UK (Presenter)
- Jack Haywood, East and North Herts Trust, UK

ABSTRACT

Background: Final-year medical students in the UK face a growing burden of examination. In addition to written and clinical exams, they must also take the situational judgement test (SJT) and prescribing skills assessment (PSA). In 2022, the Medical Licensing Assessment (MLA) will begin. Students are therefore never far away from the next exam during this crucial year. The aims of this study were: 1. To evaluate whether proximity to their next exam impacts student perception of teaching quality, and; 2. To assess how proximity to exams impacts student self-reported learning priorities.

Summary of Work: We designed four teaching sessions to deliver to approximately 50 final-year students, delivered six times by the same facilitator. Students completed a questionnaire after each session, rating their current priority (preparing for exams versus preparing to become a doctor), the relevance of the teaching session to this priority, and the overall quality of the teaching on a five-point Likert-type scale. These ratings were correlated against number of days until the next examination, of which the SJT, PSA and first day of finals were considered.

Summary of Results: Students were on average 37.4 days away from their next exam when teaching sessions were delivered (min 3 days, max 92 days, SD 26.8). Data collection is ongoing. Early results indicate: 1. The closer students are to an exam, the more they prioritise passing exams above learning to become a doctor. 2. Students rate teaching sessions that they consider relevant to their current needs more highly. 3. Student rating of teaching session quality decreases closer to exams.

Discussion and Conclusions: As we move towards introducing more assessments for medical students, in addition to an already significant burden of other exams, it is important to consider the impact this has on the ultimate goal of producing effective doctors. Our results indicate that if there is always a major exam looming on the horizon, we run the risk of entirely removing their focus from learning how to be an effective doctor.

Take-home Messages: We should be wary of adding yet more examinations to the already crowded schedule of final-year medical students.

Licensing examinations - a retrospective: (Un)intended emphases in Germany's national licensing examinations?

AUTHOR(S):

- **Nikolas Psathakis, German Medical Students' Association (bvmd e.V.), Germany (Presenter)**
- Aurica Ritter, German Medical Students Association (bvmd e.V.), Germany
- Lucas Thieme, German Medical Students Association (bvmd e.V.), Germany
- Birgitta Kütting, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Germany
- Jana Jünger, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Germany

ABSTRACT

Background: By 2021, the German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy (IMPP) will have devised a new content outline for Germany's national licensing examinations (NLE) with the intention of shifting to a more competency- as well as role-focused assessment based on Germany's non-binding national curriculum ('NKLM', 2015) and the CanMEDS framework. A joint research group consisting of IMPP researchers, medical students from various German medical schools coordinated by the German medical students' association (bvmd) conducted a 'post-examination' review of prior medical licensing examinations as an initial benchmark on the representation of the different professional roles and specialties in medicine under the currently effective content outline from 2013. ('GK2', 4th revision)

Summary of Work: Throughout 2018, the IMPP and bvmd reviewed 16 NLEs. (Spring 2015 - Fall 2018) The examinations analysed consist of 8 similar to the USMLE Step 1 as well as 8 similar to the USMLE Step 2CK resulting in 5160 items analysed. For data reliability, standardised procedures in conjunction with a specialised online platform have been used.

Summary of Results: Our preliminary results of the item review indicate an imbalance in terms of which professional roles and competencies in terms of past exams are focused on. The final data will include the spread of disciplines, roles and competencies plus secondary indicators e.g. in- or outpatient setting etc. - separately for both Step 1/2CK equivalents.

Discussion and Conclusions: As Germany's current content outline for its NLEs is focusing mainly on traditionally-organised knowledge, its balancing of professional roles and competencies struggles to fully comply with coming standards and expectations. A standardised and systematic review as conducted can yield a more comprehensive picture of medical examinations' strengths and weaknesses.

Take-home Messages: Our results show that reviewing passed examinations by students is a helpful tool for the conceptual design process of future national licensing examinations. Joint working groups including both fully-licensed physicians and students might prove beneficial in including all relevant perspectives.

Development of national licensing exam

AUTHOR(S):

- **Zalim Balkizov, ASMOK, Russia (Presenter)**
- Tatiana Semenova, Ministry of Health of Russia, Russia
- Zhanna Sizova, Federal Center for Accreditation of the Ministry of Health of Russia, Russia

ABSTRACT

Background: Medical education system in Russia requires 6 years of formal undergraduate training in medical school and 2 years of training in residency programmes. Access to the medical profession based on diploma and formal certification after residency programs. Following problems was identified: Certification by providers of education leads to conflict of interests and low quality of assessment. Health practitioners complains on low level of skills in graduates. Procedure of certification is very formal and compromised.

Summary of Work: New regulation (based on the Federal law) implements 3 types of accreditation - primary after graduation from the medical school, primary specialized after residency programs, and reaccreditation every 5 years of practice. Both primary and primary specialized accreditation includes 3 steps - MCQ, OSCE and oral examination. New institution was founded to run the system for whole Russia - Federal Center for Accreditation. Center develops all assessment materials including MCQs, OSCE stations and tasks for oral exams.

Summary of Results: Primary accreditation was implemented in 2017 for medical school graduates and independent assessment of clinical skills became strong motivation for both - students and faculty members to improve training in clinical skills centers.

Discussion and Conclusions: Implementation of OSCE is very limited - only 5 stations was adopted nationwide for the accreditation step 2. However, independent assessment of clinical skills became strong motivation for both - students and faculty members to improve training in clinical skills centers. Oral exams demonstrates low validity and going to be replaced by long cases. Selection and development of independent examiners turned out to be biggest challenge in organization of exams.

Take-home Messages: Implementation of new methods of assessment requires support from the regulators and from the professional society.

The impact on Angoff standard setting of changing to open-resource assessment

AUTHOR(S):

- **Mike Tweed, Otago Medical School, New Zealand (Presenter)**
- Jen Desrosiers, Otago Medical School, New Zealand
- Tim Wilkinson, Otago Medical School, New Zealand

ABSTRACT

Background: Assessment of healthcare students should reflect eventual practice. Healthcare professional practice encourages use of a wide range of resources, looking up information when needed, which is preferable to guessing. However, implementing resource availability in student examinations ('open-book') might alter the expected performance. We explored the potential impact on standard setting of an open-resource examination.

Summary of Work: Two pools (A and B) of 40 MCQs were created. Students sat two exams, each of 60 minutes, made up of each pool in randomised order, with access to resource also randomised. The closed instructions were standard. The open instructions allowed any resource to be used, but no communication. Prior to the students sitting the exams, a panel of five standard setters was convened. Following discussion of the format of the examination, student ability and the instructions to the students, the panelists undertook a process of judging proportion correct for minimally competent students. For 10 practice questions, this was done considering closed instructions and open instructions, with discussion of judgments after each question. Following this, the panelists made independent judgments for the 80 questions without discussion.

Summary of Results: The overall pass standard was different for pool A (59.4% for open resource instructions v 47.9% for closed, $p < 0.001$) and pool B (58.8% for open v 46.5% for closed, $p < 0.001$). There was no difference in variance of the pass-mark between open and closed instructions for both pool A and B. Of the 80 individual questions, 78 were deemed to have a higher pass-mark under open conditions, 2 a higher pass-mark under closed conditions, but no differences were statistically significant. There was no difference in variance of the pass-mark between open and closed instructions for any question.

Discussion and Conclusions: The panelists judged that exams would be easier under open resource conditions, and adjusted their decisions accordingly. In reality, there was no difference between correct scores by instruction type. This study was underpowered for question level analysis. Areas for exploration include how resource utility affects judgments and performance.

Take-home Messages: Standard setters expected, potentially erroneously, better student performance due to availability of resources.

Setting defensible standards in small cohorts: understanding when borderline regression works

AUTHOR(S):

- Matt Homer, Leeds Institute of Medical Education, UK (Presenter)
- Richard Fuller, LIME, UK
- Godfrey Pell, LIME, UK
- Jennifer Hallam, LIME, UK

ABSTRACT

Background: Standard setting, particularly in OSCEs, is always challenging, especially in examinations with small cohorts (e.g. $n < 50$). Examinee-centred approaches (e.g. borderline regression - BRM) are generally thought to be problematic in such context, and institutions often prefer to rely on test-centred approaches such as Angoff, which can be time-consuming and are not particularly reliable in themselves.

Summary of Work: In three quite different small-cohort OSCE contexts, we investigate station- and test-level BRM metrics, and the visual relationship between global grades vs. total scores, to better understand where BRM can 'work': 1. PLAB2 - The examination of international medical graduates wanting to practice in the UK ($n=30-35$ per administration, 18 stations per exam, 198 administrations, station level data). 2. Senior sequential examination of undergraduate students in a large medical school - only a small proportion of candidates have to sit the second sequence ($n=20$ to 50, 10-12 stations with 25-26 stations in full sequence, four administrations, candidate level data). 3. Physician associates ($n=25$, 16 stations, two administrations, candidate level data) - successful candidates will practice as part of a team alongside fully qualified doctors.

Summary of Results: We find that BRM works well in the vast majority of stations (the percentage of problematic stations are 5%, 18% and 9% respectively across the three contexts). Where problems occur, this is generally due to an insufficiently strong relationship between global grades and checklist scores to be confident in the standard set by BRM for these stations (i.e. low R squared), often as the result of insufficient spread in scores in these stations.

Discussion and Conclusions: From a practical point of view, extant cut-scores, preferably based on previous satisfactory station performance in a large cohort, should be available for all stations in small cohort exams so that when problems with BRM are diagnosed (e.g. a lack of spread of scores) these cut-scores can substitute.

Take-home Messages: We have shown that where there is sufficient spread of ability in a small cohort, BRM will generally also provide defensible standards but, as ever, care needs to be taken in the overall design of station level scoring instruments.

Standard Setting Using a Modified Post-Examination Borderline Group Method for Simulation-Based Performance Assessment

AUTHOR(S):

- Na Jin Kim, The Catholic University of Korea, College of Medicine, Seoul, South Korea (Presenter)
- Young-Min Kim, The Catholic University of Korea, College of Medicine, Seoul, South Korea
- Sung A Lee, The Catholic University of Korea, College of Medicine, Seoul, South Korea
- Su Young Kim, The Catholic University of Korea, College of Medicine, Seoul, South Korea

ABSTRACT

Background: We have evaluated various standard setting methods to find an optimal standard setting method for simulation-based performance assessment (SBPA) and remediation in our medical college. In 2018, we have implemented a modified post-examination borderline group method (PBGM) for the SBPA to compensate the rater qualification problem in examinee-centered standard setting during the examination.

Summary of Work: We implemented a SBPA comprised of 6 clinical performance examination and 6 OSCE stations for procedural skills at the end of 3rd year clinical clerkship. The SBPA was conducted for 2 days with 2 different sets of 12 stations. During the examination, content experts and experienced standardized patients assessed the students' performance using checklists and a global rating scale (outstanding-clear pass-borderline-clear fail). After examination, 13 experienced standard panelists have decided the cut scores through a modified PBGM with 3-round setting procedure. We compared the cut scores and failure rates calculated from the 4 methods - PBGM, BGM and borderline regression method (BRM) during examination, and a relative method [mean minus one standard deviation (SD)].

Summary of Results: During 3 rounds of the setting procedure, SD of the setters' scores were decreased. Overall cut score (sum of the cut scores) calculated from the PBGM were similar to the BRM but higher than those of the BGM and relative method. Failure rates by two decision rules including overall cut score and minimum passing station numbers were different among the methods (15.1% in BRM, 12.8% in PBGM, 10.5% in BGM and 5.8% in the relative method). In the post-setting survey, the panelists were responded that the modified PBGM is easier than modified Angoff method which was implemented in 2017 and is more appropriate for standard setting for the SBPA in our college. In an on-line survey, 89% of students responded the SBPA and remediation were helpful for their competency improvement.

Discussion and Conclusions: A modified PBGM was feasible and practical for standard setting in a SBPA and remediation in our medical college.

Take-home Messages: A modified PBGM can provide reasonable and defensible approach to standard setting for relatively low-stakes, criterion-referenced SBPA in a medical school or college.

#10J Short Communications - Empathy

Instilling empathy - is the devil still in third year?

AUTHOR(S):

- Anna Byszewski, Regional Geriatric Program of Eastern Ontario, Canada (Presenter)
- Philippe Rousseau, University of Ottawa, Canada
- Melissa Forgie, University of Ottawa, Canada
- Heather Lochnan, University of Ottawa, Canada

ABSTRACT

Background: An empathetic, humanistic approach has been linked to patient sense of satisfaction, patient safety and compliance with treatment and physician wellness. Although recent cross sectional studies have challenged the notion of decline of empathy in medical school training, longitudinal studies suggest mixed results or that empathy may erode. This project was designed to enable longitudinal assessment of medical students' empathy at the University of Ottawa starting with first year of enrollment and thus help to identify at what point in the curriculum there is a need to develop measures to support these qualities.

Summary of Work: The Interpersonal Reactivity Index (IRI) was used to measure emotional and cognitive empathy. It was preferred over other measures due to high psychometric properties, use within medical fields around the world, and validation in multiple languages. Students were contacted by email and participation was voluntary. The four IRI subtests utilized in this project included perspective taking, fantasy taking, empathic concern and personal distress.

Summary of Results: Results of student responses gathered longitudinally from year 1 to 3 demonstrated statistically significant increase in IRI subtests of perspective taking, fantasy taking and empathic concern. For personal distress there was similar tendency to experience feelings of personal anxiety and unease in tense interpersonal settings as students progress through their curriculum.

Discussion and Conclusions: The Preliminary IRI responses suggest that most of the empathy competencies may improve with training as students gain clinical exposure when provided with supports and learning experiences such as a humanities program, a diverse professionalism curriculum, reflective longitudinal mandatory eportfolio and solid faculty development (as introduced at University of Ottawa). More frequent wellness checks and student support to address pressures of the learning environment may be required in clinical years.

Take-home Messages: These findings at our institution are in contrast to previous longitudinal studies measuring empathy in medical students where empathy appeared to decline in the clinical years. It could also be reflective of the shift in medical education designed to foster overall a more positive learning environment. The results indicate also that IRI is a tool that can be applied across a medical school curriculum and assist in tracking impact of educational measures.

#10J Short Communications - Empathy

Students' stress coping strategies impact empathy trajectories during medical training: a 5-year longitudinal study

AUTHOR(S):

- Margaret Gerbase, University of Geneva, Faculty of Medicine, Switzerland (Presenter)
- Giovanni Piumatti, University of Geneva, Faculty of Medicine, Switzerland
- Milena Abbiati, University of Geneva, Faculty of Medicine, Switzerland
- Anne Baroffio, University of Geneva, Faculty of Medicine, Switzerland

ABSTRACT

Background: Research suggests that different longitudinal empathy trajectories may exist within a given student population. Empathy might be influenced by several factors during preclinical-to-clinical transition, including anxiety and stress. However, changes in longitudinal inter-individual variability in empathy due to these factors remain insufficiently explored.

Summary of Work: We tested the associations of anxiety and stress coping with pre-analysed students' empathy trajectories over time during medical studies. Group-based trajectory modeling traced different empathy trajectories among 201 medical students at the Geneva medical school ($M_{age}=20.74$, 57% females) from preclinical (Years 1) to clinical years (Years 4, 5). Differences between empathy trajectories were assessed on self-reported anxiety and stress coping strategies at years 1, 2 and at the beginning of clinical training at Year 4. Measures included the student version of the Jefferson Scale of Empathy (Years 1, 4, 5), the Coping Inventory for Stressful Situations (Years 1, 4) and the State-Trait Anxiety Inventory (Years 2 and 4).

Summary of Results: Results evidenced two empathy trajectory groups: low decreasing ($n=59$; 29%) and high stable ($n=142$; 71%). The decline of empathy among low decreasing students was evident during clinical years. At Year 4, univariate analysis of covariance (controlling for gender) indicated that low decreasing students were more likely to report low levels of task-oriented coping (i.e., dealing directly with stressful situations) than their high stable peers ($p<0.05$). No differences in anxiety levels were observed between the two groups. At Year 5, lower empathy levels were predicted by lower levels of task-oriented coping at Year 4 ($p<0.05$) according to a regression model controlling for gender, avoidance- and emotional-oriented coping strategies.

Discussion and Conclusions: Medical students individually differ in empathy development: for some empathy can remain stable while for others it can decrease especially during clinical training. Furthermore, students who showed lower empathy levels also displayed lower stress coping strategies.

Take-home Messages: Clinical years substantially impacted empathy levels in nearly one-third of medical students. Lower stress coping strategies when beginning clinical training predict lower empathy levels in the following training year.

Embodied empathy, a phenomenological study of physician touch

AUTHOR(S):

- **Martina Kelly, University of Calgary, Canada (Presenter)**
- Clark Svrcek, University of Calgary, Canada
- Tim Dornan, Queen's University, Belfast, Northern Ireland

ABSTRACT

Background: Empathic physician behavior is associated with improved patient outcomes. One way to demonstrate empathy is effective use of nonverbal communication skills (NVC). NVC include facial expression, body language, gestures, and touch. While touching someone's arm, in a moment of distress can express empathy, touch is also liable to misinterpretation. Touch is a sensitive practice in medicine, and the literature shows learners would value more guidance. To develop a better understanding of touch as a form of empathic behavior, we explored physicians' experiences communicating with touch.

Summary of Work: We used interpretative phenomenology, the study of human experience, to guide study design. We conducted in-depth interviews (40-100 mins) with fifteen physicians (7 men) of varying experience (less than five year, six-fifteen year and more than sixteen years, from a range of specialties). Participants described specific examples of touch from clinical practice. We identified themes using template analysis, followed by a process of dialectic questioning, moving back and forth between the data, to synthesize a final interpretation.

Summary of Results: Physicians used touch to acknowledge emotions, demonstrate empathy and presence. We situated our findings in the writings of Merleau-Ponty, using Finlay's model of embodied empathy to illustrate three levels of empathic engagement through touch; physicians embodied responses in a given context informed possible use of touch. Physicians 'act[ed]-into' the situation, by imagining how a patient might feel. Finally, some physicians, recalled instances where they were unable to differentiate between physical and emotional 'touch', illustrating a 'merg[ing]-with' patient experience. Empathic touch involved attending to shared context, as an intersubjective experience, rather than focusing on the individuality of either experienter.

Discussion and Conclusions: Touch is relatively unexplored in medicine but our results indicate it plays a valuable role in nonverbal communication, particularly expression of empathy. Given its complexity, we suggest initial strategies for teaching could include raising the topic with learners as part of communication skills curricula or video analysis of recorded consultations.

Take-home Messages: Touch shows empathy in clinical practice. Phenomenological accounts of empathy, which emphasize its embodied intersubjective nature, could inform pedagogical approaches to touch in medical education and deepen our understanding of empathy.

Empathy microskills training program for undergraduate medical students in Chile

AUTHOR(S):

- Juan Arellano, Universidad de Concepción, Chile (Presenter)
- Debora Alvarado, Universidad de Concepción, Chile
- Mary Jane Schilling, Universidad de Concepción, Chile
- Carolina Bustamante, Universidad de Concepción, Chile
- Maritza Espinoza, Universidad de Concepción, Chile
- Nancy Bastias, Universidad de Concepción, Chile

ABSTRACT

Background: In the last 20 years research have supported the importance of empathy and communication skills for doctors and patient interactions, mainly having a positive effect in adherence and outcome. However, there is not a proven way to teach students these abilities. We took the microskills proposal from Beck & Kulzer (2018) and developed an empathy microskills training program for undergraduate medical students. The aim of this study is to evaluate this program.

Summary of Work: An experimental design with two groups (A and B) was realized. Students were randomly allocated in each group. The program was divided in two part: a theory and discussion module and a workshop module. Both groups received both modules but in different times. Group A received the workshop first and then the theory module. Group B, otherwise. There were four measures, one at the beginning, one after the first month (end of theory module “ middle term of workshop module), one after the second month (end of workshop module) and one at the end. Video recording of simulated patient interview was done for each student in each measure time. Five judges evaluated the student microskills through the microskills rubric for the five microskills: silence, active listening, non verbal communication, conveying empathy, and resonance.

Summary of Results: 28 students participated in this study. In the first measurement, there were no statistical differences between the groups in any of the skills. In the second measurement, an improvement of 0.7 ($ir=1.0$) was observed for both groups, with no statistical differences between them. In the third measurement, there was a decline of 0.6 ($ir=1.3$), but also with no statistical differences between the groups. In the last measure, there were statistical differences between the groups for every microskills, in exception of silence.

Discussion and Conclusions: It is crystal clear that we can teach empathy, and that it can be done with theory and discussion groups or through workshop where students can apply and practice these abilities. A combination of both is preferred. Simulated patients are also needed for teaching empathy.

Take-home Messages: Empathy can be taught to medical students from a microskills perspective.

Fostering social empathy in medical students

AUTHOR(S):

- Caroline Wellbery, Georgetown University Medical Center, USA (Presenter)

ABSTRACT

Background: The Social Empathy Index (SEI) is a validated instrument that measures self-reported empathy for both individuals and vulnerable groups. The social empathy component is comprised of two categories: Contextual Understanding of Societal Barriers and Macro Self-Other Perspective-taking.

Summary of Work: We published a study of all first-year medical students' SEI scores before and after completing a required course on the social determinants of health. In a follow-up publication, we re-administered the SEI to the original student cohort entering their 4th year to determine longitudinal changes in individual and especially social empathy.

Summary of Results: Of 130 4th-year eligible medical students, 76 (58%) completed all three surveys. Significant changes occurred in 2 categories of individual empathy and in one category of social empathy. The mean 'Affective Mentalizing' score increased by 0.15 points from the first to fourth year of medical school, $P < 0.05$. A concomitant decline was observed in 'Emotional Regulation' decreasing 0.68 points, $P < 0.001$. 'Contextual Understanding of Systemic Barriers' (CU) increased in mean score by 0.26 points, $P = 0.006$. Fourth-year students who indicated their plan to enter primary care specialties had higher scores at base-line and at follow-up.

Discussion and Conclusions: Our findings support promoting interventions to combat a decline of emotional regulation in their clinical years. The consistent increase in CU at each follow-up testing point may indicate a need to place greater emphasis on students' sense of self-efficacy in addressing the social determinants of health, as CU represents a focus on barriers rather than a doorway to efficacious action. One measurable gauge of success in instilling a sense of agency would be improvement in the second social empathy category, Macro Self-Other Perspective-taking (MSP), which in our studies did not change over time. Social empathy scores also might predict on entry into medical school which students are likely to choose primary care specialties.

Take-home Messages: The SEI can be used to gauge students' empathy for social groups. 2. Helping students regulate their emotions may stop empathy decline and reduce burnout. 3. When teaching social determinants of health, educators should engage students in practical, actionable solutions. 4. Higher Social Empathy Index scores on matriculation may predict students' entry into primary care specialties.

Measuring the level of clinical empathy in Moscow medical students and residents by the Jefferson Scale of Empathy - the first pilot study in Russia

AUTHOR(S):

- **Sergey Gatsura, A.I. Yevdokimov Moscow State University of Medicine and Dentistry, Russian Federation (Presenter)**
- Oxana Gatsura, A.I. Yevdokimov Moscow State University of Medicine and Dentistry, Russian Federation
- Vladimir Deriushkin, A.I. Yevdokimov Moscow State University of Medicine and Dentistry, Russian Federation
- Pablo Gonzalez Blasco, SOBRAMFA “ Medical Education & Humanism, Brazil
- Graziela Moreto, SOBRAMFA “ Medical Education & Humanism, Brazil
- Mikhail Navarkin, A.I. Yevdokimov Moscow State University of Medicine and Dentistry, Russian Federation

ABSTRACT

Background: Empathy is considered to be a core competence of practicing physician who is expected to master it before launching unsupervised medical practice. On the other hand most Russian medical educators use research tools designed to estimate empathy in general population. The aim of this study was to evaluate the level of empathy in Moscow medical students and residents using Russian translation of Jefferson Scale of Empathy version for medical students (JSE-S).

Summary of Work: This cross-sectional study was conducted in September-December 2018 at the A.I. Yevdokimov Moscow State University of Medicine and Dentistry. The paper version of JSE-S translated into Russian was filled out anonymously by 161(30.4% males) final year medical students and 138 (30.6% males) first year medical residents. The mean empathy scores were analyzed with regard to gender, age and future specialty. The data were processed by Statistica 13.2 software.

Summary of Results: The JSE-S Russian version was well perceived by our respondents and displayed acceptable internal consistency in both students and residents (Cronbachs' alpha = 0.81 and 0.79 resp.). Total empathy scores did not differ significantly between students and residents (96.1 vs 98.1). Gender differences between student male and female respondents were not significant (94,8 vs 97.6), but female residents were obviously more empathetic than their male colleagues (100.1 vs 93.3, $p=0.0188$). No association was found between age, specialty interests and the level of empathy in both students and residents groups.

Discussion and Conclusions: Mean empathy scores of our respondents were comparable to those obtained in most Asian countries but noticeably lower than the data reported by researchers from Western countries. Interestingly, these findings match geographical position of Russia and might reflect local cultural traditions as well as certain tension within the medical profession caused by ongoing reforms of healthcare system in this country.

Take-home Messages: Encouraging results of our preliminary study substantiate further appraisal and validation of the JSE-S Russian version in national system of medical education. More targeted teaching on communicative skills could raise the level of empathy in medical trainees before they start their independent medical practice.

'The Silence Pact' - a qualitative exploration of cultural differences in breaking bad news

AUTHOR(S):

- Sophie Holmes, Newcastle University, UK (Presenter)
- Jan Illing, Newcastle University, UK

ABSTRACT

Background: Breaking bad news is recognised as an area where cultural practice varies significantly. In India, up to half of patients receiving chemotherapy are unaware of their diagnosis. Increasingly, our European medical workforce relies on international medical graduates (IMGs), who find communication skills a particularly difficult area during transition.

Summary of Work: This study explores cultural differences in breaking bad news with a view to supporting international transition. The research questions were: 'What is different in breaking bad news between the setting where IMGs trained and the UK?' And 'What could be underlying these differences?' A single investigator (SH) conducted 40 minute telephone interviews with IMGs who felt that breaking bad news had been different in their place of training.

Summary of Results: 35 IMGs were invited to participate and 16 were recruited. One key difference identified was whether to inform patients of a serious diagnosis, termed in Spain 'the silence pact'. This decision is motivated by a wish to protect the patient from emotional distress and improve their potential for recovery. In Northern Europe, on the other hand, we prioritise autonomy: confidentiality and informed consent are bastions of ethical practice.

Discussion and Conclusions: Underlying 'the silence pact' were differences in three key relationships. 1) The doctor-patient relationship - In their country of training, IMGs reported that many patients do not want to know their prognosis and feel suspicious of two-way decision making. In return, doctors demand respect and can be hostile when questioned. 2) The patient-family relationship - Family members are often interdependent and decisions are made collectively. Relatives feel that they are best placed to decide whether the patient will cope with knowledge of their diagnosis. 3) The doctor-family relationship - Family members are perennially present in doctor-patient interactions, providing valuable information for the doctor, contributing significantly to patients' care and taking part in decision-making.

Take-home Messages: Cultural variation in breaking bad news pivots on key healthcare relationships. Further exploration of this area will usefully inform effective IMG transition. In addition, this work has the potential to illuminate biases in our own ethical framework. How far do we prioritise autonomy and confidentiality over compassion?

Learning communication skills and how to deliver bad news in a multicenter fellowship for medical students. Results from a five year experience program

AUTHOR(S):

- Laura Boguea Muller, SOBRAMFA, Brazil (Presenter)
- Pablo G. Blasco, SOBRAMFA, Brazil
- Maria Auxiliadora Craice De Benedetto, SOBRAMFA, Brazil
- Graziela Moreto, SOBRAMFA, Brazil
- Pedro Subtil de Paula, SOBRAMFA, Brazil

ABSTRACT

Background: Communication skills and how to deliver bad news are complex themes and involves issues related to empathy and the ability to deal well with ones own and others emotions. Protocols have been proposed for facilitating the communication of bad news. However, many doubts persist regarding them. Would it be enough? Moreover, if the protocol is not enough, where can we find the resources to assist us in this communication at a delicate time?

Summary of Work: Qualitative approach of reports and interviews with medical students that have participated in a multicenter fellowship with a Tag Along model.

Summary of Results: Through the students' perspective, it is possible to identify the insecurity in face of uncertainty in delivering bad news: 'very difficult to be completely prepared and sure how to do it'. The protocol appears as a safe harbor: 'the doctor feels more insecure because he does not have a step by step'. However, the individuality of situations appears: 'When there is a pre-established technique, many professionals end up getting carried away by it and do not consider the particularities of people, leaving humanity aside to give bad news mechanically'.

Discussion and Conclusions: Because of the individuality of situations, families and patients the student realize that the protocol is a limited tool and it is necessary to appeal to subjectivity, based on an intuitive sensitivity, to deal with the unusual situations they encounter. This intuitive sensitivity can be fostered by paying attention to patient and family histories. Reflection on the human condition can have as its starting point the personal stories of patients and be strengthened by the human stories revealed through art. In conclusion, the tag along model allows learning in the field with real experiences, allowing the student to feel and reflect.

Take-home Messages: 1. Insecurity and uncertainty are part of the daily routine of all doctors, talk to your colleagues about what is going on inside you as well. 2. Learn to deal (do not ignore!) with your anguish in order to be able to deal with the anguish of the other.

Analyzing expert criteria for authentic resident communication skills

AUTHOR(S):

- Heeyoung Han, Southern Illinois University School of Medicine, USA (Presenter)
- Susan Hingle, Southern Illinois University School of Medicine, USA
- Timothy Koschmann, Southern Illinois University School of Medicine, USA
- Muralidhar Reddy Papireddy, East Tennessee State University, USA
- Jacqueline Ferguson, Southern Illinois University School of Medicine, USA

ABSTRACT

Background: Effective communication is context dependent and work-process oriented. Training and assessing the skills require flexible holistic approaches rather than itemized scoring. Despite this discrepancy between assessment criteria and real-world practice, few efforts have embraced a holistic understanding of how physician-patient communication skills should unfold in real patient care. We investigated what constitutes physician communication skills in real patient encounters. This study focuses on what experts refer to when they speak about physicians' communication skills and what is treated as important when they evaluate residents' communication skills during real patient encounters.

Summary of Work: The residents are recorded annually as a part of their program for formative assessment of communication skills in real patient encounters. The structure of an evaluation panel: listen to the recording with the transcript, construct notes individually, then jointly develop feedback comments for the resident. For this study, the evaluation panel discussions were recorded and transcribed. Forty-one (89%) panel discussions out of 46 one year evaluation sessions were analyzed. For data analysis, we use grounded theory to discover themes emerging from the data. We received an IRB approval.

Summary of Results: Results showed that existing elements of communication skills are connected and inter-dependent around two concepts of thoroughness and natural flow that were neither sufficiently called for in the current assessment form nor received much treatment in the literature. Themes included (1) thoroughness within a boundary set by agenda setting, (2) making agenda setting explicit to all parties up front, (3) dynamics between natural and controlled flow, (4) question designing using both open-ended and closed questions, (5) understanding patient perspective and environments as pre-condition for patient education, (6) shared decision-making requiring patient education, and (7) empathy multifaceted and demonstrated in multiple ways.

Discussion and Conclusions: Findings can be utilized to improve the current training and assessment approach of physician-patient communication skills, especially formative feedback practices. The main expected outcome is to improve the residents' competence to represent holistic communication skills in real patient care.

Take-home Messages: Rather than sticking to a specific rubric, training and assessment criteria should evolve through authentic experiences of physician-patient communication.

Culture and Human: What does it mean for medical students?

AUTHOR(S):

- Ozlem Surel Karabilgin Ozturkcu, Ege University Faculty of Medicine, Turkey (Presenter)

ABSTRACT

Background: As societies become increasingly multicultural, the importance of cultural competence in healthcare is increasing. In this study, it is aimed to enhance medical students' self-awareness and to improve their communication skills in the context of the main elements of culture.

Summary of Work: Forty second and third year students took the eight week course. The subjects of the course were: self-expression; individual traits; differences; formation and development of culture; cultural richness and cultural awareness; cultural empathy; spontaneity and creativity in intercultural communication. Psychodrama techniques were used. Cultural Intelligence Scale-CIS and Intercultural Sensitivity Scale-ISS were administered twice during the first and last week of the course.

Summary of Results: In the CIS, statistically significant increases were found between the scores of the students in the first and last week on metacognition (p:0.012), and motivation (p:0.001) subscales. There were slight increases in scores on cognition (p:0.360), and behavior (p:0.168) subscales. There were statistically significant increases between the scores obtained at the first and last week on the three subscales of the ISS. These subscales were responsibility in communication (p:0.004), self-confidence in communication (p:0.001), and enjoyment from communication (p:0.010). There were no statistically significant score increases on the subscales of respecting cultural differences (p:0.703), and being careful in communication (p:0.853).

Discussion and Conclusions: The cognitive and affective approaches of the students towards different cultures developed positively throughout the course. In terms of cultural intelligence, it was shown that there was an improvement in medical students' high level thinking skills on culture at the end of the study. In addition, there was an increase in their willingness to interact with people from different cultures and to learn about intercultural situations. In terms of intercultural sensitivity, students have developed a sense of responsibility, self-confidence and enjoyment in communication with people from different cultures.

Take-home Messages: It can be planned educational activities related to communication with different cultures from an early stages of medical education curricula. Thus, medical students' cognitive, affective and behavioral approaches related different cultures can be developed. As a result, the cultural competence levels of medical students may increase until graduation.

Doctor-patient communication in an Iranian and Norwegian context

AUTHOR(S):

- **Jorgen Urnes, Dep. of Public Health and Nursing Faculty of Medicine, Norway (Presenter)**
- Assistant Professor Nick Faradonbeh, Dept. of Public Health and Nursing, Faculty of Medicine and Health Sciences, Norway
- Assistant Professor Marit Rye, Dept of Public Health and Nursing, Faculty of Medicine and Health Sciences, Norway
- Medical Student Parna Alikhani, Shahrekord University of Medical Sciences, Iran

ABSTRACT

Background: Increasing worldwide migration confronts healthcare with the consequences of a multi-ethnic society. Intercultural doctor-patient contacts are potential sources of misunderstanding and low-quality communication, which may reduce the quality of care. Causes for misunderstanding and difficulties in intercultural communication are sought in differences in perspectives, values and beliefs about illness between doctors and patients with different ethnic backgrounds. Given the growing cultural diversity among physicians and patients, and the demand for intercultural communication between doctors and patients, research is needed on the degree to which patterns of doctor-patient communication vary between cultures of countries.

Summary of Work: We describe and compare doctor-patient communication in an urban area of Iran and an equivalent area in Norway to explore differences in communication when performed within its own native context. Consultations are audiotaped, transcribed and analysed by frequency of categorical variables and time as continuous variable. Themes brought into the consultation by either the patient or the doctor will be explored.

Summary of Results: Analyses: The opening sequence of the consultations defined by the first four minutes will be analysed. Statements by patients and doctors are categorised as 'open' (inviting to a free response from patient) or 'closed' (inviting to patient to give specific answers). Furthermore, time occupied by doctor's talk and time occupied by patient will be recorded, as well as time of silence. The data recorded from each location will be compared. Both the frequency of statement categories and time registrations will be compared using relevant statistical methods. Fifteen consultations will be recorded in a random day in each study location. Preliminary results: In native Iranian Doctor-patient communication less time is spent in total, and particularly less time spent on statements building a personal relationship when compared to native Norwegian Doctor-patient communication. Further results will be investigated.

Discussion and Conclusions: Recognising differences in native Doctor-patient communication in different cultures will be of value for understanding differences in expectations, outcomes and training communication skills for managing multi-ethnicity in present and future healthcare.

Take-home Messages: Recognising differences in native Doctor-patient communication in different cultures will be of value for understanding differences in expectations, outcomes and training communication skills for managing multi-ethnicity in present and future healthcare.

Clinical communication for the 21st century: A faculty approach for curriculum renewal and improved graduate outcomes

AUTHOR(S):

- Robyn Woodward-Kron, University of Melbourne, Australia (Presenter)
- Charlotte Denniston, University of Melbourne, Australia
- Caitlin Barr, University of Melbourne, Australia
- Rebecca Wong, University of Melbourne, Australia

ABSTRACT

Background: Clinical communication teaching is established in medicine but less so in other disciplines, including audiology and dentistry. While aspects of clinician-patient communication differ across health professions, there are generic skills that can be taught faculty wide. Further, to prepare students for contemporary healthcare, communication teaching should include communication technologies as well as participatory healthcare. Current curricula rarely include these aspects or interprofessional communication.

Summary of Work: The initiative involves scoping faculty existing clinical communication teaching and learning and assessment activities at the University of Melbourne, Australia, in the first instance in dentistry and audiology using a template developed for the Melbourne MD. Small discipline based working groups were established for priority setting. Professional development workshops are planned, informed by recent PhD studies with observational data from student placements, as well as current clinical communication research about pedagogy, assessment, and curriculum content.

Summary of Results: The work is ongoing, yet the results from the working group in medicine suggest that the Community of Practice can be sustainable with regular updates, cross faculty engagement, involvement of doctoral students researching learner clinical communication, and input from international experts. Curriculum scoping can present unique challenges when clinical placements are diverse and communication teaching is implicit.

Discussion and Conclusions: The expected impact is both for participating clinical educators and academics in terms of increased awareness, knowledge, and improvement in teaching clinical communication. Incorporating patient partners that reflect the diversity of patients in clinical settings remains an ongoing challenge. The activities outlined in this proposal should also contribute to improved clinical communication of the health professions' students in the faculty, which can contribute to the quality of patient care.

Take-home Messages: A Community of Practice for a faculty wide approach to teaching, learning and promoting clinical communication holds promise as a sustainable and effective initiative for curriculum renewal and improved graduate outcomes.

Impact of an innovative endowed chair program on medical educator recipients

AUTHOR(S):

- Peter ChinHong, UCSF, USA (Presenter)
- Helen Loeser, UCSF, USA
- Alissa Peterson, UCSF, USA
- Rageshree Ramachandran, UCSF, USA
- Patricia O'Sullivan, UCSF, USA

ABSTRACT

Background: In 2001, UCSF's Academy of Medical Educators launched a matched endowed chair program in support of teaching excellence, career development and professional identity formation. Like other endowed chairs the holder receives discretionary income to pursue value-added education work. Unlike other chairs, these chairs are co-funded by the School of Medicine and an academic department, and limited to two 5-year terms. What is the impact of holding an endowed chair for medical educators on individual chair holders?

Summary of Work: We conducted a grounded theory study, interviewing chair holders who had completed at least one term. We double-coded all transcripts and reconciled codes. When analyzing the codes we identified themes through an iterative consensus-building approach.

Summary of Results: Twenty-three of 24 (96%) eligible faculty members from 14 departments participated. The themes included opportunity, resources, expectations and recognition. Holding the chair provided opportunity to advocate for education within departments or beyond the institution, to network locally and globally, and to build scholarship and self-confidence. The resources allowed the holder to develop oneself and/or support learners/others. Expectations as to how to use and manage the funds for education was often not immediately obvious. With experience, holders recognized how to leverage the funds. Ultimately, the chair brought recognition as an indicator of quality and amplified visibility and status within the institution and externally.

Discussion and Conclusions: A model of impact emerged. Having resources and both institutional and departmental expectations allowed the holder to take advantage of opportunities. These, and just having the chair title, led to visibility and 'gravitas' as an educator. In general, an endowed chair allowed holders to escalate their commitment to medical education. Importantly, the individual increased the recognition of education in their departments, and often in their national clinical specialty. The notion of a term limitation provided focus.

Take-home Messages: Establishing a time-limited endowed chair program in medical education can have tremendous impact beyond the individual to the department and to the specialty in general.

Oh my goodness, what have I done? - Exploring the experiences of non-medically qualified clinical teachers of undergraduate medical students

AUTHOR(S):

- Sonia Bussey, Newcastle University, UK (Presenter)

ABSTRACT

Background: In recent years, the number of non-medically trained teachers of undergraduate medical students has risen sharply, yet there have been few studies to investigate the views and experiences of these teachers.

Summary of Work: Semi-structured interviews were conducted with thirteen clinical teachers involved in the delivery of the FoCP rotation (delivered during year three of the MBBS programme). An inductive approach based on a social constructivist philosophy was adopted, and thematic analysis used to identify emergent themes from participants.

Summary of Results: Differences in professional background were associated with differences in teaching experiences and how participants identified as teachers. Clinical teachers from non-medical backgrounds found the transition from clinician to teacher of medical students more challenging than their medically trained colleagues. An additional challenge for all teachers who were not medically trained was that their colleagues may not understand their scope of practice and expertise, which may lead to them not being utilised appropriately. Lack of respect or perceived 'lower status' was experienced by some non-medical participants from students and colleagues, as was an associated lack of confidence in teaching ability. Career pathways for clinical teachers were unclear, and suitable career role models were not easily identified or available in many cases.

Discussion and Conclusions: Participants from non-medical professional backgrounds described some characteristics and clinical teaching experiences that differed from those of their medically qualified counterparts in terms of role structure, perceived isolation and issues of confidence and capability. Lack of perceived opportunities for career progression of non-medical teachers was evident in the findings. This is a potential concern, as clinicians motivated to become involved in clinical teaching may become discouraged if the opportunities for progression in a teaching role are not comparable with those offered by clinical posts. Non-medical teachers expressed a desire to become more involved with the university and attend networking events to establish new collaborative working relationships and raise awareness of their role and capabilities.

Take-home Messages: Organisations involved in medical education should seek to provide opportunities for non-medically trained teachers to identify similar colleagues to engage in professional development and to promote their role and expertise.

The Characters of A Good Teacher - An Exploratory Study

AUTHOR(S):

- Lieh-Yu Yi, School of Medicine, Tzu Chi University, Taiwan (Presenter)
- Shao-Yin Chu, Tzu Chi General Hospital, Taiwan
- Jo-Hsin Chao, Tzu Chi General Hospital, Taiwan

ABSTRACT

Background: A good medical teacher has many attributes, including sharing medical knowledge and the value as a medical personnel, listening and answering medical students' questions, giving constructive feedback, and promoting reflections. What makes those attributes of a good medical teacher in 21st century? Will those attributes different from the past and within different cultural setting? We hope this questionnaire study not only contributes to the wider literature, but also informs and promotes personal and administrative reflection upon faculty and student's development program.

Summary of Work: A mixed quantitative and qualitative questionnaire survey was conducted in School of Medicine, Buddhist Tzu Chi University. In this questionnaire, a total of 47 5-point Likert scale questions contain categories of good medical teacher trait defined from literature revises. 6 open-ended questions are also designed to explore respondents' own point of view. IRB approved questionnaire was sent to 100 medical teachers of clinical and basic medical science and 100 medical students.

Summary of Results: The overall response rate is 80%. According to the results of the Likert scale data, this study includes the following six different domains: the curriculum planner and the course planner, the information provider, the mentor/ learning facilitator, the assessor, the resource developer, and the role model. According to those open questions, medical students values how their teachers spend time as students in need while medical teachers focus on the appropriate methods and attitudes when teaching. Furthermore, we can also find it's hard for teachers of basic medical science to serve as role models and to share career experience.

Discussion and Conclusions: The characteristics of a good teacher are alike for medical teachers and students, but the most important attribute is partially different for each other.

Take-home Messages: A good medical teacher is not only a knowledge provider but a role model and a true friend for students. Good teachers also take enough learning resources and supports from school.

Tensions in perceptions of the role of 'nurse as teacher' for medical trainees

AUTHOR(S):

- **Asif Doja, CHEO, University of Ottawa, Canada (Presenter)**
- Carolina Lavin, CHEO Research Institute, Canada
- Chantalle Clarkin, Bruyere Research Institute, Canada
- Gerry Ashton, The Ottawa Hospital, Canada
- Laura Hopkins, The Ottawa Hospital, Canada
- Glenn Posner, The Ottawa Hospital, Canada

ABSTRACT

Background: The informal curriculum -- an essential complement to the formal curriculum -- is delivered to medical trainees through learning outside the classroom. We sought to explore nurse-mediated aspects of trainee education in the informal curriculum in obstetrics and gynecology (OBGYN), as well as nursing perceptions regarding their role in medical trainee education.

Summary of Work: In this qualitative, exploratory study we employed a series of naturalistic observations (40 hours over 10 days) on a tertiary care OBGYN unit. Field notes focused on interprofessional dynamics, educational opportunities, and nurse-trainee interactions were collected and synthesized. Informed by this data, we conducted focus groups with third year medical students (n=10 participants), and one-on-one interviews with OBGYN nurses (n=10). Focus group and interview audio was transcribed and analyzed thematically.

Summary of Results: Various themes emerged, highlighting how the educational role of nurses was conceptualized differently by nurses and medical trainees. Nurses perceived themselves as gatekeepers and patient advocates; while trainees acknowledged this important role, they did feel the gatekeeper role occasionally interfered with learning. Nurses viewed engagement as a mediator of teaching and tended to teach more to trainees who demonstrated an interest in OBGYN. Many trainees realized this, and tended to explicitly declare their interest in OBGYN in order to obtain more nurse-led teaching. Nurses also described tailoring teaching to the learner; the amount of detail they would include in their teaching depending on trainee level. Finally, nurses felt their key role was the teaching of 'hard' skills' such as procedures and the administrative aspects of OBGYN care and of 'soft skills/field wisdom' i.e. what nurses felt was not taught in textbooks. Trainees acknowledged the important role of nurses' instruction in learning 'hard skills'; however, they did not seem to appreciate the nurses' role in teaching 'soft skills/field wisdom'.

Discussion and Conclusions: Nurses routinely participate in the education of medical trainees. Tensions remain regarding the systematic enactment of this role.

Take-home Messages: Given the valuable teaching resource OBGYN nurses present, more emphasis should be placed on the actualization of this role within the informal curriculum.

Building a better mousetrap: A utility-focused clinical teaching evaluation instrument

AUTHOR(S):

- Joan Binnendyk, Western University, Canada (Presenter)
- Saad Chahine, Western University, Canada

ABSTRACT

Background: Over the past decade, numerous studies have been published decrying the use of Student Evaluations of Teaching (SETs) for faculty tenure and promotion purposes due to inherent bias. However, SETs are the predominate method of capturing learner experience to provide formative feedback and enhance faculty development initiatives. The purpose of this project is to design an instrument that aligns with what learners look for and what teachers can use for self-development.

Summary of Work: Drawing on Patton's framework of utility-based evaluation, the development of the utility-focused clinical teaching evaluation (UF-CTE) instrument was conducted in two parts. First, a literature review of published studies in medical and higher education was conducted. A prototype evaluation was chosen as it leveraged the input of residents who contributed the qualities valued in a clinical teacher through a critical incident approach. Second, items with high correlation from this study were reviewed by key stakeholders, six clinical educators, three administrators, and one educational technologist. Discussions centred on appropriateness, relevance, and utility of the results to facilitate feedback.

Summary of Results: The development process was conducted in 3 rounds of refinement and resulted in a computer-based instrument with pedagogy, quality care, and competence items. The pedagogy items are on a 5-pt Likert scale (unsatisfactory - exceptional), comprised of items including devoted time and energy to teaching activities; assigned progressive responsibility with appropriate supervision; and communicated clearly and effectively. The quality care and competence items are dichotomously scored (yes/no) and comprised of items including, 'Did you receive training on patient safety?' and 'Would you refer a friend to this physician?'

Discussion and Conclusions: Combining research with input from learners who complete evaluation forms, faculty who are the target, administrators who value the results, and technologists who program the instrument, ensures the evaluation tool is practical and useful for everyone involved - one that balances form and function: length, level of detail, and interface with current IT processes.

Take-home Messages: Clinical teaching evaluations require a thoughtful, utility-based approach to ensure the instrument accurately reflects the needs of all stakeholders.

Can analyzing student feedback help simulation center faculty improve their teaching and professionalism?

AUTHOR(S):

- **Matthew Emery, Michigan State University College of Human Medicine, USA (Presenter)**
- Monica van de Ridder, Michigan State University College of Human Medicine, USA
- Lindsey Ouellette, Michigan State University College of Human Medicine, USA

ABSTRACT

Background: Students at the Michigan State University (MSU) College of Human Medicine receive over 200 hours of simulation-based clinical skills teaching during the first two years of the curriculum. Faculty observe and provide feedback, with nearly 7,000 hours of faculty-student contact scheduled. Feedback is primarily provided in small groups, creating unique challenges for maintaining a safe learning environment. Recent professionalism scandals at MSU heightened awareness of the need to identify concerning faculty behavior early, which led simulation leadership to the following questions. What are students telling us about points for improvement for our faculty? What themes are identified in negative student feedback regarding faculty?

Summary of Work: Students open-ended comments of negative faculty feedback for the 2017-2018 academic year were analysed using a qualitative conventional content analysis with an inductive approach (Hsieh 2005, Elo 2008). This approach is used when the theory of data under study is limited. We used open coding, axial coding and selective coding to analyze our data. In collaborative meetings, discrepancies were resolved through a process of deliberation until consensus was achieved. A member check was included to increase validity.

Summary of Results: 342 students completed surveys (91.7% response rate), and 111 of 126 faculty received negative comments (88.1%). 925 negative comments were submitted. A total of 81 (8.8%) comments could not be used for this study; they were too vague, positive in nature or about the curriculum. Three main themes were identified: Teaching activities (n=362, 39.1%) with the subcategories of 'assessment of the learner,' and 'methods of delivery of skills and knowledge.' Teaching style of faculty (n=143, 15.5%) with the subcategories of 'timing,' 'speaking,' 'listening' and 'learning environment.' Teacher (n=339, 36.6%) with the subcategories of 'personality (n=221, 23.9%),' 'teacher's knowledge base,' and 'unprofessional behaviors (major/minor)' (n= 86, 9.3%) such as 'being distracted,' 'discrediting the curriculum,' or 'using off color language.'

Discussion and Conclusions: Serious professionalism concerns were rare. The most common theme identified was related to faculty personality. Feedback often lacked specificity and some feedback was vague or contradictory. The students feedback was nonetheless provided to the faculty.

Take-home Messages: Students need better training on the provision of effective feedback to make it more actionable by faculty.

#10M Short Communications - Student: Burnout and Resilience

Burnout in medical students during initial career years: mental health implications

AUTHOR(S):

- Carolina Pérez, Universidad Andrés Bello, Chile (Presenter)
- Hugo Orellana, Universidad Andrés Bello, Chile
- Jessica Goset, Universidad Andrés Bello, Chile
- Mariana Searle, Universidad Andrés Bello, Chile (Presenter)
- Verónica Silva, Universidad Andrés Bello, Chile
- Ricardo Ramirez, Universidad Andrés Bello, Chile

ABSTRACT

Background: Burnout is a common syndrome in medical students due to the personal resources deployed in response to academic demands. There is little evidence about the effects of burnout on critical cognitive learning parameters such as attention, memory and metacognitive skills, neither on the relationship between burnout and mental health. The relationship between burnout with anxiety and engagement; and its effect on cognitive parameters was evaluated in second year medical students.

Summary of Work: A descriptive transversal study was conducted. Applying the Maslach Burnout Inventory, 46 second-year students were divided into presence or absence of burnout. The following tests were also applied: cognitive meta-attention (Five Facet Mindfulness Questionnaire); Subjective memory (Failures of memory in everyday life); Attentional capacity (Sustained Attention to Response Task); Anxiety (Anxiety-State Scale) and Engagement (Engagement Survey). Informed consent was obtained. Inferential statistical analysis was used ($p < 0.05$).

Summary of Results: 30% of students have severe burnout (three diagnostic criteria). A meaningful decrease in the ability to remember daily life events and meta-attention is observed. Sustaining attention was modulated by burnout. 86% of students that have low or very low engagement, have burnout. Anxiety, has no relation with the statistically significant syndrome, however, a general tendency of the sample to present levels of permanent anxiety (trait anxiety) is reported.

Discussion and Conclusions: Significant percentage of students have a severe state of burnout, affecting functions necessary for learning: attention, memory and the ability to engage. This is worsened by high levels of baseline anxiety. Self-observation could be considered as a protective factor in the syndrome. Early in the career diagnosis could show students at risk in their cognitive functioning. Results obtained would account for the relevance of affectivity within the students learning process.

Take-home Messages: These findings reinforce the need to establish preventive measures to ensure correct training and quality of life for students.

Implementing a Burnout Prevention and Education Program in a Physician Assistant Program

AUTHOR(S):

- Heidi Brown, Idaho State University, USA (Presenter)
- Jennifer Forbes, Idaho State University, USA
- Talia Sierra, Idaho State University, USA
- Melanie Domenech Rodriguez, Utah State University, USA

ABSTRACT

Background: Provider burnout has been linked to higher medical error rates, slower patient recovery times, greater malpractice lawsuits and higher turnover. It affects retention in the profession and quality of patient care. It leads to higher suicide and depression rates. This study aims to determine if implementing a burnout education and student wellness program decreases burnout and burnout sequelae in a physician assistant (PA) program students.

Summary of Work: A Student Wellness and Burnout Prevention Program (SWBPP) was established at three separate campuses of a PA program. This program provided burnout education and prevention skills PA students while creating an environment aimed to reduce student stress and foster support among faculty and students. The voluntary program held guided monthly meetings, with the option for students to meet more frequently. All students completed an initial survey, regardless of their intent to participate, to collect data on burnout, depression, and support from fellow classmates and faculty. The survey was re-administered at the conclusion of the SWBPP. Survey results were compared between those who participated in the program with those who did not.

Summary of Results: Final results will be available in June, 2019. A mixed analysis of variance (Mixed ANOVA) with time (pre, post) as the within-subjects condition and group (participated, did not participate) will yield information regarding main effects for time, group participation, and the interaction between group membership and time on a variety of outcomes with particular emphasis on student mental health (distress, burnout, substance use).

Discussion and Conclusions: It is important that the habits of professional practice and self-care develop during healthcare professional training, including burnout prevention. Providing specific education sets the stage for being prepared to recognize and cope with burnout; doing it in a group format, prepares students to understand the importance of a quality wellness program, peer support, and the positivity that follows.

Take-home Messages: -Burnout is a problem in the healthcare field. - Students feel burnout education is beneficial. - Burnout education and a wellness program is important to implement in healthcare training programs.

Burnout syndrome in medical students and association with poor sleep quality, sedentary lifestyle and use of psychotropic drugs

AUTHOR(S):

- **Arnaldo Aires Peixoto Junior, Centro Universitário Christus (UNICHRISTUS), Brazil (Presenter)**
- Priscila Brasil de Carvalho Rocha, Centro Universitário Christus (UNICHRISTUS), Brazil
- Talita Mendes Bezerra Ximenes, Centro Universitário Christus (UNICHRISTUS), Brazil
- Emmanuella Passos Chaves Rocha, Centro Universitário Christus (UNICHRISTUS), Brazil
- Raquel Autran Coelho, Centro Universitário Christus (UNICHRISTUS), Brazil
- Marcos Kubrusly, Centro Universitário Christus (UNICHRISTUS), Brazil

ABSTRACT

Background: Burnout syndrome is characterized by emotional exhaustion, a feeling of reduced labor productivity and depersonalization. It can occur in individuals under constant and prolonged emotional tension in the professional context. Among medical students, this emotional tension is frequent and may result in an increase in the prevalence of this condition. Therefore, with this work we seek to investigate the prevalence of burnout syndrome and associations with health indicators among medical students.

Summary of Work: A cross-sectional, descriptive and retrospective study of medical students from the first to the eighth semester of a university center in the northeast of Brazil during the period of August to December of 2018. After signing the Free and Informed Consent Term, the students answered a structured questionnaire to investigate lifestyle habits and use of medications. The Maslach Burnout Inventory - Student Survey and the Pittsburgh Sleep Quality Index were applied. The study was approved by the research ethics committee of the institution. For data analysis, the IBM SPSS Statistics software version 20.0.0 was used.

Summary of Results: A total of 523 medical students were evaluated and the prevalence of burnout syndrome was 9.2%. The median age was 21 (20 - 23) years and the majority was female (63.5%). There was no difference in age and sex among students with this condition or not. Among students with burnout syndrome, a lower percentage of appropriate place to study at home (10.7 vs. 20.8%, $p = 0.038$) and lower practice of physical activity (8.3 vs. 29.1%, $p = 0.010$) were identified. Students with burnout syndrome used more anxiolytics (20.8 vs. 6.1%, $p < 0.001$), more antidepressants (27.1 vs. 7.4%, $p < 0.001$) and had a higher prevalence of poor sleep quality (77.1 vs. 51.6%, $p < 0.001$).

Discussion and Conclusions: Burnout syndrome in medical students was frequent, associated with sedentary lifestyle, poor sleep quality, and frequent use of psychotropic drugs. The possibility of perpetuating this condition after graduation alerts to the need for a preventive approach during the medical course.

Take-home Messages: Burnout syndrome in medical students is frequent and is associated with indicators that have a negative impact on health.

Learning strategies of Chilean medical students change along clinical training and predict their levels of burnout and wellbeing at graduation

AUTHOR(S):

- **Guadalupe Echeverría, Pontificia Universidad Católica de Chile, Chile (Presenter)**
- Denisse Zúñiga, Pontificia Universidad Católica de Chile, Chile
- Oslando Padilla, Pontificia Universidad Católica de Chile, Chile
- Maribel Calderón, Universidad Bernardo O'Higgins, Chile
- Marcela Bitran, Pontificia Universidad Católica de Chile, Chile

ABSTRACT

Background: Transition to clinical training poses a learning challenge to medical students; they have to adapt their study approaches in order to learn from clinical experiences within complex health-care settings. This transition is marked by increases in stress levels and burnout prevalence. Aim. To characterize medical students' learning strategies along the clinical training and determine whether these strategies predict students' burnout and wellbeing status at graduation.

Summary of Work: 700 medical students (43.7% females) from eleven Chilean universities were evaluated at the beginning (T1) and two years later, at the end of their clinical training (T2). Participants answered validated questionnaires of burnout (Maslach Burnout Inventory), psychosocial wellbeing (Mental Health Continuum Short Form) and clinical learning strategies (Clinical Learning Strategies Questionnaire, CEACLIN). CEACLIN is a 48-item scale rated with a 4-point frequency scale and comprised of four dimensions: Academic Engagement (AE), Study Techniques (ST), Emotion Regulation (ER) and Stress Management (SM).

Summary of Results: Students changed their clinical learning strategies: the use of AE (i.e. autonomy-seeking and proactive behaviors, and resorting to others) and ER strategies decreased whereas ST and SM strategies use increased. The likelihood of suffering burnout at T2 was associated with a less frequent use of SM strategies two years before. On the other hand, the chances of being in a flourishing state in T2 were associated with a more frequent use of AE and ST strategies in T1.

Discussion and Conclusions: Medical students change their learning strategies along the clinical training decreasing their engagement and emotional regulation in favor of the use of study and stress management techniques. The state of burnout and flourishing at the end of the undergraduate studies was significantly associated with the type of clinical learning strategies used two years before.

Take-home Messages: The learning strategies used by medical students change along the clinical training years. This probably reflects an attempt to cope with the increased academic challenges. Acquiring tools to better deal with stress and to enhance the academic engagement early in medical career could decrease students' vulnerability to burnout and increase their chances of achieving higher levels of wellbeing.

#10M Short Communications - Student: Burnout and Resilience

Clinical training stress and professional quality of life among medical students: the buffering effect of resilience and its determinants

AUTHOR(S):

- Blossom Yen-Ju Lin, Chang Gung University, Taiwan (Presenter)
- Yung Kai Lin, Chiayi Branch, Taichung Veterans General Hospital, Taiwan
- Chia-Der Lin, China Medical University and Hospital, Taiwan
- Der-Yuan Chen, China Medical University Hospital, Taiwan

ABSTRACT

Background: Resilience is a flexible, adaptive act that occurs in response to challenges. This study aimed to explore whether medical students' resilience plays a protective role against stress incurred during workplace training and on their professional quality of life during clerkships (Hypothesis 1) and whether resilience development can be determined from their preclinical school life (Hypothesis 2).

Summary of Work: This was a 1-year prospective cohort web-based questionnaire study comprising one cohort of medical students in their fifth year of clerkships at one medical school in Taiwan between September 2017 and July 2018. Web-based, validated, and structured self-administered questionnaires were used. Medical students' demographics (i.e., sex and age), personal characteristics (i.e., grit and resilience), and preclinical school life (i.e., psychosocial support, mentoring, social and health activities, and school climates) were measured at the beginning of their clerkships. Their perceived training stress (i.e., physical and psychological demands) and professional quality of life (i.e., burnout and compassion satisfaction) at each specialty rotation were routinely measured. Ninety-three medical students were included. Hierarchical regressions and a multiple regression analysis were performed, respectively, for testing Hypothesis 1 and 2.

Summary of Results: The medical students' perceived training stresses were related to higher burnout and worse compassion satisfaction in clerkships, but their resilience could buffer the negative effects of their perceived physical demands but not psychological demands. Medical students' grit and preclinical school life played crucial roles in developing their resilience properties; grit especially demonstrated a relatively larger explanatory power than other factors.

Discussion and Conclusions: Medical students' resilience could be a buffer against the negative effects of physical demands on their professional quality of life but not against those of psychological demands in workplace training. Grit among medical students' could be further explored to determine the degree to which it is a product of nature versus nurture.

Take-home Messages: Clinical training produce training stresses negative to medical students' professional quality of life. Resilience is a buffer for the negative effects derived from physical demands in training. Grit seems to play a relatively important role in medical students' resilience compared with other factors.

The longitudinal effect of grit on academic achievement among Japanese medical students

AUTHOR(S):

- Yusuke Karouji, Kansai Medical University, Japan (Presenter)
- Katsumi Nishiya, Kansai Medical University, Japan

ABSTRACT

Background: Medical students need to intensively study and train over a period of years. 'Grit' has recently attracted attention as a factor that underpins such a persistent level of effort. Grit is defined as 'perseverance and passion for long-term goals,' and it consists of two factors: perseverance of effort and consistency of interest. Grit has shown to have positive correlations with academic achievement, retention within specific programs, and participation in sports activities. However, little is known about how grit affects longitudinal achievement. This study examined whether grit predicted cumulative grade point average (GPA) after a year among Japanese medical students. In addition, we examined how grit influenced class attendance and club activities, which most Japanese medical students engage in.

Summary of Work: Four hundred forty-six undergraduates from the first to the fourth year at Kansai Medical University in Japan completed the Short Grit Scale at the beginning of the first semester. This scale consisted of four items measuring perseverance of effort and four items measuring consistency of interest. At the end of the first semester, the students reported their frequency of class attendance and the hours per week spent in club activities on a 5-point scale. The cumulative GPA was obtained at the end of the second semester.

Summary of Results: The results revealed that perseverance of effort (but not consistency of interest) showed a significant positive correlation with GPA ($r = .12$). A path analysis revealed that perseverance of effort predicted higher class attendance ($B = .20$), which predicted a higher GPA ($B = .31$). Perseverance of effort also predicted the greater time spent in club activities ($B = .19$), which in turn predicted a lower GPA ($B = -.13$).

Discussion and Conclusions: The results show that grit affected long-term academic achievement (i.e., cumulative GPA) both positively and negatively: Grit positively affected GPA through higher attendance and negatively through greater participation in club activities, respectively. It indicates that we should consider the goals to which students dedicate their grit.

Take-home Messages: Grit positively influences academic achievement through class attendance but negatively through participation in club activities.

Identifying the learning objectives of clinical clerkship in community health (CCC) in Japan: Focus Group

AUTHOR(S):

- **Daisuke Kato, Department of Family Medicine, Mie University Graduate School of Medicine, Japan (Presenter)**
- Hideki Wakabayashi, Department of Community Medicine, Kameyama, Mie University School of Medicine, Japan
- Akiteru Takamura, Department of Medical Education and Community Medicine, Kanazawa Medical University, Japan
- Yousuke C. Takemura, Department of Family Medicine, Graduate School of Medical and Dental Sciences, Tokyo Medical and Den, Japan

ABSTRACT

Background: The importance of medical education in the community has been recognized globally. World Federation for Medical Education emphasized in 2015 the importance of medical education in various settings in the community. In Japan, the Model Core Curriculum for medical education stated the necessity of clinical clerkship in community health (CCC) in 2016, as well. On the other hand, learning objectives of CCC and the concrete strategy for CCC have not been clearly established in Japan yet.

Summary of Work: We conducted six focus groups (n=35) at three prefectures in Japan from 2017 to 2018, with medical professionals and inhabitants, who were involved in CCC. We recorded, transcribed, and analyzed the discussion thematically. In the analysis, we used the SPICES model as a conceptual framework.

Summary of Results: We extracted 13 domains for learning objectives: 'professionalism', 'medical knowledge and ability to solve problems', 'medical skills and patient care', 'communication skills, 'team-based care', 'quality and safety management in medical care', 'medical care in society', 'scientific inquiry', 'lifelong learning attitude', 'future-oriented systematic view,' 'organic integration of knowledge/skill,' 'understanding of the community,' and 'awareness as an individual physician' The latter four domains were not found in 'Basic Qualities and Capacities for Physicians' in the Model Core Curriculum in Japan.

Discussion and Conclusions: This study had mainly two strengths. First, we conducted this study in various settings: a mountain/seacoast area, and a city/rural area. For example, at Mie University, many types of medical professionals and inhabitants have involved in CCC for four weeks in the community: health care centers and other community health care settings. Second, some participated physicians belonged to both a university and a community hospital/clinic. The outcome of this study would reflect the community needs and academic perspective.

Take-home Messages: We explored the learning objectives of CCC by focus groups targeting medical professionals and inhabitants in communities. Some domains we found were specific in CCC. We hope these learning objectives are useful for the further improvement of CCC in Japan in the future.

Re-thinking the purposes and practices of community based medical education

AUTHOR(S):

- Clare Morris, Barts & The London School of Medicine and Dentistry, Queen Mary University London, UK (Presenter)
- Louise Younie, Barts & The London School of Medicine and Dentistry, Queen Mary University London, UK

ABSTRACT

Background: Community Based Medical Education (CBME) offers vital insights into what it means to care holistically, how to manage uncertainty and complexity and what it means to be a General Practitioner (GP). The challenges of ensuring that students are able to access authentic clinical learning experiences are ever increasing, not least due to nation-wide challenges faced in recruiting and retaining GPs.

Summary of Work: We believe that is time to re-think approaches to CBME. Drawing on the conceptual and methodological tools offered from Activity Theory (Engestrom 2001), we devised a modified change laboratory that offered opportunities to analyse existing practices and imagine new ones. We ran 4 sessions, lasting between 1 and 2 hours, involving GP Tutors, Medical School Faculty, Medical Students and Physician Associate Students. The emphasis of each session was to consider the purposes of offering students clinical placements in community settings and how we might make best use of an increasingly scarce resource.

Summary of Results: Our preliminary analysis reveals tensions between the desired purposes of CBME and the practices traditionally adopted. For example, GP Tutors wish to offer students insights into how health systems work and what it means to be a GP and/or how GPs practice. In reality, they feel constrained by historical approaches to teaching that emphasise (body)systems-based teaching and the collection of procedural skills in student logbooks. Students experience tensions between the wide learning GP placements offer and the narrow imperatives created by summative assessments.

Discussion and Conclusions: The change lab approach offers deep insights into the ways in which CBME is conceptualised by faculty in medical school and placement environments and how it is experienced by students. It offers up contextually rich suggestions of ways to make better use of clinical placements.

Take-home Messages: An Activity Theory approach moves the researchers gaze from individual learner to the interactions between the learning environments they operate in. Change Lab methodology can be adopted and adapted to inform curriculum developments and shape pedagogic practices.

Non-clinical community clerkships: experiences from University Medical Center Utrecht

AUTHOR(S):

- Conny Seeleman, UMC Utrecht, the Netherlands (Presenter)
- Ruben Schmits, University Medical Center Utrecht, the Netherlands
- Stella Martens, University Medical Center Utrecht, the Netherlands
- Marielle Jambroes, University Medical Center Utrecht, the Netherlands

ABSTRACT

Background: Good health cannot be achieved by focusing solely on treating disease. In most European countries health gaps exist between groups, related to social determinants of health (SDoH). At the same time, healthcare changes: there is a shift from hospital care to outpatient and primary care and society expects increasing self-management of its citizens. This means future physicians have to learn more about SDoH and how to take patients' social context into account. Additionally, interdisciplinary collaboration with professionals in the social domain is important. However, medical curricula still train students predominantly within the hospital setting.

Summary of Work: We developed an innovative one-week community clerkship for all fifth-year medical students at UMC Utrecht. Students follow this clerkship in a variety of community care and welfare organizations (e.g. social community teams or organizations that support psychiatric patients or migrants). Learning goals are: students experience the social context of health(care); students get acquainted with vulnerable groups and social domain professionals; and students learn what self-management means in patients' daily lives. The students conclude the week with a reflection paper.

Summary of Results: Since 2017, 250 students fulfilled this clerkship. Participating social organizations appreciate the clerkship because they experience the need to train future doctors about SDoH. Also, the majority of students experience the relevance of this week. Learning about clients in their everyday life is much appreciated by students, as well as getting insight in the social domain. The reflection papers show that students learn about SDoH, however they find it difficult to relate these experiences with their future work as a physician.

Discussion and Conclusions: We succeeded to develop a valued clerkship that provides students insight in SDoH and vulnerable groups. Nevertheless, we experience that learning goals are not fully achieved. In further development of this clerkship we aim for a new reflection method in which students receive daily reflection exercises to increase learning outcomes.

Take-home Messages: - A community oriented clerkship can contribute to students' insight in the relevance of SDoH and vulnerable groups' daily lives. - Students need support in relating community experiences to future work as physicians.

Fostering Socially Accountable Rural Health Research through Longitudinal Faculty Development

AUTHOR(S):

- **Shabnam Asghari, Memorial University of Newfoundland, Canada (Presenter)**
- Thomas Heeley, Memorial University of Newfoundland, Canada
- Cheri Bethune, Memorial University of Newfoundland, Canada
- Wendy Graham, Memorial University of Newfoundland, Canada

ABSTRACT

Background: Rural faculty often encounter questions that matter to their patients but lack the skills to investigate them through research. Memorial University of Newfoundland (Newfoundland & Labrador, Canada) launched 6for6 to address these issues.

Summary of Work: 6for6 is a longitudinal faculty development program focused on improving the research skills of rural faculty at Memorial University. Named after its unique design where six rural faculty are sponsored to attend six face-to-face educational sessions annually, 6for6 uses a tailored curriculum to empower participants during and between sessions to pursue socially accountable, rurally relevant research projects.

Summary of Results: We assessed the needs of our rural faculty and devised a blended curriculum to address identified areas for training in scholarship and common barriers to conducting research. The final curriculum is divided into six two-day small group learning sessions using synchronous face-to-face workshops supplemented by a dedicated research assistant, individual mentorship from academics, and asynchronous online content (e.g., readings, videos, activities, assignments). Each participant develops their own research project that emerges from their rural context while learning applicable research skills. Peer review in each session provides pragmatic feedback and opportunities for learning from and contributing to several authentic research projects. The program is also continuously assessed and improved using face-to-face discussion, pre-post surveys, and an end-of-program focus group. To date, thirty rural faculty have participated across five years of the program. Each has pursued a research project addressing a health issue in their community, resulting in 10 publications and \$3 in grants for every \$1 Memorial University invests in the program.

Discussion and Conclusions: 6for6 has empowered its participants to conduct impactful, socially accountable health research. This success is attributable to vigilant support from faculty mentors and staff, and a meticulously tailored curriculum that promotes professional networking and a safe learning environment that is responsive to participant needs.

Take-home Messages: Longitudinal faculty development programming can empower rural faculty to conduct socially accountable research. The curriculum should be supported by passionate faculty and staff, tailored to the needs of participants, incorporate peer engagement and feedback and be responsive to changes in those needs.

North and south: Rural medicine attracts students with a similar approach to learning

AUTHOR(S):

- **Kylie Mansfield, University of Wollongong, Australia (Presenter)**
- Anita Iversen, The Arctic University of Norway, Norway
- Maja-Lisa Lochen, The Arctic University of Norway, Norway
- Torsten Tisor, The Arctic University of Norway, Norway
- Lyndal Parker-Newlyn, University of Wollongong, Australia
- Gregory E Peoples, University of Wollongong, Australia

ABSTRACT

Background: The shortage of rural doctors has led medical schools worldwide to focus on training doctors for underserved communities. Doctors in rural areas are often isolated and need to be independent and self-directed. The aim of this cross-cultural study was to compare learning approaches of students in two geographically separate medical schools that focus on producing doctors with a desire to practice rural medicine.

Summary of Work: Medical students from Wollongong University (Australia), a graduate-entry 4 year medical program (n=158, mean age 26 years), and, the UiT the Arctic University of Norway, an undergraduate 6 year program (n=110, mean age 21 years, $P < 0.0001$), were included. Three instruments were administered during the first study month. The study process questionnaire was resolved into deep or surface learning approaches. Student achievement goal orientation, a measure of self-directed learning capacity, was resolved into learning goal and performance goal orientation. Exploratory factor analysis of the learning disposition survey results were resolved into four factors: curious, creative, conscientious and routine. Comparisons between the responses from the two Universities were made using unpaired t-tests.

Summary of Results: Medical students from both countries had similar scores for deep learning ($P 0.64$), performance goal orientation ($P 0.087$) and creativity ($P 0.39$). However, the Norwegian students had higher scores for surface approaches ($P < 0.0001$), and lower scores for learning goals orientation ($P 0.011$), and they displayed higher scores for conscientiousness ($P 0.05$) and routine ($P < 0.0001$) while the Australian students were more likely to be curious ($P 0.0033$).

Discussion and Conclusions: Students from both cohorts had similar deep approaches to learning which probably correlate with success in medical school. Australian medical students had higher scores for learning goal orientation indicating a strong self-efficacy and more adaptive responses to challenging learning situations. Differences could be due to age or selection methods as entry into UiT is based on prior academic performance while selection in the Australian school is based on academic success and portfolio and interview.

Take-home Messages: - Rural medical education attracts students with a similar approach to learning. - Selection methods and age might define students learning goal orientation at entry.

Understanding the factors affecting student performance in rural and metropolitan campuses

AUTHOR(S):

- Jessica Macer-Wright, University of New South Wales Rural Clinical School, Australia (Presenter)
- Boaz Shulruf, University of New South Wales Office of Medical Education, Australia
- Lesley Forster, University of New South Wales Rural Clinical School, Australia
- Linda Ferrington, University of New South Wales Rural Clinical School, Australia

ABSTRACT

Background: In 2017, 177 local and rural students commenced the 6-year undergraduate medicine program at the University of New South Wales (UNSW). Of these students, 14 became the first to embark on their entire medical degree in a rural setting at a Go8 University by commencing at the Port Macquarie (PMQ) campus of UNSW's Rural Clinical School (RCS). Increased exposure of medical students to a rural medical environment is associated with increased regional and rural career preferences, although few studies have examined the educational outcomes of rural medicine training programs. While students' education in a rural setting may be enriched by their environment, equally their studies may be compromised by the unique challenges experienced in this setting. Thus, we sought to examine the performance outcomes of the first two years of delivery of the full UNSW medicine program in a rural setting.

Summary of Work: Examination data from all 177 students was included in this study. A multiple regression analysis was carried out to investigate the factors affecting student performance. The independent variables included: demographics, admission path, admission scores and campus of study. The dependent variables consisted of student academic and clinical skills examination outcomes.

Summary of Results: The results of the regression indicated that the model explained 10.5% ($R^2=0.105$) of the variance and that the model was a significant predictor of weighted average mark (WAM); $F(9,167) = 2.182$, $p=0.026$. Studying at the PMQ campus was the strongest statistically significant predictor of WAM outcome ($B=6.597$, $p=0.039$), when the other independent variables were controlled for.

Discussion and Conclusions: The data describes only a small percentage of the variation in WAM, possibly due to a small sample size. With continued study of future cohorts we will more fully understand the impact of campus on overall performance. Future studies will include a comprehensive evaluation of the impact of rural training on medical student education, and an exploration of the benefits of access to a full medical program in a rural setting.

Take-home Messages: These preliminary results demonstrate that the Phase 1 undergraduate medical education programme introduced at UNSW RCS does not compromise the performance of medical students and may improve outcome measures for students.

Experiences from the implementation and pilot of a Rural Elective in a Brazilian University: feedback from students

AUTHOR(S):

- Ana Julia Araujo de Carvalho, Universidade Federal de Uberlândia, Brazil (Presenter)
- Fernanda Arantes Mendonça Toledo Almeida, Universidade Federal de Uberlândia, Brazil
- Mayara Floss, Rural Seeds, Brazil
- Erica Maria Ferreira de Oliveira, Universidade Federal de Uberlândia, Brazil
- Marcela Araujo Oliveira, Universidade Federal de Uberlândia, Brazil

ABSTRACT

Background: According to the World Health Organization, 50% of the population lives in rural areas, however just 24% of the doctors work in them. Some factors influences doctors moving from an urban to a rural area and, one of the most important, is if the doctor had experienced rural health during their medical education. The aim of this study is to show the potentialities and difficulties of building a rural internship program in a countryside university in Brazil.

Summary of Work: The Federal University of Uberlândia (UFU), in Brazil, is building a rural internship program, the idea was raised by the students advocacy. Currently, the students spend one month, during the family physician rotation, in a locality near the University, doing activities in the primary care facilities and emergency department. To evaluate that experience, it was performed a focal group with 20 students, for share positive and negative points in the rural rotation.

Summary of Results: The students pointed as negative the lack of experience of supervisors. Some did not have a supervisor to guide the patient care in primary care facilities and in emergency department. Despite this, they understand that the reality that they were exposed to is frequent in Brazil, and agreed that this rotation is necessary in the graduation. The students were asked if they consider working in a rural area after the experience and all said yes.

Discussion and Conclusions: The lack of structure and human resources are barriers for the implementation of a rural internship at UFU. Despite all odds, the pilot of implementation of the rural elective could work as a catalyzer for students and open new opportunities.

Take-home Messages: Rural practices should be encouraged to improve medical recruitment and retention in rural areas.

A Scoping Review of how Learners Use, Seek and Respond to Feedback

AUTHOR(S):

- **Muirne Spooner, Royal College of Surgeons in Ireland, Ireland (Presenter)**
- Teresa Pawlikowska, Royal College of Surgeons in Ireland, Ireland
- Catherine Duane, Royal College of Surgeons in Ireland, Ireland
- Paul Murphy, Royal College of Surgeons in Ireland, Ireland
- Samuel McConkey, Royal College of Surgeons in Ireland, Ireland

ABSTRACT

Background: There is strong evidence that feedback messages and responses to them vary. However little is known of medical students' feedback recipience in terms of how it affects their follow-up learning. The purpose of this review is to map the landscape of what is currently known regarding feedback-seeking behaviours and response to feedback among undergraduate and postgraduate learners in health professions' education.

Summary of Work: A scoping review was conducted to explore how learners use, seek and respond to feedback. The Joanne Briggs Institute protocol was utilised. The following databases were searched: Pubmed Medline, PsychInfo, Embase, CINAHL, Emerald and Health Business Elite. Citation searching was also conducted. 3,486 papers were identified initially. Screening, data extraction and analysis procedures were performed by two independent reviewers using a consensus approach.

Summary of Results: The following themes emerged concerning feedback: definition, formats, stimulus and response matters. Additionally, much of the literature focusses on the nature of feedback, rather than behavioural elements associated with the learner. Importantly studies often did not provide a definition of feedback. The most common formats of feedback were performance data, e.g. correct results, haptic metrics, etc. In most studies the feedback stimulus was either a written assessment (usually MCQs) or a clinical examination- WBAs or OSCE. Feedback response was categorised under three headings- repeat assessments, affective response and cognitive response. The former was in the majority: many studies equated improved assessment performance with proof of feedback efficacy. The next main category were studies which surveyed learners on the value/usefulness of feedback, which was invariably positive. Only a minority of papers addressed cognitive response, and most involved learners' self-report on learning behavioural changes or planned changes. Theories of feedback and/or conceptual frameworks were not referenced or mobilised frequently, nor were learners' use of feedback or feedback-seeking behaviours.

Discussion and Conclusions: There is heterogeneity in conceptualization of feedback and thus, feedback recipience. Indirect measures, including assumptions on how learners use and/or respond to feedback are frequently reported.

Take-home Messages: Future research should be directed towards explicit examination of these factors with a more theoretical focus to inform study design.

Using Deliberate Practice Framework to Assess the Quality of Feedback in Undergraduate Clinical Skills Training

AUTHOR(S):

- Reina Abraham, Nelson R Mandela School of Medicine, South Africa (Presenter)
- Veena Singaram, Nelson R Mandela School of Medicine, South Africa

ABSTRACT

Background: Performance feedback to clinical learners ultimately impacts on their development into competent clinicians. Students' concerns with inconsistency in the nature of feedback provided by clinicians in the clinical skills laboratory led to implementation of a standardized clinical skills logbook feedback instrument which included a feed-forward improvement strategy. The instrument was also extended for peer assessment. This study aims to assess the quality of feed-forward in feedback using the deliberate practice framework.

Summary of Work: A feedback scoring system was used to retrospectively assess the quality of tutor and peer feedback provided to second and third year medical students to identify deliberate practice components i.e. task, performance gap and action plan. The sample consisted of 425 second year and 600 third year feedback responses over a year.

Summary of Results: All three deliberate practice components were observed in the majority of the written feedback for both classes. The frequency was higher in peer (83%, 89%) than tutor logbook assessments (51%, 67%) in both classes respectively. Average tutor and peer task, gap and action feedback scores ranged from 1.84 - 2.07 and 1.93 - 2.21 respectively. The overall quality of feed-forward in feedback provided by the tutor and peer was moderate and less specific (average score < or =2). The absence of the three components was noted in only 1% of the feedback responses in both 2nd and 3rd year.

Discussion and Conclusions: This study found that adding in a feed-forward strategy to the logbooks increased the overall quality of tutor and peer feedback as the task, gap and action plans were described. The findings from our study suggest that the ratings from the tool can also be used as guidelines to provide feedback providers with feedback on the quality of feedback they provided.

Take-home Messages: Rating feedback using a framework based on deliberate practice allows for objective evaluation of feedback and can be used for faculty development and training. Medical educators might be able to provide higher quality feedback by better articulating to trainees the gap between their performance and an expert standard, and provide them with specific learning plans.

Content of Feedback for Test-Enhanced Transfer of Learning

AUTHOR(S):

- Anna Ryan, University of Melbourne, Australia (Presenter)
- Kulamakan Kulasegaram, University of Toronto, Canada
- Terry Judd, University of Melbourne, Australia
- Douglas Larsen, Washington University School of Medicine, USA
- David Swanson, American Board of Medical Specialties & University of Melbourne, USA & Australia

ABSTRACT

Background: The role of feedback in test-enhanced learning is an understudied area that has potential for valuable impact in medical education. Optimizing feedback is an especially promising approach to maximising the benefits of formative testing to support transfer of learning. This study investigates the impact of different forms of post-test feedback on transfer of medical knowledge within a test-enhanced learning framework.

Summary of Work: 64 participants from two medical schools in Canada and Australia sat two single-best-answer MCQ tests one week apart. We compared conceptual feedback with item-level feedback providing explanations for right and wrong answers with feedback showing only the right answer without explanation. On the first test occasion, participants sat parent items with feedback, and then attempted items which were closely related (near transfer) and more distant (far transfer) in relation to the parent items. In a repeat test at one week, participants sat different items which were near- and far-transfer versions of original parent items. Feedback type, and near- and far-transfer items were randomized within and across participants.

Summary of Results: On both test occasions, participants performed better following item-level and conceptual feedback compared to right/wrong feedback. For items originally answered incorrectly, there was a main effect of feedback with item-level and conceptual feedback being superior to right/wrong feedback ($p < 0.001$) for near transfer. No significant differences were seen for items originally answered correctly or for far-transfer items.

Discussion and Conclusions: Right/wrong feedback appears to have limited test-enhanced learning potential. Item-level feedback and feedback that identifies and elaborates on key conceptual knowledge appears equally effective when participants answer test items that are very closely related to the original items.

Take-home Messages: Near transfer of knowledge appears greater when feedback contains elaboration of conceptual knowledge necessary for building a diagnostic schema or when feedback contains a brief explanation of the correct answer and distractors. Re-presentation of test items with correct responses appears relatively ineffective. Further research is required to determine the ideal feedback format for items which are more distantly related to (ie. far transfer versions of) original items.

Adopting the Concept of Feedback Orientation to Health Professions Education

AUTHOR(S):

- James Fraser, Griffith University, Australia (Presenter)
- Christopher Klopper, Griffith University, Australia
- Michelle Hood, Griffith University, Australia

ABSTRACT

Background: Feedback is critical for a student to be able to measure their performance against criteria that define success. Feedback may provide one of the most powerful effects on learning, though these effects are highly variable (Hattie & Timperley, 2007). Norcini et al. (2011) referred to the effect of feedback on assessment to 'drive future learning' as 'catalytic'. However feedback often fails to deliver on its goal to positively influence student learning (Boud & Molloy, 2013) and in 40% of instances has been found to result in a deterioration in student performance (Kluger and DeNisi, 1996).

Summary of Work: Understanding individual student's approaches and responses to feedback may help educators address one of the factors contributing to variable feedback effects. The concept of feedback orientation, which is defined as 'an individual's overall receptivity to feedback' was described by London and Smither (2002). Feedback orientation is a multidimensional construct and has been demonstrated to be an important contributor to an individual's longitudinal development in the workplace.

Summary of Results: Individuals with high feedback orientation were conceived as having control over their emotional response to feedback and abilities to analyse the feedback and apply the feedback to future tasks (Dahling, Chau, & O'Malley, 2012; London & Smither, 2002). High feedback orientation has been identified as a predictor of successful career development, positive outcomes from coaching and higher quality of work outputs (Gregory & Levy, 2012; London & Smither, 2002). London and Smither (2002) stated that feedback orientation is an individual characteristic capable of modification and development and is capable of being changed by external influences in the medium term (Dahling & O'Malley, 2011), suggesting that high feedback orientation can be actively developed.

Discussion and Conclusions: This presentation will discuss the concept of feedback orientation and studies in other disciplines and the relevance and application in health professions education.

Take-home Messages: What individual factors influence feedback? How do educators perceive these and how do individual student factors influence the provision of effective feedback? Future research plans to assess feedback orientation in a medical student cohort.

#100 Short Communications - Feedback

Understanding the enablers, inhibitors and processes around earlier development of feedback-seeking behaviour

AUTHOR(S):

- Michelle Arora, School of Clinical Medicine, University of Cambridge, UK (Presenter)
- David Hope, Edinburgh Medical School, UK
- Helen Cameron, Aston Medical School, UK

ABSTRACT

Background: Feedback is one of the most effective learning interventions but students often feel they receive insufficient useful feedback. However, students who actively seek feedback perceive that feedback to be more valuable, and are more receptive to its message. Since feedback-seeking develops as students become more mature and experienced, we therefore need to consider how to promote the development of feedback-seeking earlier.

Summary of Work: This constructive grounded theory study explores the promoters and inhibitors of feedback-seeking in students in a 5-year MBChB programme, and the processes involved in developing skills to seek feedback. Data were collected from 13 student and 11 staff interviews, and questionnaires across the years. Interviews were transcribed and analysed using a constant comparative analysis approach to develop key themes, which reached data saturation.

Summary of Results: Feedback-seeking was influenced by intrinsic, extrinsic and feedback factors. Inhibitors included lack of confidence or even fear of approaching staff, fear of patients, ambivalence about the value of feedback and anxiety about negative feedback. As students progressed, they were more likely to feedback-seek because they developed confidence and successful strategies to approach staff, which overcame fear. Students became familiar with interacting with patients and how to be useful in a team, encouraging feelings of belonging. Such positive experiences increased the predicted value of feedback sought, as did their increasing yearning to be safe, competent doctors, which outweighed their apprehension about receiving negative feedback.

Discussion and Conclusions: Understanding what inhibits feedback-seeking helps us support student to develop the skills and motivation to feedback-seek earlier. We can also break down barriers ourselves. For example, we can describe how to approach clinicians, and reassure them that this is expected. Increasing staff receptivity to students' feedback-seeking, through training to improve confidence and recognition, will increase success.

Take-home Messages: We provide insights into the enablers, barriers and processes associated with feedback-seeking and some practical suggestions to enable feedback-seeking amongst students.

Influencing factors and outcomes of Multisource-Feedback in Postgraduate Medical Training - A Focus Group Study

AUTHOR(S):

- Eva K. Hennel, University of Bern, Institute for Medical Education, Switzerland (Presenter)
- Christoph Berendonk, University of Bern, Institute for Medical Education, Switzerland
- Ulrike Subotic, Universitäts-Kinderspital Zürich, Switzerland
- Andrea Trachsel, University of Bern, Institute for Medical Education, Switzerland
- Sören Huwendiek, University of Bern, Institute for Medical Education, Switzerland

ABSTRACT

Background: Multisource-Feedback (MSF) is a form of workplace-based assessment appropriate for postgraduate training. Here, feedback is given by raters via questionnaires and then summed up by a supervisor in a facilitating conversation, in which learning goals are formulated. While there has been published much on the MSF questionnaire itself, only little is known on the other factors of the MSF process. Thus, our research question is: Which factors influence MSF which aims to improve postgraduate training and what are the expected and unexpected outcomes?

Summary of Work: We implemented MSF in the surgical unit of a paediatric university hospital in Switzerland and conducted focus group interviews with participants from all stakeholder groups: trainees, raters, and supervisors. The transcripts of all interviews were analysed using a thematic analysis approach as described by Braun and Clarke [Braun 2006].

Summary of Results: We identified the following factors and outcomes: Supporting factors: Clear communication of goal of MSF; self-assessment and narrative comments on the questionnaires to set learning goals; training of raters; continuity and preparation of raters; timing of MSF during rotations; clear role of supervisor; clear structure of the facilitating conversation. Outcomes: Residents perceived that the multiperspective feedback supported the improvement of their professional development; Teamwork and interdisciplinarity were perceived as helpful and were enhanced by MSF; Raters raised their commitment on the training of residents.

Discussion and Conclusions: Some of our results confirm other studies, other results have not yet been described in detail such as a helpful structure of the supervision conversation, timing of the MSF assessments during clinical rotations and impact on teamwork and shared responsibility. Further analysis is planned to better understand the relationships between the extracted factors and to derive recommendations on how the potential of MSF can be exploited further.

Take-home Messages: When implementing MSF, factors already described in the literature as well as our findings regarding influencing factors and outcomes can be helpful to make best use of it.

Resident perspectives on impression management and receiving feedback in residency: a qualitative study

AUTHOR(S):

- **Brandon Huffman, Mayo Clinic, USA (Presenter)**
- Fred Hafferty, Mayo Clinic, USA
- Anjali Bhagra, Mayo Clinic, USA
- Emily Leasure, Mayo Clinic, USA
- Adam Sawatsky, Mayo Clinic, USA

ABSTRACT

Background: Feedback is critical in physician growth; however, it is predominantly based on external observations. Goffman described impression management as the process individuals experience when portraying themselves to those around them. We explored how and why resident physicians manage the impressions of their evaluators when feedback is expected.

Summary of Work: We used constructivist grounded theory to examine the role of impression management during the evaluative process in residency. Residents in the Mayo Clinic Internal Medicine Residency participated in hour-long semi-structured interviews from June-August 2018. Interviews were transcribed verbatim and de-identified prior to analysis. Data collection and analysis were conducted simultaneously. We applied open codes, wrote analytic memos and discussed themes. We identified themes and relations between themes regarding impression management, feedback type, and mindset. Using constant comparison, we refined our categorization using Goffman's theory of Impression Management, Heen and Stone's characterization of feedback type (coaching versus evaluation), and Dweck's mindset paradigm (growth versus fixed) to define themes. Theoretical saturation was determined by group consensus. This study was approved by the Mayo Clinic Institutional Review Board.

Summary of Results: We conducted 15 interviews; 9 (60%) participants were male. Five participants (33%) were postgraduate year (PGY) 1s, 5 (33%) were PGY2s, and 5 (33%) were PGY3s. Residents identified relationships between context, feedback type, mindset, and impression management. Coaching feedback and growth mindset were related to comfort with making weaknesses and uncertainty visible. Evaluation and fixed mindset were related to discomfort with making weakness and uncertainty visible. Relationship and trust with faculty members facilitated a growth mindset and comfort internalizing feedback, where written evaluation and perceived high stakes consequences drove residents to hide weaknesses and adopt a fixed mindset.

Discussion and Conclusions: The context of feedback can affect resident mindsets which may affect their ability to grow as physicians.

Take-home Messages: **Evaluators should be aware of the context while maximally facilitating a growth mindset as it promotes resident comfort and, ultimately, their development as physicians.**

Understanding Mentoring Culture through Thematic Analysis of Learning Culture in Medicine: a Systematic Scoping Review

AUTHOR(S):

- **Kuang Teck Tay, Yong Loo Lin School of Medicine, National University of Singapore, Singapore (Presenter)**
- Elisha Wan Ying Chia, Yong Loo Lin School of Medicine, National University of Singapore, Singapore
- Annelissa Mien Chew Chin, Medical Library, National University of Singapore Libraries, National University of Singapore, Singapore
- Ann Ying Pin Toh, Department of Family Medicine, National University Health System, Singapore
- Lalit Kumar Radha Krishna, Division of Supportive & Palliative Medicine, National Cancer Centre Singapore, Singapore

ABSTRACT

Background: Mentoring is core component of medical education. Mentoring's success has been attributed to a nurturing mentoring environment which is composed of the Mentoring Culture (MC) and mentoring structure. Whilst literature abounds on mentoring structure and processes, a lack of data on MCs has necessitated scrutiny of closely related Learning Cultures (LCs) to enhance understanding of MCs to facilitate the development of a positive mentoring environment, contributing to mentorings overall success.

Summary of Work: Using Arksey and O'Malley's (2005) approach to scoping review, 4 authors performed literature searches of LCs in medicine published between 1st January 2000 to 19th September 2018 from 10 databases. Based on selection criteria, articles were selected. Open coding and thematic analysis using Braun and Clarke's (2006) approach was adopted to make comparisons of LCs across different settings, diverse mentee and mentor populations, and host organizational characteristics possible.

Summary of Results: 11,723 abstracts were identified, 179 full-text articles were reviewed, 110 full-text articles were thematically analysed. The 7 themes identified include descriptions and definitions of LC, key elements of LC, reasons to evaluate LC, approaches to nurture LC, methods to evaluate LC, LC outcomes and challenges to nurturing LC.

Discussion and Conclusions: MCs, drawing from key concepts of LCs, consists of complex relationship amongst the mentor, mentee, and host organization (stakeholders) that is influenced by the prevailing curricular structure and context. MCs encapsulate the shared beliefs, attitudes, values, goals, and practices of the stakeholders that influence the mentoring process and relationship. Pivotal to a nurturing MC is the constant alignment of personal expectations and values of stakeholders with the overall goals, practices and ethos of the programme. Designing an accurate, holistic and longitudinal assessment system in tandem with the mentoring process empowers the host organization to nurture and shape MC by providing timely support and oversight of the mentoring process.

Take-home Messages: - **Holistic and longitudinal assessment of MC addresses evolving and dynamic needs of mentors and mentees, and empower the host to provide personalized support to them.** - **Alignment of individual expectations and values with overall ethos and goals of programme is crucial to nurturing personalized MCs.**

Study Phase Specificity of Success Factors of a Longitudinal, Portfolio-Based Mentoring Programme to Foster Medical Students' Professional Development

AUTHOR(S):

- Maria Farquharson, Competence Centre for University Teaching in Medicine - Baden-Wuerttemberg, University of Tuebingen, Germany (Presenter)
- Tanja Mirjam Riess, Competence Centre for University Teaching in Medicine - Baden-Wuerttemberg, University of Tuebingen, Germany
- Jan Griewatz, Competence Centre for University Teaching in Medicine - Baden-Wuerttemberg, University of Tuebingen, Germany
- Maria Lammerding-Köppel, Competence Centre for University Teaching in Medicine - Baden-Wuerttemberg, University of Tuebingen, Germany

ABSTRACT

Background: Reflective portfolios and mentoring can help foster students' professional development systematically and effectively. However, success of such programmes depends on a number of factors. Knowledge of success factors facilitates purposeful development of programmes. Since 2013, a longitudinal, portfolio-based mentoring programme has been an obligatory part of the curriculum at the University of Tuebingen for all students from semesters 1 to 10. Mentors are faculty members, clinicians or scientists working in the medical context. Research question: What are general and study phase-specific success factors of a longitudinal, portfolio-based mentoring programme from mentors' and mentees' perspectives?

Summary of Work: Semi-structured interviews were conducted with mentors and mentees (n=6 each). Additionally, free text data from an online survey was collected (n=102 mentors, n=524 mentees). Data was analysed via qualitative content analysis in MAXQDA 2018. One quantitative question from the survey was included to examine phase-specific student needs (n=102 mentors).

Summary of Results: Structural, personal, relational and contentual factors were categorised. Most frequently named supportive factors (more than 50% of respondents) include: (1) structural: mentor training, mandatory programme, combination of portfolio and mentoring, longitudinality, mentor exchange on standards; (2) personal (mentors): professional experience, role modelling, self-reflection; (3) personal (mentees): acceptance of programme aims, willingness to participate; (4) relational: trust, motivating behaviour, mentee-focussed, familiarity, openness; (5) contentual: adaptability, openness for further topics, discussion of written reflections. Student needs and thus relevance and hierarchy of factors are study phase-specific. During pre-clinical phase, students require more mentor guidance to establish self-regulated learning and reflective practice (e.g. mandatory participation; written, guided reflection). During clinical phase, career planning and networking are central, requiring e.g. trustful and long-lasting mentoring relationships.

Discussion and Conclusions: For targeted programme implementation and development, phase-specific success factors need to be considered. Knowledge and consideration of such factors facilitates further optimisation of our established programme (e.g. targeted, longitudinal mentor trainings) and ensures acceptance among students. Generally, knowledge of phase-specific factors provides a framework for purposeful programme implementation and optimisation.

Take-home Messages: Success factors of longitudinal, portfolio-based mentoring programmes can be general or study phase-specific; their consideration supports targeted programme implementation and optimisation.

Development and initial validation of a dual-purpose questionnaire capturing mentors' and mentees' perceptions and expectations of the mentoring process

AUTHOR(S):

- Sylvia Heeneman, Maastricht University/ Dept of Pathology, the Netherlands (Presenter)
- Willem de Grave, Maastricht University/ Dept of Educational Development and Research, the Netherlands

ABSTRACT

Background: In health profession education, learners are often coached by mentors for development of competencies, self-direction of learning and professionalism. It is important that the mentee-mentor relationship is aligned in terms of mutual expectations.

Summary of Work: A dual-purpose questionnaire capturing both the mentor and mentee perceptions on the actual and preferred mentoring functions was designed and validated, by performing a principal component analysis (PCA) using the data of mentees (n=103) and mentors (n=23) of a medical course. As a proof of concept, alignment of needs and changes in the mentoring perceptions in mentee groups of different years were determined.

Summary of Results: PCA showed that specific sets of questions addressed important elements in the mentoring process, such as self-direction of learning and reflection (Scale 1), guidance of behavioural change (Scale 4), addressing personal issues and professional identity development (Scale 3 and 5) and how the mentor and mentee presents oneself in the mentoring relationship (Scale 2). Mentors and mentees perceived comparable situations as critical for an effective mentoring process, such as mentor presence and guidance of reflection, although there was also evidence of gaps, such as perception of cultural issues. By comparison of the mentee groups in the different years of the program, the dynamic or evolving nature of the mentor process became evident, mentees experienced more emphasis by the mentor on reflection (Scale 1), at a constant level of mentor presence (Scale 2).

Discussion and Conclusions: Given the individualized, context-specific, dynamic and organizational-dependent nature of mentoring practices, programs would benefit from a regular evaluation of mentoring practices, in order to facilitate organizational revisions of the mentoring system and further development of the mentoring competencies of individual mentors.

Take-home Messages: - **The dual-purpose questionnaire capturing mentors' and mentees' perspectives of the mentoring process can disclose gaps or misalignments in the mentors' and mentees' experiences and expectations, facilitate evaluation of the mentoring system and attune the mentor training program.**

What makes mentors of medical students thrive and succeed in group-mentoring programs? A multi-centre mixed methods study

AUTHOR(S):

- Eirik Hugaas Ofstad, Uit The Arctic University, Norway (Presenter)
- Elise Pauline Skjevik, Uit The Arctic University, Norway
- Unni Ringberg, Uit The Arctic University, Norway
- Monika Kvermenes, University of Bergen, Norway
- Edvin Schei, University of Bergen, Norway

ABSTRACT

Background: In the last decades, the establishment of group-mentorship programs for undergraduate medical students has become a significant trend, particularly in European and North American medical schools. The aim of our study was to identify factors in which group mentors of medical students thrive and succeed.

Summary of Work: We invited 456 mentors at three universities (McGill in Montreal, Canada and the universities of Bergen and Tromsø, Norway) with longitudinal group-mentoring programs to a survey. The response rate was 59% (n=272). From these we, through a convenience-based maximum variation sampling, did in-depth semi-structured interviews with 24 mentors (8 at each site). Interviews were analyzed using systematic text condensation. Associations between findings from the qualitative interviews were cross-checked with quantitative data from the survey.

Summary of Results: Mentors, who in qualitative interviews expressed a primarily student-centered approach, reported a high level of satisfaction and well-functioning group sessions. In the qualitative interviews, mentors who reported a low level of satisfaction and fulfillment with mentoring, focused on lack of clarity concerning their function, tasks and contribution to the task of mentoring student groups. The informants who in their interviews revealed a student-centered focus commonly were less experienced and female.

Discussion and Conclusions: Several of the informants with high levels of satisfaction said that their lack of experience and loss of control had helped them shift their focus towards the students, and by being curious about the students' perspectives in a sense came to understand the true purpose and reward of group mentoring. Recruiting mentors with high intrinsic motivation is recommended. Lack of experience should not be an exclusion criteria in the recruitment process.

Take-home Messages: **Mentors who thrive and succeed in group-mentoring medical students do so because they manage to be student-centered, not mentor-centered. Qualitative interviews add knowledge to and can explain findings not extractable from quantitative survey data.**

An Insight into undergraduate mentoring program

AUTHOR(S):

- Mahwish Arooj, University of Lahore, Pakistan (Presenter)

ABSTRACT

Background: Mentoring involves a long-term relationship where a senior person (mentor) supports and guides a junior person (mentee) during their period of training and education. Mentoring can be beneficial for mentees, mentors and the educational institutes. This study was conducted with an aim to evaluate the effectiveness of the mentoring program which was initiated in University College of Medicine, Pakistan since 2014.

Summary of Work: The present study is conducted on first, second and third year students enrolled in the mentoring program at University College of Medicine, Pakistan. The effectiveness of mentoring program was evaluated by Mentorship Effectiveness Scale which was modified according to the local need and validated by expert review. Final questionnaire comprised of 14 items divided in 6 sections; mentor characteristics, professional advice, personnel issues, academic performance, research, attendance and disciplinary issues. Students were asked to mark their response on 5 Likert scale. Data was analysed by using SPSS 16. The perception of students in pre-clinical (1st and 2nd year) and clinical year (3rd year) was also compared.

Summary of Results: Out of 450 students, 351(78%) participated in this study. Among them, 81% students feel that mentoring was helpful in improving their academic performance, 80% students are satisfied with their mentors, 79% students feel that mentoring is helpful in providing them career guidance, 72% students feel that mentoring helped them in improving their attendance as well as decreasing the disciplinary referrals. While 70% students are satisfied that the mentoring program provide them with personal support and helped them in research collaboration.

Discussion and Conclusions: Mentoring program helped the students in many aspects including academic and career guidance, improved attendance, personal support and research collaboration. Year wise analysis showed that the first year students find mentoring most helpful as compared to 2nd and 3rd year. It may be due the fact that first year students need more support in order to get adjusted in a new and competitive field.

Take-home Messages: **Formal mentoring program is an effective way to provide the students with an immediate supporting network which can help students to reach their full potential and provide them with a conducive environment.**

Mentoring: in the Eyes of the Beholder

AUTHOR(S):

- Iman M. Eissa, Kasr Al Aini School of Medicine, Cairo University, Egypt (Presenter)

ABSTRACT

Background: Having been a student in the same institution in which I currently teach, I often memorize staff who had an impact on my life. What is the exact role of a mentor? Is every educator a mentor by default? How do students describe a mentor? How do educators describe mentorship? I often reflect upon these questions. At our institution, no teacher is formally given mentorship roles. Instead, it is more of a personal initiative. Stemming from a strong belief in the importance of mentorship, this survey was done.

Summary of Work: A survey of opinion was asked simultaneously to teachers and students alike, asking them to describe the difference between a mentor and a teacher from their point of view. The same question (with the same wording) was delivered to each person individually through a mobile texting app. Responses came in text, and were collected and compared by the author.

Summary of Results: Similarities and differences in points of view will be discussed in the presentation. Of the responses were A teacher has broader knowledge, a mentor has broader perspective, Mentors teach you how to fish, not what a fish is made of, my mentor helps me de-clutter my thoughts. Upon comparing responses, it was noted every one had his very explicit description of a mentor and a teacher. Responses varied more between teachers, than between students.

Discussion and Conclusions: Taking this survey made us, teachers, reflect. How far do we stand from mentorship? Do we teachers have a consensus on what the role of a mentor is? Students have a clearer description of a mentor and what they expect from him. This picture when seen from the eyes of educators did not seem to be equally clear.

Take-home Messages: **Mentoring in medical education is an established worldwide role that may still be - formally- lacking in our institution. A consensus is needed where the role of a mentor is clear, well explained and made easy to be adopted by staff members. Training can be introduced where teachers are able to exercise mentoring roles and feel the positive impact of it.**

A simulation-based educational program to improve 3rd year medical student bag-valve-mask ventilation (BVM) and cardiopulmonary resuscitation (CPR) techniques for EPA #12: Preliminary Results

AUTHOR(S):

- **Vaia Abatzis, Department of Anesthesiology, University of Virginia School of Medicine, USA (Presenter)**
- John Kwock, Maine Medical Center, USA
- Jessica Sheeran, Department of Anesthesiology, University of Virginia School of Medicine, USA
- Lisa Morton, Department of Anesthesiology, University of Virginia School of Medicine, USA
- Stephen Eason, University of Virginia School of Medicine, USA
- Keith Littlewood, Department of Anesthesiology, University of Virginia School of Medicine, USA

ABSTRACT

Background: CPR and BVM are critical life saving techniques all health care professionals, including medical students, need to master. Using Laerdal's SimMan 3G, BVM and CPR effectiveness can be displayed in real time on a monitor and/or recorded for future use. This data, either in real time or reviewed after the learner has practiced BVM or CPR, can result in more effective resuscitation efforts. Does using simulation acquired BVM and CPR data improve BVM and CPR techniques of medical students in preparation for EPA #12?

Summary of Work: 3rd year medical students practiced BVM and CPR on SimMan 3G on three separate occasions. On Day 0, baseline BVM and CPR data was collected on every student (no real time feedback). For Day 1 and Day 2, half the students got feedback on Day 1 (Group A) and the other half got feedback on Day 2 (Group B). BVM and CPR data was saved for each student encounter.

Summary of Results: Preliminary results from our first 120 medical students is presented here. The non-parametric independent samples Mann-Whitney U test was used to analyze data sets collected from the simulator. For CPR, compression rate/min was statistically significant on day 2 when comparing Group A with Group B ($p=0.0002$). Mean compression depth was statistically significant on day 1, when comparing Group A with Group B ($p=0.047$). In addition, % adequate rate and % adequate depth was statistically significant at all 3 days.

Discussion and Conclusions: Simulator feedback improves CPR techniques of 3rd year medical students. Group A students improved with real time simulator feedback on Day 1 and maintained these improvements on Day 2 (when they did not have real time simulator feedback). Group B students also improved on Day 2 when they received real time simulator feedback. A statistically significant improvement was not seen with BVM. The lack of improvement with BVM may be due to students having many opportunities to practice BVM on patients in the OR during their peri-operative clerkship.

Take-home Messages: As medical schools are revising curriculums and preparing medical students for the AAMC's EPAs, simulation can be used to prepare students for EPA#12.

Warm bodies and plastic patients: Thinking sociomaterially about simulation

AUTHOR(S):

- Anna MacLeod, Faculty of Medicine, Dalhousie University, Canada (Presenter)
- Paula Cameron, Dalhousie University, Canada

ABSTRACT

Background: Perennial challenges have been identified with respect to simulation, including issues of patient-centredness. Despite a history of important work in the area, the existing literature is limited in terms of theoretical explorations. We believe the challenges of simulation are sociomaterial in nature, meaning they are the product of both social relations and material elements. The materials, or tools, of simulation include mannequins, simulated patients, task trainers, and many others. Looking at simulation through a sociomaterial lens helps to shift our focus to explore overlooked elements. Rather than seeing materials as neutral tools that are controlled by people, a sociomaterial approach recognizes that the stuff of simulation is actively shaping medical education, working to support and/or disrupt teaching and learning.

Summary of Work: We will describe emerging findings from an ongoing sociomaterial ethnography of simulation at a Canadian university. Our goal was to theorize how the materiality of simulation actively shaped developing professional identities in undergraduate medical students. To date, we have collected: 38 hours of video-observations of interactions with mannequins, task trainers, and simulated patients; 20 photo-elicitation interviews with medical students, educators, and simulated patients; and, 150 photographs. Analysis is ongoing.

Summary of Results: We are learning that the materials of simulation are actively shaping emerging professional identity. Simulation tools, particularly mannequins, serve as 'stand-ins' for real patients, but mannequins present problematic pictures of patients as dehumanized, compliant, and uniform. They permit, and perhaps inspire, questionable practices, including minimizing the importance of consent, ignoring appropriate draping, using the patients body as a table or waste bin, and allowing for fiddling with patients bodies.

Discussion and Conclusions: Taking a sociomaterial approach helps us to think differently about the tools of simulation. Mannequins, and other materials, are doing what we intended: they provide a safe opportunity for learners to practice clinical skills. However, these materials also do things we did not intend, including facilitating a space to engage in questionable representations of patients, and problematic patient-physician interactions.

Take-home Messages: Sociomateriality provides a lens to think critically about some of the under-explored elements of simulation. Further research should be conducted on the ways mannequins shape physician identities, including attitudes and practices regarding patient centredness.

Using Learning Curves to Identify and Explain Growth Patterns of Learners in Bronchoscopy Simulation: A Mixed Method Study

AUTHOR(S):

- Briseida Mema, Hospital for Sick Children, Canada (Presenter)
- Yoon Soo Park, University of Illinois at Chicago, USA
- Maria Mylopoulos, Wilson Center, Canada

ABSTRACT

Background: Learning curves show how trainees acquire a skill and what the path to competence looks like. The aim of this study was to describe and explain the growth trajectories of novice trainees while practicing on a Bronchoscopy Virtual Reality (VR) simulator.

Summary of Work: This was a sequential explanatory mixed methods design. In 2018, 20 Pediatric Subspecialty trainees and eight faculty practiced with the VR simulator. We looked at relationship between number of repetitions and VR outcomes and patterns of growth using a growth mixture modeling. Using a qualitative instrumental case study method we collected field notes and conducted semi-structured interviews with trainees and simulation instructor to explain the patterns of growth. We used a constant comparative approach to identify themes iteratively. Team analysis continued until a stable thematic structure was developed and applied to the entire data.

Summary of Results: Using a growth mixture modeling we statistically identified and then explained two patterns of growth. A slower growth included learners that had: inherent difficulty with the skill, did not integrate the knowledge of anatomy in simulation practice and used the simulator for simple repetitive practice with no strategy for improvement in between trials. The faster growth included learners that used an adaptive expertise approach: integrating knowledge of anatomy, finding flexible solutions and created a deeper conceptual understanding.

Discussion and Conclusions: We provide validity evidence for use of growth models in education and explain patterns of growth such as a 'slow growth' with a mechanistic repetitive practice and a 'fast growth' with adaptive expertise.

Take-home Messages: Predictive analytics while useful should be used carefully in medical education and coupled with teachers and supervisors reflection about the progress of learners. The faster growing learners not only have an inherent ease at the task but show an adaptive approach to learning by using struggle, embracing variation and forming deeper understanding. These should be encouraged in all learners.

Acute scenarios simulation for Foundation Doctors: does it work?

AUTHOR(S):

- Philip Jones, South Tyneside District Hospital, UK (Presenter)
- Lucy Baxter, South Tyneside District Hospital, UK

ABSTRACT

Background: Many junior doctors feel poorly prepared for emergency situations. This study examined the role of simulation as a tool to increase Foundation doctor confidence in acute scenarios. It also evaluated whether Foundation doctors found the course useful, learned from it and consequentially changed their practice.

Summary of Work: 21 F1 doctors and 25 F2 doctors attended a half day simulation session on acute and common scenarios. Foundation doctors attended each session in groups of 3-4. Each participant completed a specifically designed scenario of 15 minutes length while the others observed, and they all participated in debriefing each scenario. The scenarios were based around an ABCDE assessment, or acute mental health assessment, with appropriate escalation and handover to a senior. They were all mapped to the Foundation Programme curriculum. A pre- and post- simulation questionnaire was used to assess trainee confidence over several areas: overall confidence, airway, breathing, circulation, disability, exposure, mental health, handover and prescribing. Likert scale was used for each response.

Summary of Results: F1 doctors' average confidence across all areas was 48% pre-simulation and 61% post-simulation, equating to a mean proportional increase from baseline of 27%. F2 doctor's pre-simulation confidence was overall 53% which rose to 63% post-simulation, with a mean proportional increase of 20%. For both cohorts there was increased confidence in all areas assessed. Usefulness of session was rated at 99% and likeliness to change practice at 95%.

Discussion and Conclusions: A post simulation survey was sent 1-6 months post session to all attendees. This survey is currently still open but responses so far (n=8) report 75% have made changes to practice and 12.5% have not yet but intend to. Examples of changes reported include increased confidence in speaking up in emergencies, improved handover, keeping an open differential, and tackling a problem systematically using ABCDE assessment.

Take-home Messages: Simulation has led to an increased level of confidence, learning and subsequent changes to practice amongst junior doctors across all areas assessed. It is hoped that these changes to practice will ultimately result in improved patient care. Moving forward we aim to ensure this is maintained by working to integrate simulation into Foundation Teaching throughout their training.

Multidisciplinary simulation training: emotions before and after training

AUTHOR(S):

- Outi Äyräs, Helsinki University Hospital, Finland (Presenter)
- Marja Kaijomaa, Helsinki University Hospital, Finland

ABSTRACT

Background: Weekly sessions of multidisciplinary simulation training are routinely held in the Helsinki University hospital Obstetric Department. Safe learning environment and a good atmosphere are essential for their

Summary of Work: We performed an empirical study by the questionnaire method to chart participants' emotions before and after simulation training. The variables under scrutiny were professional groups and working experience, and our goal was to detect whether emotions varied in respect to them. Each participant filled in a questionnaire and chose from the options one or more that best described their own experience. The options before training were: excitement, fear, tension, and neutral; and after: excitement, relief, shame, joy, neutral, and other.

Summary of Results: In 2018, these simulation training sessions had 219 participants: of them 125 (57%) were midwives, 78 (36%) doctors, and 16 (7%) midwifery students. The strongest emotion before the simulation was tension (35%) and excitement (32%) followed by neutral feeling (25%); only 2% felt fear. After simulation the strongest emotion was excitement (67%) followed by joy (34%), and relief (19%); neutral feeling was reported by 9% and shame by 2%. When studied according to the professional groups midwives felt more tension before the training compared to doctors ($p = 0,001$) and had less neutral feelings ($p = 0,02$). In both groups, only few participants felt negative emotions after the session. Working experience had no effect neither before nor after training.

Discussion and Conclusions: The results indicate that the professional groups experienced different emotions before multidisciplinary simulation training sessions. Midwives felt more negative feelings before the training compared to doctors. One of the most important tasks of the facilitators is to create a positive atmosphere both before and after simulation training. Midwives might need encouragement before training more than doctors.

Take-home Messages: The emotions between professions proved different before simulation training sessions, with midwives feeling more tension than doctors. Facilitators should be aware of this difference as they should make all participants feel comfortable in these sessions.

Predicting Board Certification Examination Scores using Milestone Ratings in a Longitudinal Dataset

AUTHOR(S):

- Kenji Yamazaki, Accreditation Council for Graduate Medical Education, USA (Presenter)
- Gerard Francisco, University of Texas at Houston McGovern Medical School, USA
- Mikaela Raddatz, American Board of Physical Medicine and Rehabilitation, USA
- Larry Robinson, University of Toronto, Canada
- Stanley Hamstra, Accreditation Council for Graduate Medical Education, USA
- Eric Holmboe, Accreditation Council for Graduate Medical Education, USA

ABSTRACT

Background: A positive correlation of high-stakes certification examination (CE) with medical knowledge (MK) milestones may provide validity evidence for the milestone approach to assessment. Similarly, weaker associations between non-MK milestones and CE would indicate discriminant validity for milestones assessment. This study determined whether (a) an MK subcompetency judgment in physical medicine and rehabilitation (PMR) correlated with CE scores and (b) if non-MK subcompetencies were related less strongly to the same CE.

Summary of Work: We examined longitudinal national milestones data for 207 residents (88.8% of residents eligible for the CE) (2014-16 cohort). They received four milestone assessments by graduation in June 2016. They subsequently took the Part I CE of the American Board of PMR in 2016 or 2017; this exam has item reliability of 0.99 and tests a single MK construct. At each milestone review occasion, Part 1 scaled score (200-800 points) was regressed on each subcompetency (levels 0-5) using a Generalized Estimating Equation model to account for nesting within program. Bonferroni corrections were used to adjust for 19 subcompetency comparisons.

Summary of Results: The MK subcompetency was positively correlated with Part I for all four milestone review occasions (all p-values < 0.003). The MK subcompetency regression slopes indicated a one-level difference in milestone rating equated to 38-to-60-point differences on Part I score performance. One practice-based learning and improvement (self-directed learning and teaching) and two patient care subcompetencies (history, diagnostic evaluation) were less strongly correlated with the Part I score over three different occasions. The remaining 15 subcompetencies were not statistically significantly related to Part I at any review occasion.

Discussion and Conclusions: The PMR MK subcompetency demonstrated consistent and educationally meaningful association with another valid knowledge assessment measure. Weaker correlations (three subcompetencies) or non-significant correlations (15 subcompetencies) among the non-MK competencies support discriminant validity for the PMR milestones assessment.

Take-home Messages: This study provides validity evidence for the PMR MK Milestone assessment. This finding may be helpful in identifying struggling residents and help programs to intervene early with struggling residents. It also appears that the other milestone assessments are targeting competencies other than medical knowledge.

Trainee mistrust of the E-portfolio & Workplace Based Assessment Process

AUTHOR(S):

- Andrew Tomkins, Edge Hill University, UK (Presenter)
- Mumtaz Patel, Health Education England, UK
- Cathy Sherratt, Edge Hill University, UK

ABSTRACT

Background: Electronic-portfolios (ePortfolios) have played a significant role in postgraduate medical training in the United Kingdom for many years, having been designed to facilitate and support lifelong learning. The ePortfolio's use is multifaceted in supporting development - they are used both formatively and summatively in the assessment process, support the quality assurance process and promote self-reflection in order to enhance future performance. A recent high profile medical negligence case in the United Kingdom created uncertainty in the medical community regarding the security of recorded information on the ePortfolio and prompted the development of a Reflective Practice Toolkit (Academy of Medical Royal Colleges & COPMED, 2018). Trainees' trust in the ePortfolio process are yet to be established.

Summary of Work: As part of a study into trainees' perceptions of workplace based assessments, higher specialty trainees (n=14) attended two focus groups to discuss their perceptions of the ePortfolio process. Grounded theory methods were applied.

Summary of Results: Participants reported a general heightened mistrust of the assessment process. Key themes were identified: - Concerns regarding permanency of ePortfolio documentation and potential negative implication on their own, and other trainees' training progression. These concerns impaired the provision of honest feedback in trainees' roles as assessors for other colleagues. - Assessment process mistrust. Experiences of confidentiality breaches and the negative implications this can create on working relationships when completing seemingly anonymised assessments for other colleagues - Self-editing of documentation to ensure only positive comments are captured on the ePortfolio

Discussion and Conclusions: Trainees identify a number of factors that impair their trust of the ePortfolio process. Suggestions for improvement include the introduction of clearer guidelines and processes.

Take-home Messages: - Several factors appear to impact trainees' trust of the ePortfolio process including concerns regarding the anonymity of certain assessments (assessment process mistrust) and negative repercussions of the permanent recording of suboptimal performance; - Improved guidance and processes may help maximise the ePortfolio use in supporting lifelong learning and development.

Competency assessment of postgraduate year 1: a preliminary report for implementing national-level graduate competency assessment

AUTHOR(S):

- Kanokwan Sriruksa, Khon Kaen Medical Education Center, Thailand (Presenter)

ABSTRACT

Background: Competency of newly graduate doctor may be insufficient for independent practice. Over 40 years, a one-year internship is compulsory for all Thai medical graduates. However, their competencies had been assessed only once by global rating. The objective of the study was to report a preliminary analysis of graduate competency assessment.

Summary of Work: Three assessment tools were selected including case-based discussion (CbD), mini-CEX and direct observation of procedural skill (DOPS). These tools cover 4 areas of competency: critical thinking, problem-solving, communication skill and procedural skill. All new graduate doctors training in a tertiary care hospital were assessed by attending physicians during their internship. One year internship included 9 months rotating in the tertiary care hospital and 3 months in a community hospital. The data was collected for 2 years from 2017 to 2018.

Summary of Results: One hundred and twenty-two interns were assessed 268 times while rotating in Medicine, Pediatrics, Surgery, and Obstetrics-Gynecology Departments. These assessments included 109 CbD (41%), 80 mini-CEX (30%) and 79 DOPS (29%). Their global rating competencies were met expectations and beyond 100%, 98%, and 96% using CbD, mini-CEX, and DOPs respectively. The competency in critical thinking, problem-solving, and communication skill were met expectations and beyond (98%). The most frequent assessed procedural skill was lumbar puncture and ultrasound. The competency in procedural skill was also met expectations and beyond (96%). However, their dexterity in performing manual skill needed some improvement.

Discussion and Conclusions: This was the first attempt to systematically assessed medical graduate competency during their internship in Thailand. These assessment tools had advantages over the previous global rating including more detailed and more specific competencies were being assessed, easily identified training needs and more specific feedback can be done by assessors. In conclusion, overall competencies in critical thinking, problem-solving, communication skills and procedural skills of the interns have met expectations, although more training was needed to master their procedural skills.

Take-home Messages: This assessment should be implemented at the national level to ensure that new graduate doctors are properly trained and assessed during their internship.

Enforcing a completion of basic checklists for different level learners: exploring the unplanned outcomes

AUTHOR(S):

- Luciana Rodriguez Guerineau, The Hospital for Sick Children, Canada (Presenter)
- Jason Macartney, The Hospital for Sick Children, Canada
- Briseida Mema, The Hospital for Sick Children, Canada

ABSTRACT

Background: The designing of a curricula should be based on the needs of the learners. It is not uncommon for programs to adopt a 'one size fits all approach' for pragmatic reasons, despite having learners with varying degree of knowledge and needs. In a program where a standardized approach of completing a series of checklists to ensure basic competence was achieved by everyone, we examined the unplanned outcomes of this approach.

Summary of Work: The basic competences in respiratory care were assessed in 26 trainees with varying degree of expertise (0 to 5 years) by a number of standardized checklists. Respiratory therapists (RT) were in charge of the assessment. Upon completion of this program, all trainees were interviewed to explore the usefulness of participating in these series of assessment to prove competence.

Summary of Results: Least experienced learners felt safe to complete the assessments since they were not 'singled out' as the only ones who needed to prove basic knowledge. Most experienced learners, when forced to participate, found 'work arounds' to make the activity useful to them. They use the encounter as an opportunity to learn about the RT role, the culture of the place and the roles and responsibilities of each other. The assessment was seen as irrelevant and filled out to simply complete the mandatory requirement. For all, the mandatory checklist acted as an introduction to each other and improved inter-professional relations.

Discussion and Conclusions: The same learning activity resulted in different outcomes with different learners. The learners can modify the activity to adjust to their needs. Being able to capture this process, not only informed the program of the unplanned outcomes but also of the unperceived learners needs. While less experienced trainees followed the mandatory path, the more experienced trainees modified the activity to benefit their needs.

Take-home Messages: Mandatory assessments enforce encounters amongst teachers and learners. Both adapt to these encounters and transform them to benefit their own contexts. These findings might be useful in a CBME era when there is doubt about the usefulness of mandatory assessments.

Using electronic health record data to assess trainees' independent and interdependent performance: A prototype trainee report card in Emergency Medicine

AUTHOR(S):

- Lorelei Lingard, Western University, Canada (Presenter)
- Stefanie Sebok-Syer, Stanford University, USA
- Lisa Shepherd, Western University, Canada
- Adam Dukelow, London Health Sciences Centre, Canada
- Rachael Pack, Western University, Canada
- Allison McConnell, Western University, Canada

ABSTRACT

Background: Competency-based medical education (CBME) requires that trainees receive timely assessments and effective feedback about their clinical performance. While data from the electronic health record (EHR) hold promise for assessment in the clinical workplace, few examples exist of how to create EHR-based assessment tools. A number of complications have been identified, including the ability to attribute EHR data points to individuals in a collaborative work environment where trainees work under supervision. In this study, we partnered with a single clinical division (Emergency Medicine, EM) and hospital decision-support staff with the goal of creating a trainee report card that captures relevant EHR data and represents both independent and interdependent clinical performances in a training context.

Summary of Work: Individual semi-structured interviews were conducted with 10 faculty and 11 trainees across postgraduate years. Participants were presented with the current list of EM faculty performance indicators and asked to comment on how valuable each would be in assessing trainee performance, and the extent to which each indicator captured independent or interdependent performance. Based on interview results, and in collaboration with hospital decision support, a prototype trainee report card of clinical performance indicators was created for a senior EM trainee. Faculty and trainee interviews to explore the face validity of the prototype report card are underway.

Summary of Results: Participants refined and eliminated faculty performance indicators and created new indicators specific to trainees. We present our catalogue of clinical performance indicators from the EHR database at the study site, organized on a spectrum of independent and interdependent EM trainee performance. For instance, independent indicators include number of patients seen and interdependent indicators include length of stay.

Discussion and Conclusions: Our findings document a process for developing trainee report cards that incorporates the perspectives of clinical faculty and trainees. This work has important implications for capturing trainees' contributions to clinical performances, by distinguishing between independent and interdependent indicators in this collaborative work setting.

Take-home Messages: Using a multi-stage, collaborative process combining empirical research and tool development, it is possible to create a prototype trainee report card that meaningfully represents independent and interdependent performance of EM trainees.

Inter-professional assessment of junior doctors

AUTHOR(S):

- Charlotte Green, Aarhus University Hospital, Denmark (Presenter)
- Jeppe Glenting, Aarhus University Hospital, Denmark
- Lene Aagaard, Aarhus University Hospital, Denmark
- Rikke Moustén, Aarhus University Hospital, Denmark
- Mads Ingeman, Aarhus University Hospital, Denmark

ABSTRACT

Background: Inter-professional teamwork is widespread at the Emergency department at Aarhus University Hospital. Acute admissions are managed in a teamwork consisting of both doctors and nurses. Often, a junior resident and a nurse are the primary care providers in the admission of stable patients. Patient admission conducted by junior doctors are regularly supervised and assessed with seven questions according to a national assessment form. We hypothesize that nurses have the ability to assess junior doctors and thereby contribute to strengthen the inter-professional teamwork and support the development of an inter-professional culture.

Summary of Work: A pilot project showed that a nurse and a doctor assessed doctors similarly when using the assessment form. In our study, eight junior doctors were assessed by a nurse or a senior doctor multiple times using the form. We performed focusgroup interviews with the junior doctors and nurses after the assessment. The groups were asked to identify promoting and obstructing factors in the assessment. The interviews were then analyzed using a phenomenological hermeneutic approach.

Summary of Results: The study showed that nurses had more emphasis on and appreciated the opportunity to give systematic feedback on communication and teamwork skills. The nurses, however, found it difficult to assess medical expert domains. The junior doctors appreciated feedback on communicative skills, and felt that the assessment contributed positively to their inter-professional development. The use of the assessment form eliminated some of the obstacles experienced by nurses in the feedback process.

Discussion and Conclusions: Systematic feedback supports inter-professional communication and teamwork. Systematic assessment supports the common goal of teamwork and enlightens the focus on junior doctors communication skills and teamwork.

Take-home Messages: Systematic inter-professional feedback to junior doctors by nurses, improves teamwork and supports inter-professional development.

A comparison of formative and summative assessment methods in Qatar's FM Residency Program: A retrospective study to evaluate the impact on residents' performance, career satisfaction & teaching involvement

AUTHOR(S):

- Youssef Nauf, Primary Health Care Corporation (PHCC), Qatar (Presenter)
- Muna Aseel, Primary Health Care Corporation (PHCC), Qatar
- Mohamed Hashim, Primary Health Care Corporation (PHCC), Qatar

ABSTRACT

Background: Summative Assessment (SA) is used as a tool to measure the achievement of preset learning's objectives while Formative Assessment (FA) is used to provide a more structured and continuous feedback. The Family Medicine Residency Training Program in Qatar, after obtaining accreditation from Accreditation Council for Graduate Medical Education–International (ACGME-I) in 2013, replaced the method of evaluating residents from SA to FA which is based on the six ACGME-I competencies.

Summary of Work: Data was collected using both quantitative and qualitative methods for all residents who completed the third and fourth year of residency in 2012 and 2013 (pre- ACGME-I accreditation group PGY3-G1/PGY4-G1) and 2015 and 2016 (post- ACGME-I accreditation group PGY3-G2/PGY4-G2). Quantitative data was collected from residents' performance portfolios. This included scores from in-training-exams, departmental MCQs and OSCE. Qualitative data was collected by administering a survey and conducted interviews to determine residents' outcomes. The collected data for both groups was analyzed to determine the residents' performance, careers-satisfaction and teaching-involvement.

Summary of Results: A-Residents' Portfolio Results:-

1-In-training Mean-Score;

PGY3-G1-(2012)=317.8(MIAS=476)///PGY3-G2-(2015)=478(MIAS=460)

PGY4-G1-(2013)=420(MIAS=454)///PGY4-G2-(2016)=525(MIAS=456)

2-MCQs Mean-Score;

PGY3-G1-(2012)=60///PGY3-G2-(2015)=65

3-OSCE Mean-Score;

PGY4-G1-(2013)68///PGY4-G2-(2016)79

B-Residents' Survey and Interview Results:-

1-Career-Satisfaction;

PGY4-G1-(2012)=77%///PGY4-G2-(2016)=100%

2-Teaching-Involvement;

PGY4-G1-(2012)=0%///PGY4-G2-(2016)=60%

Key:-

PGY=Post Graduate Year

G1=Group1(one-year Pre-accreditation and one-year Post-accreditation): PGY3-G1/PGY4-G1

G2=Group2-(Post-accreditation): PGY3-G2/PGY4-G2

MIAS=Mean International Average Score for American Board of Family Medicine In-training Exam

MCQs=Multiple Choice Questions

OSCE=Objective Structured Clinical Examinations

Discussion and Conclusions: Above in-training exams' international average passing score of the G2 was so obvious in both years explaining the influence-power of the FA which was also very clear within the G1 (pre and post) implementation (transitional-period) despite its below average international scores in both years.

Improvement in performance-scores as well as career-satisfaction levels and involvement in teaching in G2 compared to G1 suggests implementation of ACGME-I CBFA that helps in improving residents' learning-process including behavior and ways of thinking. This will definitely lead to more comprehensive and well-structured residents training program that can be the benchmark for the recently introduced Milestone Competency-Based Assessment-system (MSCBA).

Take-home Messages: It is highly recommended to continue using ACGME-I CBFA that is associated with more competent and career-satisfied graduates who are interested in teaching. MSCBA is the new challenge for future implementation.

Impact of Drama-based Educational Programme, Diabetes Theatre, on Healthcare Professionals' Attitudes toward Patient Centred Care

AUTHOR(S):

- Kentaro Okazaki, Nagoya University Graduate School of Medicine, Dept of Education for Community-Oriented Medicine, Japan (Presenter)
- Noriyuki Takahashi, Nagoya University Graduate School of Medicine, Dept of Education for Community-Oriented Medicine, Japan
- Mina Suematsu, Nagoya University Graduate School of Medicine, Dept of Education for Community-Oriented Medicine, Japan

ABSTRACT

Background: Patient empowerment is crucial in diabetes care. However, it is still unclear for healthcare professionals (HCPs) how to learn this concept. We developed a drama-based educational workshop for HCPs, Diabetes Theatre (DT) to learn the philosophy of empowerment, a patient-centred approach. They reflect on their own practice by watching the play based on common problems of misunderstanding between a patient and healthcare professionals (HCP) in a clinical practice, and joining the discussion by focusing the good points and improvements of the practice in the drama. The study aimed to investigate the effect of DT on participants' attitudes toward patient centred care.

Summary of Work: Participants in DT at the annual scientific meeting of Japan Diabetes Society in 2015 were requested to answer a questionnaire before and after the program. During the workshop, participants reflect on their practice by watching a play about common misunderstandings between patients and HCPs in a clinical practice, and discussing points to improve the practice in the drama. Attitudes for patient centred care were evaluated by 4 items of 11-point Likert scale from the Diabetes Attitude Scale. Answers for open-ended questions were analysed qualitatively.

Summary of Results: We analysed data from 131 respondents; nurses 54%; dietitians 16%; doctors 11%; pharmacists 11%; and others 8%. HCPs' attitude scores increased significantly in each item (all $p < 0.05$). In detail, 'HCPs should be trained how to communicate with their patients' (from 8.1 to 9.1); 'HCPs should learn counselling skills' (from 8.0 to 9.2); 'HCPs should learn how to set goals with patients' (from 8.5 to 9.4); 'people with diabetes have the right not to take good care of their diabetes' (from 6.2 to 7.4). Qualitative analysis revealed participants learned 1) HCPs should wait the time when patients decided to start self-management, 2) Two-way communication between patients and HCPs is important.

Discussion and Conclusions: HCPs put more importance on training relating elements of patient empowerment, such as communication, counselling, and collaboration with patients. DT could be useful to improve the attitudes of HCPs toward patient centred care.

Take-home Messages: Drama-based programme helps HCPs to learn how to encourage patients with diabetes to manage their problem by themselves.

The continuum of reflection on professional development: the Amsterdam VUmc reflection-line

AUTHOR(S):

- **Veronica Selleger, Amsterdam UMC, Location VUmc, the Netherlands (Presenter)**
- Albert Wenisch, Amsterdam UMC, Location VUmc, the Netherlands
- José van de Kreeke, Amsterdam UMC, Location VUmc, the Netherlands

ABSTRACT

Background: Reflection is crucial for the professional development of medical students and doctors. At the introduction of the 'VUmc-compas 2005', an 8th role, 'the Reflector', was added to the CanMEDS framework (Whitehead et al., 2014). This VUmc reflector-role was implemented as a series of reflection classes, running through the bachelor and master curriculum, with some extensions into the residents' programme. Over the last fourteen years this reflection-line has been refined and additions were implemented.

Summary of Work: From the very start, the first principle was: reflection classes should be scheduled 'just in time', when students go through important professional developments, e.g. their first dissection class or internships. Secondly, reflection classes should be 'safe spaces': small groups in which participants feel free to share or not to share experiences or emotions and where students are not assessed on the content of what they confide to their peers. (Assessment of reflection skills takes place elsewhere, e.g. based on portfolio's.) Thirdly, reflection classes are coached by experienced, flexible, psychologists or physicians, preferably the same coach per group.

Summary of Results: Evaluations of bachelor reflection classes over the years have been sufficient to good, with means ranging from 3.0 (rarely) up to 4.3 (1-5 Likert-scale). In 2015-2016 the master groups were graded 3.7-4.0. In 2015, 93% of the surveyed master-3 clerks (N=158) considered these classes relevant and/or interesting. Based on mostly qualitative evaluations, adaptations were implemented over the years. Amongst others, coaches were trained to use innovative, artistic, reflection tools, bachelor group sizes were reduced, and resident reflection groups were introduced. The 2017 Dutch visitation report defines the reflector-role as 'a valuable addition to the seven CanMEDS-roles, that is also beautifully embedded in the VU-wide vision on education'.

Discussion and Conclusions: Reflection education should be tailor-made, focused on each student's professional development. This asks for a safe, small group, coached by an experienced teacher who can adapt to unexpected, often emotionally charged, student experiences, and who will recognize a student at risk.

Take-home Messages: Reflection in small, continuous groups, provides the possibility for flexible, personalised education. By creating 'safe spaces' for reflection, educators can enhance students' and residents' personal professional development.

Is it about getting interested? Exploring how deliberate reflection might help medical students learn from clinical cases

AUTHOR(S):

- **Ligia Ribeiro, UNIFENAS, Brazil (Presenter)**
- Silvia Mamede, Institute of Medical Education Research Rotterdam, the Netherlands
- Eliza de Brito, UNIFENAS, Brazil
- Alexandre Moura, UNIFENAS, Brazil
- Rosa de Faria, UFMG, Brazil
- Henk Schmidt, Institute of Medical Education Research Rotterdam, the Netherlands

ABSTRACT

Background: Recent empirical studies(1) support the notion that reflection can help students learn from clinical practice(2), but additional evidence and a better understanding of the mechanisms underlying the potential positive effect of reflection on learning are still lacking. This study aims at filling this gap.

Summary of Work: A three-task experiment (diagnostic-task, learning-task, test) is being conducted with fifth-year students from UFMG Medical School, Brazil. Diagnostic-task: participants are randomly assigned to diagnose two clinical cases (diseases associated with jaundice) either by following a deliberate-reflection procedure of comparing/contrasting patient's findings to alternative diagnoses(3) (experimental group) or by making differential diagnosis (control group). After each case, participants answer a questionnaire on awareness of knowledge gaps (AKG) and situational interest (SI) regarding the case. Learning-task: half participants in each experimental condition read a study-material about jaundice either under free- or restricted-time. Test: the four subgroups perform the same recall-task with cued-questions about the study-material.

Summary of Results: So far, 79 students participated (data collection to be completed in February). Analysis of current data shows a significant effect of reflection on participants' AKG ($p=0.03$) and SI ($p<0.001$). Mean study-time of reflection/free-time group was longer than control/free-time group (450" vs 374"); mean scores in the test of reflection/free-time (44) were higher than reflection/restricted-time (35), control/free-time (35,2) and control/restricted-time (35,7), but differences are borderline. Additional participants will allow to explore the potential interaction of reflection and study-time on test scores.

Discussion and Conclusions: Relative to making differential diagnosis, deliberate reflection fostered students' AKG and SI. Higher interest and, consequently, longer engagement in the study-task is apparently the mechanism underlying the tendency towards better performance of deliberate reflection in the test. Completing the study sample will show whether these findings hold.

Take-home Messages: Encouraging deliberate reflection on clinical cases might help students become aware of knowledge gaps, consequently fostering interest/engagement in learning and learning outcomes. 'Doctor Jazz': lessons that medical professionals can learn from jazz musicians

AUTHOR(S):

- Allard van Ark, University Medical Center Utrecht, the Netherlands (Presenter)
- Marjo Wijnen-Meijer, Technische Universität München, Germany

ABSTRACT

Background: Jazz is a musical form that originates from New Orleans in the late nineteenth century. A typical jazz ensemble consists of a rhythm section (drums, double bass, piano) and a horn section (tenor and alto saxophone, trumpet). Jazz consists of a layer of repetitive rhythmic and harmonic cycles, called 'choruses'. The chorus is provided by the rhythm section and has a fixed length (rhythm) and chord progression (harmony). The chord progression that is given to the soloist by the rhythm section serves as the foundation and starting point for improvisation, as jazz musicians have learned which tones can be used in improvisation together with a certain given chord. The resulting improvised solo can take many forms: from a simple variation on a well-known melody to discarding the melody entirely to rely solely on its underlying chord progression. The jazz framework of improvisation based on underlying rhythmic and harmonic structure in an ensemble context has been related to medicine previously. It applies to medicine and medical education both as a metaphor for organisation and culture as well as a practical tool in clinical education.

Summary of Work: A systematic search was conducted, combining keywords with regard to jazz, medicine and medical education. Background information concerning jazz music and several jazz musicians was retrieved through an additional non-systematic search using Google Scholar.

Summary of Results: Lessons with regard to improvisational skills, both in communication with patients and in a technical context, communication skills, leadership, interprofessional teamwork and coping with errors are presented.

Discussion and Conclusions: Doctors and medical students could learn various lessons from jazz music performance and jazz musicians. The potential and the possibilities of implementing jazz into the medical curriculum, in order to contribute to the development of professional skills and attitudes of medical students, could be explored further.

Take-home Messages: - Medical professionals can learn from the concepts behind jazz music and its required skills. - These include improvisational skills, both in communication with patients as well as in a technical context, conversational skills, leadership, interprofessional teamwork and coping with errors. - Evidence on implementation of jazz in the medical curriculum is scarce. Its potential could be explored further.

#10S Short Communications - Teaching and Learning 3

10S6 (3298)

Date of Presentation: Wednesday, 28 August 2019

Time of Presentation: 0945-1000

Location of Presentation: Room 0.51, Level 0

Using design thinking to re-invent the delivery of undergraduate medical education

AUTHOR(S):

- **Rahim Kachra, University of Calgary, Canada (Presenter)**
- Allison Brown, University of Calgary, Canada
- Nishan Sharma, University of Calgary, Canada
- Mike Paget, University of Calgary, Canada

ABSTRACT

Background: Medical schools have overhauled their mechanisms of education delivery. Lectures have been cast aside as antiquated and ineffective methods of information exchange. Students experience inattention early and throughout lectures. Students in classes with traditional lectures are 1.5 times more likely to fail than those with active learning. The optimal method of educational delivery is unclear. Design thinking can be used in the creation of a new product/process. The first stage emphasizes data gathering, keeping users at the centre of the research, but engaging all stakeholders. The second stage consists of a series of tools through which one can make sense of what has been learned, turning it into opportunities for design, and making and evaluating prototypes. The final stage makes concepts real and assesses if they are working.

Summary of Work: We observed student behaviours during lectures and small group sessions throughout pre-clerkship. We also conducted interviews and focus groups with students, course chairs, faculty lecturers, technology management, and course administrators. Insights were used to create theme. Ideas were bundled into more complex concepts, from which we identified quick wins and larger solutions. Next steps include assessing feasibility and prototyping our innovations.

Summary of Results: 316 unique insights were identified and subsequently divided into 11 themes, including clinical experiences, logistics, and finances. Eighty-nine unique solutions were proposed by our team, which were bundled into 12 larger-scale solutions. We selected our top 5 quick wins, and top 3 major projects to present to the pre-clerkship committee for consideration.

Discussion and Conclusions: At this unique time in medical education, many programs are redefining themselves in order to determine the optimal method of course delivery. We believe we are the first program to use design thinking to create a student-centered approach to the delivery of course content. Our process promises to uncover rich data and insights that we are currently not capturing. Change, if indicated, will be a transparent and 'evidence-based' process.

Take-home Messages: - Design thinking is a promising methodology for reformatting the delivery of medical education. - A student-centered approach does not ignore other key stakeholders. - While change is exciting, it should be well-founded and necessary, and not for the sake of change.

#10S Short Communications - Teaching and Learning 3

Date of Presentation: Wednesday, 28 August 2019

Time of Presentation: 1000-1015

Location of Presentation: Room 0.51, Level 0

“Naturally, we will become more ‘immune’ to such visions”: Accepting and internalizing inappropriate behaviors as part of medical students’ professional socialization process

AUTHOR(S):

- Galit Neufeld Kroszynski, Sackler School of Medicine, Tel Aviv University, Israel (Presenter)
- Orit Karnieli-Miller
- Dafna Meitar

ABSTRACT

Background: Senior physicians play an essential role in medical students’ socialization process, where some become positive role models, while others become negative role models behaving inappropriately. To date, most of the research on exposure to inappropriate behavior was cross-sectional. Less is known about the longitudinal process of interpretation and perception of these behaviors, by the same students, over-time. Therefore, the present study explored a cohort of medical students’ prospective and retrospective observations and interpretations of senior physicians’ inappropriate behaviors.

Summary of Work: This was a systematic qualitative immersion/crystallization analysis of 134 reflective diaries and narratives describing inappropriate physicians’ behaviors written by 53 students throughout their medical studies; and 11 in-depth, semi-structured interviews with randomly selected students who wrote these narratives. The data was analyzed in an iterative consensus-building process to identify how inappropriate behaviors were perceived and interpreted.

Summary of Results: At the beginning of their training, the students expressed a judgmental attitude towards problematic behaviors such as lack of respect/sensitivity to patients and physicians using aggression. At that point, students mainly expressed confidence and hope that they would behave differently when they become doctors. Towards/upon completion of their training the same students were more forgiving of these behaviors, focused on providing explanations and justifying them (including blaming the system), and mentioning that they can see themselves behaving similarly or even have been acting in that manner.

Discussion and Conclusions: The process of medical students’ professional socialization includes a transition from expecting a respectful and caring behavior, towards legitimization and acceptance of undesirable behaviors that the same students previously criticized. The shift exemplifies how empathy and caring decreases. Students struggling with the system challenges found themselves accepting inappropriate behavior.

Take-home Messages: The socialization process of legitimizing inappropriate behaviors is concerning; The study's findings show that the reflective process by itself is not enough as it does not necessarily lead to the preservation of empathic attitudes and behaviors. Therefore, there is a need to develop other interventions that will help students preserve their original values of respect, compassion, and caring, even within the difficult and challenging healthcare settings.

#10T Round Table – Research

10T1 (374)

Date of Session: Wednesday, 28 August 2019

Time of Session: 0830-1015

Location of Presentation: Room L5, Level 1

Longitudinal Qualitative Research in Health Professions Education: Heeding the Call

AUTHOR(S):

- Dorene Balmer, University of Pennsylvania, USA (Presenter)
- Elise Paradis, University of Toronto, Canada
- Anique Atherley, University of the West Indies, Barbados
- Pim Teunissen, Maastricht University, the Netherlands

ABSTRACT

Research papers in health professions education (HPE) often conclude with call for longitudinal qualitative research to explore how complex phenomena unfold through time. Seldom is that call heeded. As a result, the field of HPE continues to understand complex phenomena (e.g., role transition, identity construction) as a process but to study them as if they were static.

In a search of HPE journals, only 11 articles were identified as employing a longitudinal qualitative research approach. Many factors are likely to contribute to this dearth of longitudinal qualitative research. The aim of this Round Table presentation is to develop a shared understanding of the genre of longitudinal qualitative research in HPE, to explore barriers to conducting such research in HPE and to describe implications for analysis, reporting, and research relationships that should inform plans to conduct longitudinal qualitative research.

#10T Round Table – Research

10T2 (2171)

Date of Session: Wednesday, 28 August 2019

Time of Session: 0830-1015

Location of Presentation: Room L5, Level 1

Dethroning experimental research methods in developing education innovations

AUTHOR(S):

- Satid Thammasitboon, Baylor College of Medicine, USA (Presenter)
- Brian Rissmiller, Baylor College of Medicine, USA
- Kyle Brown, Baylor College of Medicine, USA

ABSTRACT

There are constant needs for innovative solutions to address educational problems. This discussion will serve as a call to arms for educators and scholars to be equipped with innovation skills to stay abreast in the Volatile, Uncertain, Complex, Ambiguous (VUCA) world.

Traditionally, an experimental research model (i.e. hypothesis driven research) has been used to plan and study innovations in health professions education (HPE). However, employing this methodology in the complex reality of a learning environment has met with mixed results as data from many creative educational endeavors simply cannot disprove the null hypothesis or minimize confounders. Thus, it is important to underscore how other research paradigms, such as constructivism and critical theory, align with the complex environment of research and innovation in HPE.

Educators and HPE scholars, therefore, need to embrace alternative paradigms and apply appropriate methods to the design and evaluation of innovations. We must learn how principles from design-based research, design thinking, practical trials, and implementation research can be applied to the HPE innovations. These methods share frameworks and processes such as embracing complexity (rather than controlling it) and focusing on hands-on solutions via iterative improvement cycles (rather than completing an experiment and then assessing pre-determined outcomes).

#10T Round Table – Research

Review methodologies: Meta-narrative synthesis for secondary research in medical education

AUTHOR(S):

- Eleanor Bowen-Jones, King's College London, UK (*Presenter*)
- Birgit Fruhstorfer, Warwick University, UK
- Ann Wylie, King's College London, UK
- Paula Baraitser, King's College London, UK
- Carwyn Hooper, St George's, University of London, UK

ABSTRACT

Meta-narrative synthesis is an approach to literature reviews that synthesises literature regarding a given topic from multiple research traditions. This methodology is relatively new and was developed by Greenhalgh et al. (2005) when conducting a review in health services research. Since then meta-narrative reviews have been conducted in various fields of health care but they have not yet received much uptake in medical education.

During this presentation the lead author will outline how she approached conducting a meta-narrative review for her PhD on the topic of international electives in undergraduate medical education. She will use her own research as a case study to explore the process of carrying out a meta-narrative review, and to highlight the opportunities and challenges inherent in this review methodology.

#10T Round Table – Research

10T4 (2048)

Date of Session: Wednesday, 28 August 2019

Time of Session: 0830-1015

Location of Presentation: Room L5, Level 1

Show Me The Money: How to speak to donors about funding health professions education research

AUTHOR(S):

- Robert Paul, University of Toronto, Canada (*Presenter*)
- Kerry Knickle, Michener Institute, Canada
- Nancy McNaughton, Wilson Centre, University of Toronto, Canada
- Jeannine Girard-Pearlman, Wilson Centre, University of Toronto, Canada

ABSTRACT

Funding for health professions education research is becoming more and more challenging. Traditional governmental sources are becoming overstretched and as a result are unlikely to be able to meet the growing funding needs in this burgeoning area. Philanthropy is emerging as an important funding mechanism and as a supplement to traditional government sources in countries around the world. Research on philanthropy in health professions education is only beginning but preliminary results are showing that there is a fundamental lack of knowledge and communication skill related to fundraising amongst medical education leaders and researchers to meet this challenge. To meet this growing need and the emerging obligatory competency for fundraising, health professions leaders and educators are beginning to engage in discussion with their institutional leaders, their institutional fund-raisers and even their potential donors. In doing so, they are rapidly becoming aware that speaking with each of these groups about their work is different than speaking with colleagues; that they have to re learn how to speak in clear, simple non-technical terms. They are also quickly realizing that understanding this and doing it are two different things.

In this round table presentation, characteristics of successful conversations will be discussed as will how simulation and “simulated donors” can help health professions education leaders and academics re-learn how to speak about their domain in ways the layperson can understand.

#10U Conference Workshop

10U

Date of Workshop: Wednesday, 28 August 2019

Time of Workshop: 0830-1015

Location of Workshop: Room L8, Level 1

Implementation of Competence Based Medical Education in Surgery (CBME): Challenges from an international perspective

PRESENTER(S):

- Helen MacRae, University of Toronto, Department of Surgery, Canada
- Gareth Griffiths, NHS Tayside, UK

ABSTRACT

Background: CBME is a new framework for medical education currently being implemented in many jurisdictions. Procedural based specialties face special challenges both with implementation of a CBME curriculum, and with evaluation of the outcomes. Entrustable professional activities (EPA's) are the outcome measure used for progression within CBME, and in surgery, EPA's include the ability to complete operations independently, along with other important milestones. This workshop will explore how CBME in surgery has been implemented in different jurisdictions to help participants recognize and develop an approach to implementation challenges.

Who should attend: Surgical educators involved in post graduate education programs that have transitioned to or are considering transitioning to a CBME framework.

Structure of workshop: Surgeons from different parts of the world (North America, Europe, Australasia) will share their perspectives on the challenges, pitfalls and successes of CBME implementation in their own jurisdictions. This will be followed by a facilitated discussion on overcoming implementation challenges within small groups.

Intended Outcomes: At the completion of the workshop participants will be able to:

- Describe the challenges of implementation of CBME in surgery
- Outline the importance of faculty development prior to CBME implementation
- Describe how assessment in CBME in surgery can be used

Level: Intermediate/Advanced

#10V Conference Workshop

10V

Date of Workshop: Wednesday, 28 August 2019

Time of Workshop: 0830-1015

Location of Workshop: Room 0.11-12, Level 0

Constructive Alignment: What makes teaching-learning interactions stick?

PRESENTER(S):

- Chitra Subramaniam, AO Foundation, USA
- Miriam Uhlmann, AO Education Institute, Switzerland

ABSTRACT

Background: In CPD, most educational activities are developed with a focus on “what needs to be taught”. Most presenters use existing content that they assume was well received and adapt them to the new topic that they are presenting on. Research in the cognitive and the learning sciences have provided insights into the way people learning and process information. Most of the teaching techniques and instructional design concepts in CPD do not align with what the cognitive and learning sciences tell us. Instructional elements and teaching formats that support such deep learning engagements need to be completely aligned with the overall goals and objectives, the learning needs of the audiences and hence the practice gaps. John Biggs describes such alignment as the most critical component that promotes active learning and learner engagement. The session will also discuss techniques that can support achieving such alignment and current challenges in CPD related to this and how to overcome them

Who should attend: All those involved in the design and development of content, instructional elements, and delivery of CPD can benefit from this session. In addition, those that serve as faculty, speakers and authors of content, curriculum developers, instructional designers and developers and everyone with an understanding of the adult learning principles will be invited to join.

Structure of workshop: The session will further extend the application of the adult learning principles to develop and deliver aligned teaching formats. The facilitators through small group activities and discussions will help the audience achieve alignment for case `scenarios presented. The facilitators will then the case scenarios and provide the necessary feedback. In addition, once the formats have been identified, the facilitators will discuss effective ways to deliver the formats through teaching. In small groups participants will be given the necessary time to develop their own plan to implement such instructional design elements and the associated activities.

Intended Outcomes:

- Discuss the concept of constructive alignment
- Identify ways to achieve the alignment in CPD
- Explain the steps involved in achieving constructive alignment when developing content for CPD sessions
- Discuss learning interactions that are effective in CPD
- Explain the ways to deliver different formats of teaching effectively

Level: Beginner to intermediate

#10W Conference Workshop

10W (3328)

Date of Workshop: Wednesday, 28 August 2019

Time of Workshop: 0830-1015

Location of Workshop: Room 0.49-0.50, Level 0

Deconstructing Competency-Based Assessment in Interprofessional Education and Collaboration: A Three-Stage Continuum

PRESENTER(S):

- Susan J. Wagner, Dept. of Speech-Language Pathology, Faculty of Medicine, University of Toronto, Canada
- Brian S. Simmons, Dept. of Pediatrics, Sunnybrook Health Sciences Centre & Faculty of Medicine, University of Toronto, Canada

ABSTRACT

Background: The interprofessional education (IPE) literature has expanded significantly in the past few years to provide a rich variety of evaluation studies of different IPE activities, however, efforts to produce rigorous assessment of IPE learning continue to be a challenge. At present, most IPE learning is focused on self-assessment that only provides a perception of what the learner thinks s/he may have learned. This reliance on weak forms of assessment data continue to undermine the quality of IPE assessment and fail to engage with key principles of assessment that should be adhered to in any IPE learning activity. This workshop is intended to introduce participants to a new competency-based assessment model that addresses many of the challenges inherent in assessing IPE.

Who Should Attend? Health profession educators interested in assessment, evaluation, competencies and interprofessional education.

Structure of Workshop: This workshop provides an exploration of key issues or challenges related to the assessment of IPE. It deconstructs the processes of designing and implementing an IPE assessment focusing on the structure (individual), function (team) and outcome (task). This new three-pronged clinical competency continuum model is illustrated employing the concepts of milestones and entrusted professional activities (EPAs) in a performance framework. Use of brief didactic presentations will help maximize interactive discussion and reflection, which will make up the majority of the session. Participants will also watch (DVD), a simulated IPE learning activity and consider how it could be assessed using the new assessment model. Specifically, this workshop will introduce participants to a range of key assessment concepts and ideas for consideration and implementation. This will enable them to apply strategies for application in their own contexts. As a result, the workshop will help to develop an understanding of the process of assessment and how to reconceptualize and develop assessment relevant to IPE.

Intended Outcomes:

- Identify key issues related to assessing performance in IPE;
- Describe a new Structure-Function-Outcome Model of IPE assessment;
- Reflect on the application of milestones and entrustable professional activities (EPAs) to this model

Level: Intermediate, for those with a background in IPE

#10X Conference Workshop

10X (695)

Date of Workshop: Wednesday, 28 August 2019

Time of Workshop: 0830-1015

Location of Workshop: Room 0.96-97, Level 0

Adaptive Education: Designing and offering education that is optimized for individual learners and contexts

PRESENTER(S):

- Michael Seropian, iMedTrust, USA
- Ian Curran, Duke-NUS Medical School, Singapore
- Davinder Sandhu, RCSI-Bahrain, Bahrain
- Hill Jason, iMedTrust, USA
- Jane Westberg, iMedTrust, USA
- Kamila Hawthorne, RCGP-UK, UK

ABSTRACT

Background: Individualizing our educational offerings should no longer be treated as a luxury. It can and should be a central obligation of all programs in the health professions. Our learners and the public deserve educational programs in the health professions that reliably help learners become effective, safe clinicians who continue learning throughout their careers. This challenging obligation must be accomplished under growing economic constraints, requiring us to be as effective and as efficient as possible. Substantial research and brain science confirm that some of our traditional habits, practices and assumptions are suboptimal. In particular, programs need to be far more responsive to the uniqueness of each learner and situation. With adequate educator preparation and the use of available, new technologies, we can provide more effective learning experiences than at any time in the past.

Who Should Attend? Anyone interested in redefining medical education

Structure of Workshop: This workshop will be highly participatory and a real-time demonstration of Adaptive Education. We will offer exercises and discussions built on direct engagement with simulations, multimedia, and illustrations of Adaptive Education in action. We will engage in tasks that are relevant to the participants' daily work as educators. We will use "Strategic" simulations to offer experiences that reinforce key topic areas
 Time: 15 minute- introduction & ice breaker
 30 minute - content review and introduction to key concepts
 40 minutes - progressive serial simulation to build complexity and understanding of key concepts and challenges
 5 minutes - wrap-up

Intended Outcomes:

- An understanding of potential benefits for their learners from their having had a direct experience of being learners themselves in some examples of Adaptive Education.
- Expanded and more refined thinking about Adaptive Education.
- Ideas and practical plans they can consider implementing in their own settings.

Level: Suitable for all levels. This workshop will be a real time illustration of strategies to address mixed learner groups. We will respond to the full range of levels of readiness of those who attend.

#10Y Conference Workshop

10Y (1924)

Date of Workshop: Wednesday, 28 August 2019

Time of Workshop: 0830-1015

Location of Workshop: Room 2.17, Level 2

Towards a shared understanding of threshold concepts in global health in health professions education

PRESENTER(S):

- David Davies, University of Warwick, UK
- Ann Wylie, King's College London, UK
- Susan van Schalkwyk, Stellenbosch University, South Africa
- Moira Maley, The University of Western Australia, Australia

ABSTRACT

Background: Threshold concepts are understandings that open up new ways of thinking about something, that until the threshold has been crossed, learning cannot progress. These 'stuck places' represent fundamental ideas and practices that can be thought of as a transition, or a transformation of one way of thinking or being into another. The authors hypothesise that global health education, and electives in particular, offer rich opportunities for learners to resolve and reconcile troublesome knowledge or a disorientating dilemma to achieve new ways of understanding how the world works. As such, threshold concepts could represent important routes or gateways in the global health curriculum. If there are threshold concepts that all curricula share, then could we also share ways of teaching these, or guiding our students across the threshold, and also come to a common understanding of how to assess that transition?

Who Should Attend? Curriculum developers, global health teachers and elective leads, assessment leads, educationalists and students interested in global health education.

Structure of Workshop:

- Participant and facilitator introductions (10 mins)
- Plenary introduction to threshold concepts and transformative learning theory followed by a brief whole group discussion to clarify unfamiliar concepts (25 mins)
- Facilitated small group discussion topics (30 minutes) to include:
 - What might constitute a threshold concept in global health education?
 - Do we recognise and share these threshold concepts and transformative learning in our own curricula?
 - How are students supported through these threshold concepts, what other strategies could be used?
 - What are some suitable strategies for the assessment of threshold concepts?
 - What are the implications for the student that fails to cross the threshold?
- Plenary report back from small groups (30 mins)
- Synthesis of findings by facilitators and suggestions for next steps (10 mins)

Intended Outcomes: By the end of the session participants will be;

- familiar with concepts and theory associated with threshold concepts and transformative learning
- able to reflect on the value and potential of these concepts in global health learning
- able to consider strategies for teaching and assessing threshold concepts in global health

Level: Suitable for attendees of all levels, no prior understanding of threshold concepts is required.

#10Z Conference Workshop

10Z (3031)

Date of Workshop: Wednesday, 28 August 2019

Time of Workshop: 0830-1015

Location of Workshop: Room 2.44, Level 2

Medical Humanities: Education and Practice

PRESENTER(S):

- Jonathan McFarland, Sechenov University, Russian Federation
- Irina Markovina, Sechenov University, Russian Federation
- Ourania Varsou, Glasgow University, UK
- Emma Black, University of St Andrews, UK

ABSTRACT

Background: “The future of medicine depends on finding the way to (re)introduce the humanities to the core of medical education”. * The further we move into the 21st century the more important this statement becomes, with more medical educators around the world seeing how critical it is to balance the tremendous advances of scientific medicine, with the humanities and their values. The main aim of this workshop is to explore how this (re)introduction can be made(1).

Who Should Attend? All interested in Medical Humanities.

Structure of Workshop: The workshop is divided into two sections: the first, Education, looks at the birth of a project, The Doctor as a Humanist, and its progress. We explain our journey from the first symposium in 2017, to a new online course dedicated to introducing the medical humanities to students around the world, and our recent second symposium held in Moscow. We will discuss the aims and ideals of this new and exciting project. The second section, Practice, will explore in small groups how arts and humanities can be integrated into vocational and science curricula through the use of the following three case studies:

- 1) Art in Anatomy - a current project using body painting and ‘alternative’ artistic methods on teaching and learning anatomy amongst science students,
- 2) Poems for Doctors - a current online project using poetry to promote conversation amongst medical students and doctors about challenging topics, and
- 3) Films in Medical Education - a past project where films were coupled with expert-led discussions to discuss medical topics. The main goals of the workshop will be to allow the participants to learn about new medical humanities projects (The Doctor as a Humanist), and interactively discuss the impact of these in their own institutions.

Intended Outcomes: Based on the above discussions the participants will be able to initiate similar activities at their institutions, develop their own projects or join the projects presented and truly make them International, Interdisciplinary and Intergenerational.

Level: All levels

#10AA Conference Workshop

10AA (1763)

Date of Workshop: Wednesday, 28 August 2019

Time of Workshop: 0830-1015

Location of Workshop: Room 2.61, Level 2

Achieving patient-oriented care with an interprofessional team. Implications for the educational process

PRESENTER(S):

- Angelika Eder, FH Campus Wien University of Applied Sciences, Department Health Sciences, Austria
- Richard Marz, Medical University Vienna, Austria
- Matthäus Ch. Grasl, Medical University Vienna, Austria
- Karl F Kremser, Medical University, Austria

ABSTRACT

Background: Insufficient teamwork among healthcare professionals has been identified as a systemic problem in providing patient-oriented care. On the other hand, there is good evidence that functioning interprofessional interactions improve motivation and lead to more stable working conditions. Students benefit from didactic concepts which embrace interprofessional education (IPE) by improving their own perception of their professional identity and at the same time develop a better understanding for other professions.

Who Should Attend? Healthcare professionals (physicians, nurses...) educators, students

Structure of Workshop: Based on discussions in small groups you will design an interprofessional working and training environment for the care of geriatric patients. This will be followed by a plenary discussion in which all ideas generated will be discussed and evaluated.

Intended Outcomes: You will learn about and experience the competence profiles of various medical professions and their potential for interaction. You will identify common issues and challenges in designing goal-oriented therapy and care.

Level: introductory

#10BB Conference Workshop

10BB (720)

Date of Workshop: Wednesday, 28 August 2019

Time of Workshop: 0830-1015

Location of Workshop: Room 2.83, Level 2

How to introduce high quality Team-based learning (TBL) into the curriculum

PRESENTER(S):

- Annette Burgess, The University of Sydney, Australia
- Jane Bleasel, The University of Sydney, Australia
- Chris Roberts, The University of Sydney, Australia
- Roger Garsia, The University of Sydney, Australia
- Antonia Clarke, The University of Sydney, Australia
- Inam Haq, The University of Sydney, Australia

ABSTRACT

Background: Team-based learning (TBL) has gained recent popularity as an alternative to problem-based learning (PBL), particularly in the pre-clinical years of medical school. In comparison to PBL, TBL maintains the advantages of small group teaching and learning, but importantly, without the need for large numbers of tutors. Using a flipped classroom approach, and specific steps, TBL promotes: collaborative peer learning in small groups, student accountability, and provides standardisation across large student cohorts. The workshop facilitators have developed and implemented a TBL format within a medical program, specifically designed to promote class discussion and clinical reasoning, with free-text responses, avoiding pre-determined outcomes. The purpose of this workshop is to empower attendees to explore the relative merits of TBL, and how these may be applied to their own medicine and health science curricula. This interactive workshop will utilise the TBL format to explore the application of readiness assurance testing, student feedback, clinical problem-solving, and student peer-review.

Who Should Attend? Any individual (student, staff, faculty, deans level) involved in health education and training may benefit from this workshop. We will facilitate an interactive workshop, designed to share our experiences, and allow participants to discuss best practices and instructional strategies that will align with their curriculum outcomes, and promote student engagement in TBL designed classes.

Structure of Workshop: We will facilitate an interactive workshop, designed to share experiences, and allow participants to discuss instructional strategies that align with their curriculum outcomes, and promote student engagement in TBL designed classes. Active participation in small groups in the format of a team-based learning class is required. We will use a short video, Individual Readiness Assurance Test (multiple choice questions), Team Readiness Assurance Test, feedback, and problem solving activities.

Intended Outcomes: Participants will gain an understanding of the application of TBL, within the pre-clinical years of a medical curriculum. Participants will leave with the tools to apply best practice in the implementation of TBL, to suit the needs of their students, faculty, curriculum, and associated institutions.

Time of Workshop: 0830-1015

Location of Workshop: Room 2.95, Level 2

Artificial Intelligence in Medical Education: A Practical Guide

PRESENTER(S):

- Nabil Zary, Mohammed Bin Rashid University of Medicine and Health Sciences, United Arab Emirates
- Smriti Pathak, Imperial College London, UK
- Paul Gagnon, Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore
- Malolan Chetlur, IBM Research, India

ABSTRACT

Background: Artificial Intelligence (AI) has evolved throughout the years, developing rapidly in several aspects, with the recent advances in deep learning and artificial neural networks. AI, the term coined by John McCarthy in 1955, is defined as a machine exhibiting intelligent behavior which includes perceiving, reasoning, learning or communicating as well as the ability to perform human tasks. AI is a spectrum which consists of, but not limited to, the following: machine learning, computer vision, natural language processing, and pattern recognition. Over the past 25 years, there have been significant developments of AI in education, better known as Artificial Intelligence in Education. Advances such as teacher bots: teaching assistants tasked to support content delivery, provide feedback and manage supervision are applications of AI in education. The increased interest in the application of AI in medical education brings its own set of challenges. As the degree of digitalization in medical curricula increases, it is therefore timely to provide AMEE participants with an opportunity to understand and actively consider the leveraging of AI in medical education.

Who Should Attend? Anyone with an interest in the use of Artificial Intelligence in Medical Education is invited to participate. Individuals involved with planning, design, development and implementation of technology enabled/enhanced innovations are especially encouraged to attend.

Structure of Workshop: The workshop will start with an overview of the current state of AI in medical education, followed by small group interactive activities aimed at increasing participants' overall understanding of AI in education. There will then be a large group discussion of some case examples brought by the presenters. Two further large and small group exercises will allow participants to apply key concepts related to the planning of an AI project, targeting (i) curriculum, (ii) learning or (iii) assessment. (A toolbox containing templates and best practice guidelines will be provided for each participant)

Intended Outcomes: At the conclusion of this workshop, participants will be able to
(i) identify key elements specific to understanding artificial intelligence in medical education,
(ii) describe an approach to designing AI enabled learning and assessment activities, and
(iii) outline common strategies and challenges when planning and evaluating AI projects.

How can photography reflect student self-awareness?

AUTHOR(S):

- Marisa Jitnupong Bunphan, Suratthani Hospital, Thailand (Presenter)
- Thanita Somton, Suratthani Hospital, Thailand

ABSTRACT

Background: Reflective practice is a great tool for learning process. It promotes student's understanding both self and situation that can lead to intellectual growth. Our aim is to improve reflective skills in medical students.

Summary of Work: A descriptive study was conducted in 4th and 5th year medical students of Suratthani Medical Education Center, Thailand on August, 15th 2018. Each student had time to free walking and took the photo that evoked the feelings, thoughts and memories. Four small group reflection were discussed using Gibbs reflective model (1988). Medical teachers facilitated them to explore their emotions and belief system.

Summary of Results: There were 44.45% of medical students participated. Most of them had reflected their feelings and experiences abundantly and openly, few students needed encouragement. But most students should gain more practices in deep listening and learn to reflect others. All pictures were about buildings, nature, people and medical related images. Two-third pictures students expressed were about experiences during medical studies. One-third pictures students expressed were about inner feelings. Some negative experiences became negative feelings and thoughts, but after group sharing it can relief stress and find some solutions. Most students reflected on this practices could help them explore own self, and deepen understanding friends' feelings through their pictures. Surprisingly it reduced some stress and they got some tips for overcoming it.

Discussion and Conclusions: Reflective practices using photography could help medical students to develop self-awareness and understand others that can improve lifelong learning skills. Also it could lower the stress.

Take-home Messages: Medical teachers should create reflective exercise activities for develop reflective skills to improve student self-awareness. Also more deep listening practices is an essential for reflective practices group.

Research in action - how to teach research skills in undergraduate biomedical students

AUTHOR(S):

- Femmie de Vegt, Radboud university medical center, the Netherlands (Presenter)
- Iris van Rooij, Radboud university medical center, the Netherlands
- Thom Oostendorp, Radboud university medical center, the Netherlands
- Jos van Dijck, Radboud university medical center, the Netherlands
- Hans Otten, Radboud university medical center, the Netherlands

ABSTRACT

Background: In order to understand and appreciate clinical research, it is important to integrate research in (bio)medical education. Students develop research skills at a higher level if they are actively involved and participate in realistic research activities. We describe and evaluate our practice-based learning approach in undergraduate students Biomedical Sciences at Radboud University in Nijmegen, the Netherlands.

Summary of Work: Freshman students who started their study Biomedical Sciences between 2015 and 2018 were prepared for clinical research activities at the start of their study. In the first semester, they collected data on themselves concerning body weight, body circumferences, fat mass, bone mass, heart rate, ECG findings, genetic variants, life style habits, physical activity and food consumption. All data were entered into one (anonymous) Student Research Database. In the second semester, all students defined their own research questions, performed the statistical data analyses and wrote a short research paper. The research papers were assessed with the use of a rubric by experienced researchers. The program is still running and the students currently involved (n=100) will be asked for their experiences and appreciation of this practice-based learning approach in spring 2019.

Summary of Results: At this moment, the Student Research Database includes data from 298 individual students. Until now 272 short research papers have been made and assessed. The mean grades (range) were 6.4 (4.7 - 9.5) in 2016, 6.6 (2.3 - 9.2) in 2017 and 6.5 (4.0 - 9.3) in 2018. The experiences and appreciation scores of students will be presented at AMEE 2019.

Discussion and Conclusions: It is feasible and attractive to implement research skills in undergraduate programs by practice-based learning. Students experience research by performing measurements and collect data in their own group and they are more connected with the data collected. Using these, more personal, data when performing statistical analyses and writing research reports will introduce them gently in the world of clinical research.

Take-home Messages: It is feasible and attractive to implement research skills in undergraduate programs by practice-based learning. Students develop research skills at a higher level if they are actively involved and participate in realistic research activities.

How do residents develop self-efficacy through clinical training? A qualitative study

AUTHOR(S):

- Kazuki Tokumasu, Department of General Medicine, Okayama University Hospital, Japan (Presenter)
- Mikako Obika, Department of General Medicine, Okayama University Hospital, Japan
- Haruo Obara, Department of General Internal Medicine, Okinawa Chubu Hospital, Japan
- Makoto Kikukawa, Department of Medical Education, Kyusyu University, Japan
- Fumio Otsuka, Department of General Medicine, Okayama University Hospital, Japan

ABSTRACT

Background: Self-efficacy is the 'belief in one's capabilities to organize and execute the courses of action required to produce given attainments' (Bandura, 1997). Self-efficacy has demonstrated positive correlations with students' performances in undergraduate medical education (Sevgi, 2013). However, a few quantitative studies revealed that interview or simulation training increased the level of self-efficacy in postgraduate training settings (Robert, 1998). Thus, studies that explain what kind of experience is effective or how residents develop their experiences to enhance self-efficacy have been rarely conducted. The purpose of this study is to explore how residents develop self-efficacy in clinical training qualitatively.

Summary of Work: Qualitative semi-structured interviews of five Japanese postgraduate medical residents at Okinawa Chubu Hospital and Okayama University were undertaken, recorded, and transcribed. The transcripts were analyzed based on Steps for Coding and Theorization (Otani, 2008), which is a sequential and thematic qualitative data analysis technique.

Summary of Results: Two main experiences were identified to develop residents' self-efficacy: First, 'Successful clinical experience with autonomy and responsibility' was the most effective factor in enhancing residents' self-efficacy. Additionally, thankfulness from patients and attending physicians' approval reinforced the efficacy. Autonomy is an attitude of having one's own choice in managing patients. Responsibility was a force that obliges residents to take charge of their patients. Second, 'Role model of a close member' influenced self-efficacy positively. Spending time with well-trained senior doctor, inspired the resident doctors to attain the same performance level and improve their sense of self-efficacy.

Discussion and Conclusions: Successful clinical experience is strongly related to mastery experience, which is the most effective way of creating a strong sense of efficacy. Additionally, in postgraduate clinical settings, autonomy and responsibility, that are crucial qualities for clinicians, are powerful factors that strengthen the mastery experience. As young doctors, residents felt a huge gap between own goals to contribute to patients' management and actual abilities. Thus, these mastery experiences have a great power to develop self-efficacy. Role modeling is a vicarious experience in which seeing similar people succeed strengthens self-efficacy. The closer the relationship, the deeper is its influence on self-efficacy.

Take-home Messages: Realization of the processes involved in developing self-efficacy among physicians-in-training can make their development more effective.

Stimulating reflective learning and practice in anaesthesiology residents with the obstetric anaesthesia diary

AUTHOR(S):

- **John Lee, Department of Women's Anaesthesia, KK Women's and Children's Hospital, Singapore (Presenter)**
- Raymond Goy, Department of Womens Anaesthesia, KK Womens and Childrens Hospital, Singapore
- Farida Ithnin, Department of Women's Anaesthesia, KK Women's and Children's Hospital, Singapore
- Rajive Dabas, Department of Women's Anaesthesia, KK Women's and Children's Hospital, Singapore
- Singaraselvan Nagarajan, Department of Women's Anaesthesia, KK Women's and Children's Hospital, Singapore
- Eileen Lew, Department of Women's Anaesthesia, KK Women's and Children's Hospital, Singapore

ABSTRACT

Background: Anaesthesia training is based on the principle of constructivism, whereby residents construct new knowledge and understanding through task-centred, experiential practice. However, despite experiential learning, our residents reported low levels of reflective learning. Challenges reported included clinical and time pressures, lack of stimuli and a platform for reflection. We designed the obstetric anaesthesia diary, using the principles of the ALACT model (Action, Looking back, Awareness, Creating alternative methods, Trial), consisting of clinical and non-clinical open-ended questions. This qualitative study was conducted to explore the usefulness of the diary in stimulating reflective learning in the ACGME-I six core competencies.

Summary of Work: The study involved 15 residents and was conducted at the KK Women's and Children's Hospital, Singapore from 1 January to 30 December 2018. Pre-exposure focus group interviews were conducted prior to the introduction of the diary in order to explore the challenges with reflective learning. Participants were then given the reflective diary, which consisted of simple reflection instructions and trigger questions - their reflections were subsequently discussed with their mentors. Post-exposure focus group interviews were conducted after 3 months to explore the usefulness of the stimuli and diary. An inductive and iterative process of information collection, analysis and thematic classification was used.

Summary of Results: The participants were able to complete the learning cycle with the diary. Five positive learning outcomes were achieved: (1) a focus on patient well-being, (2) a transfer from superficial to deep learning in the clinical and non-clinical domains, (3) an increased ability to make clinical, professional and ethical judgments, (4) an insight into individual competencies and deficiencies, and (5) an awareness for interprofessional communication and collaboration.

Discussion and Conclusions: The diary is a simple, resource-appropriate platform to stimulate reflective learning and deep learning in anaesthesia training. The use of the diary created opportunities for formative feedback, and allowed validation of further explorations and trials.

Take-home Messages: The acquired reflective learning skills in reflection and exploration could be applied to other subspecialty training in anaesthesia and translated to other forms of learning and clinical situations.

Developing students' academic questioning skills: reliability and validity of an evaluation sheet

AUTHOR(S):

- Junichi Kameoka, Tohoku Medical & Pharmaceutical University, Japan (Presenter)
- Akira Horii, Tohoku University Graduate School of Medicine, Sendai, Japan
- Hajime Mushiake, Tohoku University Graduate School of Medicine, Sendai, Japan
- Ritsuko Shimizu, Tohoku University Graduate School of Medicine, Sendai, Japan
- Seiichi Ishii, Tohoku University Graduate School of Medicine, Sendai, Japan
- Yutaka Kagaya, Tohoku University Graduate School of Medicine, Sendai, Japan

ABSTRACT

Background: Developing students' academic questioning skills not only nurtures students' self-learning skills, but also can encourage them to ask good questions in future academic conferences, activating further scientific investigations. We have launched a program to develop questioning skills in three steps: 1) encourage students to ask as many questions as possible in classes, 2) develop a reliable and valid evaluation sheet for questions, and 3) make students ask many good questions in academic conferences using the evaluation sheet. Here, we report the results of the second step.

Summary of Work: This study was approved by the Tohoku University Research Ethics Board. We have created an evaluation sheet for questions consisting of: 1) importance, 2) originality (unexpectedness), 3) rhetoric, 4) whether micro or macro level (5-point scale) and 5) who benefits (3-point scale: questioner only; questioner plus audience; all including presenter). We tested the reliability of the evaluation sheet in three academic conferences (gastroenterology, hematology, and nursing) by asking reviewers (5 to 10 conference attendees belonging to other universities or hospitals) to evaluate questions asked in certain sessions using the evaluation sheet. We also asked reviewers to assess content validity (5-point scale).

Summary of Results: The average measure intraclass correlations for the five items (importance, originality, rhetoric, micro or macro, and 'who gets benefit' •) were 0.276, 0.683, 0.022, 0.823, 0.153 in the first trial (gastroenterology, 14 questions, 5 reviewers), 0.690, 0.550, 0.142, 0.852, 0.632 in the second trial (hematology, 16 questions, 6 reviewers), and 0.795, 0.627, 0.625, 0.874, 0.779 in the third trial (nursing, 17 questions, 10 reviewers), respectively. The mean content validity scores of the five items above were 4.5, 3.7, 4.3, 4.3, 4.3 in the first trial, 4.4, 3.6, 3.5, 3.6, 4.6 in the second trial, and 3.9, 4.0, 3.6, 3.1, 4.6 in the third trial, respectively.

Discussion and Conclusions: We have developed an evaluation sheet for good academic questions, with high inter-rater reliability and content validity.

Take-home Messages: Good questions could be measured by the current evaluation sheet, which might enable us to teach questioning skills systematically.

“It unsticks your mind”: Using a Narrated Musician's Masterclass as an Introduction to Competency-based Medical Education and Coaching

AUTHOR(S):

- Michael Sanatani, Western University, Canada (Presenter)
- Kylea Potvin, Western University, Canada

ABSTRACT

Background: Conveying the importance of direct observation and feedback is a major task in faculty development during the transition to competency-based education (CBME). Little is known about how best to achieve this goal. Musicians however have a strong coaching culture. We included a live cello masterclass in a faculty/trainee workshop in order to demonstrate coaching practice and highlight its use of observation and feedback.

Summary of Work: After a brief introduction on CBME, one faculty member who is also an amateur cellist worked on a classical piece with his professional coach, followed by a moderated 60 minute discussion with the audience. A subset of the attendees was subsequently interviewed to explore their reactions to the workshop. The interviews were then transcribed and a thematic analysis was performed according to Braun & Clark's 6-step framework.

Summary of Results: The subset consisted of 3 trainees and 10 faculty. Mean time since medical school graduation was 3.5y (Trainee) and 21.4y (Faculty). Twelve had prior participation in music or sports. Themes emerging from the transcripts were that the demonstration a) triggered reflection on their own teaching/learning habits, b) highlighted indicators of high quality teaching in general, and c) clearly was an educational tool with a beneficial effect on the audience including changed perspectives on the giving and receiving of feedback. Some common subthemes included recognition of inadequacies/challenges of observation in medicine (10 respondents), the importance of personal teaching skills improvement (7), the realization of time commitment needed (6), the benefits of observing a faculty member in the role of the trainee (6), and the importance of timely feedback (5).

Discussion and Conclusions: Inclusion of a moderated live music masterclass in an introductory faculty and trainee workshop appears to be an effective way to bring participants to a realization and articulation of key aspects of coaching and observation.

Take-home Messages: Using a narrated live music coaching demonstration can efficiently lead to audience self-reflection, recognition of high-quality educational practices, and changed perspectives about CBME.

Medical student perceptions of their knowledge and skills in pharmacology in their first and final clinical years

AUTHOR(S):

- Shane Bullock, Monash University, School of Rural Health, Australia (Presenter)
- Anne Leversha, Monash University, School of Rural Health, Australia

ABSTRACT

Background: Pharmacology and therapeutics is important in medical education because it provides the scientific basis for safe and rational prescribing of medications. Students and junior doctors report feeling poorly prepared with respect to clinical pharmacology.

Summary of Work: Students in their first clinical year and final clinical year in our university's medical course, were surveyed as to the perceptions of their knowledge and skills in pharmacology, and valued aspects of their teaching and learning experience.

Summary of Results: Student knowledge of drug actions, adverse drug reactions (ADRs), pharmacokinetics and drug interactions were surveyed. Student ratings of knowledge of drug actions and ADRs was found to be different across the two clinical years, with the ratings higher in the final year. No such difference was found for pharmacokinetics and drug interactions. Final year students were also asked about their confidence to manage a patient's treatment using particular medications. The highest level of confidence was for antihypertensives and opioids, with the lowest level noted for anticonvulsants. First year clinical students wanted to know more about detail on individual drugs, ADRs, drug interactions, as well as antimicrobial drug choice and dosage. Final year students perceived their pharmacology experiences to be challenging in nature and indicated a desire for more formal systematic teaching of pharmacology and more prescribing practice.

Discussion and Conclusions: The findings suggest that across the clinical years, students perceive their knowledge of drug actions and ADRs improving. This was not found to be the case for pharmacokinetics and drug interactions. These aspects of knowledge are important components of medication management and patient safety but are complex to understand. Improved structured opportunities for integrated and applied learning in the clinical years of these aspects, as well as reinforcement of underlying threshold concepts, may be helpful.

Take-home Messages: Medical students value their pharmacology and therapeutics education, but want more formal teaching across their course. Some aspects of pharmacology and therapeutics knowledge, such as pharmacokinetics and drug interactions, are particularly complex and would benefit from more integrated and applied student learning opportunities, as well as reinforcement of threshold concepts. Medical students want more prescribing practice in the final year of their course.

Evaluation of Scholarly Concentration Programs at Inha University College of Medicine

AUTHOR(S):

- Jiho Choi, Inha University College of Medicine, Republic of Korea (Presenter)
- Yeon Ji Lee, Inha University College of Medicine, Republic of Korea

ABSTRACT

Background: Scholarly concentration(SC) programs are curricular experiences that allow medical students to study specific subjects (both medical and nonmedical) in-depth beyond the conventional medical school curriculum. Inha University College of Medicine introduced SC programs at 2011. SC programs have 4 tracks which are (1) clinical programs(hospitals, local clinics etc.) (2) research programs(basic medicine, research laboratories, pharmaceutical companies etc.) (3) service programs(medical service, missionary service, welfare facilities etc.) (4) social programs(FDA, Ministry of Health and Welfare, law firms, newspaper companies etc.). The aim of this study is to compare the levels of achievement in the tracks and know whether there are differences in achievement among 4 tracks.

Summary of Work: At 2017, 50 second grade students participated in SC programs with either one 8weeks program or two 4 weeks programs. The programs were 76 in total. Students' achievements were evaluated in three fields which were the proposal (50%, autonomy & level of difficulty), the fulfillment(25%, attendance, attitude & performance) and the reports (25%, written report & presentation).

Summary of Results: There were 31 clinical programs, 8 research programs, 17 service programs and 20 social programs. The achievement scores were almost same in the proposal of clinical programs, research programs, service programs and social programs(48.9±4.2, 50, 50, 50). In the field of fulfillment the scores were 24.1±2.5, 24.9±0.4, 25 and 24.9±0.4 and in the field of reports, the scores were 18.6±1.6, 20.0±2.2, 18.9±2.1, 19.2±1.2.

Discussion and Conclusions: In the achievement scores of SC programs there were no difference in the field of proposal. But in the field of fulfillment the scores in clinical tracks were lower than other tracks. In the field of reports, the highest scores were in research tracks and the lowest scores were in clinical tracks. The reason of lower scores in clinical tracks is due to relatively lower interest in clinical tracks that seem less challenging than other tracks to the medical students.

Take-home Messages: There were differences in the achievement of SC programs among 4 different tracks.

The Development of Practice-Based Reflective Learning Tools for Electronic Consultations

AUTHOR(S):

- Douglas Archibald, University of Ottawa, Canada (Presenter)
- Rachel Grant, University of Ottawa, Canada
- Sheena Guglani, Bruyere Research Institute, Canada
- Clare Liddy, University of Ottawa, Canada
- Delphine Tuot, University of California San Francisco, USA
- Erin Keely, University of Ottawa, Canada

ABSTRACT

Background: Electronic consultations (eConsults) between primary care providers (PCPs) and specialists provide a unique opportunity to use real patient presentations and consultative exchanges between providers to develop innovative educational activities. The purpose of this portion of study is to develop two eConsult reflective learning tools (RLTs) for PCPs and specialists that document learning arising from eConsults.

Summary of Work: Two multi-specialty eConsult programs were selected for investigation in Canada and the USA. Six experienced eConsult users and members of the research team reviewed existing reflective practice instruments and recommended modifications to optimize the applicability to eConsults. First, a validation exercise was completed by Subject Matter Experts to draft two preliminary RLTs (one for PCPs and one for specialists). Second, edits to the draft tools were made during a 3-round Delphi consensus building process that consisted of 36 providers in the US and Canada. The Delphi panel indicated importance of including each RLT item using a five-point Likert scale ranging from definitely include to definitely exclude. Consensus was defined as 70% agreement on a single item, or 80% or greater on two adjacent items at either end of the Likert scale. Third, a testing phase with 7 providers in the US and Canada was conducted. A pilot of the RLTs in real time is currently underway.

Summary of Results: After 3 rounds, consensus was reached for 3 items in each RLT. Revisions were made to other items based on suggestions of the Delphi panel. Testing of the RLTs with previous eConsult cases showed the use of the tools to be feasible. Piloting in real time is ongoing until later in the spring 2019, followed by participant interviews.

Discussion and Conclusions: Two RLTs have been developed using best practice principles. RLTs for eConsults have the potential to align and integrate continuing professional development for physicians with their medical practices.

Take-home Messages: 1. The primary benefit of electronic consultations is improving access to care for patients. However, there is a secondary benefit of learning opportunities for healthcare providers. 2. RLTs may facilitate physicians' professional practice learning needs.

Medical Students' Performance of Group Discussion in Problem Based Learning: Can it Influence A Cognitive Performance?

AUTHOR(S):

- Yeny Dyah Cahyaningrum, Medical Education Department, Faculty of Medicine, Universitas Islam, Indonesia (Presenter)

ABSTRACT

Background: Problem based learning encourage students to have the ability of self directed, collaborative, contextual, and student centered. Group discussion is an important learning activity in problem based learning. Students are given problems and encouraged to learn solving problems in the small group. The ability of students to discuss will reflect their cognitive abilities. The aim of this study knew the influence of student performance in the group discussion to the cognitive performance.

Summary of Work: This study was an analytical study with a cross sectional approach. We conducted an analysis of 610 students who attended the undergraduate learning. The students were assessed during group discussions. This assessment was carried out by the tutor and did with a form that has been validated. We analyze the influence for 24 block in undergraduate training. The block was consisted of 7 block in the first year, 7 block in the second year, 6 block in the third year, and 4 block in the fourth. The analysis was used to determine the effect of performance of the discussion on another cognitive abilities (block exams, achievement indexes, and quizzes). Data analysis was carried out by linear regression to determine the correlation between each assessment and the influence.

Summary of Results: This study was conducted on 610 students in undergraduate medical education. In all phases, the discussion performance contributes to variations in the written test scores, the final exam, and the achievement index in that semester (R square between 0.88-0.96). In each block, the discussion performance has a strong correlation with academic performance (r between 0.93-0.97). The final exam, quizzes, and achievement indexes together influence the discussion ability (p <0.05).

Discussion and Conclusions: Students performance in group discussion of Problem Based Learning can be a predictors of a cognitive performance. The concept of assessment for learning can be used in the assessment of student performance in group discussion.

Take-home Messages: The good students have a good willingness to learn and have a good ability in the context that being discussed. The assessment of group discussion can encourage the medical student to understand the knowledge.

What Do You Want to Learn? Goal Setting in a Second Year Student Emergency Medicine Rotation

AUTHOR(S):

- Colleen Bush, Michigan State University College of Human Medicine, USA (Presenter)
- J.M. Monica van de Ridder, Spectrum Health Office of Medical Education, USA

ABSTRACT

Background: Exposure to Emergency Medicine (EM) is a crucial aspect of medical student education yet has historically been absent from training until 3rd or 4th year required or elective rotations. Michigan State University offers a new curriculum with EM as a mandatory rotation in the 2nd year. Research has been limited to determine what students want to learn from this type of early experience and if their goals are realistic. Goal setting helps students take ownership of their learning process, but unrealistic goals can be a hinderance. How realistic are the goals and strategies formulated by students prior to an early clinical EM rotation?

Summary of Work: We analyzed learner's short essays (n=45) using a qualitative conventional content analysis with an inductive approach (Hsieh 2005, Elo 2008). We used open coding, axial coding and selective coding to identify and categorize the goals that students set. Constant comparison was used to determine if students identified why goals were important and described strategies to accomplish them. Content experts identified if the strategies that students described were sufficient to reach their goal. Discrepancies were resolved through a process of deliberation until consensus was achieved.

Summary of Results: All students described one (n=33) or more goals in their essay. In total 64 goals were identified. Most frequently identified: physical examination (n=15), differential diagnosis (n=10), getting to know the EM practice (n=10), history taking (n=7), procedures (n=5), and working on autonomy (n=4). Most students (n=39) described strategies to achieve their goals. According to content experts those steps were useful (n=27), not very practical (n=10) or lacking (n=2). Only 20 students explained why the goal was important for them (e.g. to gain confidence or to reduce anxiety).

Discussion and Conclusions: The majority of goals formulated align with the Core Entrustable Professional Activities and are therefore are realistic in this setting. Half of the students were able to identify useful strategies for achieving their goals. Further research will focus on whether the students feel that they accomplished the goals they set for themselves.

Take-home Messages: Students need further training to identify useful strategies to accomplish goals.

The role of the preceptor and reflection stands out in nursing students' clinical skills training in practice

AUTHOR(S):

- Karin Blomberg, Örebro University, Sweden (Presenter)
- Mona Ewertsson, Örebro University, Sweden
- Reneé Allvin, Clinical Skills Centre, Örebro University Hospital, Sweden
- Sangeeta Bagga-Gupta, School of Education and Communication, Jönköping University, Sweden

ABSTRACT

Background: Clinical skills forms a core part of nurses' professional work. Their theoretical understanding of skills and competence in performance are related to patient safety and efficient care. However, studies reveal that newly-graduated nurses doubt their ability in clinical skills, and fear risks of injuring patients. There is a lack of evidence on how nursing students learn clinical skills during their clinical practice. The aim was to explore how development of clinical skills occurs.

Summary of Work: An ethnographic approach was used. Data were collected by participant observations, informal conversations and interviews during clinical practice at an emergency department at a university hospital in Sweden. Data were analysed in an interactive collective process interwoven with data gathering.

Summary of Results: The preceptor has a central position in order to enhance learning and socialisation into clinical skills. Learning styles by the students influenced the relation to the preceptor and how their interaction played out. Preceptors and students showed different approaches in potential learning situations regarding practical skills. The way in which they interacted influenced how the student acted in the performance of practical skills. A tension was described between previous experiences from learning clinical skills at the clinical skills center and the clinical practice. In some cases, the students expressed that they understood that different performance was possible without the patient being injured but data also showed a difference from guidelines that could jeopardise patient safety.

Discussion and Conclusions: A salient theme was the role of perceived professional identity of the nursing student. The relation to the preceptor and also how expectations of, and space for, reflection played an important role in the formation of proficiency in clinical skills. There is a need for building continuity between the ways that students' experiences are organised across university-based and practice-based learning to enhance nursing students' learning and socialisation into practical skills.

Take-home Messages: The preceptor's role should be highly considered in skills training in practice. Reflecting on actions is essential for developing and learning practical skills, and thus to develop a professional identity as a nurse.

Does Simulation Improve Medical Student Confidence and Preparedness to Care for the Dying?

AUTHOR(S):

- Geoffrey Wells, Brighton and Sussex Medical School, UK (Presenter)
- Julia Montgomery, Brighton and Sussex Medical School, UK
- Andreas Hiersche, Brighton and Sussex University Hospitals, UK

ABSTRACT

Background: Current medical education fails to adequately prepare new doctors to care for dying patients, a status quo that has recently been subject to discourse within literature and reports from governing bodies. A lack of opportunity for clinical exposure to dying patients at undergraduate level is a well-documented contributory factor. The value of teaching using simulation is well-evidenced, but remains underused and under-reported in undergraduate palliative care curricula and literature respectively. We have undertaken a study to identify whether simulation can improve the confidence and preparedness of medical students to look after dying patients and their families.

Summary of Work: Six medical students undertook simulations individually, involving the care of a dying patient (Hi-fidelity simulator) and family member (actor). In four scenarios patient death occurred irrespective of student actions. Pre and post-simulation Thanatophobia (fear of dying) questionnaires measured student attitudes towards caring for dying patients. A post-simulation focus group facilitated collection of qualitative data regarding student confidence, preparedness, and value of the simulated experience. Common themes within the focus group data were identified using thematic analysis.

Summary of Results: Students found the simulations realistic, safe, and left them feeling better prepared to care for dying patients. Positive feedback regarding the opportunities afforded by simulation in exposure to dying patients was unanimous. Mean Thanatophobia scores fell (improved) following the simulations, and whilst not statistically significant ($p=0.07$), this suggests simulation can improve student attitude and confidence to care for a dying patient. None of the students was negatively affected by the simulated experience.

Discussion and Conclusions: Results suggest a potential for simulation to work alongside clinical placement when improving much needed exposure of undergraduate medical students to the care of a dying patient, and in turn improve their confidence and preparedness. This study adds to a currently limited body of literature documenting the positive use of in-simulation death to teach medical undergraduates how to care for dying patients.

Take-home Messages: Simulation increases medical student exposure to the care of dying patients and may prove to be a valuable resource when preparing our newly qualified doctors to provide care at the end of life.

Building a nationwide medical teachers' network engaging in simulation-based education

AUTHOR(S):

- Kazunobu Ishikawa, International University of Health and Welfare, Japan (Presenter)
- Gen Kobayashi, International University of Health and Welfare, Japan
- Hiroshi Igarashi, Hamamatsu Medical University, Japan
- Akiko Sugawara, Fukushima Medical University, Japan
- Toshiyuki Naka, International University of Health and Welfare, Japan
- Yukie Abe, Tokyo Medical University, Japan

ABSTRACT

Background: Since recent changes in medical care security policy have made clinical skills training difficult even in teaching hospitals, trainings utilizing suitable models and simulators are becoming essential to acquire clinical skills for medical students.

Summary of Work: We have performed nationwide survey on the prevalence and application of clinical skills laboratories for clerkships in 2012 and 2016. Registered questionnaires were sent to all medical schools in Japan (n=80). The response rate was 95%. In 2018, we have held a seminar and workshop for medical teachers engaging in simulation-based education in Japan to build a nationwide medical teachers' network.

Summary of Results: Two surveys revealed that almost all medical schools in Japan has installed clinical skills laboratories and that the floor space has been expanded. However, there were significant disparities in the implementation of simulation-based undergraduate education among schools. A total of 43 medical teachers engaging in simulation-based education in medicine, dentistry, nursing, pharmacology and health sciences participated in a first seminar and workshop in 2018. Through this event, we have observed significant needs for the learning opportunities to reinforce the skills such as organizing a faculty development, providing facilitation or feedback and analyzing outcomes after educational practice.

Discussion and Conclusions: Although there have been significant progresses in simulation-based education such as more spacious learning space of the facilities and the increased number of the annual uses by learners, human resource development for simulation remains to be achieved. In addition, we need to promote discussion how we qualify teachers/individuals for simulation in view of the circumstances in medical schools in Japan. To build a nationwide medical teachers' network engaging in simulation-based education, we have just opened a new mailing list 'Sim-Unit'.

Take-home Messages: A sustained effort building an alliance among medical teachers engaging in simulation-based education is essential to reform nationwide medical education. A project to build a nationwide medical teachers' network engaging in simulation-based education has been started.

Among doctors, simulation training concerning obstetric emergencies is considered beneficial regardless of professional experience

AUTHOR(S):

- Marja Kaijoomaa, Helsinki University Hospital Women's Clinic, Finland (Presenter)
- Outi Äyräs, Helsinki University Hospital Womens Clinic, Finland

ABSTRACT

Background: Simulation training is a safe and efficient way to learn the management of emergencies. This is of utmost importance in the field of obstetrics, where the optimal treatment of the mother or the fetus can require prompt decisions and a well-trained multi-professional team. Usually these cases are taken care of both residents (professional experience < 6 years) and senior doctors together. In this study, we wanted to analyze how the professional experience effects the experienced benefit of simulation training among doctors.

Summary of Work: A weekly multi-professional full-scale simulation training (FSST) concerning obstetric emergencies is organized in Helsinki University Hospital Womens' Clinic. A post-training feedback questionnaire is requested from all participants. The answers of residents and senior doctors for the following questions were analyzed: 1) I am professionally competent to treat obstetric emergencies 2) I gained professional benefit, when participating in a FSST 3) I gained professional benefit, when observing a FSST 4) I will change my actions in obstetric emergencies after this training Answers were given on a visual scale from 0 (completely disagree) to 10 (completely agree).

Summary of Results: Compared to residents (n=162), senior doctors (n=136) felt significantly more competent to treat obstetric emergencies (5.90 ±1.85 vs. 7.33 ±1.50, p<0,001). However, there was no difference in the experienced professional benefit of training or observation between residents and senior doctors (9.34±1.03 vs. 9.15±0.00, p=0.125, 8.38±2.45 vs. 8.60±2.12, p=0.479). After the training, the intension to change personal actions in obstetric emergencies was stronger among resident doctors (8.57±1.67 vs. 8.09±2.32, p=0.041).

Discussion and Conclusions: Working experience gives doctors self-confidence and the feeling of professional competence to treat emergencies. However, the incidence of emergencies per doctor is small and training is needed throughout the career. Simulation training is an efficient way of learning even among senior doctors. After training, the reported intention to change personal emergency actions is still high, reflecting the participant's experience of learning professionally important issues.

Take-home Messages: Simulation training is professionally beneficial even among experienced senior doctors.

Enhancing student learning by Simulation

AUTHOR(S):

- **Ngamjit Pattaravit, Prince of Songkla University, Thailand (Presenter)**
- Orarat Karnjanawanichkul, Prince of Songkla University, Thailand
- Maliwan Oofuvong, Prince of Songkla University, Thailand
- Pannawit Benjhawaleemas, Prince of Songkla University, Thailand
- Boonthida Suwannarat, Prince of Songkla University, Thailand

ABSTRACT

Background: From the survey study in our unit, The average pre and post session SDL time for lecture were 28.2 and 40.1 minutes respectively. In this study, the investigators want to prove that simulation can enhance student to do SDL in the both pre and post session period.

Summary of Work: Twenty-five Anesthesia residents were enrolled in this study. Students were noticed about the simulation classes one month prior the day of practice. On the day of study, students were voluntarily separated into two groups, directed- learner and observer. After the class, three consecutive questionnaires (day 0 ,30, 90) were sent to the subjects. The statistically significance in this study is classified at $p < 0.05$.

Summary of Results: The average pre-class SDL duration among the residence markedly increase after simulation session from 28. 2 minutes (lecture) to 40.1 minutes. Thirteen students in the directed-learner group spent their time 120 and 129.2 minutes for post-class self study at day 30 and 90, while nine students in the observer group spent their time longer (180 and 186.7 minutes respectively). However, there was no statistically significance among the type of learners, post session SDL, knowledge retention and also level of self confidence in order to treat the real patient. Student who had high level of confidence at post-class day 90 seem to have high level of confidence at immediate post class day 0 and day 30 (p -value 0.017 and 0.01 respectively).

Discussion and Conclusions: Compared with the survey data, Simulation enhances the student learning process by increasing the SDL duration both in pre-post session. Sense of real situation can trigger the student to study more in order to keep the simulated patient safe. Simulation enhanced the students to do post class self-study harder, especially the students in observer group who had no chance to do practical skills to the patient. Conceptualization after experiencing from simulation is the key components to help the student to combine their knowledge and skills which lead them to improve their practice in the future.

Take-home Messages: Simulation introduces the sense of real situation to the student. Experiencing from the simulation class can enhance learning process.

The study of agreement between emergency physician staff and paramedic students to evaluate simulation training

AUTHOR(S):

- Chaiyaporn Yuksen, Ramathibodi Hospital, Thailand (Presenter)
- Sorawich watcharakitpaisan, Ramathibodi Hospital, Thailand
- Nicha Cha-aim, Ramathibodi Hospital, Thailand

ABSTRACT

Background: Simulation training has become an important strategy in the field of paramedicine and is universally recognized as a potential alternative to learning through actual encounters. It has consistently been improved into an ideal approach that promotes clinical knowledge and skills of medical procedures, teamwork, developing an effective management strategy, and critical thinking under stressful conditions without putting patients at risk. Simulation training is adapted into the curriculum of Ramathibodi Hospital's Faculty of Medicine, regularly arranged under the supervision of emergency physician staff and assessed with the standardized checklist.

Summary of Work: Objective: This study aimed to validate the simulation evaluation of senior paramedic student compare with emergency staff evaluation with the standardized checklist. Methodology : A retrospective analytic cross-sectional study design was conducted to evaluate total of 10 paramedic simulation training scenarios. The Cohen's kappa values and agreement percentages were calculated for the agreement of the emergency staff VS senior paramedic student evaluation. Each scenario was scored according to a standardized checklist for trauma, ACLS, Toxicology and PALS situations by 3 independent raters which includes 2 senior paramedic students and an emergency physician staff.

Summary of Results: The Emergency staff evaluation in Trauma and ACLS standardized checklist had substantial agreement with the evaluation of 4th year paramedic student (kappa of 0.760; $P < 0.001$ and kappa of 0.704; $P < 0.001$ respectively) and 3rd year paramedic student (kappa of 0.820; $P < 0.001$ and kappa of 0.882; $P < 0.001$ respectively). But there are slight agreement in other scenario (PALS, Toxicology).

Discussion and Conclusions: The Emergency staff evaluation in Trauma and ACLS standardized checklist had a strong correlation with the senior paramedic student evaluation.

Take-home Messages: The used of standardized checklist in Trauma and ACLS scenario for paramedics training can be evaluated by senior paramedic students.

Exploring Perceptions of Preparedness and Exposure to Simulation Training in Foundation Trainees

AUTHOR(S):

- Oluseyi Adesalu, Newcastle University, UK (Presenter)
- Clare Van Hamel, UK Foundation Programme Office, UK
- Alexander Hollis, UK Foundation Programme Office, UK

ABSTRACT

Background: In 2018, the GMC reported that only 68.6% of Foundation Year 1 (FY1) doctors feel adequately prepared for their first post. Simulation training is a commonly used educational tool for students to learn the essential skills required to be a junior doctor. This study aimed to investigate the association between FY1 doctors' perceived exposure to simulation training at medical school and feeling adequately prepared for their first foundation post.

Summary of Work: In 2018, an optional survey was sent to FY1 doctors in the UK during their first foundation post. 962 responses were received, 723 of which were UK medical school graduates. UK medical schools (n=32) were ranked and cross-referenced in accordance to the proportion of respondents reporting 'strongly agree' or 'agree' to the statements 'I was adequately prepared for my first foundation post' and 'I have had regular simulation training to prepare me for clinical work'.

Summary of Results: 72.2% (n=522) of respondents agreed or strongly agreed that they felt adequately prepared for their first foundation post. 79.8% (n=577) of respondents agreed or strongly agreed that they had received regular simulation training to prepare them for clinical work. 70% (n=7) of the top ten ranked institutions for preparedness were also in the top ten ranked institutions for perceived exposure to simulation training. 20% (n=2) of the bottom ten ranked institutions for preparedness featured in the bottom ten ranked institutions for perceived exposure to simulation training.

Discussion and Conclusions: Whilst greater exposure to simulation appears to be associated with increased feelings of preparedness, perceived lack of exposure to simulation does not appear to be associated with feeling less prepared for the first foundation post. For example, a medical school ranked fourth for their graduates feeling most prepared, yet 25th for perceived simulation exposure.

Take-home Messages: A perceived lack of simulation training does not appear to correlate with feeling less prepared for the first foundation post. This indicates that there may be more effective ways to prepare medical students for clinical work. Further research into additional educational methods and exploration of what constitutes 'regular simulation training' is required.

Evidence of surgical skill acquisition for dental students taught on haptic simulator

AUTHOR(S):

- Parnyan Ashtari, King's College London Faculty of Dentistry, Oral and Craniofacial Sciences, UK (Presenter)
- Barry Quinn, Kings College London Faculty of Dentistry, Oral and Craniofacial Sciences, UK
- Margaret Cox, Kings College London Faculty of Dentistry, Oral and Craniofacial Sciences, UK

ABSTRACT

Background: Advances in technology assisted teaching of healthcare professionals along with concomitant increasing complexity of clinical procedures and increasing societal expectation of 'never first on a patient', means better simulated deliberate practice is required. Traditional methods of teaching clinical practice to healthcare students have limitations which are now being overcome with innovative technologies such as haptically-enabled virtual reality stimulators (HEVRS). The evidence-base though increasing, is still limited with the majority of studies focusing on laparoscopy simulation. There is now increasing evidence from the dental profession for HEVRS efficacy and affordances of the systems which offer transferable clinical skills across the healthcare team.

Summary of Work: Aims & Objectives: The aim was to analyse students' performance records of increasing complexity of clinical practice with the use of HEVRS (hapTEL device) and explore whether time taken on undertaking virtual clinical procedures influenced the percentage of dental tissue that was treated successfully. Methodology: Five tasks involving the removal of carious tissue from haptically-enabled simulated teeth were programmed into the hapTEL software with varying degrees of difficulty and 3-D complexity. Students were instructed to remove carious dental tissue whilst maintaining the maximal amount of healthy dental tissue. Data was retrieved for the 144 year-1 dental students at King's College London. The data was analysed using appropriate statistical tests.

Summary of Results: 93.75% of the cohort participated in the study and 78.31% completed all the tasks. A positive correlation was seen between the percentage of carious lesion successfully removed and a reduction in iatrogenic damage in various clinical scenarios. An improvement was seen amongst students who participated in the 2015/2016 study from the 2014/2015 study.

Discussion and Conclusions: Within the limitations of this study, the majority of dental students improved their psychomotor skills between sequential sessions in carious tissue removal. Differences were seen between the study results obtained from 2014/2015 and 2015/2016. An improvement in the latter was due to an increase in time provided during the sessions. Increasing practice using a HERVS increased the clinical results, namely more diseased tissue removal and less healthy tissue removal.

Take-home Messages: Increasing practice using a HERVS improved clinical results and the psychomotor skills of the majority of dental students.

Simulation in undergraduate medical education improves self-perceived confidence in managing emergency scenarios

AUTHOR(S):

- Euan Fisher, NHS Ayrshire and Arran, UK (Presenter)
- Kevin Hart, NHS Ayrshire and Arran, UK

ABSTRACT

Background: Simulation is broadly accepted as a means of improving confidence in dealing with high-stakes emergency scenarios. Little work has been done however in assessing medical students' own views regarding these sessions. We therefore set out to investigate student perceptions of the educational utility of repeated simulations and their effect on overall sense of preparedness in managing common medical emergencies.

Summary of Work: A simulation course was designed for fourth year medical students with 6 emergency situations requiring a standardised ABCDE approach. Efforts were made to encourage realistic conditions, including peer assistants completing practical procedures and dynamic changes in patient physiology. The remainder of the group was asked to observe from behind a one-way mirror. Feedback was provided using Kolb's reflective cycle. On completion of the course, an 11 point questionnaire utilising a Likert scale was administered.

Summary of Results: 26 of 29 (89.7%) questionnaires were returned. 86% (n = 25) agreed or strongly agreed that the sessions identified knowledge gaps for further study. 86% (n = 25) agreed or strongly agreed that the feedback given was useful to their development. 86% (n = 25) agreed or strongly agreed that their knowledge of emergency management was increased as a result of the sessions.

Discussion and Conclusions: Our results demonstrate that regular exposure to a simulated clinical environment improves students' self-perceived sense of readiness for dealing with medical emergencies and is seen as a useful adjunct to their educational development. Despite our attempts to promote realism in this setting, recent evidence suggests that a 'high-fidelity' approach may actually be detrimental to performance in undergraduates. Further work should seek to explore the absolute need for realism in these sessions.

Take-home Messages: - Senior medical students perceive simulation to be valuable to their education and in improving their confidence in managing emergency scenarios. - Further work is needed to establish whether high-fidelity simulation in the undergraduate context is necessary in further improving the educational experience.

Simulation-based training is beneficial to undergraduate students whether taking part or observing

AUTHOR(S):

- Kevin Hart, NHS Ayrshire & Arran, UK (Presenter)
- Euan Fisher, NHS Ayrshire & Arran, UK

ABSTRACT

Background: Simulation-based training (SBT) has been shown to increase knowledge and confidence in healthcare professionals, while protecting patients from unnecessary risk¹. It is a useful teaching method in undergraduate medicine, but is resource heavy². Many sessions for undergraduate students involve volunteers from a larger student group taking part, while the rest observe. The authors set out to identify if SBT was still of benefit if not directly taking part.

Summary of Work: We designed a SBT course aimed at fourth year undergraduate medical students at the University of Glasgow. This was comprised of six common medical emergency scenarios requiring a standardised ABCDE approach. Students not directly involved in the scenario observed through a one-way mirror in the adjacent room. These students were asked to take notes on their fellow students performance and feed back at the end. On completion of the course, students were asked to answer a questionnaire for feedback.

Summary of Results: There were 29 surveys issued and 26 returned. 85% of students agreed or strongly agreed that observing fellow students from the next room allowed them to consider how they would perform in the same situation. Additionally 77% agreed or strongly agreed that observing from an adjacent room was less stressful. Finally, 96% of the students agreed or strongly agreed that the course was enjoyable and useful for their development.

Discussion and Conclusions: These results show that the majority of students feel that they benefited from SBT, even if not directly taking part. Observing in a separate room to the students taking part in the simulation makes the experience less stressful. Therefore, SBT can still be delivered successfully and to students benefit despite large class numbers. Additionally students find SBT an enjoyable experience, despite not always being directly involved in the scenarios.

Take-home Messages: SBT can be delivered to larger groups to their benefit whether they are taking part or observing, therefore reducing resources. Having observing students in a separate room makes the experience less stressful. SBT is an enjoyable way to learn for undergraduate medical students, despite not always being involved directly.

Virtual reality simulating Dentistry Education: User experience and development of a VR Dental Training

AUTHOR(S):

- **Alessandra Dahmer, Universidade Federal de Ciências da Saúde de Porto Alegre, Brasil (Presenter)**
- Rodrigo Tubelo, Hospital Moinhos de Vento, Brasil
- Maria Eugénia Bresolin Pinto, Universidade Federal de Ciências da Saúde de Porto Alegre, Brasil
- Fabrício Mezzomo Collares, Universidade Federal do Rio Grande do Sul, Brasil
- Vicente Leitune, Universidade Federal do Rio Grande do Sul, Brasil
- Susana Maria Samuel, Universidade Federal do Rio Grande do Sul, Brasil

ABSTRACT

Background: The effectiveness of information and communication technologies in dentistry teaching have been evaluated since the beginning of the last century. Among various resources available, immersive virtual reality (IVR) is shown to be a promising technology in the health teaching market.

Summary of Work: This study aims to describe the development of an IVR simulator for teaching students the preparation of fixed dental prosthesis, and to evaluate the user experience. Methods: The simulator was developed in three stages: content planning, device selection, and IVR simulator development. The evaluation of the user experience was performed with second-year undergraduate dental students. After they performed the IVR simulator experience, the time to accomplish each task and the number of interactions between the auxiliary and student were recorded. After the experiment, the students answered a questionnaire (17 questions, Likert scale).

Summary of Results: Using the Samsung Gear VR platform, an IVR simulator was developed for the preparation of a fixed dental prosthesis. The average time required to finish the IVR tasks was higher for women (19.98 ± 6.67 min) than for men (14.51 ± 5.09 min). The number of student-auxiliary interactions is positively correlated with the conclusion time of the IVR experience ($r = 0.38$, $p = 0.20$).

Discussion and Conclusions: The feedbacks of the dentistry students range between four and five items in the questionnaire, indicating a positive evaluation of the IVR simulator.

Take-home Messages: In regard to the motivation to study, the students believe that IVR could increase their engagement to learn.

High fidelity 3G simulation and virtual reality: an evaluation of medical students' experiences

AUTHOR(S):

- Alexandra Macnamara, Hull York Medical School, UK (Presenter)
- Katie Bird, Hull York Medical School, UK
- David Hepburn, Hull York Medical School, UK
- Thozhukat Sathyapalan, Hull York Medical School, UK

ABSTRACT

Background: Simulation is widely used in medical education, allowing students to practise a wide variety of skills, from basic clinical and communication skills, to emergency care and team working. It allows students to practise invasive, rare or important skills in a safe environment, and allows mistakes to be analysed and used as learning points, without impacting on patient safety. Simulation aims to replicate real life experiences, thus the fidelity of the simulation scenario is important. Simulation features throughout the Hull York Medical School (HYMS) curriculum. For final year students, emphasis is placed upon preparing the students for clinical practice. Paramount to this is allowing students to practise using the ABCDE approach on acutely unwell patients. Final year students undertake four simulated emergency scenarios using 3G SimMan. Student feedback has been positive, with students reporting increased confidence in dealing with acutely unwell patients. It also highlights some pitfalls with the 3G SimMan. For example the general 'look' of a patient cannot be replicated with a mannequin. Existing research suggests that complete immersion helps to improve knowledge acquisition and conceptual learning. HYMS has started to incorporate virtual reality technology into the final year simulation sessions, aiming to add an additional immerse experience that cannot be created with the SimMan alone. This study aims to evaluate the experiences of final year medical students with both virtual reality simulation and a high fidelity patient simulator.

Summary of Work: The project takes a quantitative approach. Participants partake in simulation scenarios in the two different modalities, 3G simulation and virtual reality, and complete a written feedback questionnaire. 24 students are involved in the study. These students are already completing simulation sessions as part of their curriculum.

Summary of Results: Data is currently being gathered and will be available for presentation at the conference. Numerical data is gathered from the student's responses using the Likert scale. The scores for the questions are compared between the two simulation modalities. Statistical analysis techniques, such as calculation of p values, are utilised to ensure reliability of results. In addition to this, the students' written responses will be collated and analysed.

Discussion and Conclusions: Dependent upon results.

Take-home Messages: Dependent upon results.

Introducing Boot Camp for PGME Interns and Residents in Pakistan

AUTHOR(S):

- Charles Docherty, The Aga Khan University's Centre for Innovation in Medical Education, Pakistan (Presenter)
- Mehak Rajani, The Aga Khan University's Centre for Innovation in Medical Education, Pakistan
- Muhammad Salman Alam, The Aga Khan University's Centre for Innovation in Medical Education, Pakistan

ABSTRACT

Background: Expectation of excellence from interns and residents from the very beginning stresses the need for bridging the gap between theoretical knowledge and clinical practice. Worldwide, simulation-based boot camps ease this transition and equip the novice trainees with essential foundation knowledge, technical skills and effective communication. This study analyzes the effectiveness of the first ever boot camp in Pakistan in improving the self-efficacy of PGME interns and residents.

Summary of Work: A 4 days-long boot camp was conducted in December 2018 at The Aga Khan University Hospital (AKUH) for newly inducted PGME interns and residents. 10 stations were set up including venous and arterial puncture, urinary catheterization, nasogastric tube insertion, lumbar puncture, central venous catheter (CVC) insertion, infection control, suturing, surgical wound dressing, hospital management software sahl and communication along with BLS certification, using low and high fidelity simulation. 40 residents and 68 interns completed self-administered self-efficacy questionnaire at the completion of boot camp.

Summary of Results: There was an overall improvement in the self-efficacy of trainees across all skills. Highest pre-boot camp self-efficacy score was in infection control (74.01, on 0-100 scale, p-value <0.001), while, the lowest was in CVC insertion (20.0, p-value <0.001), sahl software (25.14, p-value <0.001) and communication (26.20, p-value <0.001). Self-efficacy improved the most in CVC insertion (40.13, p-value <0.001), sahl software (49.32, p-value <0.001) and communication (51.38, p-value <0.001), while, the least in infection control (19.66, p-value <0.001) post-boot camp.

Discussion and Conclusions: Low pre-boot camp self-efficacy scores with most improvement in 'sahl' software can be explained by the induction of non-AKUH trainees who were not familiar with the system. Low pre-boot camp scores in CVC insertion indicates lack of experience and most improvement in this skill re-emphasizes the effectiveness of simulation-based-education. The analysis supports the effectiveness of boot camp in improving the self-efficacy of new trainees and provides the direction for future planning of boot camps.

Take-home Messages: Boot camps provide a safe, forgiving and an experiential learning environment for healthcare professionals and prepare them to thrive in a new hospital setting.

Transition from Paper-Based to Electronic Portfolio Using On-Hand Social Medias for Undergrads: Generation Gap Perspective

AUTHOR(S):

- Chalinee Monsereenusorn, Phramongkutklo Hospital and College of Medicine, Thailand (Presenter)
- Piya Rujkijyanont, Phramongkutklo Hospital and College of Medicine, Thailand
- Chanchai Traivaree, Phramongkutklo Hospital and College of Medicine, Thailand
- Sangkae Chamnanvanakij, Phramongkutklo Hospital and College of Medicine, Thailand

ABSTRACT

Background: The academic portfolio has become a key to evaluate holistic approach, mentality, ethics and professionalism for health professions. On-hand technologies and social media become a vital part of life in this century. Integration of technologies and social media into electronic portfolio aims to motivate student in creating prosperity portfolio with satisfaction and user friendly.

Summary of Work: Transition from paper-based into electronic portfolio by combining with Google® form to submit and compile documents in a single place with Line® application to communicate between students and teachers was initiated. Feedback from teacher was submitted by email directly to student and administrator. We conduct a study to evaluate students and teachers' satisfaction by using a questionnaire focusing in 4 domains to compare between paper-based and electronic portfolio: easy and less complex to fill up; fast and convenient; beneficial for longitudinal follow-up and easy archiving. A Likert scale from 0 to 5 was used to define levels of disagree to totally agree.

Summary of Results: All ninety-eight students filled and submitted portfolio electronically. On contrary, 13 of 26 teachers (50%) provided feedback electronically while the rest wrote feedback in a paper. 12 of 13 (92.3%) and 1 of 13 (7.7%) who provided paper-based feedback were age 39-53 years (generation x) and 24-38 years (generation y), respectively. 98 of the 4th year medical students (100%) and 21 of 26 teachers (80%) returned the questionnaire. Students and teachers preferred electronic to paper-based portfolio (83.7% vs 16.3% and 95.2% vs 4.8%, respectively) in 4 domains; fast and convenience ($p < 0.001$), benefit for longitudinal follow-up ($p < 0.001$) and easy archiving ($p = 0.002$). There was no difference in the score of ease and complexity to fill up between the two groups for both students and teachers perspective. However, fast and convenience for electronic inferior to paper-based portfolio in generation x teachers perspective (2.53 vs 3.6, $p < 0.001$).

Discussion and Conclusions: Medical students preferred electronic to paper-based portfolio. Electronic portfolio should be implemented to improve the quality of portfolio in undergraduate level. However, paper-based feedback from teachers might be provided as an option.

Take-home Messages: Technologies might be a good tool for reflection and feedback in portfolio assessment.

- Han Kun Wang, National Healthcare Group, Singapore

ABSTRACT

Background: Neurophobia, fear of neural sciences and clinical neurology, is common among junior learners of neurology. This has been attributed to lack of knowledge and low interest. We created an interactive e-learning tool (Neurobot) to learn neurolocalisation - a systematic approach to localizing a lesion based on a patient's symptoms and signs. We assessed the efficacy by comparing it to conventional tutor-led teaching.

Summary of Work: We developed an initial online e-learning tool 'Neurobot', with seven clinical cases involving neurological localisation. A pilot study involved a total of 30 undergraduate medical students who tested the tool with quantitative and qualitative feedback collected. A second version of Neurobot with fifteen clinical cases was developed and used in a controlled study, involving students rotating through National Neuroscience Institute. The control arm received conventional tutor-led teaching while the intervention arm received neurological localization education via the Neuroapp. The primary outcome was the mean test scores of the students on an extended-matching (EMQ) test. Secondary outcomes include qualitative and quantitative feedback on the Neuroapp and level of neurophobia pre and post-teaching.

Summary of Results: In the pilot study, quantitative and qualitative feedback was positive. The controlled study had 183 students who participated in the study. Mean EMQ score for the control group was 31.69 (SD 6.74) and the Neuroapp group was 31.20 (SD 7.72) with no statistically significant difference between the two ($p=0.673$). Mean neurophobia level at baseline was similar in the control group (2.2) and the Neuroapp group (2.16), (score of 1 = most neurophobic, score of 5 = least neurophobic). Post teaching, neurophobia scores improved in both the control group (2.45) and the Neuroapp group (2.45).

Discussion and Conclusions: The e-learning tool (Neuroapp) is not inferior to conventional tutor led teaching for the learning of neurological localization in medical students. It appears that the Neuroapp has shown to reduce Neurophobia amongst medical students alongside with conventional teaching.

Take-home Messages: Developing E-learning tools is feasible and non-inferior with conventional teaching. Clinicians should consider further collaborations with developers to develop e-learning tools for students.

Can Pharmacy Students Use Wikipedia as a Learning Resource? Assessment of 100 Entries on Chemotherapeutic Agents

AUTHOR(S):

- Aya Alsharafi, King Saud University, Kingdom of Saudi Arabia (Presenter)
- Samy Azer, King Saud University, Kingdom of Saudi Arabia

ABSTRACT

Background: Pharmacy students tend to use Wikipedia as one of their primary sources of knowledge for drug information. The aim of this work is to evaluate the accuracy of content and readability level of English Wikipedia entries on chemotherapeutic agents, using quality and readability tools.

Summary of Work: Using the British National Formulary (BNF-2018) and ClinicalTrials.gov we identified 188 chemotherapeutic agents. We randomly selected 100 drugs using Excel randomization program. Wikipedia was searched on the 3rd June 2018 for the selected 100 drugs and identified entries were printed out from Wikipedia. Entries were independently scored by the two researchers using modified DISCERN. The readability was calculated using an online instrument.

Summary of Results: The DISCERN scores had a median=24 (IQR=7.5). Of these 2% were of good quality (DISCERN 36-40), 38% were moderate (DISCERN 26-35), and 60% were poor (DISCERN 25 or less). The number of updates of entries varied from 2 to 905 (mean±SD= 209.5±189.6). Although the entries covered drug indications and side effects, there were deficiencies in routes of administration, contraindications, pharmacokinetics, and mechanisms of actions. The number of references varied from 2 to 150. Also, several problems were identified in the list of references and citations made in the articles. The readability had a mean±SD of 14.35±3.13; consistent with a readability level of college students.

Discussion and Conclusions: The Wikipedia entries on chemotherapeutic agents were not written for pharmacy students. While they matched expected readability level, they were incomplete and lacking important information.

Take-home Messages: Pharmacy students and course designers should be aware of the limitations of Wikipedia on chemotherapeutic agents.

Facebook page as a learning platform for video-based airway management education

AUTHOR(S):

- Ying Lin Tan, Shin Kong Wu Ho-Su Memorial Hospital, Taiwan (Presenter)
- Jui Shih Kao, Shin Kong Wu Ho-Su Memorial Hospital, Taiwan
- Chee-Fah Chong, Shin Kong Wu Ho-Su Memorial Hospital, Taiwan
- Li-Wei Lin, Shin Kong Wu Ho-Su Memorial Hospital, Taiwan
- Chen-Wen Lee, Dalin Tzu Chihospital, Taiwan
- Jiann Ruey Ong, Taipei Medical University Shuang-Ho Hospital, Taiwan

ABSTRACT

Background: New concepts, techniques, and devices make rapid progress of airway management in anesthesiology. Airway education is also crucial for other healthcare workers, including emergency physicians, surgeons, internists, nurses, medical students, and emergent medical technicians (EMTs). In Taiwan, airway training is less available for non-anesthesiologists and most healthcare workers are trained in advanced cardiac life support course only. We introduce a funny, creative and simulative method to effectively promote airway education.

Summary of Work: We developed a Facebook page 'Crazy Airway Training Lab' and created videos for spreading and sharing airway management education. From March 22, 2017 to January 28, 2019, 105 videos were released with 433946 Views, 8153 Likes and 2381 Shares. The Pearson correlation was 0.948 ($p=0.000$) between View and Like and 0.687 ($p=0.000$) between View and Share. 70 (66.7%) videos were for education and others were promotional videos. Airway skill demonstration, airway equipment application, and creative airway teaching were three types of educational videos and had the median view of 4074 [IQR 2180-6568], 5353 [IQR 1761-10220] and 3143 [1751-5156] per video respectively.

Summary of Results: The highest view of videos was 'bag-valve mask with PEEP valve' that had 60891 views. We connected a BVM attached with PEEP valve to an endotracheal tube with a glove. The glove simulating the lung demonstrated different suspend distension when adjusting PEEP level. This video demonstrated a simple way to teach the concept of PEEP during ventilation and show its effectiveness for medical education.

Discussion and Conclusions: Adult learning process needs more motivate and attractive way to get involved. They have short attention span. Hence, lengths of time of the videos are within minutes, so we add fun, creation, and simulation into our airway education videos. People who review our videos are including EMTs, nurses, medical students, interns, residents and physicians from different specialty. It indicates practical clinical utility and the wide diversity of our airway education videos.

Take-home Messages: Spreading and sharing short, creative and simulative videos via Facebook page is an effective way for continuing airway education.

Comparison between medical students' and medical postgraduates' perspectives on Artificial Intelligence (AI) in medical fields: a multi-center survey study

AUTHOR(S):

- Pimpnipa Chaimongkonrojna, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand (Presenter)
- Patranit Nuntasilapachai, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand
- Nutnicha Pattanadee, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand
- Kullawan Chaichareonpong, Department of Family Medicine, King Prajadhipok Memorial Hospital, Chanthaburi, Thailand
- Jathurong Kittrakulrat, Khlung hospital, Chanthaburi, Thailand

ABSTRACT

Background: Recently, artificial intelligence (AI) has been introduced as potential innovation in medical field. Even though the impacts of AI in medical students have been studied, perspectives of general practitioners have not yet been analyzed. Since postgraduates have superior experiences compared to undergraduates, this study aims to compare the perspectives of medical students versus general practitioners regarding AI especially in a role of specialty preference.

Summary of Work: In December 2018, an internet-based questionnaire composing of demographic data, interested medical fields and various aspects on AI using 5-item Likert rating scale was designed and distributed to medical students and postgraduates from sixteen medical schools in Thailand. Once raw data was gathered, a two tailed unpaired t-test was used to test whether AI impacts on specialty selection differed between medical undergraduates and postgraduates.

Summary of Results: Of all 370 respondents, 324 were medical students and 46 were general practitioners. In total, the first three interested specialties were surgery, internal medicine and paediatrics, consecutively. The result showed that among medical students, 179 (55.25%) of them insisted that AI development would not change their choices of specialty (Mean = 2.46, SD = 0.50) similarly to 34 (73.91%) of postgraduates (Mean = 1.87, SD = 0.50) at p-value = 0.05.

Discussion and Conclusions: Although AI would potentially revolutionize medicine in the foreseeable future, our study reveals that AI impacts on specialty selection did not differ among medical students and postgraduates. This could be explained by that most respondents considered AI as an adjunctive technology instead of medical personnel substitution.

Take-home Messages: Overall, both medical undergraduates and postgraduates felt that AI would be a challenge in the near future.

Digital scholarship: A pilot project for knowledge production in medical education in the digital age

AUTHOR(S):

- Pierre Drolet, Université de Montréal, Canada (Presenter)
- Ilian Cruz-Panesso, Université de Montréal, Canada
- Tanoubi Issam, Université de Montréal, Canada
- Julie Grandmaison, CAE, Canada
- Sebastián Arel, Université de Montréal, Canada
- Ahmed Moussa, Université de Montréal, Canada

ABSTRACT

Background: In the last ten years, social media have increased opportunities for creating healthcare virtual networks that support community-oriented dialogues. However, there is still a lack of consideration of what and how social media help participants to transcend the role of consumers to producers of content and knowledge of social networks. Understanding of these questions is the first step for conceptualizing new forms of producing knowledge and generating scholarship in a digital age.

Summary of Work: We designed a theory-driven bundle of social web technologies with the purpose of promoting different levels of participation and knowledge building that go from understanding, comprehension, to analysis and creation. Facebook, Twitter, LinkedIn, YouTube and Edmodo platforms were conjointly used to present a virtual community in medical education with innovative research, faculty development activities, and soon to come scholarly driven debates aimed at fostering social-media scholarship in simulation and medical pedagogy. Principles of communities of practice and active learning theories are at the base of the technology interaction framework that supports this initiative.

Summary of Results: Alternative metrics, known as 'almetrics', used to measure the impact of digital scholarship will be presented. These metrics focus on social media reach of scholarly works. This study will build upon reach measures such as pageviews and mentions on academic social sites, blogs, Facebook, Twitter. Regression analyses are used to identify which of these metrics correlate strongly with variables of active learning and community of practice such as knowledge building, knowledge sharing, and access to expertise.

Discussion and Conclusions: In this paper, we argue that theory-driven social media pushes a reconceptualization of scholarship beyond traditional ways of creating knowledge.

Take-home Messages: We contend that a new generation of social scholars pushes educators and learning designers to propose opportunities and tools for democratization of knowledge and democratized access to expertise. Difficulties for shifting from traditional to innovative ways of scholarship will be presented. More specifically, issues related to collaboration, copyright and standards for evaluating digital scholarship.

Application of computer vision and artificial intelligence in clinical skill training

AUTHOR(S):

- Ching-Ju Shen, Kaohsiung Medical University Hospital, Taiwan (Presenter)

ABSTRACT

Background: The maturation of a medical doctor takes not only acquiring textbook knowledge, but more importantly the ability of procedural competency and professionalism acquisition. Moreover, modern medical care involves an array of monitoring and imaging modalities to optimize disease management and patient safety. These factors make clinical skill training more essential than ever before. Effective learning requires proper and timely feedbacks during purposed practices, so that trainees can improve themselves each time. Although many simulators are available with the same aim, they are costly and specific to some surgical techniques, such as laparoscopy and endoscopy, which might not pertain to medical student's needs of basic clinical skills practice.

Summary of Work: To build a training program that integrates computerized visual analysis and artificial intelligence (AI). The program can provide assistance to trainers' existing teaching protocols or become a trainer itself with demonstration, evaluation and feedbacks if the trainees choose to learn independently. The study utilizes quasi-experimental design, where the two learning styles were led by 1 to 2 instructors in 10 sessions each for a total of 120 trainees. Structured interviews and questionnaires were given to both the trainees and the instructors to assess their thoughts about AI-assisted learning program and their preference between AI-assisted learning or traditional learning. In particular, whether or not AI-assisted learning affects trainees' motivation and learning outcome is investigated; instructors' input about this AI-assisted learning program is also collected.

Summary of Results: The project investigates trainees' learning motivation, effectiveness and subjective perception about this novel learning model. This system facilitates personalized need of learning, and increased learners engagement, motivation, and independence.

Discussion and Conclusions: The technology influences the medical industry deeply and improves the way teachers run their classrooms. Using AI systems, students can learn independently and in relatively judgment-free environment. Educational programs powered by AI are already helping students to learn basic skills.

Take-home Messages: AI-assisted medical education is growing rapidly, it will likely offer students a much wider range of services.

Ultrastructural images as interactive tools to increment cell biology learning

AUTHOR(S):

- Paula Ludovico, School of Medicine, University of Minho, Portugal (Presenter)
- Belém Sampaio-Marques, School of Medicine, University of Minho, Portugal

ABSTRACT

Background: Students are often asked to describe and to interpret textbook model cells and organelles representations misinterpreting the real structure as well as their spatial organization. In class study of cellular ultrastructure is demanding, but constitutes a major challenge for faculty, to find efficient and effective ways to impact on students' approaches to learning.

Summary of Work: The aim of this work was to develop an interactive class activity to promote student's comprehension on different types of cellular organization and also on cellular ultrastructure for the 1st curricular year medical students. For that, students in groups, about 5-6 students per group, are challenged with transmission electron microscopy (TEM) images. These images correspond to prokaryotic and eukaryotic cells and include different amplifications of diverse organelles. Students are requested to identify as much cellular structures as they can during 90 minutes. At the end, the groups shared and discussed with the entire course their findings concerning the type of cellular organization and cellular ultrastructure present in each image.

Summary of Results: Teacher's perception is that students get really excited by their own findings on the real cellular ultrastructure. Students refer that finally they understand the diversity and spatial structure of cells and this is challenging way to understand cell biology.

Discussion and Conclusions: The introduction of students to TEM images is suggested to promote student's motivation and learning of cellular ultrastructure anatomy. This type of activity seems to improve educational efficiency, promoting critical and creative thinking, and incrementing the cell biology learning.

Take-home Messages: This interactive activity allows demystifying the common representative cell schemes and inter-organelles relationships and spatial organization. Students are able to learn with this in class interactive activity the diversity of intracellular organization that is often lacking in the textbooks.

Ultrasound: the future of anatomy teaching?

AUTHOR(S):

- Rosie Conroy, School of Medicine, University of Central Lancashire, UK (Presenter)
- Gerard Browne, School of Medicine, University of Central Lancashire, UK
- Nasir Hameed, School of Medicine, University of Central Lancashire, UK
- Andrew Ginty, School of Medicine, University of Central Lancashire, UK

ABSTRACT

Background: Ultrasound imaging is increasingly being introduced into the undergraduate medical curriculum to support the learning of clinical anatomy (Wakefield, et al., 2018). The best approach and the extent to which ultrasound teaching should be integrated throughout the undergraduate curriculum in the UK is widely debated (Wakefield, et al., 2018) (Walrod, et al., 2018)). It is well recognised that there is an increasing need for foundation doctors to be proficient in the skill of ultrasound. Could the introduction of ultrasound within gross anatomy teaching provide a way to give medical and healthcare students fundamental ultrasonography skills that will enhance their clinical examination skills and will be of benefit post-graduation?

Summary of Work: In this eposter we set out to examine the evidence base supporting the use of ultrasound imaging as part of routine undergraduate medical teaching and from this to examine if there is a role for this technology in teaching anatomy to early years medical students.

Summary of Results: We will present our school's strategy to integrate ultrasound imaging into early year's anatomy teaching. In doing this we will examine 5 key factors from current literature which are integral in aiding successful implementation of ultrasound as an adjunct technology to the current anatomy sessions (Wakefield, et al., 2018) (Walrod, et al., 2018).

Discussion and Conclusions: We anticipate that incorporating ultrasound into anatomy teaching for early year students will enhance their applied knowledge, interest in imaging and diagnostic confidence as well as providing an introduction to fundamental imaging skills. However, with the ever-increasing demands on students to be competent in a diverse range of subjects in years one and two of the course, we should be mindful that there is the potential to overburden learners.

Take-home Messages: The integration of ultrasound imaging as part of anatomy teaching and learning offers an opportunity to enhance anatomical education and build imaging skills for undergraduate students.

Interdisciplinary Learning Curriculum in Making a Virtual Reality Game for Daily Lives Training in Children with Autism Spectrum Disorder

AUTHOR(S):

- **Chung Pei Fu, Fu Jen Catholic University, Taiwan (Presenter)**
- Chih Chia Wang, Department of Family Medicine, Tri-Service General Hospital, National Defense Medical Centre, Taiwan
- Chia Ting Su, Department of Occupational Therapy, College of Medicine, Fu Jen Catholic University, Taiwan

ABSTRACT

Background: The interdisciplinary learning is an approach that integrates multiple disciplines to solve a problem. The purpose of this study was to develop an interdisciplinary learning curriculum for the students of the department of occupational therapy (OT) and the students of the department of information management (IM), and to examine the qualitative and quantitative learning outcomes.

Summary of Work: We developed a 5-stage, 18-week, interdisciplinary learning curriculum. Nine students of OT and four students of IM participated in this curriculum. The theme of this curriculum was to integrate the knowledge of OT and IM, and to make a virtual reality (VR) game for daily lives training in children with autism spectrum disorder (ASD). In the professional development stage, 6 weeks, the students of OT reviewed the literature and wrote VR game scripts for the daily lives training in children with ASD. The students of IM learned to make a VR game by using Unreal engine. In the interdisciplinary teaching and learning stage, 2 weeks, the students shared the professional knowledge to those of the other department by using oral presentation and discussions. In the team building stage, 1 week, students of the two departments built a team. In the interdisciplinary collaboration stage, 8 weeks, all the students cooperated to make a VR game for daily lives training in children with ASD. In the final presentation stage, 1 week, students took the VR game to participate in the competition.

Summary of Results: Most of the students thought that this curriculum increased the learning motivation (77.8%) and the practical experiences (88.9%). They reported that this curriculum improved their active learning, critical thinking, collaboration, creativity, innovation, and problem-solving abilities. The students of IM thought that their technology could be applied to medical fields. The students of OT thought that their dreams of making a VR game for daily lives training in children with ASD could be come true. Their VR game also got the first prize of the 2017 International ICT Innovative Services Awards.

Discussion and Conclusions: The interdisciplinary learning increased students' active learning, critical thinking, collaboration, creativity, innovation, and problem-solving abilities.

Take-home Messages: The interdisciplinary learning is a helpful strategy in medical education.

Patient Inputs Beneficial in Evaluating a Resident's Communication Skill During the Residency Training

AUTHOR(S):

- Jiratha Budkaew, Khon Kaen Medical Education Center, Khon Kaen Hospital, Thailand (Presenter)

ABSTRACT

Background: The patient's experience reflects physician interpersonal and communication skills. Our objective was to evaluate the Family Medicine (FM) residents by using a patient assessment tool for communication skills during a home visit.

Summary of Work: We conducted a field test in the primary care settings affiliated with Khon Kaen Hospital. The evaluation was made using the 11-item self-administered tool (Cronbach's alpha = 0.87) to identify communication skills of FM residents during the home visit. The skills were rated by community nurses, pharmacists, patients and themselves. Resident reflections on patients' feedback were collected and analyzed.

Summary of Results: Fourteen residents, 28 patients, 4 community nurses, and 2 pharmacists participated in the field test. The average satisfaction scores by patients, colleagues, and self-assessment were 72.3%, 70.2%, and 72.3%, respectively. Treating patients with respect (71.2%), a cordial greeting (70.5%), and encouraging questions (69.8%) were a top three item rated by patients, colleagues, and self-assessment. Involving patient in decision making was the lowest rated item by patients, whereas expressing empathy was the lowest rated by colleagues and self-assessment. The overall percentage of items scored as satisfaction was significantly varied based on the training year ($P=0.035$, test for trend). Residents mostly reflected that patient assessment was beneficial for their learning and practicing communication skills and patients' feedback enhanced their confidence in these skills.

Discussion and Conclusions: The patient could help to assess residents' communication skills concurring with healthcare providers and resident's self-assessment.

Take-home Messages: The patient could be a good asset for evaluating communication skills and facilitating residency training.

Students' Learning Outcomes of Patient-Centered Home Care facilitated by Village Health Volunteer as Educator

AUTHOR(S):

- Chanat Kanchit, Medical Education Center, Ratchaburi Hospital, Thailand (Presenter)
- Sudarat Wijitsetthakul, Medical Education Center, Ratchaburi Hospital, Thailand
- Sirote Srimahadthai, Medical Education Center, Ratchaburi Hospital, Thailand
- Anon Sathapornsathid, Medical Education Center, Ratchaburi Hospital, Thailand

ABSTRACT

Background: Patient-Centered Home Care (PCHC) is a comprehensive care approached by multidisciplinary team including family physician, nurse practitioner, physical therapist and village health volunteer (VHV). The VHVs are also the patients obtain high health literacy, so they can facilitate medical students for PCHC as educators. This study aims to evaluate the student's learning outcomes of PCHC facilitated by VHV.

Summary of Work: This study was conducted for the total of 32 fourth-year medical students in November and December 2018 at Family Medicine department, Medical Education Center, Ratchaburi Hospital, Thailand. Four students per group approached PCHC facilitated by VHV as educator for once a week by two months. All VHV were patients with non-communicable diseases treated by Family physicians in Ratchaburi Hospital and were trained to care the patients in community with PCHC program. Student's learning outcomes regarding three domains of knowledge, attitude and skill toward PCHC were determined by 12 multiple-choice questions in summative evaluation, questionnaire with 5-point Likert scale and home care rubrics respectively. Reliability of assessment tools including attitude and skill were 0.813 and 0.876, respectively.

Summary of Results: A total of 32 medical students participated in PCHC facilitated by VHV. All students passed in minimal passing level of knowledge and skill with the percent scores of 70.3 ± 10.6 and 86.9 ± 7.9 , respectively. Attitude toward understanding PCHC was improved from the percent scores of 56.9 ± 14.5 to 78.1 ± 9.3 ($p < 0.001$).

Discussion and Conclusions: Patient, role of VHV, as educator could promote medical student's learning outcomes because of high health literacy; the capacity to obtain, process, and understand basic health information and services needed to make appropriate health decisions. However, they could facilitate the students to approach good PCHC. The strengths of this program were inter-professional education and effective learning. In case of none VHV in some country, the caregiver or care-manager can take the role of educator.

Take-home Messages: The patient can be a good educator. They were provided medical knowledge, patient-centered attitude and home care skill by medical educator, and transfer all of integrated knowledge, attitude and skill with their experiences absolutely to medical students.

National Advance Care Planning Educational Workshop for Healthcare Professionals in Taiwan: Using Learning Science with 3 Levels of Course Design

AUTHOR(S):

- Wei-Min Chu, Department of Emergency Medicine, Taichung Veterans General Hospital, Taiwan (Presenter)
- Wei-Chun Lin, Department of Oncology, Chi Mei Medical Center, Liouying, Taiwan
- Shih-Chun Ho, Palliative Care Center, Chi Mei Medical Center, Taiwan
- Yi-Yin Lin, Hospice Foundation of Taiwan, Taiwan
- Chao-Huei Chen, Center for Faculty Development, Taichung Veterans General Hospital, Taiwan

ABSTRACT

Background: In Jan 2019, Taiwan has officially approved Patient Autonomy Law (PAL) which allows all citizens in Taiwan to make advance decision (AD) for 5 critical conditions. According to the law, all citizens wish to make an AD must go through official advance care planning (ACP), which will be held by certified healthcare professionals (HCP). Thus, several national ACP educational program were arranged to train future ACP professionals. Our ACP educational program was designed based on learning science that made participants learning by going through three levels: encoding, consolidation and retrieval.

Summary of Work: The course was designed as 4-hours workshop and the concept was 3 levels of structure, including the first level Encoding (1 hour): Introduction of PAL and ACP with making practices by given specific situation in small groups; The second level Consolidation (1 hour): Practicing self ACP by pairs of two to fill the full AD form and to understand the difficulty of choices. The third level Retrieval (2 hours): Situational role-play in large groups, some participants would be appointed as HCP, others would be appointed as patient and family. They went through the simulational ACP process and completed patient's AD.

Summary of Results: In 2018, 14 courses were held. Totally 1247 HCP completed training, including 263 physicians, 641 nurses, 243 social workers, 79 psychologist and 21 other professionals. We collected all participants' feedback after each course. The average score of course design assessment was 97.3%; The average score of program content assessment was 98.0%; And the average score of teacher assessment was 96.8%.

Discussion and Conclusions: The key elements for a successful ACP educational workshop are: 1. Level by level course design based on learning science. 2. Using different grouping method (either small group or large group) to fulfill the goal of learning. 3. Teacher's experience in problem solving, guidance and fast response during teaching.

Take-home Messages: 3 levels of course design based on learning theory helped HCP learn more efficiently and with more competency in future ACP. We believe that learning theory could also be applied to different aspect of medical educational workshop in the future.

Entrustable procedural skill teaching to improve patient safety

AUTHOR(S):

- **Adisak Tantiworawit, ChiangMai University, Thailand (Presenter)**
- Parichat Salee, ChiangMai University, Thailand
- Atikun Limsukon, ChiangMai University, Thailand
- Pattraporn Tajarenmuang, ChiangMai University, Thailand
- Nuntana Kasitanon, ChiangMai University, Thailand
- Chalerm Liwsrisakun, ChiangMai University, Thailand

ABSTRACT

Background: Insertion of a central venous catheter (CVC) is a procedure which may cause morbidity in patients. Our hospital has experienced a high complication rate. The method of teaching this procedure was reviewed and updated with a key aim being patient safety. This skill development has been termed the entrustable approach.

Summary of Work: The model of apprenticeship teaching by a senior resident was changed to a systematic approach involving 3 steps. Step 1: Resident completed a course of self-study followed by a video demonstration. This step aimed to encourage the learner to self-assess, review the basic concepts, consider indication-contraindication and complications. Step 2: A procedural work shop. The residents attended a group workshop in the clinical skill center. An experienced teacher shared best practice of the CVC procedure using a manikin to demonstrate, explain and model the different steps. This was followed by a group discussion. After discussion the residents carried out the procedure on the manikin. Step 3: Clinical practice under supervision. The residents practiced CVC insertion on a patient under supervision. The final step is critical in ensuring the learner is entrusted by the teacher to perform this procedure safely.

Summary of Results: Student not only learnt the procedural skills, but also showed increased awareness of the concept of patient safety. There was a 100% pass rate by the residents in step 1 and 2 however only 86% of residents passed step 3. In the final step the issue of patient safety was the most concerning. Following the implementation of this sharing best practice teaching method the complication rate has decreased by 57% in the department.

Discussion and Conclusions: The widely used concept of “See One, Do One, Teach One” to enable the acquisition of procedural skills needs to be reconsidered and in many cases discarded. We have demonstrated a method for effective procedural skill teaching using CVC insertion. Various teaching methods can be used to promote effective learning, the methods being appropriate to all learner styles.

Take-home Messages: This entrustable systematic teaching method not only promotes learner success but also results in improved patient safety.

Quality and Patient Safety Linked to Healthcare across Middle-Eastern and Asian Countries: A Systematic Review

AUTHOR(S):

- **Maha Hameed, AlFaisal University, Saudi Arabia (Presenter)**
- Anam Yousuf, AlFaisal University, Saudi Arabia
- Sara Ahmed, AlFaisal University, Saudi Arabia
- Chowsan Safa, AlFaisal University, Saudi Arabia
- Noora Rameez, AlFaisal University, Saudi Arabia
- Amal Saadallah, King Faisal Specialist & Research Centre, Saudi Arabia

ABSTRACT

Background: A paucity in literature regarding comprehensive reviews of healthcare quality and safety status has been noted. The aim of this systematic review is to evaluate this status amongst Middle-Eastern and Asian countries.

Summary of Work: A systematic research of itemized healthcare services was done including Middle-Eastern and Asian countries. Google and PubMed database were used, with 208 scholarly publications filtered according to government and international collaboration, patient involvement, adverse events/compliance/medical errors, and category focus on which of healthcare professionals focused on.

Summary of Results: 10 out of 15 Middle Eastern and 4 out of 6 Asian countries had governmental involvement, while 10 out 15 Middle-Eastern and 5 out of 6 Asian countries had international organization collaboration.

5 out of 15 Middle Eastern, and 5 out of 6 Asian countries included patients' involvement.

11 out of 15 Middle Eastern, and 5 out of 6 Asian countries reported adverse effects.

12 out of 15 Middle Eastern countries involved more nurses/nursing students, while 5 out of 6 Asian countries involved residents/physicians more.

Discussion and Conclusions: Bahrain had higher governmental involvement while the countries Egypt, UAE and high-risk countries Syria and Yemen had focus by international organizations.

Iran is the Middle-Eastern country having most influence in patient safety culture, reporting the most adverse effects, patient and healthcare professionals involvement.

More than half the Asian countries displayed governmental or international contributions, Singapore being most for governmental. Meanwhile, Vietnam was the only Asian country that did not involve international organizations collaboration.

Take-home Messages: More attention is needed towards patient and healthcare professionals involvement in healthcare quality and safety amongst Middle-Eastern and Asian countries.

Learning-needs focused hands-on workshops on Chest Drain insertion and post-insertion Chest Drain management: How we improved the identified patient safety issues in our hospital

AUTHOR(S):

- Catherine Russell, University Hospital Ayr, NHS Ayrshire and Arran, UK (Presenter)
- Anur Guhan, University Hospital Ayr, NHS Ayrshire and Arran, UK
- Sagara Dissanayaka, University Hospital Ayr, NHS Ayrshire and Arran, UK

ABSTRACT

Background: Intercoastal Chest Drain Insertions (ICD-I) are the most invasive medical clinical procedures. After the NPSA (2007) alerted ICD-I associated morbidity and mortality, NHS organisations made concerted efforts to improve ICD-I training for medical trainees in simulated setting. Subsequent practical training remains opportunistic. In our practice, we noticed: a) Patient selection for ICD-I is often sub-optimal b) Much of the complications and morbidity occurs post-ICD-I and c) Junior doctors (JD) have limited knowledge and confidence in managing chest drains post-ICD-I. We set out to understand the range of ICD-I and post-ICD-I management (P-ICD-I-M) skills in our hospital, with a view to organising hands-on workshops to address any learning needs identified. We share our experience.

Summary of Work: Doctors of all grades and specialities at the University Hospital Ayr were invited to complete an anonymous on-line survey: <https://goo.gl/forms/c3CHq1YRn2Ua1sDs2> The results informed the programme design of five 4-hour hands-on ICD-I and post-ICD-I management workshops delivered to JD between June and December 2017. Accordingly, focus of the workshops was weighted towards decision making (patient selection and P-ICD-I-M). We assessed our effectiveness through a) Participants' feedback and evaluation b) By repeating the on-line survey and c) By auditing case note documentation of ICD-I's in the 12 months following the workshops.

Summary of Results: Workshop evaluation: 100% of participants rated the workshop as Excellent overall. 60 responses to the online survey were received. Post course improvement in patient selection (from 48.3% to 95%) and P-ICD-I-M (21.6% to 85%) was demonstrated. Audit: 19 patients had 20 drains. Valid indications for chest drains were recorded in all cases. P-ICD-I-M was also well documented with clear management plans in 90% of cases.

Discussion and Conclusions: Often technical skills' training of ICD-I, overlooks development of the arguably more important cognitive skills of optimal ICD-I patient selection and safe P-ICD-I-M.

Take-home Messages: Our hands-on workshops addressed the identified lacunae in knowledgebase, receiving very satisfactory feedback and evaluation with demonstrably improved change in behaviour, contributing to increased patient safety.

Simulation based education on chemotherapy medication safety of new graduated nurses

AUTHOR(S):

- **Shu-Fen Chen, Taipei Medical University-Shuang Ho Hospital, Taiwan (Presenter)**
- Tze-Fang Wang, National Yang-Ming University, Taiwan
- Mei-Hua Wang, National Taipei University Of Nursing And Health Sciences, Taiwan
- Wen-Ting Ho, Taipei Medical University-Shuang Ho Hospital, Taiwan
- Chia-Li Wu, Taipei Medical University-Shuang Ho Hospital, Taiwan

ABSTRACT

Background: Chemotherapy are high-risk drugs and even minor negligence may endanger patient safety. New graduated nurses lack experience in the administration of chemotherapy, which is an unfamiliar process, and easily to lead adverse drug events. Simulation-based education is learner-centered and emphasizes the interaction between learners and learning situations. Therefore, our aim is use simulation-based education to enhance the ability of new graduated nurses to administer chemotherapy medications and improve patient safety.

Summary of Work: Application of simulation-based education includes skills, simulation, critique and debriefing (SSCD). (1) Technical exercises: Through videos, teaching and practice of delivery techniques. (2) Situational simulation: Key events that lead to alarm events in violation of patient safety are added to the situation, and the entire simulation learning process is recorded. (3) Learning critique: Observe peer performance and record whether the peer has performed important behavioral and safety procedures based on a critique form. (4) Debriefing: Teachers and students examine video content, discuss case focuses, patient safety principles, student performance, and the impact of negligent clinical work.

Summary of Results: First, new graduated nurses learning chemotherapy medication safety behavior and were able to identify negligence in patient safety in situation simulations. Second, teaching and learning satisfaction was 95%. Third, there was a slight decline in the rate of adverse drug events. This requires long-term observation and future research.

Discussion and Conclusions: Simulation-based education allows new graduated nurses to learn and develop relevant experience in a safe environment without having to worry about causing harm to real patients are very importance to nursing education. Application of situational simulation allows new graduated nurses can learn chemotherapy medications safety behaviors, enabling them to have impressive learning experiences. This learning approach enhances the ability of new graduated nurses to administer chemotherapy medications. Moreover, satisfaction with teaching and learning is improved, along with patient safety and nursing quality.

Take-home Messages: Compared with traditional teaching strategies, situational simulation to provide learners with an experiential learning experience. This is an approach for learning how to do a procedure, which includes learning from mistakes and repeated practice, and is effective in improving patient safety.

Physician-Pharmacist Cooperation Workshop for Reducing Medication Errors

AUTHOR(S):

- Sunee Chayangsu, Surin Medical Education Center, Suranaree University of Technology, Thailand (Presenter)
- Chawalit Chayangsu, Surin Medical Education Center, Suranaree University of Technology, Thailand
- Natenapa Trinit, Surin Hospital, Thailand
- Pakarat Sangkla, Surin Medical Education Center, Suranaree University of Technology, Thailand

ABSTRACT

Background: Medication errors are common and most recognized by pharmacists. Learning with errors may increase physician self-awareness and improve patient safety. We conducted workshop with pharmacists to improve prescribing skills and develop interprofessional education to our institute.

Summary of Work: We set up workshop with three stations consisted of 1. Medication Reconciliation 2. Prescribing Errors and 3. Drug Use Evaluation (DUE) of antibiotics. A group included with physician, pharmacists, interns and 6th year medical students (externs) rotated in each stations every 30 minutes. The questionnaire was used to evaluate satisfaction and advantage scores of workshop.

Summary of Results: All questionnaires were responded with 28 interns and 30 externs. The mean of satisfaction and advantage scores were 4.50 and 4.62 with no one responded under score 3 (max score=5). Interns rated scores more than externs both. Interns satisfaction and advantage scores were 4.64(±0.49), 4.75(±0.44) compared with externs score 4.37(±0.72), 4.50(±0.51), p=0.095 and p=0.051 respectively. Most of participants agreed that all three aspects in stations were important and necessary. Some suggested feedback directly to physician and working with interprofessional staffs will improve medication errors.

Discussion and Conclusions: Interns and externs in our institute are satisfied with this activity and physician-pharmacist workshop has the advantage for them. Both scores of externs are lower than interns reflect that medication error may be far from them because most patients are treated directly by interns.

Take-home Messages: Interprofessional education as physician-pharmacist cooperation workshop may improve medication errors and patient safety.

Evaluation of a patient safety course for intensive medicine residents using the Kirkpatrick's model

AUTHOR(S):

- Carolina Ruiz, Pontificia Universidad Católica de Chile, Chile (Presenter)
- Magdalena Vera, Pontificia Universidad Católica de Chile, Chile
- Noskar Navarro, Pontificia Universidad Católica de Chile, Chile
- Nicolas Severino, Pontificia Universidad Católica de Chile, Chile

ABSTRACT

Background: Critically ill patients admitted to the Intensive Care Units (ICU) are especially vulnerable to adverse events. The severity of their medical condition, concomitant with the complexity of their management can result in treatment and procedure errors. Daily, 1.7 errors/patient have been described during the ICU stay, and a large part of them can cause significant harm to patients. Despite this, the teaching of patient safety (PS) is limited in many intensive medicine (IM) residency programs. During 2018 a pilot PS course was developed within the IM residency program of the Pontificia Universidad Católica de Chile. This course was developed in 4 sessions by a team of multidisciplinary facilitators, stimulating active learning. The objective of our study was to evaluate this course using levels 1 and 2 of Kirkpatrick's evaluation model.

Summary of Work: To assess level 1 (satisfaction) an 11-statement survey was conducted after the first and last session. To evaluate level 2A (perception) an 8-statement survey was applied before and after the course. The results were described with percentages and the evolution of the responses was analyzed using the Fishers Test. A value $p < 0.05$ was considered significant.

Summary of Results: The 18 residents of the program participated in the course and answered the surveys. In the initial satisfaction and perception surveys 88% and 67% of the statements, respectively, were qualified with good scores. The results of both surveys improved after the course was finalized, but without statistical significance.

Discussion and Conclusions: Other studies have also shown that it is difficult to improve the perception of PS in residents, even after developing learning programs. These results will help us to improve this course using different learning methodologies. Future intensivists should be experts in PS, so it is imperative to improve the perception that they have of this topic. In conclusion, levels 1 and 2A of Kirkpatrick's model could be improved during a pilot course of PS. This learning activity should be optimized to generate an important change in the perception of PS.

Take-home Messages: Learning programs of PS for residents have the challenge to positively stimulate the perception of this topic.

Foundation doctors' perceptions towards feedback on electronic prescribing errors: a mixed-methods, single-centre study

AUTHOR(S):

- **Ann Chu, Imperial College London, UK (Presenter)**
- Arika Kumar, UCL School of Pharmacy, UK
- Geraldine Depoorter, University of Leuven, Belgium
- Bryony Dean Franklin, Centre for Medication Safety and Service Quality, Pharmacy Department, Imperial College Healthcare, UK
- Monsey McLeod, National Institute for Health Research Imperial Patient Safety Translational Research Centre, UK

ABSTRACT

Background: Medicines safety is a key component of patient safety. Reducing prescribing errors, especially by novice prescribers, is a core aspect of quality improvement in healthcare. The expansion of electronic prescribing (EP) in the NHS requires additional staff training and development. This study explores the views of UK-based Foundation doctors on the provision of feedback on electronic prescribing errors.

Summary of Work: A mixed-methods study was conducted at a large NHS hospital Trust. Electronic prescribing in all inpatient areas has been active since 2016. Phase 1 was a questionnaire study (both online and paper) delivered to all Foundation doctors (n=89). Phase 2 was an interview study with volunteer participants from the same sample.

Summary of Results: Phase 1: 25/89 submitted responses (28% response rate). Most respondents (23/25) believed feedback about prescribing errors was important. Clinically, they wanted information about their own EP errors and digitally, wanted better understanding of the EP system to prevent repeating errors. However, current feedback provision was lacking or informal. Foundation doctors were supportive of personalised, real-time, digitised feedback mechanisms, as well as learning from general prescribing errors. Phase 2: 12 participants took part in either a focus group (n=7) or an interview (n=5). Foundation doctors appraised draft error reporting templates for utility, layout and perceived impact on learning. They were receptive to receiving personalised EP data but varied in format preferences (e.g. graphs, case studies). Others highlighted the importance of multidisciplinary communication.

Discussion and Conclusions: Overall, Foundation doctors would value feedback on their electronic prescribing. As novice prescribers, they are keen to learn from errors, develop their clinical prescribing skills and use the electronic interface effectively. Our findings can be used to facilitate development of personalised EP feedback. Further research is needed to examine how Foundation doctors would engage with personalised error reporting if this was implemented.

Take-home Messages: Foundation doctors in this study recognise the importance of learning from feedback on electronic prescribing errors, both clinically and digitally. A range of tailored, user-centred options would be a positive strategy to enhance the value of patient safety information for novice prescribers.

How to increase proper and suitable competency in medical practice

AUTHOR(S):

- Boonyarat Warachit, Ministry of Public Health, Thailand (Presenter)
- Varavudh Sumawong, Faculty of Medicine, Thailand

ABSTRACT

Background: In medical practice, problem solving and decision making skills are very crucial, however these skills decrease despite practicing in both simulated and real patients.

Summary of Work: A survey from medical teachers about their opinions in information gathering, critical appraisal, decision making and communication skills in final year medical students was done. An assessment driven learning using long case examination with modified essay question (MEQ) was developed to improve their skills. Final year medical students would have history taking and physical examination with simulated patient for thirty minutes and another thirty minutes for MEQ in this case.

Summary of Results: Sixty seven percent from 112 medical teachers said that young doctors had more problems, thirty said it was not different. Sixty three percent agree that we should improve their skills despite most of them could pass national licensing examination. Both long case examination and MEQ are good for assessing clinical reasoning. All medical students satisfied with this formative assessment driven tool.

Discussion and Conclusions: Proper and suitable competency can developed using many teaching, learning and assessment tools. Both long case examination and MEQ are good for assessing clinical reasoning but low reliability except using more cases and time.

Take-home Messages: Decreasing suitable competency in future doctors resulting decreasing patient safety.

What could be the potential barrier for medical students to speak up when they encounter medical error?

AUTHOR(S):

- Chao-Chun Huang, Taipei Medical University Hospital, Taiwan (Presenter)
- Jen-Chieh Wu, Taipei Medical University Hospital, Taiwan
- Hui-Wen Chen, Taipei Medical University, Taiwan
- Yi-No Kang, Taipei Medical University Hospital, Taiwan

ABSTRACT

Background: Medical student plays an important role in preventing medical error and ensuring patient safety. “See something, say something” sounds not hard but it would be challenging for medical students to report potential medical error in a complex clinical situation. The aim of this study is to identify the potential barrier and factors affecting medical students to speak up when observing potential medical errors.

Summary of Work: A cross-sectional study was conducted among 154 clerkship medical students. Barriers of reporting a potential medical error was assessed using a 10-item structured questionnaire with a 6 points Likert-scale. The content validity was obtained by our internal expert group including faculties from different units and disciplines. The tool was developed and modified based on AHRQ hospital survey on patient Safety culture and the local cultural environment.

Summary of Results: Nearly 97% of medical students became unconfident when they observed a medical error made by a senior physician even when they are highly confident about essential knowledge and treatment protocol. 74% students considered that the senior physician was in charge so as medical students they do not need to speak up. 96.2% students felt great difficulties to speak up when there existed obvious hierarchy differences. The personality style of the senior practicing physician could affect medical student’s decision on whether to response or not. Medical students may not speak up if the senior physician who is known as stubborn (84.6%), strict (92.4%) and grumpy (88.6%). Gender and different disciplines are not significant factors affecting medical students to speak up in medical error.

Discussion and Conclusions: Hierarchy differences is a potential barrier for most medical students to response to potential medical error. Their confidence level to reporting error may decrease if the medical error is made by senior physician. Our study found together with medical knowledge cultivation and teaching, there is a great need for in-depth communication skill training to build up the confidence and competence to respond to medical error scenario for medical students.

Take-home Messages: Building up confidence, attitude and competence of teamwork is important for medical students to respond to medical error.

Improving patient safety attitude of medical students using medical error simulation scenario training

AUTHOR(S):

- Yiting Hsu, Taipei Medical University Hospital, Taiwan (Presenter)
- Jen-Chieh Wu, Taipei Medical University Hospital, Taiwan
- Hui-Wen Chen, Taipei Medical University, Taiwan
- Yi-No Kang, Taipei Medical University Hospital, Taiwan

ABSTRACT

Background: Building up teamwork and patient safety attitude is important for medical students not only to develop positive learning outcome but also for ensure patient safety. Limited medical curriculum addressing how medical students could be an important role in patient safety network and effect of team training on improving patient safety attitude. The objective of this study is to determine the efficacy of a simulation course related to medical error on patient safety attitude among undergraduate medical students in Taiwan.

Summary of Work: We designed a simulation course composing of one minor and one major medical error scenario, respectively, in medical clerkship rotation training. 154 students were enrolled in this study and divided into two groups. One group would encounter minor medical error scenario first, followed by debriefing session and then major medical error scenario. Another group started with major error scenario, debriefing session, and then minor medical error scenario. At baseline and upon completion the simulation course, students completed a 19-item structured team attitude questionnaires using 6-points Likert-scale developed based on TeamSTEPS teamwork attitude questionnaire and AHRQ hospital survey. Content validity was obtained from internal expert group. We compared their attitude score before and after simulation course.

Summary of Results: The average baseline team attitude score is 88.3 for our participants. There was no baseline attitude score difference between both groups (group one 88.0 vs. group two 88.6, $P=0.54$). After simulation scenario and debriefing session, the overall post training team attitude score improved to 89.8 ($P=0.003$). Group two has significant attitude score improved to 90.5 ($P=0.017$) and group one has trend of attitude score improved to 89.07 ($P=0.081$).

Discussion and Conclusions: Students experience medical error simulation scenario with faculty lead debriefing session could help to improve their team attitude. It is a safe and controllable teaching intervention for students to learn how to respond timely and correctly to a medical error situation without harming real patient. The students' impression of encountering medical error experience may affect their attitude improvement. Faculty could consider this factor when integrate and design simulation activity and debriefing session.

Take-home Messages: Medical error simulation scenario with faculty lead debriefing could help students to develop their team attitude.

An interactive medication error and patient safety workshop for intern and medical students

AUTHOR(S):

- Kanokrot Kovjiriyapan, Medical Education Center Phayao Hospital, Thailand (Presenter)

ABSTRACT

Background: Introducing medication error and patient safety topic to medical students is important. However, it is challenging on how this teaching should be done because medical staffs often felt difficult on apply in teaching. The aim of this study was to develop and evaluate a patient safety learning activity which designed to improve internship and medical students' knowledge and problem-solving skills toward patient safety and medication error using inter-professional team.

Summary of Work: Internship, medical students, nurse students and pharmacists were invited to participate in the workshop. In the classroom, teachers implemented the team competition to promote teamwork, leadership and practice communication, and small group discussion for incidental report and improvement method to prevent medication error. Before and after workshop, intern and medical students' perception of knowledge and clinical problem-solving skills toward patient safety and quality improvement and inter-professional skill was assessed. We also evaluated student satisfaction with the workshop.

Summary of Results: Pre and post self- assessment were completed by 13 interns and 17 medical students. Interns' mean score perception of knowledge, problem-solving skills and inter-professional skill improved from 3.53 to 4.4 ($p < 0.05$), 3.42 to 4.68 ($p < 0.001$), 3.43 to 4.79 ($p < 0.001$) respectively. Medical students' mean score perception of knowledge, problem-solving skills and inter-professional skill also improved from 3.0 to 4.18 ($p < 0.001$), 3.08 to 4.28 ($p < 0.001$), 2.88 to 4.35 ($p < 0.001$) respectively.

Discussion and Conclusions: Interns and medical students' perception of knowledge and problem-solving skills toward patient safety and medication error and inter-professional skill significantly increased from start to end of the workshop. The workshop was an appropriate method of patient safety and medication error education. They are highly satisfied with this workshop .

Take-home Messages: Integrating patient safety education into health science education is necessary and should implement in multidisciplinary early year of curriculum.

Human Factors Training: evaluating its impact on clinical practice

AUTHOR(S):

- Aaron Braddy, National Heart and Lung Institute, Imperial College London, UK (Presenter)
- Elizabeth Haxby, Royal Brompton & Harefield NHS Foundation Trust, UK
- Jo Szram, Royal Brompton & Harefield NHS Foundation Trust, UK
- Phil Higton, Terema Ltd, UK

ABSTRACT

Background: Human Factors (HF) is a social science which studies and attempts to optimise the interactions of humans, technology and the environment at work. HF offers ways to minimise and mitigate human frailties, so reducing medical error and its consequences. The past 15 years has seen a rise in awareness of HF in clinical practice and professional bodies have incorporated it into standards of practice and education for doctors and nurses. The result of these recommendations has seen the development of HF training courses. To date, only four studies have set out to evaluate HF training. At Royal Brompton & Harefield NHS Foundation Trust a training course in HF has been running since 2003, training approaching 1000 healthcare professionals. We aim to evaluate the impact of this training on participants clinical practice and ability to report clinical incidents.

Summary of Work: Each participant completes an end-of-course evaluation involving self-reflection where the participant makes promises to self i.e. how they plan to integrate the training received into practice. We will appraise these promises to look for common themes. They will also be reflected back to participants to evaluate how successfully they have been incorporated. We intend to evaluate clinical incident reports for their quality based on whether the participant has completed HF training.

Summary of Results: We will present data appraising the common themes resulting from HF training focussing on its impact on clinical practice. We will review the quality of clinical incident reporting and correlate it to HF training. This will provide an interesting insight into implementation into practice from both a self-reported and objective viewpoint.

Discussion and Conclusions: This is the largest conducted study appraising HF training and aims to look at its impact on clinical practice and clinical incident reporting.

Take-home Messages: 1) HF is a social science which studies and attempts to optimise the interactions of humans, technology and the environment at work which has been incorporated into standards of practice and education for doctors and nurses 2) This study aims to look at the impact of HF training on clinical practice and clinical incident reporting from both a self-reported and objective viewpoint.

Moving beyond written reflection: An assessment of postgraduate trainee reflective accounts

AUTHOR(S):

- **Melanie D'Costa, University of Liverpool, UK (Presenter)**
- Jeremy Brown, Edge Hill University, UK
- Gavin Cleary, Alder Hey Children's Hospital, UK
- Graham Lamont, Alder Hey Children's Hospital, UK
- Malcolm Semple, University of Liverpool, UK

ABSTRACT

Background: Reflection is considered fundamental in postgraduate medical training, as advised by the General Medical Council (GMC). In order to demonstrate engagement with this practice, compulsory written reflections are often used in work based assessment. Many clinicians remain reluctant to complete written reflections. Barriers include variable training and feedback practices, inconsistent role modelling and disparate ideas regarding the added value of formalised reflection. Some doctors appear to prefer traditional methods of evaluating errors, such as peer discussion or independent rumination. In 2018, the erroneous assumption that Hadiza Bawa-Garba's e-portfolio reflections were used in criminal court proceedings caused fear amongst the UK Medical community, worsening the collective disengagement from reflection.

Summary of Work: As part of the standard evaluation of medication errors at Alder Hey Children's Hospital, the prescribers are invited to participate in a reflective exercise. The aims of this pilot study were (1) to determine the extent of engagement with optional reflective learning and (2) to assess the quality of these reflective reports. Ethical approval was sought from the University of Liverpool. Reflections submitted by trainee doctors across a two year period were graded using a previously published quality rubric. Ordinal scores from 0 to 6 were allocated according to the description of the event, justification of lessons learned and analysis of contributory factors.

Summary of Results: Preliminary analysis indicates poor engagement with an approximate return rate of 30%. Thirty seven reflections from 2017 (n=16) and 2018 (n=21) were graded, with a mean score of 2.8 (standard error 0.22). Further analysis is planned to identify trends in engagement across different time periods and training levels.

Discussion and Conclusions: This project supports previous work in reporting poor engagement with written reflection. Results will inform a future substantive study which aims to identify andragogical methods of reflection through exploratory interviews.

Take-home Messages: Although written reflection is widely used within postgraduate medical assessment, quality and engagement can be substandard. Enhancing existing methods of authentic reflection may be preferred by doctors and promote triple loop learning, allowing for greater educational impact.

Healing architecture: a cross-national elective with on-site visits and discussions with architects about good examples of contemporary hospital architecture

AUTHOR(S):

- Michael Wilde, University of Basel, Medical Faculty, Switzerland (Presenter)
- Götz Fabry, University of Freiburg, Germany
- Rainer Schaefer, University Hospital Basel, Switzerland
- Steffen Kammler, University of Rostock, Germany
- Wolf Langewitz, University Hospital Basel, Switzerland

ABSTRACT

Background: Medical Humanities is a relatively young field within medical studies and its exact orientation can vary from university to university. In Basel (Switzerland) e.g., the Humanities track focuses on different approaches to subjective illness in literature, film and via students' reflective writing. In Freiburg (Germany), the focus is on ethics and medical history. Against the backdrop of this heterogeneous situation, we developed a joint course for medical students from both universities that highlights an additional facet that, to our knowledge, is seldomly represented in Medical Humanities curricula: the question whether hospital architecture is able to create a specific atmosphere and whether this atmosphere has an impact upon health. The aim of the course is to evoke a sensual-explorative sensitivity from the students: How does architectural design affect me and how do I know? What can architects tell me about their intentions? What do hospital staff and patients/relatives say about the effects of the buildings on them?

Summary of Work: We conduct this elective course in a small group format that is very much based on the students own initiative: they select the destinations for their excursions themselves and plan and carry them out in pairs. On site, they collect as diverse material as possible: not only their personal impressions of architecture and atmospheres, but if possible interviews with leading architects, talking to professionals, patients, or relatives about how they feel in the buildings. Each team then presents their impressions in a plenary session.

Summary of Results: Students report that they are interested in an elective course on architecture and medicine. They appreciate the change of perspective and the widening of horizons, and they consider the influence of the architectural environment on the healing process of patients to be important.

Discussion and Conclusions: An elective course on architecture and medicine complements the spectrum of Medical Humanities and is an ideal opportunity to rediscover the effects of our immediate surroundings, reflected in the ideas architects had intended.

Take-home Messages: The architecture and atmosphere of hospitals is a sensually experienceable subject that offers a variety of opportunities for personal and interprofessional exchange.

Medical Humanities Curriculum For Younger Medical Students, Home-Based Palliative Care Program Helps!

AUTHOR(S):

- Ting-Fang Chiu, Taipei City Hospital, Taiwan (Presenter)
- Jason Jiunshiou Lee, Taipei City Hospital, Taiwan
- Li-Lin Kuo, Taipei City Hospital, Taiwan
- Oscar K. Lee, National Yang-Ming University, Taiwan
- Dachun Chu, Taipei City Hospital, Taiwan
- Chih-Yuan Shih, Taipei City Hospital, Taiwan

ABSTRACT

Background: Taipei city hospital(TCH) has held the first palliative care curriculum for younger medical students since 2015 in Taiwan. For younger medical students from National Yang-Ming University, TCH kept improving the medical humanities curriculum and started to offer students 20 hours home-based palliative care(HBPC) since FEB, 2018. This study aimed to investigate the effectiveness of the program.

Summary of Work: A total of 124 students took the medical humanities course, and 12 students elected HBPC program. TCH has divided twelve students into four groups, and we assigned each group rotated in five branches. The students joined the hospice team and visited the patients in hospice care together at their own house. In each branch, students could learn how to care patients in psychosocial aspects and have palliative care experiences from different cases. At the end of the semester, students finished 11 multiple choice questions and an open-ended question to evaluate their learning situation, study habits, and the effectiveness of the program they elected.

Summary of Results: Compared with the whole class, students in the HBPC program have a higher satisfaction rate(100%). The most part that students felt wasting time was the time spent on transportation(36%) and writing reports(64%). The HBPC program helped students have 100% increased awareness of the humanistic, social, and cultural dimensions of health care while others showed 92.8%. One hundred percent HBPC students would recommend other students take the HBPC program while others were 92.79%.

Discussion and Conclusions: Overall, students felt the HBPC program was amazing and meaningful. Students want to thank patients, patients' family, and the hospice team. The hospice team found students become more enthusiastic and empathetic students. Students have important feedbacks for the hospice team: younger students hope more chance to communicate with the patients and their family and they want the hospice team to encourage them to do so. Moreover, the students want to have more time caring patients in the community.

Take-home Messages: TCH would keep improving the HBPC curriculum and ask the hospice team to encourage the students to involve in the family meeting and patient-team-family communication more. TCH will also keep offering HBPC opportunities in the community for students after the semester.

In sickness and in health: teaching medical ethics through art

AUTHOR(S):

- Sabyha Khan, London North West University Healthcare Trust, UK (Presenter)
- Shakeel Rahman, Imperial College London, UK
- Adrian Raby, Imperial College London, UK

ABSTRACT

Background: Communicating and acting with empathy are key elements of undergraduate and postgraduate medical curricula in the UK. A new “Medical Ethics and Film” specialty choice module has been introduced at Imperial College London, designed to explore medical ethics and the portrayal of the virtues of a doctor in film. The module involves four weekly sessions designed to examine themes such as end of life care, mental health, genetics and disability, with a selection of relevant films forming the basis of discussion. The objectives of the module are to utilise the narrative to stimulate critical analysis and moral imagination, alongside development of empathy. The aim of this study is to evaluate the teaching module with respect to the effectiveness of the methods used to evoke moral imagination and empathy in eight third year medical students.

Summary of Work: Eight third year medical students at Imperial College London completed evaluation forms for the four individual sessions comprising the course. In addition, students completed an assessment task designed to utilise moral imagination and analytical skills cultivated during the module.

Summary of Results: Preliminary results indicate that students believe this to be an effective method of teaching medical ethics with adequate opportunities to contribute meaningfully, develop ideas and knowledge and consider scenarios from varying perspectives.

Discussion and Conclusions: Narratives within media can simultaneously provide multiple perspectives on a given issue, as well as those of demographics of society which are otherwise poorly represented. Examination and analysis of these can facilitate the cultivation of moral imagination within a traditional classroom setting, in a similar fashion to consideration of the emotional and social experiences of patients. Determining whether this is an effective method of teaching medical ethics could impact the promotion of this model of teaching and advocate the expansion of the role of media in teaching of medical ethics.

Take-home Messages: Film and other media represent effective methods of teaching and learning within medicine. There is more scope for the incorporation and study of such methods in medical curricula; the role of art in the learning experience can expand, particularly in terms of encouraging development of moral imagination, empathy and a holistic approach in clinical practice.

A qualitative analysis of residents' reflection on palliative care movie: a pilot study in pediatric residency training

AUTHOR(S):

- Tipaporn Thongmak, Hatyai Medical Education Centre, Thailand (Presenter)
- Thitiporn Borkird, Hatyai Medical Education Centre, Thailand

ABSTRACT

Background: Movie is one of teaching methods of professionalism, ethical issues and communication skills for health professionals, particular in the palliative care topic. Movie is a part of four palliative care learning sessions in pediatric resident. This is a pilot study, which aims to explore the residents' reflection of what they have learned from the movie and how to apply it in future practice.

Summary of Work: This is a qualitative study using three semi-structure interview questions to collect the participants' reflection after watching the movie, My Sister's Keeper. Nine pediatric residents, who are in the second and the last year of training were invited to a focus group interview. The data was analysed by using the thematic analysis.

Summary of Results: Nine residents participated in a focus group interview. Most residents pointed out the family context played an important role for decision making and caring for the pediatric patient. Some residents said treatment of the chronic disease should find out the patient's meaning of life and provide quality time for the children. For the communication skill, most residents reflected the one-way communication in breaking bad news was not a good method for the patients and their family and they claimed that the family meeting was a better method for family members to discuss and decide on the best care for the patient. All residents said they should place an important emphasis on the family context for the best in palliative care patient in the future.

Discussion and Conclusions: The pilot study firmly suggested that using the movie is a good method for learning about palliative care for residents. The pediatric residents gained a lot of understanding of palliative care via the movie such as communication skills, family context and how to provide palliative care. Due to the pilot study, further studies with more residents will be the next project.

Take-home Messages: (1) Movie is a suitable method for palliative care teaching and learning activity. (2) The learners can learn several points from only one movie.

Agency or Complicity: An analysis of physicians' reflective narratives about flaws with the "system"

AUTHOR(S):

- Tracy Moniz, Mount Saint Vincent University, Canada (Presenter)
- Rachael Pack, Western University, Canada
- Lorelei Lingard, Western University, Canada
- Chris Watling, Western University, Canada

ABSTRACT

Background: Physicians often express frustration with the system in which they work. Over time, this frustration may put them at risk of burnout and disengagement, which may impact patient care. Contemporary training aims to empower physicians as systems-literate advocates. In this study, we aimed to understand the nature of the system flaws that physicians most often identified and to explore their sense of self as agents of change.

Summary of Work: We reviewed all reflective narratives published in four major medical journals (NEJM, JAMA, CMAJ, Annals IM) between January 2015 and December 2017. By consensus, we identified those that addressed system flaws (n=87). Using content and narrative analysis, we analyzed the types of flaws, the narrative strategies, and the physicians' orientation to the flawed system.

Summary of Results: Most stories pointed to medical culture as flawed, focusing on issues of communication, education, stigma, and behavioural norms. These narratives problematized the effects of medical culture on professional fulfilment, burnout and physicians' ability to meaningfully enact the values underpinning their profession. Less frequently, physicians' narratives exposed flaws external to culture, such as resource limitations and disparities as well as rigid institutional practices, as factors that impede patient-centered care. Physicians told stories to express opinions and share lessons, often stemming from an extra-ordinary patient encounter or a personal healthcare experience or because they witnessed a flaw in action. Physicians often positioned themselves as part of the flawed system, expressing varying degrees of complicity as well as agency to propel collective or individual change.

Discussion and Conclusions: Physicians narratives represent important internal conversations about the challenges they face within the complex systems they must navigate and their role in perpetuating flawed systems and/or creating change. These narratives offer insight into the limits of physicians' perceived power to effect change within medical culture and healthcare systems, and add nuance to the notion of systems-level advocacy.

Take-home Messages: What physicians find most flawed about the system is the culture of medicine itself. Physicians look inward to critically reflect on how medical culture compromises patient-centred care and perpetuates bias and burnout in the profession.

Narrative medicine's influence on medical students' readiness for holistic care practice: A realist synthesis

AUTHOR(S):

- Chien-Da Huang, Chang Gung Medical Education Research Center, Chang Gung Memorial Hospital, Chang Gung University, Taiwan (Presenter)
- Yufrica Huang, Chang Gung Medical Education Research Center, Taiwan
- Lynn Monrouxe, Chang Gung Medical Education Research Center, Taiwan
- Shu-Chung Lii, Chang Gung University, Taiwan
- Ko-Hong Lee, Chang Gung Memorial Hospital, Taiwan

ABSTRACT

Background: Narrative medicine (NM) facilitates empathy with healthcare professionals, and meaningful interactions with patients. Holistic healthcare is a form of healing, considering the whole person: body, mind, spirit, and emotions. We examined the influence of NM on medical students' readiness for holistic care to understand what works, for whom and why.

Summary of Work: Realist synthesis (RS) is a theory-driven approach, evaluating complex interventions. This RS follows five steps: locate existing theories, search strategy, study selection, data extraction, data analysis, synthesis. Electronic databases (Web of Science, Medline, Scopus, Embase) were searched. Results will be presented according to the RAMESES standard for reporting RS.

Summary of Results: 14 papers from 111 (after duplicate removal, screening). Contexts of: learning process/environment (active-learning, process-oriented, critical-pedagogy); doctor-role (educator, authority, devil-figure, partner) were identified. Mechanisms included motivation to help, feeling patients' trust, values/belief in doctor-identity, fears of changing, and self-disclosure. Outcomes included enhancing: communication, clinical-care, clinical-skills, professional/personal development, seeing patients-as-a-narrative, and peer-collaboration.

Discussion and Conclusions: We identified a range of context-mechanism-outcomes around the influence of NM on medical students' readiness for holistic care practice. For example, the in the context of the role of the doctor, the mechanisms of values and belief in being a doctor (identity) produced professional and personal development, and seeing the patients as a narrative. A realist approach looks into the 'black box' (mechanisms), which facilitate NM and develop a programme theory to explain what influences students' readiness holistic care practice. By understanding these, we can develop better NM programmes for future students and practitioners.

Take-home Messages: The realist synthesis creates an understanding about the context and mechanism, in which NM was implemented, and might have important impact on medical students' readiness for holistic care practice.

Choral music and health professional education: students' perceived benefits

AUTHOR(S):

- Lucia Pellanda, UFCSPA, Brazil (Presenter)
- Marcelo Rabello dos Santos, UFCSPA, Brazil
- Leonardo Rocha de Almeida, UFCSPA, Brazil

ABSTRACT

Background: Music and health connections are described in many studies. Choral singing is an artistic expression recognized as a promoter of social integration and humanization. The Federal University of Health Sciences of Porto Alegre (UFCSPA), the only Brazilian federal university specialized in health, has a Chorus as an extension activity for students and community.

Summary of Work: The Chorus is inclusive, with no pre-requisites and no performance test for admission. Participants collaborate to build the repertoire. In 2018 the chosen topic was "Music, resistance and freedom". The students researched political and cultural aspects, in order to situate the songs in their historical context. During this period, the chorus performed 17 concerts for a total audience estimated at 2,350 people, including vulnerable communities next to health practices. At the end of the year all singers were invited to respond an evaluation form.

Summary of Results: In 2018, the chorus had 103 participants. Of these, 14 were UFCSPA students, including Biomedicine, Pharmacy, Physiotherapy, Speech Therapy, Medical Physics, Nutrition, Psychology, Analytical Toxicology and Medicine students. Other participants include university workers (6), students from other institutions (6) or from the community (50). The response rate was 90%. For students, two dimensions emerged: the musical activities provides moments of well-being and relief from the pressures imposed by academic activities; and chorus activities complementing technical training in health, offering an opportunity to exercise more humane relationships. Non-student members cited personal transformation as the main perceived benefit, followed by establishing social bonds.

Discussion and Conclusions: The UFCSPA Chorus' inclusive characteristics promote the coexistence of Health students with diversity, not only in the rehearsals, but also in concerts. Humanization in the context of health care is to confer centrality to contact with otherness: is to direct attention to the other. Singing in group is perceived by health students as important for their professional formation. The importance of this project increases with community participation, its inclusive character, performances in vulnerable settings and collaborative construction and research of the repertoire

Take-home Messages: Inclusive art projects can promote a territory of complementary training and well-being for health students, preparing them for a more humane and qualified performance.

Learning Outside the Classroom: The Effects of Life Experience Reinforcement Camp on Medical Student Technical and Nontechnical Skill

AUTHOR(S):

- Pimpet Sukumalpaiboon, Sawanpracharak Medical Education Center, Thailand (Presenter)
- Taweesak Sutpasanon, Sawanpracharak Medical Education Center, Thailand
- Porames Khunrong, Sawanpracharak Medical Education Center, Thailand
- Kamolsin Teeyapun, Sawanpracharak Medical Education Center, Thailand
- Nongnuch Junsri, Sawanpracharak Medical Education Center, Thailand
- Tassanee Tabthimthai, Sawanpracharak Medical Education Center, Thailand

ABSTRACT

Background: Ability to apply theoretical knowledge and skill to practical use is essential in medicine and learning in authentic environment such as outpatient clinic or surgical theater make learning more meaningful. Using Kern's 6-step model, medical students report lack of confidence in performing some technical and nontechnical skills. Life experience reinforcement camp is an extracurricular activity set outside teaching hospital in sub-district health promoting hospital situated in rural areas. The camp focus on learning common community health problem, clinical and communication skill practicing, inter-professional working, holistic care, and volunteer work.

Summary of Work: Camp organizer committee prepare the following learning activities: taking history and physical examination of patients with various health problems, screening for obstetric and gynecological disease, disability evaluation, physical therapy, home/bedridden patient home visit, and community volunteer work. Medical students voluntary register online and participation of any activity depends on year of study. All performances are done under supervision of attending physician/ health care personnel who provides feedback. Students evaluate their achievement of intended learning objectives using 5-point rating scale.

Summary of Results: In 2018, four camps (10th-13th camp) in four sub-district health promoting hospitals with 212 participants, including 20 clinical teachers (major and minor discipline), 27 residents and interns, 29 health aligned personnel, 42 supporting personnel, 94 medical students. 450 patients included 105 general health problems, 231 musculoskeletal problems, 109 screenings for cervical cancer, 27 disability evaluation, 99 physical therapy, five home/bedridden patient home visit. Teamwork and decent professional attitude ranked the highest (4.39) follow by learning from community member (4.34), proactive and holistic health care system (4.19), appreciation of community value and culture (4.18), volunteer work (4.16), communication and transfer of health information (3.85), history taking (3.80), physical examination skill (3.53).

Discussion and Conclusions: Camp activities provide medical students opportunity to apply their classroom knowledge to real settings. With the current instructional design, achievement of non technical skills essential for community doctor, i.e., team working, holistic care management were higher than technical skills, i.e., history taking, physical examination. With some managerial adjustments might lead to improvement of achievement score.

Take-home Messages: Life experience reinforcement camp help prepare medical students for future work in the community.

Medicine on a Grand Scale: Selective Colloquia Broaden the Scope of an Undergraduate Medical Curriculum

AUTHOR(S):

- **Raymond Curry, University of Illinois College of Medicine, USA (Presenter)**
- Michael Zhao, University of Illinois College of Medicine, USA
- Jeanette Cheng, University of Illinois College of Medicine, USA
- Mitchell King, University of Illinois College of Medicine, USA
- Elsa Vazquez-Melendez, University of Illinois College of Medicine, USA
- Joanna Michel, University of Illinois College of Medicine, USA

ABSTRACT

Background: The medical school years afford physicians-in-training their best opportunity to explore the breadth of topics related to medicine and health (1) - in the spirit of Virchow, who referred to politics as “medicine on a grand scale.” The Illinois Medicine Curriculum, inaugurated in 2017, includes a course - “Medical Colloquia” - consisting of selective seminars augmenting material presented elsewhere in the curriculum and providing a platform for issues not easily integrated into other courses.

Summary of Work: All M1/M2 students at the College’s 3 campuses attend at least 6 Colloquia sessions per curricular term. Each session offers multiple topics (6-8 choices in Chicago; 2-4 in Peoria and 1-2 in Rockford, commensurate with relative class sizes). The curriculum is designed to collectively address five overall curricular themes, and expose students to the broad scope of issues related to medicine and health. Formats include lecture or panel presentation, small group discussion, and creative workshop sessions (e.g. poetry, narrative writing), and emphasize patients’ lived experiences and interprofessional perspectives whenever possible. Students submit post-session evaluations and narrative reflections.

Summary of Results: During fall term 2018, 102 topics were presented across the 3 campuses, with a mean of 7.3 topics/session in Chicago and 3.5 in Peoria. All Rockford sessions were in plenary format. Among the five curricular themes, Health, Illness & Society/Health Humanities and Clinical Practice were represented most often (44% and 22% of topics, respectively), followed by Health Care Systems (17%), Foundational Knowledge (10%), and Professional Development (8%). Student reviews gave the best ratings to sessions that brought to life patients’ stories of their lived experiences with illness. Feedback on session quality was used to determine future offerings.

Discussion and Conclusions: Given the intentional heterogeneity of students’ experiences in the course, progress toward specific learning objectives is difficult to delineate. Students’ enthusiastic engagement, and opportunities for students’ self-directed learning and reflection, have provided sufficient impetus for further course development and analysis of outcomes.

Take-home Messages: A colloquia-style course enhances the breadth, student-centeredness, and currency of the curriculum, while minimizing additional classroom time.

The curriculum of medical humanities museum touring for non-medical students

AUTHOR(S):

- **Kun-Long Hung, Fu-Jen Catholic University Hospital, Taiwan (Presenter)**
- Chi-Feng Hung, School of Medicine, Fu-Jen Catholic University, Taiwan
- Jaw-Town Lin, School of Medicine, Fu-Jen Catholic University, Taiwan
- Tze-Wah Kao, Department of Internal Medicine, Fu-Jen Catholic University Hospital, Taiwan
- Li-Ying Huang, Department of Internal Medicine, Fu-Jen Catholic University Hospital, Taiwan

ABSTRACT

Background: Museum of Medical Humanities of Fu-Jen University College of Medicine is a new medical humanities museum in Taiwan which is designed to provide educational theme relating to medical humanities. A curriculum of medical museum touring as a part of humanities education has been recently started.

Summary of Work: We designed a curriculum of elective learning course for the non-medical students to visit the Museum of Medical Humanities in Fu-Jen University since August 2017. Participants were arranged to attend 3 medical humanities courses including the development of Catholic medicine in Taiwan, the development of digestive medicine and the development of neonatal care. Each course included one-hour lecture and one-hour museum touring. The students were asked to fill in the questionnaire and submit the term report. The results were summarized and analyzed.

Summary of Results: Totally 147 students in one year period attended the curriculum and responded to the questionnaire. The results showed satisfaction score for the visiting was 4.48 (Likert Scale, total=5); improvement of self-awareness to the content was 4.45 and enhancement of self-awareness of humanities was 4.32 after the visiting. From the 92 written reports, they showed their impacts to historical sense (52.2%), medical knowledge (50%) and social concern (87.5%). About the medical humanities quality, they also described a various cognition of humanities on the facets of empathy, altruism, trustworthiness, correct values, and lifelong learning.

Discussion and Conclusions: Our initial study showed non-medical students performed the museum visiting with an exciting attitude. Most participants gave positive feedback and were satisfied with the course design. Visiting the medical humanities museum plays a novel role in humanities education for non-medical university students. It can stimulate the student's awareness of humanities and promote their qualities of humanism through museum visiting. The long-term effect of the touring on humanities attitude needs further follow up.

Take-home Messages: Can visiting tour of medical humanities museum play a potential role in humanities education for non-medical students?

Development of a Cross-Cultural Academic Integrity Questionnaire

AUTHOR(S):

- **Marcus A Henning, University of Auckland, New Zeland (Presenter)**
- Mohsen Alyami, University of Auckland, New Zealand
- Zeyad Melyani, King Abdulaziz University, Saudi Arabia
- Hussain Alyami, University of Auckland, New Zealand
- Ali Al Mansour, Saudi German Hospital, Saudi Arabia

ABSTRACT

Background: There are very strong arguments motivating the development of cross-cultural appropriate questionnaires in medicine and other academic disciplines. Apart from this questionnaire under discussion, no existing academic integrity questionnaire has incorporated a cross-cultural feature in their design and development. Second, there is a growing internationalization of higher education suggesting a standardised measure that is valid across regional and discipline boundaries is essential. Measurement of academic integrity is not only about quality control and measurement but can also be used as an educational tool.

Summary of Work: The design and development of this cross cultural measure of academic integrity has undergone several phases and adopted a sequential process of advancement. In phase 1, content validity was employed to develop the first iteration to be applicable for New Zealand Medical and Pharmacy students. Second, the questionnaire was trialled and further developed based on data obtained from Nigeria and Iran. Lastly, the questionnaire was translated into Arabic and trialled on Saudi higher education students.

Summary of Results: In reference to this presentation, the last two iterations utilized several factor analysis procedures (exploratory and confirmatory) in addition to inspections of the item distributions. In the most recent iteration, the Saudi Arabian dataset confirmed a refined version of the previous questionnaires which the development of a three factor, 10-item questionnaire. A summary of these results will be presented.

Discussion and Conclusions: The current research iteration of a cross-cultural measure, yielded promising results that indicated a stable measure that could be applied to different discipline groups and used across English and Arabic regions.

Take-home Messages: Designing and developing a measure of academic integrity in itself is a challenging task, but to extend this to a cross cultural measure increases the complexity. Nonetheless, it is important to develop a standardised measure that has metric applicability and translational equivalence in terms of conceptual understanding of the ideas being tested.

The Role of Medical Humanities Curriculum Related with Cadaver Dissection to Promote Medical Students' Medical Professionalism

AUTHOR(S):

- Wha Sun Kang, The Catholic University of Korea, College of Medicine, South Korea (Presenter)
- Soo Jung Kim, The Catholic University of Korea, College of Medicine, South Korea
- Pyeong Man Kim, The Catholic University of Korea, College of Medicine, South Korea
- Dong-Mi Yoo, The Catholic University of Korea, College of Medicine, South Korea

ABSTRACT

Background: Cadaver Dissection plays a significant role in the medical student's educational process on both a cognitive and emotional level. In the practice of cadaver dissection, medical students could learn not only medical knowledge but also views and attitudes on life and death as a good doctor. We designed a week medical humanities block course (MHBC) in the middle of cadaver dissection curriculum to integrate 'Gross Anatomy' and 'Medical Humanities' and promote students' medical professionalism.

Summary of Work: The subjects consisted of 99 first-year medical students. All participants completed 12 items questionnaire asking reflection in regards to the practice of cadaver dissection and view and attitudes on life and death. And we asked all participants to choose what competencies of Medical Professionalism could be developed through the cadaver dissection and the MHBC. The collected data were analyzed using mean scores and a descriptive statistics by SPSS.

Summary of Results: The participants responded that the practice of cadaver dissection helped them to have a right set of values regarding human and the sanctity of life. They also answered that they could think about life and death through the reflective opportunities in the MHBC. Additionally, 51% of the participants perceived that competencies of Medical Professionalism such as empathy, teamwork and respect for patients were developed by cadaver dissection the MHBC.

Discussion and Conclusions: The results support that cadaver dissection and the MHBC could help students not only to acquire medical knowledge but also to develop the professional competencies required by doctors, such as self-reflection, team work and professional thinking and behavior. A week medical humanities block course in the middle of cadaver dissection was the meaningful approach to integrate the basic medical sciences and Medical Humanities.

Take-home Messages: Integration of curriculum is meant to make teaching and learning activities meaningful. However, Integration of the curriculum entails a lot of time and work in respect of planning, organization and implementation. To develop and implement successfully the integrated curriculum, the faculties have to be deeply involved and cooperative, especially over disciplinary and departmental borders.

What do students gain from integrating the studies of arts and humanities with medical education?

AUTHOR(S):

- Eleen Inayat, University of Bristol, UK (Presenter)
- Sofia Mashanovich, University of Bristol, UK

ABSTRACT

Background: As students of the new MB21 curriculum at the University of Bristol that entails a case based learning course with a focus on medical humanities, we wanted to explore the importance of integrating the studies of arts and humanities with medical education. The first year of the course initially comprises of a foundations of medicine module, including a unit in the art of medicine whereby students explore holistic care and the ways in which the arts and humanities affect lay perceptions of health.

Summary of Work: We set out to gather 2 sample groups: one comprised of first and second year medical students undertaking the MB21 course (which includes modules in the art of medicine) and one of third and fourth year medical students who studied the MB16 course that was formerly offered at the university. We compiled a series of questions to gain insight into whether the students perceived the inclusion of medical humanities to be more beneficial by comparing the sample groups. Survey responses were collected from the two sample groups to collect information on the differences in student engagement, satisfaction and enthusiasm.

Summary of Results: Preliminary analysis of the data would suggest that students showed greater engagement with a course that includes an appreciation for medical humanities. Many of the MB21 students highlighted that they were able to express creativity in opportunities such as the 'Foundations of Medicine Conference' and the 'Effective Consultant Creative Assignment'. In contrast, students from the MB16 curriculum expressed a wish to include more creative opportunities in their learning, which was predominantly lecture based and scientific.

Discussion and Conclusions: The inclusion of medical humanities not only facilitates understanding of scientific concepts but also allows students to understand the Importance of patients' perceptions of the human body and the influences that this can have on a patients interaction with healthcare. Through humanities, the student sees the whole patient, rather than just their problem.

Take-home Messages: Medical education should instil a wider appreciation for the arts and humanities to enlighten future doctors on the way in which lay people perceive medicine and science.

The impact of a longitudinal integrated humanities program in an undergraduate medical curriculum: a qualitative study

AUTHOR(S):

- **Maria Cecília Lemos Pinto Estrela Leão, Universidade do Minho, Portugal (Presenter)**
- Helena Chini, IF Sul Minas, Brazil
- Nadine Correia Santos, Universidade do Minho, Portugal
- João Bessa, Universidade do Minho, Portugal
- Manuel João Costa, Universidade do Minho, Portugal

ABSTRACT

Background: Currently, the integration of the Humanities in undergraduate medical curricula is widely recommended. However, little is known about the impact of humanities curricular units on student development. This qualitative study was conducted to evaluate the impact of the longitudinal integrated humanities program of Minho Medical School, according to the perceptions of students and faculty from other units. This unit integrates topics from several disciplines.

Summary of Work: After ethics approval, coordinators and faculty from basic and clinical Curricular Units (UC's) were interviewed individually. In addition 4 focus groups were held with deliberate samples of students from the 2nd to the 5th year. The interviews followed a structured guide developed for the purpose of this study. The interviews were recorded transcribed and analysed with NVivo.

Summary of Results: Students and faculty agreed on the importance of the Humanities units (HU). Student narratives revealed that they considered the HU facilitated the improvement of their communication with patients and their reflexive capacity and attitude during clinical practice. Students also mentioned deeper knowledge about ethics, literature, palliative care and reflexion on topics not covered by other units, and also more understanding about controversial subjects. They considered the benefits of HU were more professional than personal. Faculty from other units agreed that the inclusion of Humanities enhanced aspects of professional activities - communication with patients, professional and inter-professional conflict management and positive influence on students' development, notably on their behavioural level such as resilience and the reflexive capacity during the clinical practice, having as a result a person-centred approach.

Discussion and Conclusions: In general, there were positive perspectives of the Humanities units, as they were considered to facilitate the development of personal and professional competences by coordinators, faculty member and students. This study developed in the context of one institution, suggested that the integrated humanities program achieved wide acceptance and recognition across several stakeholders.

Take-home Messages: Longitudinal integration may be an effective strategy to expose undergraduate medical students to the humanities.

Students' bioethics attitude toward gene editing - a qualitative and quantitative analysis from a medical humanity class

AUTHOR(S):

- Shiu-Jau Chen, Mackay Medical College, Mackay Memorial Hospital, Taipei, Taiwan (Presenter)

ABSTRACT

Background: With the advance of genetic technique, many bioethical issues are generated. This study aims to evaluate students' attitude before and after a genetic bioethics class. And to understand what their considerations regard to humanity are.

Summary of Work: Twenty-six medical students was enrolled in the 2 hours class talking about genetic bioethics. The class was proceeded with slide introduction, video watching, and experience sharing. There are 4 pretest questions with the answer ranged from 1 (total against) to 7 (total approve). For example: 1. Do you agree with the statement: no matter what the purpose is, we should not violate the evolution of nature. 2. With no side effect, do you agree with gene editing for human. At the end of the class, a posttest was performed and a 30 minutes quizzes was taken. The question was "The first genetic editing baby was born in China." Please express your opinion in term of medical humanity. Qualitative analysis was performed from the quizzes to understand their ethical considerations.

Summary of Results: From the analysis of pre and posttest data, students' acceptance of genetic editing declines after the class. The mean score of the 4 questions decreased from 5.8(pretest) to 4.1(posttest) with a statistical difference. Their considerations against gene editing include: Oppose universal rules (moral intuition), violation of nature and evolution (doing Gods work), national interests, personal academic interests, monetary benefits, genetic change risks and uncertainty, reduced genetic diversity, slippery slope, people being tagged (becoming tools), parents identification, go against the principle of fairness and justice (the game of rich people), invasion of privacy, violation of autonomy.

Discussion and Conclusions: Students' attitude toward gene editing became more conservative after the class. From quizzes analysis, most student conclude that gene editing can only be do when the negative effect is eliminated. In addition to ethical thinking, national and monetary factors may interfere this decision.

Take-home Messages: By quantitative analysis of the pre-and post-test result, teachers know the percentage of attitude change after class. Through quantitative analysis, teachers understand what their students learn from class. Both methods have benefits in narrowing the distance between teaching and learning, as a tool for curriculum adjustment.

Spirituality/Religiosity in Medical Education: a necessary approach

AUTHOR(S):

- Odenir Nadalin Júnior, Pontifical Catholic University of Paraná, Brasil (Presenter)
- Mary Rute Esperandio, Pontifical Catholic University of Paraná, Brasil
- Géssica Melina Hornung, Pontifical Catholic University of Paraná, Brasil

ABSTRACT

Background: The spiritual/religious coping methods are used to face stressful events in times when health is threatened. However, beliefs, practices, interpersonal relationships or experiences of the sacred can work as spiritual struggles. These struggles can predict negative mental health outcomes, like depression, worse compliance to treatment and increased mortality. It is important to approach spirituality/religiosity topics in medical education, teaching the professional how to integrate this human dimension in a positive way in therapy.

Summary of Work: This study is a quantitative research with 84 patients of a public mental health service in Curitiba (Brazil). Data was collected in 2017 using a socialbiodemographic questionnaire, in addition to the Brief Religious Coping Scale (SRC), Centrality of Religiosity Scale and the Religious and Spiritual Struggle Scale. This project aims to evaluate how spirituality/religiosity works in psychiatric patients, pointing out the necessity of teaching holistic (bio-psycho-social-spiritual) health care practices in medical schools.

Summary of Results: Data samples were mainly man (53.6%), between 20 and 65 years old, and were considered highly religious. Positive-SRC was considered high in 32.1% of the cases, and Negative-SRC was low about 35.7%. About including spiritual/religious aspects into medical treatment, only 11.9% had been asked by a health team member about spiritual/religious issues. Of the patients, 52.4% would like to discuss these issues with their doctors. 60.7% had brought some spiritual/religious questions to the therapeutic setting.

Discussion and Conclusions: Positive-SRC strategies are highly used by patients to face stress and suffering. That indicates spirituality/religion takes center stage in their lives, therefore it should be included in a therapy avaluation by professionals - moreover, it may interferences with ethical decision-making. It is necessary to include spirituality/religiosity topics in medical education, offering to the future professionals some approach strategies for a spiritual anamnesis that enables them in the humanized care exercise, being sensitive to the patients beliefs and practices.

Take-home Messages: Including spirituality/religiosity into medical education can be an important tool to help professionals to establish a better bond with their patients, increasing the compliance to treatment, mediating ethical conflicts and contributing to a humanized care.

Photography to facilitate the education of GP trainees

AUTHOR(S):

- Nicola O'Shaughnessy, GPEU, UK (Presenter)
- Sam Scallan, GPEU, UK
- Johnny Lyon-Maris, GPEU, UK

ABSTRACT

Background: The role of the arts in medicine has been the subject of research and there is recognition of the benefit of engaging with the arts and humanities on patient wellbeing and recovery from illness. This acknowledgment has been extended to doctors in training, with the arts finding a role at both undergraduate and postgraduate levels. This study looks at how photography can be used in teaching to explore 'being a GP registrar.'

Summary of Work: The GP registrars were in the last few months of their training (GPST3) prior to transitioning to independent practice. They were asked to answer the question "what does being a GP registrar mean to you?" by taking a photograph. The trainees shared the images in a facilitated small group teaching session (4 groups in total) and follow up feedback was gathered to evaluate learning. The data collection comprised: 1) A focus group with one small group; 2) Interviews with the programme directors running the groups 3) The photographs taken by the trainees.

Summary of Results: Detailed thematic analysis was undertaken: through the creation of codes the commonalities, differences and relationships within and between the data sets were examined, linking the images and transcripts. Three striking themes in the data were identified. These reflected their experience of being trainees and were: the core values of being a GP, resilience and wellbeing, and seeing their small group peers in new, and sometimes unexpected, lights.

Discussion and Conclusions: The teaching session was positively received by GPST3s and programme directors alike. The focus group and interviews allowed me to explore the impact of the opportunity to be creative and the learning they gained from it, as well as to evaluate the session. The creative element engaged the trainees and seemed to deepen the reflective discussions that followed.

Take-home Messages: This educational case study shows how the use of the arts, and photography in particular, in medical education can support the professional development of GP trainees and allow them to express their perspective on training. The session has been further developed and is part of our curriculum for the GP registrars.

Renewal of Undergraduate MD Curriculum based on National Standards of Medical Education in Georgia

AUTHOR(S):

- **Gaiane Simonia, Tbilisi State Medical University, Georgia (Presenter)**
- Zurab Vadachkoria, Tbilisi State Medical University, Georgia
- Rima Beriashvili, Tbilisi State Medical University, Georgia
- Marina Mamaladze, Tbilisi State Medical University, Georgia
- Salome Voronova, Tbilisi State Medical University, Georgia

ABSTRACT

Background: Based on recently (2017) established National standards for undergraduate medical education in Georgia, Task Force for the renewal of MD curriculum has been started at Tbilisi State Medical University (TSMU). Currently TSMU runs traditional undergraduate curriculum with elements of vertical and horizontal integration - early clinical engagement of students in clinical activities (such as communication skills in yrs I and II), introducing Case-based Clinical Reasoning (CBCR) course for the 3rd year students and OSCE for the assessment of clinical skills.

Summary of Work: Innovation of Undergraduate MD curriculum integration matching community, national and global demands, has been considered as a key strategy for TSMU. Task Force was composed by members of Curriculum Committee, main stakeholders and students representatives. Development of the new curriculum was preceded by discussions with education leaders, members of Academic Council and faculty.

Summary of Results: The following integrated modules have been developed by the Task Force for innovated MD curriculum blueprint: Fundamentals of Life Sciences, Structure of Human Body, From Gene to Human Being, Homeostasis and Human Defense with Longitudinal courses - Becoming a Doctor, Clinical and Research Skills (Years I and II), Basics of Disease Development and Treatment, Introduction to Clinical Medicine and longitudinally CBCR (Year III), followed by clinical clerkships during Years IV and V, and preparing for clinical practice (residency) during graduating - VI year of study. Increasing number of elective courses have been introduced in renewed curriculum. Learning outcomes and relevant assessment methods have been strictly defined for each integrated module. Appropriate program for faculty development have been elaborated.

Discussion and Conclusions: Renewal of undergraduate MD curriculum at TSMU has been an important step towards harmonization with national and global standards and for improvement of quality teaching, learning and assessment at the University.

Take-home Messages: Renewed, revised MD curriculum with more integration, matching local and international standards was developed confirming need for permanent innovation of undergraduate medical education.

Evaluating students' experience in a revised basic science course with an emphasis on clinical relevance

AUTHOR(S):

- Irene Lee, Duke-NUS Medical School, Singapore (Presenter)
- Siang Hui Lai, SingHealth Duke-NUS AMC, Singapore
- Pei Yan Wong, National University of Singapore, Singapore

ABSTRACT

Background: We revised a first-year course entitled “Molecules, Cells, and Tissues” that was historically taught through a basic-science lens with little clinical correlation, via a flipped-classroom, Team-Based Learning (TBL) modality. We leveraged on a “conceptual coherence” framework that emphasizes the importance of creating relevant mental representations of clinical and basic science information, undergoing purposeful reorganization in order to better integrate basic science content with clinical learning. The “application” questions of the TBL sessions were rewritten with the explicit purpose of examining the underpinnings of basic science content, particularly the molecular and cellular pathways, and how it manifests in clinical conditions. The facilitated-discussion that followed in TBL revisited the key learning points in a clinically-orientated manner. We aimed to determine if the revision of the content and application questions, grounded by a “conceptual coherence” framework, better facilitated the learning experience according to students.

Summary of Work: To describe students' learning experience with the changes implemented, we used thematic analysis on the qualitative feedback provided by students in the course evaluations from academic year 2017/18 (pre-revision) and 2018/19 (post-revision). In addition, we compared students' course ratings on specific domains such as the perceived clinical relevance of the course, based on a Likert scale that ranged from 1 (Strongly disagree) to 5 (Strongly agree). The rating was compared against the previous cohort.

Summary of Results: The thematic analysis of the qualitative feedback identified the lack of clinical correlation as the major theme that surfaced in the 2017/18 cohort. Importantly, such perception was not identified in the 2018/19 cohort. Consistent with the well-perceived clinical relevance of the restructured course, ratings of the course's clinical relevance also increased from an average of 3.91 (SD 0.67) to 4.12 (SD 0.57) between the two years.

Discussion and Conclusions: Corroborating with the framework of conceptual coherence, providing explicit connection between basic science learning and clinical context also improved students' perceptions of the learning experience.

Take-home Messages: Supplementing explicit clinical correlation in application segment of Team-Based Learning enhances students learning of basic science content.

Does longitudinal teaching in professional competencies better prepare students for clinical practice?

AUTHOR(S):

- **Elise Pauline Skjevik, UiT The Arctic University of Norway, Norway (Presenter)**
- Tor Anvik, UiT The Arctic University of Norway, Norway
- Eirik Hugaas Ofstad, UiT The Arctic University of Norway, Norway
- Unni Ringberg, UiT The Arctic University of Norway, Norway

ABSTRACT

Background: The medical faculty at UiT The Arctic University of Norway (UiT) revised its medical curriculum in 2012. A new group-based longitudinal mentoring program (all 6 years) includes mentoring, patient-centered communication training and ethical reflection. The objective of this study was to compare how new program 5th-year students' (NP) and old program 6th-year students' (OP) evaluated how teaching in communication and ethics had prepared them for clinical practice.

Summary of Work: This cross-sectional study was part of a larger survey evaluating study program and attitudes towards communication and ethics, and targeted all NP (n=96, 61,5% response rate) and OP (n=90, 53,3% response rate) medical students at UiT in the spring of 2017. Questions assessing the relevance of teaching in communication and ethics were largely quantitative using a 5-point Likert scale (5=most positive).

Summary of Results: NP students scored 17% higher than OP students when asked how teaching in communication had prepared them for clinical practice (4.41 vs. 3.77, $p < 0.05$). Likewise, the NP students scored teaching in ethics 11% higher (4.02 vs. 3.59, $p < 0.05$). In the open-ended questions, many NP students responded that experiential teaching in communication was essential in learning communication skills. Several OP students replied that the old program contained insufficient teaching in communication.

Discussion and Conclusions: Self-reported data indicate that medical students who are part of a longitudinal mentoring program feel better prepared for practice with regards to skills in patient-centred communication and ethical reflection. We believe that the core elements of this program, which is early introduction and continuity throughout medical school, are effective in preparing the students for patient-centered clinical practice.

Take-home Messages: It is essential to evaluate curricular revisions. A longitudinal systematic program in communication and ethical reflection makes students more prepared for clinical practice than scattered periods of training.

Institutional pedagogical project (IPP): participative process in the education of health professionals

AUTHOR(S):

- **Márcia Rosa da Costa, Universidade Federal de Ciências da Saúde de Porto Alegre, Brasil (Presenter)**
- Marta Quintanilha Gomes, Universidade Federal de Ciências da Saúde de Porto Alegre, Brasil
- Melissa Santos Fortes, Universidade Federal de Ciências da Saúde de Porto Alegre, Brasil

ABSTRACT

Background: Health professional education has been widely discussed recently with the aim of qualifying professional practices and meeting population health needs. In this context, collective creation of pedagogical projects and curricula is encouraged with a focus on the development of skills and teamwork throughout the education of medical and other health professionals. The IPP guides the educational practices by introducing epistemological and pedagogical conceptions. This report brings about reflections and data about the participative and dialogic construction process of an institutional pedagogical project (IPP) in a Brazilian public university.

Summary of Work: The dialogic method was developed with the participation of teachers, students and staff from 16 courses in the Health Sciences. The strategies used to prepare and analyze the IPP were: document collective reading and discussion in a virtual environment; face-to-face collective meetings with the community; face-to-face discussion forums in small groups on the different topics in the IPP. All data were systematized and the final document was presented to the community.

Summary of Results: The face-to-face forum was the most significant strategy. 782 participants, divided into groups, discussed: assessment (157); curriculum (129); humanization (72); inclusion processes (55); institutional internationalization (103); methodologies (96); the relationship between teaching, research and extension (110); and the actors of teaching and learning (60). The participants evaluated the process positively highlighting the importance of interaction and reflection upon the themes. They also suggested that the face-to-face forum should occur systematically for monitoring and evaluating the IPP implementation in order to guarantee the principles and objectives established for the university and its courses. Thus, it was set as a goal the monitoring of the implementation of the IPP.

Discussion and Conclusions: The face-to-face forum enabled the collective and collaborative debate by teachers and students on the curriculum and the education of health professionals. As an instrument of collective construction, it allows for the action-reflection-action process, being the best demonstration of autonomy and expression of the identity of a university community. (Freire, 1997; Sacristan, 2008; Harden, 2001).

Take-home Messages: The IPP becomes true when it is elaborated and shared by the academic community in an active process of collective development and evaluation of educational practices.

The learning of symptomatology in the first-year medical students is effective for better understanding preclinical medicine

AUTHOR(S):

- Eriko Okada, Tokyo Medical and Dental University, Japan (Presenter)
- Makoto Takahashi, Tokyo Medical and Dental University, Japan
- Yasuhiro Itsui, Tokyo Medical and Dental University, Japan
- Yuki Sumi, Tokyo Medical and Dental University, Japan
- Kumiko Yamaguchi, Tokyo Medical and Dental University, Japan
- Yujiro Tanaka, Tokyo Medical and Dental University, Japan

ABSTRACT

Background: In Japan, most students are enrolled in medical school directly from high school. They rarely study the preclinical medicine such as anatomy, biochemistry or physiology before their enrollment and in the first-year of medical schools for liberal arts. In the last four years, our first-year medical students should take the introduction courses to symptomatology with clinical reasoning for their better understanding preclinical medicine in the second year. In the course, small group discussion (SGD) and medical interview for clinical reasoning are carried out. In SGD, each student should present an assigned disease representing the common symptoms such as headache, chest pain, back pain, abdominal pain, cough, or short of breath.

Summary of Work: Two years after the course was implemented, the questionnaires of the second-year students suggest insufficient learning outcomes of the symptomatology course. To improve the learning outcomes of the students, a post symptomatology test (posttest) was introduced on the last day in first-year. The effectiveness of the posttest for the first-year students was evaluated by the questionnaires and the scores of the preclinical medical examinations in their second-year.

Summary of Results: Totally 458 students (229 with posttest in 2 years vs. 229 without posttest in 2 years) were studied in 4 years since the symptomatology course was started. The questionnaire of the students showed many positive opinions that there were particularly effective in learning anatomy, physiology and pathology. In terms of passing rate of the preclinical medicine exam, posttest group was significantly better in physiology (88.2% in the posttest group and 69.4% in the group without posttest ($P < 0.05$), whereas the differences were neither significant in anatomy (81.2% vs. 69.9% ($P = 0.06$)), nor in pathology (92.6% vs. 84.3% ($P = 0.06$)).

Discussion and Conclusions: The symptomatology course with posttest in first-year may facilitate medical students for better understanding, at least, a part of preclinical medicine such as physiology in the following year.

Take-home Messages: The learning of symptomatology with posttest in the first-year medical students is effective for better understanding a part of preclinical medicine.

Development of a hematology curriculum based on the cognitive load theory

AUTHOR(S):

- Samuel S Medina, University of Campinas, Brazil (Presenter)
- Fernando F Costa, University of Campinas, Brazil
- Joyce M Annichino-Bizzacchi, University of Campinas, Brazil
- Margareth C Ozelo, University of Campinas, Brazil
- Sara T O Saad, University of Campinas, Brazil
- Erich V Paula, University of Campinas, Brazil

ABSTRACT

Background: Hematology represents a comprehensive area of medical knowledge integrating basic and clinical sciences, requiring the interpretation of morphological and molecular diagnostic methods, and the recognition of a diverse range of clinical entities. Although medical students are exposed to hematology-related contents several times during their courses, the area is frequently quoted as “complicated”.

Cognitive load theory (CLT) assumes that if total mental effort required during learning exceeds the finite capacity of the learner’s working memory (WM), learning efficacy will be jeopardized. According to CLT, a proficient learner is one that incorporates knowledge into automated schemata, so that more room is left in WM for the incorporation of more complex knowledge.

Summary of Work: We present our experience using CLT framework to organize the hematology curriculum for a 6-year medical course.

Summary of Results: Activities were planned to allow (i) progressive increase of learning tasks complexity, by planned repetition of contents and use of schemata; and (ii) progressive increase in fidelity, by use of clinical vignettes, e-cases and supervised patient care. In 1st year, Chronic Myeloid Leukemia was used as an integrating theme for teaching basic science; in 3rd year, key pathophysiology concepts were presented using a flipped classroom strategy and self-guided assignments; during 4th year, simulated cases consisting of complete blood count reports and clinical vignettes were sent to students bi-weekly through a Moodle-based platform allowing immediate feedback; in 6th year, 3rd year contents were revisited using short videos, e-cases and self-guided assignments focused on the integration of pathophysiology and clinical knowledge, all used as background knowledge for daily case-based discussions in the outpatient clinic. Evidence of student engagement increase was obtained from institutional evaluations.

Discussion and Conclusions: Rational organization of curricula based on CLT framework, coupled with innovative teaching tools represent a simple and low cost strategy to improve student engagement and learning in hematology.

Take-home Messages: CLT framework based strategy, particularly in association with innovative teaching tools, may be considered as an option for planning curricula for undergraduate medical education in hematology.

Work-integrated learning opportunities and first-year university students' perceptions of employability

AUTHOR(S):

- Brooke Harris-Reeves, Griffith University, Australia (Presenter)

ABSTRACT

Background: Universities are attempting to respond to recent changes in the employment sector in order to ensure graduates are job ready. One approach for preparing students for the evolving employment sector is to expose them to work-integrated learning experiences during their undergraduate degree. Traditionally, work-integrated learning experiences have been offered toward the end of students' degrees, but there might be value in offering such opportunities as students' transition into university.

Summary of Work: The aim of this study was to explore the outcomes of brief work-integrated learning experiences on first-year university students.

Summary of Results: A series of paired samples t-tests showed significant differences in students' (N¼ 28, Mage¼ 18.89 years) perceptions of employability following exposure to 10-hours of job shadowing.

Discussion and Conclusions: The outcomes from the study suggest that students might benefit from work-integrated learning experiences in their foundation year of university.

Take-home Messages: For educators, our findings suggest that the inclusion of WIL experiences as students transition into university appears to be positive and effective for students. While WIL experiences are valuable for students as they transition through and out of their degrees, students should not be excluded from such opportunities during foundation years.

Do medical students receive sufficient information in order to make an informed decision about intercalating?

AUTHOR(S):

- Hamisha Salih, University of Liverpool, UK (Presenter)
- Jayne Garner, University of Liverpool, UK

ABSTRACT

Background: The MBChB programme prepares students to become the doctors of tomorrow. Intercalated degrees provide an additional degree alongside the standard MBChB, which is mandatory in several medical schools across the UK. At our University, medical students are given the option to intercalate which proposes economic, educational and practical challenges. A previous literature search found that only 45% of students felt they had enough information to make a decision on whether to intercalate. It is crucial students are provided with relevant and accessible information for this important decision.

Summary of Work: An online survey was sent to 4th year medical students at our University (n=289) to explore whether they felt appropriate information on intercalating was provided, whilst also identifying what aspect of intercalating in particular they feel they lack information on. The survey incorporated Likert questions and open comment boxes. Thematic coding was utilised to analyse the qualitative data collected. Ethical approval for the study was granted by the University (2160).

Summary of Results: 64 students responded to the survey. The majority of the respondents (84%) would have liked to receive more information on intercalating. Only 64% of students felt confident that they had made the right decision to intercalate, with only 27% stating they had received sufficient information from the university about intercalating. The most common theme occurring from open comments was the need for more information on finance.

Discussion and Conclusions: Students raised issues regarding the amount and quality of information received about intercalation, suggesting increasing the information given, making it timelier and having a dedicated intercalation lead within the medical school. These results are of interest to other medical schools seeking to provide students with appropriate information regarding intercalation.

Take-home Messages: Intercalation is an important decision a medical student encounters in their career. It is imperative medical schools provide sufficient support and information for such decisions in order to prevent student dissatisfaction.

Themes in Curriculum Reforms in Dental Education: A Focused Review

AUTHOR(S):

- Emilie Leth Rasmussen, Aarhus University, Center for Health Sciences Education, Denmark (Presenter)
- Peter Musaeus, Aarhus University, Center for Health Sciences Education, Denmark

ABSTRACT

Background: Dental curricula are reformed because of societal, technological, research-based and political reforms at a national, international, and institutional (university, dental school) level. The aim of this study was to describe prevalent themes in dental curriculum reform processes that have taken place in the past five decades.

Summary of Work: Using PubMed, Embase, ERIC and Web of Science, a systematic literature search to identify studies of curriculum reform and programs was conducted. Search terms were curriculum reform, curriculum development and curriculum change with dental. Abstracts from 660 peer-reviewed articles published in English, Scandinavian languages, German, Spanish, French and Portuguese were chosen for screening. These were screened for relevance through abstract and title, whereby 536 were excluded, as abstract or title did not meet the criteria for inclusion or decreased for exclusion criteria. Finally, 124 articles were chosen for review.

Summary of Results: Ten themes relating to competences were identified: (1) Academic/scientific focus; (2) Digitalization; (3) Internationalization; (4) Geriatric dental care; (5) Interdisciplinary and team cooperation; (6) Business and transition to practice; (7) Sustainable dental care; (8) Local community and value creation; (9) Integration and Early Clinic; (10) Electives.

Discussion and Conclusions: The reviewed empirical articles ranging from case studies to experimental studies showed a trend in dental curriculum reform reflecting societal concerns over an increasingly global, elderly and technological society. However, a significant amount of the reviewed articles was not explicit or indeed strong on stating which empirical methods or analytic methods were employed to characterize the curriculum research studies. This means that some of the reviewed studies suffer from lack of trustworthiness of findings, which makes it difficult to assess and discuss the nature of trends in dental curriculum.

Take-home Messages: Curriculum change is a process driven by many political and institutional interests. However, it seems to yield specific themes that are goals for the process. This review does not evaluate whether the ten identified themes are entirely new or how well they have been implemented in dental teaching practice. However, the identified themes provide a guideline for curriculum developers wanting to reform the dental curriculum.

The Value of Geographic Information Systems in Primary Healthcare as a Tool of the Enriched Medical Curriculum with Health Information Technologies

AUTHOR(S):

- Jessica Ortiz Huerta, Technische Hochschule Deggendorf, European Campus Rottal-Inn, Brazil (Presenter)
- Camila Satie Tomikawa, Technische Hochschule Deggendorf, European Campus Rottal-Inn, Brazil
- Oscar Blanco, Technische Hochschule Deggendorf, European Campus Rottal-Inn, USA
- Myrna Leticia Montemayor Flores, Facultad de Medicina, Universidad Autónoma de Nuevo León, Mexico

ABSTRACT

Background: Measuring inequality and equity in health systems is a challenging task for many countries. Information Communications technologies, now ubiquitous, can help to overcome the health challenges and disparities by connecting the “problem” area with the world. Access to healthcare has improved with the internet, and every day remote access to health experts shortens the gap between rural and urban services. Primary healthcare as the bottom of the pyramid is one of the services that could be most improved through Computer-Based and remote systems. Every country that has inequalities in health services could benefit from many solutions.

Summary of Work: Health Workers and Medical Interns in different primary healthcare facilities in rural areas were questioned of the existence of GIS in Healthcare and their experience/knowledge with it.

Summary of Results: There was a lot of interest regarding the topic, but unfortunately, no training experience (undergraduate nor postgraduate).

Discussion and Conclusions: The digital and healthcare services gap observed in rural areas is of great use to explore the tools now available in creating geospatial solutions. The benefits from approaching the bottom of the pyramid with these solutions could reflect directly in the daily reports from the health workers, facilitating the national epidemiological strategy and future planning. Geospatial planning and health policymaking is a strategy followed to manipulate data and analyze it geographically through Geographical Information Systems (GIS) by some countries with different stages in preparation and application of their programs, measuring the impact how those strategies in this emerging technology are working towards reaching their health goals.

Take-home Messages: Providing digital skills to the health workers as postgraduate or undergraduate training to use such tools, is a simple task that could bring immediate added value to the efforts done in a specific community. The training and knowledge from the uses of GIS in health should not be limited to the specific postgraduate training but also (be) included as a part of the enriched Medical curriculum with Health Information Technologies in the in the near future.

Spaced learning in medical education: Is it time for an instructional revolution?

AUTHOR(S):

- **Marnix Timmer, Center for Innovation in Medical Education, Leiden University Medical Center, the Netherlands (Presenter)**
- Marjolein Versteeg, Department of Cardiology, Leiden University Medical Center, the Netherlands
- Renée Hendriks, Center for Innovation in Medical Education, Leiden University Medical Center, the Netherlands
- Aliko Thomas, Center for Medical Education, McGill University, Canada
- Paul Steendijk, Department of Cardiology, Leiden University Medical Center, the Netherlands

ABSTRACT

Background: Medical students often struggle to recall declarative knowledge acquired during their medical training. A possible solution for addressing this problem is to apply the principles of the spacing effect which consists of distributing and repeating information over time in order to improve knowledge retention. Despite the importance of this phenomenon in health professions education (HPE), it is unclear how it has been discussed in existing literature. The aim of this scoping review was to map the definitions, applications and related theoretical frameworks of spaced learning as reported in the HPE literature.

Summary of Work: We used Arksey and O'Malley's five-step methodological framework. A literature search was performed in five databases using spaced learning and associated terms. Two reviewers independently screened articles for eligibility using pre-established inclusion criteria. Extracted data were analysed using both numerical and thematic approaches.

Summary of Results: Of the 2972 records retrieved, 103 articles were included in the review. Besides the term spaced learning, we found an additional 20 terms with a total of 74 different definitions. Almost half of the articles (n = 45) did not report a conceptual framework. In the remaining articles, the spacing and testing effect dominated the literature. The minority (n = 15) explicitly based their spacing protocol on previous literature. Application of spaced learning in online settings (e.g. sending students automated emails with quizzes) was reported most frequently (n = 51).

Discussion and Conclusions: Spaced learning is poorly and infrequently defined in the HPE literature. The current literature mainly targets the practice phase of learning, whereas research on the instructional phase is limited. Future research should target the instructional phase given existing evidence from neuroscience which suggests that spacing instruction could also benefit retention. Transparency of study procedures could promote operationalization of spaced learning and clearer definitions. Outlining the boundaries of the concept of spaced learning could contribute to educational practice and research.

Take-home Messages: • There is need for a clear definition and complete study protocols of spaced learning in health professions education research. • We may invest in research that explores the usefulness of spaced learning in the instructional phase.

Socially Responsible Behaviour in Medical Students: An inductive approach

AUTHOR(S):

- Nancy Bastias, Universidad de Concepcion, Chile (Presenter)
- Mary Jane Schilling, Universidad de Concepcion, Chile
- Cristhian Perez, Universidad de Concepcion, Chile
- Debora Alvarado, Universidad de Concepcion, Chile
- Paula Parra, Universidad de Concepcion, Chile

ABSTRACT

Background: Social responsibility is the ability to integrate the care of others, de care of the environment and care of oneself in individual behavior. This behavior depends on the role that people play in society. Although there are researches on socially responsible behavior in Chilean university students, these results do not consider the peculiar characteristics of medical students.

Summary of Work: The present research aimed to identify socially responsible behaviors expected in medical students. A non-experimental study was carried out. 262 medical students were surveyed (67.7% were women). They answered open questions about what behaviors they consider as socially responsible for medical students. Thematic content analysis was performed. This study was funded by VRID grant 216.090.005-1.0.

Summary of Results: 43 categories about socially responsible behavior in medical students were identified. They were grouped into three major themes: responsibility in academic performance, social commitment and ethical behavior.

Discussion and Conclusions: Results show that the adequate fulfillment of academic requirements is the category that students associate most directly with social responsibility. However, social responsibility is also linked with social environment in which they live. Likewise, the development of an ethical relationship with other is part of what they consider as socially responsible. No allusion to environment protection was identified.

Take-home Messages: Social responsibility in medical students implies to worry about their training without neglecting their link with the social environment and the values expected in a doctor.

Public Health Community Projects for Medical Students

AUTHOR(S):

- Selma Omer, University of Southampton, UK (Presenter)
- Robin Poole, University of Southampton, UK

ABSTRACT

Background: Medical students are often involved in community oriented activities before starting their studies but rarely have the opportunity to renew their passions and pursue old interests in a medical context as part of their medical training. The UKs General medical Council (GMC) outcomes for graduates emphasize the development of knowledge of population health and its determinants and variations of health care delivery and professional values including leadership and team working.

Summary of Work: This project was started to offer medical students a unique opportunity to work as a small team in conjunction with a charitable local community organization on a Public Health themed project that relates to the curriculum. We approached 1st year medical students via a lecture pitch to pilot the community engagement project and selected six candidates after a simple application process. We developed a short training program for students that provided them with opportunities to; 1) increase their understanding of the public health and the wider determinants of health 2) further develop leadership, project management and team working and skills and 3) receive support from a mentor.

Summary of Results: A team of students worked with Juvenile Diabetes Research Foundation. Following a needs assessment and focus groups with grandparents of grandchildren with Type 1 diabetes, students developed an information resource tailored to suit their needs. The JDFR team valued the students' contribution and plan to use the leaflet their KIDSAC - an information pack given to every child in the UK newly diagnosed with type 1. Preliminary evaluations show that the students were positive about the experience. We are exploring the students motivations and perceived benefits or barriers in participating in community projects as part of their medical training.

Discussion and Conclusions: Participating in community projects can help medical students to develop transferable skills, as prescribed by (GMC) learning outcomes, outside of the familiar clinical setting whilst contributing value to their local patient community. This pilot can serve as a model for establishing similar opportunities in medical training.

Take-home Messages: Integrating community based projects in medical training can engage students with their local patient community and enable them to develop key professional values.

In what ways may a concept of social accountability affect curriculum development in medical school - comparing two schools: one in East London and one in Western Australia

AUTHOR(S):

- Lucas Jullian, Barts & The London School of Medicine and Dentistry, UK (Presenter)
- Sandra Nicholson, Barts & The London School of Medicine and Dentistry, UK

ABSTRACT

Background: Major governing bodies (“Aspire Initiative” and the “Global Consensus for Social Accountability of Medical schools (GCSA)) have gathered the experience of hundreds of individuals with a responsibility in policy-making, to develop a consensus regarding the strategies that medical schools should adopt to improve their quality, equity, relevance and effectiveness in healthcare delivery, aiming to become social accountable. Our study would provide a qualitative perspective, and investigate how these concepts materialise in concrete efforts and initiatives in medical schools’ curricula. Our study would explore the educational efforts made by universities in order to transform their intention to incorporate local health needs in their curriculum into practice, as per the recommendations developed by the Aspire Initiative and the GCSA guidelines.

Summary of Work: Document template analysis was performed on the GCSA Guidelines and ASPIRE initiatives regarding social accountability. This was done to form a framework for our approach towards the interview and document analysis. Thematic analysis of the documents pertaining on curriculum development and educational initiatives in each respective medical school to investigate the degree to which general principles on social accountability have been implemented. Thematic analysis of the semi-structured interviews of the participants.

Summary of Results: Two medical schools were recruited (Barts & The London, East London; and Curtin University, Perth), chosen due to their commitment to social accountability. 6 Participants (3 from each school) were chosen for their expertise in medical education and their involvement in the most recent curriculum development of their medical faculty.

Discussion and Conclusions: Interviews/document analysis were useful in highlighting the different ways that social accountability is understood, and the impact of the local environment on the materialisation of social accountability recommendations.

Take-home Messages: Medical schools providing evidence regarding their successful implementation of general recommendations put forward by international governing bodies into their curriculum is incredibly useful for future medical schools interested in becoming more socially accountable, as it shows evidence that social accountability initiatives can be successfully implemented in a curriculum and have a significant impact on their graduates. We encourage more medical schools making their operationalisation of social accountability in their curriculum public to influence more faculties to make the first step.

Let us Pecha Kucha together: “New for all” group-work intervention to achieve integration

AUTHOR(S):

- Albertina Menezes Velho, University of Warwick Medical School, UK (Presenter)

ABSTRACT

Background: Globalisation and Internationalisation in the 21st century, has contributed to increasing diversity in our learning spaces. As a passive observer, I noticed students preferred their own cliques in an undergraduate health studies class. Also, there was lack of learning-space integration among ethnic minority and majority students. Health related pedagogy, that does not promote intercultural dialogue, respect for diversity or innovation and integration of learners could significantly affect requisite skills of future health workers.

Summary of Work: Pedagogical approaches, flipped-classroom and a “new for all” student-centred activity, were used during shared learning in an undergraduate health studies class. Pre-intervention data suggested, students lacked insight into the use or applications of Pecha Kucha, a freely available online digital presentation tool. To promote inclusive pedagogy, Pecha Kucha as the “new for all” activity was integrated with a novel yet simple 4-I interactive pedagogic tool designed by this study author - 1) Introduce the application of “new for all” activity during the student-centred task e.g. in random groups, 4-5 students, prepare and present to peers a group Pecha Kucha on a particular learning outcome, 2) Involve learners in a peer-peer dialogue during the shared task, 3) Interrogate task objectives collectively, and 4) Interact with peers to recall knowledge, encourage intercultural dialogue and integration.

Summary of Results: Qualitative and quantitative data was analysed by comparative approach with separate analysis performed on pre- and post-intervention anonymous questionnaires, classroom discussion forums and tutor observation notes. Data suggests, the “new for all” student-centred intervention and the 4-I interactive pedagogic tool innovated pedagogy through peer-peer dialogue and positive learning, because there was no advantage of some learners over others.

Discussion and Conclusions: Pecha Kucha as a “new for all” activity combined with the 4-I interactive tool achieved integration through shared learning by challenging all learners to collaborate and learn. Simple pedagogic interventions can innovate pedagogy, prevent clique formation, increase learner satisfaction and interaction.

Take-home Messages: Any “new for all” pedagogic activity combined with the study authors 4-I interactive tool can remove advantage of some learners over others, thereby promoting positive peer-peer learning and integration during a shared learning process.

How a UK children's hospital summer school influences attitudes to careers in paediatrics amongst medical student and foundation doctors

AUTHOR(S):

- Craig Knott, Great Ormond Street Hospital, UK (Presenter)
- John King, UCL Great Ormond Street Institute of Child Health, UK
- Jonathan Smith, Great Ormond Street Hospital, UK
- Justin Poisson, Great Ormond Street Hospital, UK
- Paul Winyard, UCL Great Ormond Street Institute of Child Health, UK
- Sanjiv Sharma, Great Ormond Street Hospital, UK

ABSTRACT

Background: Recruitment to UK paediatric training has seen a 27.5% drop over the last three years, with significant depletion on the trainee workforce. Many UK bodies have led initiatives to highlight the positives of the speciality and encourage applications including the successful #paedsrocks twitter campaign. There is a need to provide further sources of careers inspiration and guidance to potential applicants to encourage careers in paediatrics further.

Summary of Work: We developed a 3-day Paediatric 'Summer School' together with children's hospital specialists, general paediatricians, researchers, academics and educators. The programme consisted of speciality experts describing their work and exciting innovations in their field, careers panels, interactive QI and leadership group-work, and sessions delivered by former or current patients. To assess the impact this initiative had on perceptions of paediatrics and career intentions we sent a 9 question survey to attendees.

Summary of Results: 55 medical students and foundation doctors attended the summer school. Medical students attended from 16 different UK medical schools, and 2 international students attended. 28/55 participants completed the survey. Attendees were asked to score their likelihood of a career in paediatrics on a 5-point Likert scale. The mean score before and after the summer school showed a statistically significant increase - 3.86 vs 4.68 ($p=0.002$). Sessions about subspecialities and the careers sessions made attendee had the biggest impact on likelihood of applying for a career in paediatrics. 44% felt long working hours were the biggest factor putting them off the speciality.

Discussion and Conclusions: There is a need to engage medical students and foundation doctors in order to foster positive attitudes towards paediatric careers and large tertiary children's hospitals and academic institutions are well placed to do this. The number of medical schools represented, suggests this is not being adequately provided locally. Our summer school shows this approach appears to have a positive impact on medical students and foundation doctors.

Take-home Messages: #paedsrocks

Effects of integrations of stroke patients, family and multidisciplinary team's perspectives compared with traditional-style lecture on student learning outcomes in stroke rehabilitation course

AUTHOR(S):

- Anon Sathapornsathid, Medical Education Center Ratchaburi Hospital, Thailand (Presenter)
- Sudarat Wijitsetthakul, Medical Education Center Ratchaburi Hospital, Thailand

ABSTRACT

Background: In successful stroke rehabilitation, collaboration between doctors, patients, families, and multidisciplinary team are very important. Learning from their perspective can offer opportunities to develop authentic and holistic learning experiences for medical students and enhance good attitude in patient care and working as a team. However, this learning strategy has never been used with medical students at Ratchaburi Hospital before.

Summary of Work: This study was conducted on 59 fifth-year medical students in 2017(32 students) and 2018 (27 students). Students in both groups were similar in baseline characteristics. Both groups received traditional-style lecture on stroke rehabilitation. After lecture in 2018 group, stroke patients, families and multidisciplinary team were invited to join the class. Multidisciplinary team consist of physical therapist, occupational therapist, speech therapist and rehabilitation nurse. Patient and family gives perspectives about stroke from their experiences from the beginning and progression of recovery, proper medication use, exercise program, psychological adaptations, environmental adaptations and social reintegration. Also multidisciplinary teams share their perspectives about treatment goal and experiences from this patient. After finishing the class, both groups were tested with MCQ and MEQ questions, graded satisfaction and opinions about learning.

Summary of Results: Students in group with integration of perspectives received a better score in examination $89.6 \pm 5.8\%$ vs. $84.2 \pm 8.0\%$ ($p = 0.0053$), better overall satisfaction $92.0 \pm 5.9\%$ vs. $79.2 \pm 10.4\%$ ($p = 0.003$). From most of opinions, students think integration of perspectives make them understand patients better, have more confidence to apply knowledge with patients and acknowledge the importance of teamwork.

Discussion and Conclusions: This study showed that integration of perspectives helped students to link knowledge learned earlier with real patients. Thus learning was practical, more focused and more meaningful and also helped students understand biopsychosocial aspects of patients' lives and model of multidisciplinary staff work together as a team. Integrations of stroke patients, family and multidisciplinary team's perspectives is more effective than traditional lecture on student knowledge, satisfaction and student have better attitude in patient care and working as a team.

Take-home Messages: Medical education center should encourage integrations of patients, family and multidisciplinary team's perspectives in the future.

Participatory Action Research for Developing Learning Autonomy for Senior Nursing Students - A Case Study of Community Cross-discipline of Disaster Health Care Alliances

AUTHOR(S):

- Shiu-Yun Fu, Department of Nursing, Fu Jen Catholic University, Taiwan (Presenter)
- Huang-Chou Chang, Fu Jen Catholic University Hospital, Fu Jen Catholic University, Taipei, Taiwan
- Hui-Ting Wu, Department of Nursing, Fu Jen Catholic University, Taiwan, Taiwan
- Chia-Lin Ko, Department of Nursing, Fu Jen Catholic University, Taiwan, Taiwan
- I-Ling Lin, Department of Nursing, Fu Jen Catholic University, Taiwan, Taiwan

ABSTRACT

Background: The background of the study originates from problems encountered by students in learning disaster health care course modules, including the impact of individual learning motivation on their study outcomes, the dilemma of inter-disciplinary resource links, and the widening of autonomous learning topics which enhance the teaching goals. We will use the participatory action research theory to address the direction of motivational enlightenment and “technical, government and academic cooperation into the spirit of 3C (Care, Concern, Compassion) and to concentrate on disaster health ethical issues and cultural differences to achieve the required goal of research.

Summary of Work: The objectives of the research include: 1) nurturing senior students in acquiring knowledge and skills in disaster care and improving their ability to judge a crises or tragedy, and enhancing their learning effectiveness in disaster health care; (2) strengthening the motivation of nursing students and bringing the results of resource networks into the practice of the teaching design- in order to seek more appropriate designs for student learning and for more efficient teaching strategies.

Summary of Results: This research process includes qualitative and quantitative data analysis. The results will include a greater understanding the students learning circumstances and the continuing process in the development of their systematic study and learning motivation; participatory action research on the educational programs of cross-disciplinary professional team alliances; changes in autonomous learning behaviors and the motivation to explore results in depth; practical reflection reports, localized education programs established, and research findings published.

Discussion and Conclusions: Through this protocol, innovative teaching programs are designed to provide educators with competencies to enhance the motivational objectives of senior nursing students. Furthermore, they learn about the importance of professional roles in the community and to augment their communication and coordination skills when they affiliate with the cross-sector alliance. This will result in strengthening cross-disciplinary inter-professional alliances, in their respective professional fields and place value on the orientation of senior students and can clearly guide the direction for future research.

Take-home Messages: 1. Enhance the motivational objectives of senior nursing students. 2. Improving senior nursing students ability to judge a crises or tragedy. 3. Strengthening cross-disciplinary inter-professional alliances.

Integration of Professionalism, Health Economics and Evidence-Based Medicine: a New Learning Method in Radiology

AUTHOR(S):

- Chalakot Dejarkom, Buddhachinaraj Medical Education Center, Thailand (Presenter)
- Kosa Sudhorm, Buddhachinaraj Medical Education Center, Thailand
- Pornpimon Kasemsook, Buddhachinaraj Medical Education Center, Thailand

ABSTRACT

Background: In spite of teaching by lecture, reading and interpreting radiographs as usual, we had created a new learning method in the course of radiology. This research aimed to evaluate the medical students' attitudes towards this learning method.

Summary of Work: Fifth year medical students in Buddhachinaraj Medical Education Center who took elective course of radiology in the academic year 2018, had learned a two-hour class by integration of professionalism (communication skills and humanism by role play), health economic, journal reviews and finally, case discussion with instructor. At the end of the course, their attitudes were surveyed with using five rating Likert scale questionnaires. The data were analyzed by mean, ranking and t-test.

Summary of Results: Forty-one students (100%) had completed the questionnaires. The mean level of attitudes were high (3.41-4.20) for all items. The three highest score were instructor feedback (4.15), attractive (4.07) and learning atmosphere (4.07). They felt their knowledge significantly gain from 2.68 to 4.02 (p-value <0.001). The problem of this method was excessive time using on journal reviews.

Discussion and Conclusions: The instructor feedback had highest attitude because they had effective feedback and the student felt free to discuss with instructors. This method was attractive and had good learning atmosphere due to good preparation, good teamwork and the student could create the thinking process by role play. The journal reviews took excessive time because there were many journal items.

Take-home Messages: Our new integrated course is the good choice study method. Furthermore we will add on game-based learning in this method.

Health service and sexual education - pilot implementation in 2nd-year medical students in Reims

AUTHOR(S):

- Marie Laurent, Reims Faculty of Medicine / CEMR, France (Presenter)
- Evan Gouy, Reims Faculty Of Medicine, France
- Chloé Castagna, Reims Faculty Of Medicine / CEMR, France
- Margot Lafolie, Reims Faculty Of Medicine / CEMR, France
- Jean Baptiste Oudard, Reims Faculty Of Medicine, France
- Bach-Nga Pham, Reims Faculty Of Medicine, France

ABSTRACT

Background: CanMEDS framework suggests six roles for a medical expert including those of communicator and health advocate. Solutions had to be found to develop these skills during medical studies in France. Supported by the Reims Faculty of Medicine and French National Association of Medical Students, the Reims Medical Students Association launched the Sexuality Education Project (EALS) in 2017-2018.

Summary of Work: The aim of EALS was to send pairs of medical students to work in high school classes to address topics related to sexuality in a playful form and to debate social issues. Students were trained in content and communication ; examples of activities, summary documents and an exchange group were made available. To prepare the sessions, pupils completed a preliminary questionnaire to find out their expectations (among STIs, contraception, respect, pornography, gender in society, feelings of love, sexual orientation, stereotypes, consent, ...) and knowledge. Evaluation questionnaires were completed after each session by students and pupil. A debriefing was planned after each session for the students and board.

Summary of Results: 274 pupils in 16 groups conducted 2 sessions of 2 hours each. Subjects particularly requested were respect, feelings of love, contraception and consent. Many questions were also asked by the pupils. In post-session questionnaires, more than half indicated that they were interested or thought-provoking. The majority were satisfied with the content offered, the richness of the exchanges and the animation quality. The playfulness was greatly appreciated. There was an improvement between the 2 sessions following the debriefing and the improvements made to the preparation of the sessions. The majority of the students considered that the experience had added value to their training.

Discussion and Conclusions: Sort of peer education due to the generational proximity between medical students and pupils, we believe that EALS is an interesting solution to convey key ideas to pupils in an interactive way and provide students with communication and public health skills. Moreover, this project served as a pilot for the health service planned in all French medical schools in 2018.

Take-home Messages: Sometimes, the best way to make students want to learn is to support their projects in themes that are close to their hearts!

Developing a Geriatric Palliative Workshop: Responding and meeting the Health Professionals' Needs

AUTHOR(S):

- Allyn Hum, Tan Tock Seng Hospital, National Healthcare Group, Singapore (Presenter)
- Wah Ying Ong, Dover Park Hospice, Singapore

ABSTRACT

Background: Ideally, all healthcare professionals should be trained to care for patients suffering with dementia across its spectrum of severity, including at the end stage. Unfortunately, many have limited, or even no training in palliative care for serious illnesses, including in advanced dementia.

Summary of Work: To develop and refine a geriatric palliative workshop designed to equip healthcare professionals with basic knowledge of geriatric and palliative care. In integrating the knowledge of both specialties, the secondary aim was to enable practical application of palliative care for advanced dementia patients. A blended learning, flipped class model was developed for the workshop. Pre workshop articles and didactic lectures were combined with case based discussions and role play. The 2 day workshop was designed after conducting a series of didactic lectures over a 3 year period with healthcare professionals in various healthcare settings. The workshop was conducted in Thailand and Singapore by an interdisciplinary geriatrics and palliative team. Anonymous surveys were completed at the end of the workshop by study participants to assess effectiveness of the course.

Summary of Results: All course participants in Singapore completed the survey (n=45). 78% strongly agreed that learning objectives were met, rating the effectiveness of the course as 4.7 (Maximum score:5). 76% strongly agreed that the coverage and depth of the course was adequate, rating it as 4.73. They appreciated that the facilitators were interdisciplinary, that it was highly interactive and participative, with lectures based around problem solving. Patient centred care as the educational outcome was highlighted. Role play as part of communications and group work were elements of the course which appeared to play a role in understanding and responding to the needs of patients suffering with advanced dementia. 73% of participants surveyed strongly agreed that the concepts and skills learnt in the course were relevant to their work.

Discussion and Conclusions: An interdisciplinary geriatric palliative workshop integrating different forms of andragogy may aid learning of new skills.

Take-home Messages: A blended learning, flipped class model adopted by an interdisciplinary team in a geriatric palliative workshop helps to integrate palliative care knowledge and skills, enabling healthcare professionals care for advanced dementia patients.

Designing a teaching programme for nursing staff on a frail and functional psychiatry ward using single best answer assessments and small group teaching sessions

AUTHOR(S):

- Zara Sheikh, NHS, UK (Presenter)
- Ruben Thumbadoo, NHS, UK
- Hema Ananth, NHS, UK

ABSTRACT

Background: There has been a huge drive in mental health to address the physical health of mental health patients and to prevent diagnostic overshadowing. Whilst working on a frail and functional elderly care ward, we discovered that psychiatry nurses have not been given the training to assess and manage physical health but are expected to do so nonetheless. In order to address this, we trialled a teaching programme which was delivered by doctors to the nursing staff.

Summary of Work: The teaching programme was delivered in a lecture based format with small group sessions, participants were given 10 case based single best answer questions to work through before and after a teaching session on hypertension. Each case was designed to represent scenarios staff may be faced with at work. This assessed knowledge of hypo/hypertensive emergencies, diagnosis and management of hypertension, and when nursing staff should escalate to doctors. Furthermore, we included the physiology of hypo/hypertension in order to provide context to the interpretation of blood pressure readings.

Summary of Results: After the teaching sessions were delivered, the mean single best answer scores increased from 49% to 89% ($P < 0.01$). 80% of participants felt the teaching was very useful to their clinical practice and 20% felt it was useful. Staff felt it was a reciprocal teaching environment and 100% said they would like more teaching from doctors. Qualitative feedback was also very positive, 'Very informative, delivered in a way appropriate to the staff, embellished concepts when required', 'beneficial to our clinical practice, enhanced my knowledge of blood pressure management'.

Discussion and Conclusions: This project allowed us to evaluate doctor to nurse teaching methods, we found that interactive tutorials created a positive team dynamic and enabled nursing staff to clarify any misconceptions in an informal environment. As well as improving patient safety, teaching programmes like this can inspire staff to seek development opportunities and encourages continued learning.

Take-home Messages: 1. Optimising physical health in mental health patient is important 2. The lack of physical health training given to mental health nursing staff can be successfully supplemented by doctor led teaching programmes and this should be trialled in other specialties.

Changing the way of hospital library service in facilitating medical humanity and holistic care education in the transforming era

AUTHOR(S):

- Yun Chen, Far Eastern Memorial Hospital, Taiwan (Presenter)
- Pei-Chun Lin, Far Eastern Memorial Hospital, Taiwan

ABSTRACT

Background: In coping the need of holistic care and medical humanity (MH) education in 21 century, the hospital library should changing their service way. We instilled a MH program in our library and hope through this new role and soft environment of library to establish learners the meaningful learning actions and reflections by using experiential learning.

Summary of Work: We designed a program with a series of MH session incorporate MH book resources exhibition and expert lecture in different subject including cardiovascular, transplantation, dementia, etc. The sessions included the historical library resources exhibition, film festival broadcasting about related topics and providing a master talk from each special field to share the holistic care experiences at our medical library. Questionnaire to evaluate participants' satisfaction and reflections was collected.

Summary of Results: Learners' feedback on overall activity gave a very high satisfaction rating 5 (5-point scale). Over 98.5% of participants were satisfied with the library exhibition which can understand more about the library resources and literature retrieval system in MH and strengthen the attitude and capability in lifelong learning. Moreover, through the expert talk 95% of participants can experience the MH style, apply the empathy and respect about life, as well as use positive attitude to face the adversity and keep the medical enthusiasm on holistic care.

Discussion and Conclusions: We incorporate library resource and lecture to induce participant's reflections in MH and holistic care. Through activities they can find the adequate library resources and connect to MH and care experiences. 95% participants thought this program can induce self-learning desire and create the connections with their previous holistic care experiences. All of them would like to recommend this program to other fellows. Through using incorporated program to teach doctor-patient relations, medical ethics, empathy and cross-cultural understanding about MH with library facilities as a driving force for having reflections with positive perceptions in order to induce participant self-aware and improve their capability of holistic care.

Take-home Messages: A program integrated library materials and expert's sharing as a mentor to educate MH not only can utilize the library resources, but also can enhance participant's experiencing learning and holistic healthcare cognition.

What is correlated to Hackathon Participants' Readiness to Cooperative Problem-solving?

AUTHOR(S):

- **Kung-Pei Tang, Taipei Medical University, Taiwan (Presenter)**
- Yi-Hsin Elsa Hsu, Biotech EMBA & School of Health Care Administration, Taipei Medical University, Taiwan
- Ya-Ting Yang, Center for General Education, Taipei Medical University, Taiwan
- Yi-Ting Lien, School of Medicine, College of Medicine, Taipei Medical University, Taiwan

ABSTRACT

Background: Hackathon is an activity to induce students from different health care professions to solve problems creatively together. However, not everyone is in readiness for interdependent problem-solving. We arranged two themed Hackathons at Taipei Medical University (TMU) to engage students to propose local health promotion projects, i.e., PSBH (Problem Solving for Better Health) Hackathon and AD (Assistive Devices) Hackathon. This study aims at investigating which factors are correlated to Hackathon participants' readiness to collaborative problem-solving, and to their preference for independent problem-solving as well.

Summary of Work: PSBH Hackathon was devoted to health promotion issues addressed by medical caregivers. Its member composition comprised only Hackathon newcomers (82 freshmen and sophomores in TMU), who were randomly allocated into 19 teams. Participants of AD Hackathon were 74 students including 44 undergraduates, 4 junior college students, and 26 graduate students nationwide. They build their own team and delivered 21 prototypes of assistive devices as outcomes of this hackathon. The 5 items Independent Problem-Solving Scale (IPSS) and the Positive Social Interdependence Readiness Scale (PSIRS) were employed to investigate 156 hackathon participants' collaborative readiness at the end of their teamwork. PSIRS comprises three factors: 1. appreciation of cooperative learning (ACL), 2. positive interdependent mindset (PIM), 3. collective efficacy (CE). An independent-samples t-test was conducted to compare participants' IPSS and PSIRS scores in PSBH Hackathon and in AD Hackathon.

Summary of Results: There was a significant difference in the IPSS scores for AD Hackathon ($M=18.78$, $SD=7.618$) and PSBH Hackathon ($M=12.27$, $SD=5.271$) with $p < 0.01$. Another significant difference is found in the positive interdependent mindset scores for Assistive Device Hackathon ($M=60.51$, $SD=6.055$) and PSBH Hackathon ($M=62.27$, $SD=5.216$) with $p < 0.05$.

Discussion and Conclusions: Comparing to the experienced "hackers", participants in the whole newcomer Hackathon had a significantly higher score in positive interdependent mindset but lower score in preference to independent Problem-Solving.

Take-home Messages: The Hackathon participants who chose team members by their own prefer not to ask other people to help them to solve problems.

Importance of Small-Group Tutoring for Improved Step 1 Performance

AUTHOR(S):

- Marcel Brus-Ramer, Tel Aviv University, Israel (Presenter)
- Kenneth Rubin, Elite Medical Prep, USA
- Nina Kagan, Tel Aviv University, Israel

ABSTRACT

Background: Preparing graduating students for Step 1 of the USMLE is an area of increasing interest for medical schools. A significant concern is the percentage of students not taking Step 1 on time, passing with weak scores, or failing. We decided to research the effectiveness of small-group online tutoring by experienced, trained USMLE tutors.

Summary of Work: In 2017-18, Elite Medical Prep LLC (EMP, www.elitemedicalprep.com) created an integrated Step 1 program, taught at the Technion - Israel Institute of Technology. An optional small group component was offered so students could work online with an experienced USMLE tutor. These were 5 two-hour sessions over a 2-3 month period. Small group tutors employed a structured methodology based on 'Challenge Questions'. Of 25 students total in the class, 18 signed up for the optional group tutoring. Groups were comprised of 3 students each totaling 6 groups. The students contributed to 16% of the cost. The performance of the 18 students was compared against the previous years cohort.

Summary of Results: Results: Comparing the 2017-2018 small-group cohort with the 2016-2017 cohort, we found: • Significantly improved average test scores (+14 pts, t-test $p < 0.05$) • Marked improvement in on-time test taking of Step 1 (increased from 44% to 64% of students) • Increased number of strong (> 230) scores on Step 1 (increased from 5 to 10) • Additionally, 10 students who were at the failing mark on their pre-Step 1 comprehensive assessment test, passed Step 1 on time.

Discussion and Conclusions: Small-group online tutoring significantly improved Step 1 performance. Additional cohorts of small group tutoring for the USMLE are currently in progress. Further research should be considered to address the optimal duration and intensity of tutoring. Selection bias needs to be controlled.

Take-home Messages: Small-group online tutoring is not an option often not offered in medical schools, but it should be considered.

Re-imagining Small Group Learning and the Development of Soft Skills

AUTHOR(S):

- Gary Hamlin, Bond University, Australia (Presenter)
- Kirsty Forrest, Bond University, Australia
- Jo Bishop, Bond University, Australia
- Sharon Hall, Bond University, Australia
- Amy Bannatyne, Bond University, Australia

ABSTRACT

Background: Bond University Medical Program is an undergraduate program structured around 2 years of problem-based learning (PBL), then 1 year of case-based learning followed by 2 years of clinical immersion. Program review identified the need to focus on the development of soft skills, coaching and career development. In response, the program leadership group conceptualised soft skills as essential skills and commenced implementation of a curriculum stream called Small Group Learning (SGL), Essential Skills and Career Development.

Summary of Work: A curriculum model defining the three key student experience transition points as; an undergraduate university student (1st year), a medical student (2nd-3rd years), and a clinically placed medical student (4th-5th years) has been developed. Transition will be supported by a shift from PBL to focus on SGL, essential skill development, and a coaching/career development program. The presentation will describe the model, the implementation of the SGL program and outcomes from an action-learning project to support the first transition. The action-learning project guides students to identify interpersonal skill (essential skills) developmental needs and supports a small focused intervention in the continuous development of the students interpersonal skills in a small group environment. Student choice will be an important component of the project and the presentation will discuss student choice of the; i) small group context to explore their skill development, ii) skill/micro-skill or attribute chosen for their intervention, and iii) the method of observation for their intervention.

Summary of Results: A model of student transition and an action learning project to support development of soft skills have been implemented.

Discussion and Conclusions: There is a central relationship between the essential skills associated with successful transition to and through a medical program and the soft skills increasingly being reported as essential for employability and the future world of work. To better prepare students to meet these challenges medical curricula need to continue to evolve and align learning and continuous development with societal and workforce needs.

Take-home Messages: Constructive curriculum planning is needed to embed essential skill development to meet the changing requirements of our healthcare future graduates.

Study guide : A friendly tool to get familiar with Pediatric Oncology

AUTHOR(S):

- Pitchayanan Kuwatjanakul, Udonthani Medical School, Thailand (Presenter)

ABSTRACT

Background: Fifth year medical students in Udonthani Medical school have to rotate in pediatric oncologic ward which are difficult and complicated by its nature and characteristics of the patients. Moreover , they have to learn about holistic care, humanized health care and communication skills which are hardly to understand. To make them familiar and happy with this ward, we developed the “study guide” to be their guidance during this rotation. This study aimed to evaluate student satisfaction in this tool.

Summary of Work: From March 2017 to December 2019, fifth year medical students in Udonthani Medical school were assigned to learn from “study guide” which contained knowledge about the disease, chemotherapy , emergency management , guideline of treatment and general knowledge for counseling one week before rotating in pediatric oncologic ward, on the first day of rotation, students and teacher studied the guide and answered the question together. After the rotation, student satisfactions in the study guide were surveyed and their perceptions about pediatric oncologic ward were reflected.

Summary of Results: Forty two medical students from their 5th year were enrolled in this study. All students were satisfied with the study guide with 93%, 93%, 90%, 85% and 81% had most satisfaction in helping them to understand the treatment and complications of chemotherapy, helping them to learn about holistic care, humanized health care and communication skills, being useful during ward round, helping them to achieve oncologic knowledge and helping them to have confidence in initial treatment, respectively. Most students agreed that this tool made them familiar and happy with the rotation.

Discussion and Conclusions: The study guide is very useful for preparing students before attending the class especially in a complicated and difficult one. Not only a knowledge content, holistic care, humanized health care and communication skills which are more complicated can be included. Using this tool with understanding made it as a friend of the students to help them pass through the difficult lesson.

Take-home Messages: The study guide is a friendly tool to get familiar with Pediatric oncology which is difficult and complicated.

Role-play as a way to learn about host microbe interactions

AUTHOR(S):

- Elisabeth Hultgren Hornquist, Örebro University, Sweden (Presenter)

ABSTRACT

Background: The start of a new Medical School at Örebro University, Sweden in 2011 gave us unique possibilities to form a new integrated and outcome based curriculum with a PBL-based pedagogy. The curriculum consists of six themes representing organ systems and (patho)physiological processes. Each theme is repeated three times, enabling progression, with increasing depth and complexity. Theme Defense includes e.g. Immunology and Microbiology.

Summary of Work: One learning goal in the second cycle of Theme Defense is to understand host-microbe interactions. To help students achieve this we set up a seminar using role-play. All students were asked to collect knowledge about the invasion and evasion strategies, and host defense strategies for four different pathogens; Measles virus, Mycobacterium tuberculosis, Plasmodium falciparum (malaria), and Trichophyton spp (ring worm). Each seminar group consisted of about 30 students, and at the seminar they were openly drawn to represent either the invader or the host of one of the microbes, and to role-play, in groups of 3-4 students/microbe and invader/host. Each combat was allowed approximately 20 minutes, and the other students were encouraged to help either side.

Summary of Results: A written anonymous survey was performed the second semester we ran the seminars, and 52/55 students participated. Although 75% felt information was given in enough time prior to the seminar, 67% wished for more detailed information. 75% felt the seminar increased the understanding of the concept of host-microbe interactions. Only 20% would have preferred to have this as a PBL scenario, but 46% would have preferred a lecture. 56% of the students were positive to using a joint digital tool (e.g. Padlet) to share their preparatory efforts with the rest of the class.

Discussion and Conclusions: Host-microbe interactions is a learning goal well suited for this type of seminar, with two sides combatting. Engaging the students' feelings by "gaming" in the form of interactive, prestigeless role-play was appreciated by many students and they felt this made them think more deeply.

Take-home Messages: Role-play is an attractive way to learn about host microbe interactions. Students found the seminar nice, novel and thought-provoking. Improved information about the form of the seminar early in the course is needed.

Constructive alignment with peer role play to improve learning on Aged Care for students and residents

AUTHOR(S):

- En Ye Ong, Eastern Health, Australia (Presenter)

ABSTRACT

Background: Aged Care education is increasingly important with the ageing population often with geriatric complications, however, learning about aged care can be difficult and limited. Simulation-based education (SBE) such as role play is increasingly employed to train skills without patient contact, which is increasingly important due to reducing opportunities - with evidence that SBE improves educational outcomes. Myths that learners hate it and the lack of resources/time have limited the adoption of SBE, however, peer-based role play may be acceptable and reduce resource requirements without being inferior in achieving specific aims especially with constructive alignment.

Summary of Work: Review the literature on peer role play in teaching Geriatric Medicine and explore if constructively aligned peer role play is helpful in improving learning. A brief literature review (PubMed and ERIC) of the use of medical peer role play and role play in Aged Care education to determine the acceptability, rationale and to inform the design of a peer role play teaching activity.

Summary of Results: There is also no literature on peer role play in Aged Care education. Studies evaluating peer role play in other disciplines note good learner perceptions, increased confidence and engagement. Studies evaluating role play in Geriatrics also report good learner perceptions, increased confidence, engagement and improved knowledge and skills. Role play covering crucial geriatric skills aligns with Aged care learning outcomes and assessment; Role play structured similarly to planned Objective Structure Clinical Examinations (OSCEs) or MiniCEX/Workplace Based Assessment will align with assessment tasks - such constructive alignment improves student engagement and learning outcomes.

Discussion and Conclusions: Learners have been shown to often approve of peer role play (especially if relevant to assessment/constructively aligned). Several examples for implementation are described. Feasibility (resources and time) continue to be a challenge possibly ameliorated by registrar (near-peer) engagement and possibly peer engagement in being the “examiner” with detailed marking rubrics. If this becomes a learners common practice, self-directed learning and self-regulation could be promoted.

Take-home Messages: Peer role play teaching can be a useful tool in improving learning particularly for improving confidence and use of basic skills, especially with limited patient access. Further evaluation is likely to be fruitful.

Student Role Play: A Triad of Learning

AUTHOR(S):

- Thomas Baker, University Hospital Coventry and Warwickshire, UK (Presenter)
- Dhanya Pillai, University Hospital Coventry and Warwickshire, UK
- Arwa Meki, University Hospitals Coventry and Warwickshire, UK
- Alexandra Tebbett, University Hospitals Coventry and Warwickshire, UK
- Amanda O'Keefe, University Hospitals Coventry and Warwickshire, UK
- Nanditha Sathyanarayana, University Hospitals Coventry and Warwickshire, UK

ABSTRACT

Background: Role play is a strategy that can increase student engagement and promote active learning (Van Ments 1999). It can be used to consolidate student knowledge and understanding (Joyner 2006). Furthermore, it provides a safe learning environment and can aid with the transition from theory to clinical practice (Joyner 2006).

Summary of Work: Role play was introduced into the A-E assessment teaching session within the 'Acute Block' rotation for final year medical students. The students were provided with 3 cases and rotated through the roles of 'student doctor', 'examiner' and 'patient'. The 'student doctor' was required to perform an A-E assessment. The examiner was provided with an A-E 'checklist' with prompts for observations and examination findings. The 'examiner' and 'patient' were instructed to provide peer feedback on the 'student doctor' performance. The aim of this project was to explore the student's perception and perceived benefit of each role. A questionnaire instructed the students to rank with justification the roles with respect to their impact on their learning and clinical development.

Summary of Results: The majority (72%) of students ranked 'student doctor' as the most beneficial. Citing reasons such as 'good test of knowledge' and 'able to practice'. The students (77%) ranked 'examiner' as the second most beneficial. Citing reasons such as being 'able to read the full A-E assessment list'. Although the majority (95%) of students reported the role of patient as the least beneficial, some students did find positives within this role. Stating it was useful 'listening to my peers go through the process'. Students also reported that role play 'reinforced learning' and maintained engagement.

Discussion and Conclusions: Although the majority of students reported the role of 'student doctor' as the most beneficial, they did highlight positives within the other roles. The additional roles provided the students with a different perspective of the A-E assessment and allowed for peer feedback, which in turn can promote critical reflection (Liu 2006).

Take-home Messages: Role play can be used in combination with lectures to enhance learning experience and maintain student engagement. The various roles within the role play scenarios can provide different and unique learning opportunities for the students.

Human Library: An opportunity to facilitate cultural competence development for occupational therapy students

AUTHOR(S):

- Kirsty Pope, Monash University, Australia (Presenter)
- Mang Yee Eli Chu, Monash University, Australia

ABSTRACT

Background: The Australian Occupational Therapy Competence Standards (2018) state that an occupational therapist ‘practises in a culturally responsive and culturally safe manner, with particular respect to culturally diverse client groups’. According to Wells (2000) there are 5 stages to the development of this competence. The original Human Library project started in 2000 in Copenhagen aimed to provide a positive framework for conversations, which challenge stereotypes and prejudices and therefore, build positive relationships between people.

Summary of Work: Over 300 occupational therapy students on both the undergraduate and graduate entry Masters programs at Monash University participated in a Human Library to address stages 2, 3 & 4 of cultural competence development. Students completed pre-session activities including an online cultural competency module, readings relating to the importance of cultural competence for occupational therapists and a reflective worksheet asking them to rate their knowledge of their own culture and confidence at talking to someone with a different cultural background to their own. Students then attended the Human Library where real people (books) are on ‘loan’ to readers who are encouraged to explore and challenge stereotypes and prejudices.

Summary of Results: The majority of the students and ‘books’ reported the Human Library to be a positive experience, with students noting it deepened their learning about prejudice, stigma or discrimination and ‘books’ enjoying the opportunity to share their story.

Discussion and Conclusions: Previous curriculum content addressed student knowledge and, to a certain extent, awareness of cultural competencies but the experiential Human Library took this one stage further to the development of cultural sensitivity (stage 4).

Take-home Messages: Gaining cultural knowledge (stage 2) is not enough for graduates to develop cultural competency. An experiential session such as the Human Library provides the opportunity for students to put knowledge into practice, develop cultural awareness (stage 3) and sensitivity (stage 4) and therefore cultural competence (stage 5).

Opportunities of Interprofessional Training in Undergraduate Health Courses: the students' point of view

AUTHOR(S):

- Ana Carolina Bonetti Alves, Ribeirao Preto Medical School, Brasil (Presenter)
- Maria Paula Panúncio-Pinto, Ribeirao Preto Medical School, Brasil
- Marcos Borges, Ribeirao Preto Medical School, Brasil

ABSTRACT

Background: The need to expand teaching scenarios for the training of health professionals is recognized from international movements that have problematized the concept of health, its determinants and the best way to achieve it. Thus, interprofessional education and practice are highlighted as emerging issues in the field of health, with studies conducted at the global level.

Summary of Work: In order to identify the students point of view on the interprofessional education opportunities offered in undergraduate courses in Physical Therapy and Occupational Therapy, 30 participants were approached through an in-depth interview, recorded in audio, transcribed in full and analyzed in their content.

Summary of Results: Thematic content analysis allowed the identification of four main categories: (1) the lack of knowledge of professional roles among RPMS undergraduate courses; (2) limitations of professional training in health; (3) the patient as the focus of work and interprofessional practice and (4) primary care as a privileged scenario for interprofessional practices.

Discussion and Conclusions: The results point to the lack of knowledge among the students about the other professions that could act together reinforcing the hierarchy between Medicine and the other health professions. In addition, students report that their few interprofessional experiences occurred in the context of primary care, which reiterates the importance of teaching scenarios in the community. Students also consider that interprofessional education is fundamental and reflects on the quality of patient care.

Take-home Messages: Interprofessional education occurs when two or more professions learn about others, and with each other for effective collaboration and improvement of health outcomes. Teaching students how to learn and think in a interprofessional way is a necessary experience in health professionals' training and expanding interprofessional education opportunities is urgent.

An Interprofessional Education Intervention for First-Year Medical and Nursing Students: Changes in attitudes toward interprofessional learning

AUTHOR(S):

- Sang Hui Chu, Yonsei University College of Nursing, South Korea (Presenter)
- ChangMoo Kang, Yonsei University College of Medicine, South Korea
- Hayoung Park, Yonsei University College of Nursing, South Korea
- Soyoon Park, Yonsei University College of Nursing, South Korea

ABSTRACT

Background: Interprofessional collaboration (IPC) is a key to deliver qualified healthcare and to enhance patient safety. Interprofessional education (IPE) based on mutual learning and collaborative communication is need to be integrated in a stepwise, systematic manner in undergraduate health profession education curriculum. First-year IPE, the starting point of a multi-year professional development, can give a critical opportunity for building the foundation of IPC.

Summary of Work: A prospective controlled trial was piloted to evaluate effects of an IPE intervention, which consisted of two sessions including games, lectures, and team activities, focused on attitude on interprofessional learning, professional identity (role and responsibility), and collaborative communication for first-year undergraduate medical and nursing students during 2018 fall semester. The scores of modified Readiness of health care students for Interprofessional Learning Scale (RIPLS) and those of professional identity were evaluated. Following each session, students of the IPE intervention group completed an open-ended survey. Communication skill and attitude were also measured at the end of the semester. A total of 87 responses (control group: n=59, IPE intervention group: n=28) were analyzed.

Summary of Results: The IPE intervention group, consist of 13 nursing and 15 medical students, showed significantly higher attitude of interprofessional learning at the end of the semester ($p=.014$). However, professional identity and communication skill and attitude were not significantly improved compared with those of the control group.

Discussion and Conclusions: This study adds to the emerging body of evidence for IPE effects on health professional education and provides important data on first-year medical and nursing students readiness for interprofessional learning from a Korean perspective.

Take-home Messages: Two sessions of IPE intervention met its primary aim and supported the need to start IPE early, from first-year, before professional dogmas have been established. These results will demand further efforts to integrate IPE in medical and nursing curriculum so that the intervention developed in this study can evolve as a continual interprofessional learning practice.

Integrated Interprofessional Collaborative Healthcare to Postgraduate Learning: Experience from Medical Intensive Care Setting

AUTHOR(S):

- Pornanan Domthong, Khon Kaen Hospital, Khon Kaen, Thailand (Presenter)

ABSTRACT

Background: Effective and high-quality patient care in ICU is a complex activity. Interprofessional education (IPE) offers a possible way to improve healthcare in various medical settings. Integrated interprofessional collaboration to service round and postgraduate learning are challenging. However, some previous studies about IPE shown heterogeneity outcomes and studies in ICU were limited. The aim of this study was to compare effectiveness of IPE interventions to routine education interventions.

Summary of Work: Medical ICU clerkship comprised 4-month for IPE group and 8-month for control group in each academic year. All residents were trained for both groups. The residents' knowledge was evaluated using MCQs and SAQs examination at the end of month. Teamwork satisfaction (3 intensivist staff, 16 ICU nurses and one clinical pharmacist) and medical errors were collected using visual analog score questionnaire, risk report system, and medical records review.

Summary of Results: The data was collected from 21 internal medicine residents from June, 2016 to December, 2018. The average posttest score is not significantly increased in IPE group (0.5 from 20). Analysis of the teamwork satisfaction score in IPE group was 9.53 from 10 scores, and 7.23 in control group. The preventable medical errors decreases from 8.6 to 5.3 events per month in control and IPE groups, respectively.

Discussion and Conclusions: Interprofessional care team in ICU enhanced postgraduate learning in term of increased satisfaction level of ICU teamwork, especially in ICU nurses. Moreover, IPE decreased medical errors due to preventable causes.

Take-home Messages: From interprofessional collaboration to IPE leading to a successful ICU practice included postgraduate students to understand their own professional identity while gaining understand of other professional's roles on the healthcare system.

Tumor Board Shadowing: A Unique Opportunity for Medical Students to Learn Effective Collaboration Through Multidisciplinary Cancer Care

AUTHOR(S):

- **Milani Sivapragasam, McGill University Health Centre, Canada (Presenter)**
- James M. G. Tsui, McGill University, Canada
- Nicholas K.S. Grewal, University of Chicago, USA
- Daniel W. Golden, University of Chicago, USA
- Joanne Alfieri, McGill University, Canada
- Malcolm D. Mattes, West Virginia University, USA

ABSTRACT

Background: Teamwork and collaboration is an important required competency for medical education. Most learning experiences, however, do not capitalize on existing collaborative processes among physicians for experiential learning of the multidisciplinary aspects of patient care.

Summary of Work: We evaluated a novel tumor board shadowing experience at three medical schools in the USA and Canada. A total of 323 first and second year medical students participated, of which 77.4% completed a follow-up survey assessing the effectiveness of the program as a learning tool.

Summary of Results: Compared to traditional clinical shadowing, students were more likely to believe that tumor board shadowing provided a similar or better experience in terms of educational content (85%), exposure to a new field (96%), and the overall experience (89%). Forty-eight percent of students perceived a greater amount of multidisciplinary collaboration in oncologic care than they previously thought. A total of 48% of students felt more competent interacting with oncologists after participating, whereas 21% felt more competent interacting with cancer patients. Students' perception of increased competence was correlated with the amount of time spent with their assigned physician mentor ($p < 0.01$). Second year medical students also had a more favorable overall experience than the first year medical students did ($p = 0.04$).

Discussion and Conclusions: Our results demonstrate the feasibility of multi-institutional implementation of this learning experience and illustrate ways to optimize the effectiveness of the experience for students. Multidisciplinary tumor boards can be effectively used as a unique immersive learning opportunity, which can be feasibly implemented to improve knowledge of clinical oncology and multidisciplinary care in medical schools, and expose students to physicians in smaller fields like radiation oncology.

Take-home Messages: Tumor boards provides medical students with a fundamental understanding of the multidisciplinary nature of cancer care, while serving as an example of effective collaboration in clinical practice.

Community Emergency Medicine (CEM): Multiprofessional education to encourage learning experience, four years of implementation

AUTHOR(S):

- Sirote Srimahadthai, Medical Education Center, Ratchaburi Hospital, Thailand (Presenter)
- Anon Sathapornsathid, Ratchaburi Medical Education Center, Thailand
- Athip Sangrungruang, Ratchaburi Medical Education Center, Thailand

ABSTRACT

Background: Community Emergency Medicine (CEM) is a half-day program of learning emergency medicine at Ratchaburi hospital. The program is conducted every 3 weeks. The CEM team comprises doctors, nurses, pharmacist, radiology technician and medical students. Medical students are encouraged by care team to be versatile in multiprofessional education, interprofessional relationship and psychomotor skill. Aim of this study is evaluating psychomotor skill, attitude and interprofessional relationship in CEM.

Summary of Work: Medical students take part in emergency care team in CEM. History taking and physical examination and skill enhancement are evaluated at workplaces by the facilitator. Likert scale is used to determine attitude and interprofessional relationship to CEM. Reliability test of the scale is done. Cronbach's alpha is 0.848. Duration of working in community hospital will asked after CEM program.

Summary of Results: From 2016 to 2019, 131 sixth year medical students were enrolled. All student passed workplace evaluation in good level. Mean score was 7.51(SD=1.56). After and before CEM, mean attitude was 7.38 (SD=1.47) vs 6.15 (SD= 1.77) p value < 0.001. Interprofessional relationship was increase significantly 6.66 (SD=1.83) vs 7.84 (SD=1.67) p value <0.001. Duration of working at community hospital was increased 2.96 years (SD= 1.82) to 3.15 years (SD= 1.59) p value < 0.001.

Discussion and Conclusions: Both Multiprofessional education and good interprofessional relationship enhance learning climate in CEM. Effective resource and communication promote psychomotor skill development. From that reason, medical students are encouraged to work for longer periods in community hospitals when they are doctors. In conclusion, CEM is novel program in emergency medicine learning. CEM enhance psychomotor and attitude domain.

Take-home Messages: CEM is multiprofessional learning emergency medicine at community hospital and it encourage learning experience.

Call the On Call: Authentic team training and communication at the Inter-Professional Training Ward

AUTHOR(S):

- Lana Zelic, Karolinska Institutet, Sweden (Presenter)
- Josefine Ivarson, Karolinska Institutet, Sweden
- Eva Samnegård, Karolinska Institutet, Sweden
- Klara Bolander Laksov, Stockholm University, Sweden
- Anders Sondén, Karolinska Institutet, Sweden

ABSTRACT

Background: Inter-Professional Training Wards (IPTW) are designed to train students' team and communication competences. To promote team building students are retained in stable teams at the wards. However, this is not an authentic setting since especially doctors are nomads with concurrent working duties i.e. at the operating theatre. Thus, there is an unmet need to prepare students for the complexity of communication, and the change in professional responsibilities, when team members are not at hand. The aim with our work was to create a learning activity that prepares students for authentic teamwork and ensures training in inter-professional telephone communication. Furthermore, to explore how the learning activity affected team training at the IPTW.

Summary of Work: An inter-professional faculty developed the learning activity "Call the On Call" for the IPTW at Södersjukhuset, Sweden. An authentic need for telephone communication was created by separating the IPTW team from the medical student, who instead followed a physician according to the on-call organisation. A telephone exercise using SBAR, regarding a real, or a simulated scenario, linked to a real patient at the ward, was performed. Student and supervisor perspectives on the learning activity, and its effects on the IPTW teamwork, were explored through surveys, reflection seminars, focus interviews and field observations.

Summary of Results: Students (n=198) perceived that the learning activity developed their professional and inter-professional knowledge and skills. The activity did so by exposing students to new concrete situations, which they could reflect upon and share with each other. Concerns that the team collaboration would suffer from splitting the team were not met. Instead students and supervisors reported that the learning activity developed the student team by giving them an authentic task to solve where the different competencies were needed. Students found trust in the team although they were in different premises. Authenticity was highlighted as the strength of the exercise.

Discussion and Conclusions: In contrast to previous literature we show that constant physical proximity is not a requisite for effective team collaboration at the IPTW. Splitting the IPTW-team to different premises can in fact enhance interprofessional learning.

Take-home Messages: Inter-professional student teams need to be exposed to the complexities of authentic teamwork.

In Situ Simulation Training as a Tool for Interprofessional Education in Pediatric Emergency

AUTHOR(S):

- Wanna Ardonk, Buddhachinaraj Medical Center, Thailand (Presenter)
- Thumnop Tunnitupawong, Buddhachinaraj Medical Center, Thailand
- Nipaporn Hanpitakpong, Buddhachinaraj Medical Center, Thailand
- Kusuma Syananondh, Buddhachinaraj Medical Center, Thailand

ABSTRACT

Background: Pediatric emergency demands skills precision and team efforts to provide patient safety. It is vital that healthcare providers from various discipline work together to achieve the best results within a safe and professional environment. Our study sought to identify and evaluate the resident physicians' knowledge gaps, system competence, and latent safety threats (LSTs) that may become susceptible to medical errors through diverse in situ simulation scenarios.

Summary of Work: Unannounced in situ simulations were conducted using emergency scenarios involving clinical deterioration to cardiopulmonary arrest in the pediatric ward of Buddhachinaraj hospital between October and November 2018. Multidisciplinary teams including nurses and resident doctors responded to various simulations on alternating shifts. Each simulation was limited to 30 minutes with the additional 60 minutes for debriefing. The primary outcome was to ascertain the number and types of LSTs from the simulations. Secondary outcomes, obtained from 5-score Likert questionnaires, collected participants' assessment of task value, impact on patient care, and simulation practicality.

Summary of Results: Thirty-four healthcare providers (22 nurses and 12 residents) participated in 5 in situ simulations within 8 weeks. A total of 14 LSTs were identified (2.8 threats per one simulation). Safety threats were categorised as medication, equipment, and resource/system where knowledge gaps occurred most frequently while the threats from medication were least detected. Participants responded to the 5-score Likert questionnaires, which elicited 5 for task value, 2.18 for patient care disruption, and 4.32 for practicality. Written feedbacks were positive such that the simulation provided effective teamwork, improved patient evaluation in emergency situations, and developed emergency management knowledge and skills.

Discussion and Conclusions: LSTs such as malfunctioning equipment and role responsibility concerns became apparent from the scenarios. Thus, the practical aspect of in situ simulation can be used to improve safety from the identified knowledge gaps, and reinforce multidisciplinary collaboration when used as a part of an organisational safety programme.

Take-home Messages: Despite the quality of care improvement and being remarkably practical, in situ simulation may be limited by replacement costs, performance anxiety, and time constraints. Besides debriefing, preparing appropriate resources and simulation scenarios can mitigate some limitations.

Development of interprofessional learning objectives for the National Licensing Examination in Medicine, Pharmacy and Psychotherapy in Germany

AUTHOR(S):

- **Maryna Gornostayeva, The German National Institute for State Examination in Medicine, Pharmacy and Psychotherapie, Germany (Presenter)**
- André Mihaljevic, Department of General, Visceral and Transplant Surgery, University Hospital Heidelberg, Germany
- Susanne Weinbrenner, Department of Public Medicine and Rehabilitation, German Statutory Pension Insurance Scheme, Berlin, Germany
- Ulrich Scherer, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Germany
- Hildegard Spahn-Langguth, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Germany
- Jana Junger, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Germany

ABSTRACT

Background: Interprofessional collaboration and communication is of enormous importance for efficient and high-quality patient healthcare. International frameworks recommend to include interprofessional education (IPE) in training programs. IPE is already anchored in the medical licensing regulations in Germany. However, there are no specific interprofessional learning objectives, which define the frame of IPE in the medical education. The aim of this project was to develop specific interprofessional learning objectives according to the core competencies for interprofessional collaboration practice.

Summary of Work: The development of interprofessional learning objectives takes place as a part of a project supported by Robert Bosch Foundation (2016-2019) and is based on existing national and international references. An interprofessional expert-group of twenty persons representing different health care professionals, e.g. nurses, pharmacists, physiotherapists, psychotherapists, physicians and medical students, was founded in 2016. The expert-group resolved that concrete operationalizable learning objectives are required to coordinate IPE implementation and conception of interprofessional teaching units and assessments.

Summary of Results: Initially the expert groups identified crucial interprofessional job-related fields based on the evidence on interprofessional collaborative care, e.g. handover, treatment planning, case discussions, ward round, error disclosure, etc. Specific learning objectives have been formulated to these fields in four workshops. Then, in a multi-phase procedure, these learning objectives were evaluated and condensed. In the next phase the condensed learning objectives were assigned to the core competencies for interprofessional collaboration practice: values and ethics, roles and responsibilities, interprofessional communication, and teams and teamwork to represent the international standards for IPE.

Discussion and Conclusions: It is significant to develop interprofessional learning objectives together with representatives of different health care professionals. Therefore the interprofessional coordination of learning objectives can be saved.

Take-home Messages: Simultaneous implementation of interprofessional competencies in the national licensing examination in Medicine, Pharmacy and Psychotherapy support the strengthening and improvement of IPE in Germany.

Applying World Café to initiate the reform of Inter-professional practice(IPP) and holistic care(HC) curricula among all professions

AUTHOR(S):

- Pi-Yu Wu, National Defense Medical Center Tri-Service General Hospital, NDMCTSGH, Taiwan (Presenter)
- Li-Chen Lin, National Defense Medical Center Tri-Service General Hospital, NDMCTSGH, Taiwan
- Yaw-Wen Chang, National Defense Medical Center Tri-Service General Hospital, NDMCTSGH, Taiwan
- Cheng-Yi Cheng, National Defense Medical Center Tri-Service General Hospital, NDMCTSGH, Taiwan

ABSTRACT

Background: IPP enabled by inter-professional education(IPE) could be the practice foundation for delivering team-based holistic care. World Café is useful to engage broad perspectives and gain collective wisdom. To build a better environment for UGYs and PGYs to learn about IPP and HC, we designed a workshop, styled as a World Café to facilitate each profession to reform their curricula by learning about, with and from other professions.

Summary of Work: Twenty-five faculty members from 14 professions attended this workshop. Following the World Café principals, the participants discussed the obstacles, visions and action plans of IPP and HC in 3 rounds. The posters and the videos of the final presentations were transformed into transcripts. The main themes and keywords of those discussions were analyzed and presented in the form of a mind map and word cloud. We also use questionnaires to collect the feedback for this workshop.

Summary of Results: Several obstacles were identified: insufficient training of faculties, lack of technology assisting IPP and IPE, low participation of some professions. The proposed solutions are: building an IPP care platform, applying social media to engage all professions, providing clinical faculties and students learning protection time, direct-delivery of IPP template writing curriculum. 16 participants filled the post-workshop questionnaire. The overall satisfaction rate of this workshop is 93.75%. Over 90% of participants thought this workshop is helpful to improve the IPP and HC curricula and care.

Discussion and Conclusions: World Café method is helpful to engage all professions in leading collaborative dialogue and creating possibilities for actions. The conclusion of this workshop revealed that applying technologies, engaging faculties, providing learning protection time and giving each profession the right to initiate IPP are important elements to the reform of IPP and HC curriculums among all professions.

Take-home Messages: World Café with the nature of initiating open discussions can be used to engage all professions and realize the spirit of IPP to initiate the redesign of clinical curricula, especially for IPP and HC.

Interprofessional Education

AUTHOR(S):

- **Albena Gayef, Trakya University Faculty of Medicine, Department of Medical Education, Edirne, Turkey (Presenter)**

ABSTRACT

Background: Common sense developments in health and social care policy have positioned interprofessional practice at the heart of contemporary health and welfare systems. In this context, interprofessional education has become an important issue (Cooper et al., 2005). Interprofessional education is defined as “Those occasions when members (or students) of two or more professions learn with, from and about one another to improve collaboration and the quality of care” (Hammick et al., 2007).

Summary of Work: This study is aimed to review of the literature to understand context and underlying mechanisms related to successful and unsuccessful interprofessional education programs for medical and healthcare trainees. In this review, a detailed literature review was done in Medline and Google Scholar (1998 to 2018) with education, interprofessional education and collaboration keywords.

Summary of Results: The review included trainees from various disciplines including medicine, nursing, rehabilitation sciences, social work and psychology. The analysis made for a better understanding of the successes and failures of interprofessional education learning situations. A clear learning context, goals of the interprofessional education, roles and expectations of the participants, multidisciplinary representation of the participants, collaborative skills and teamwork were searched.

Discussion and Conclusions: This study emphasizes the need to carefully plan interprofessional education programs. In conclusion, medical and health sciences programs will be able to develop better workshops allowing for more effective interprofessional education programs. Due to the importance of teamwork we must teach our students how to collaborate.

Take-home Messages: This study emphasizes the need to carefully plan interprofessional education programs.

Presage, Process and Product: Analysis of an Interprofessional Education Intervention

AUTHOR(S):

- **Marcio Gomes, University of Ottawa/Royal College of Physicians and Surgeons of Canada, Canada (Presenter)**
- Carolina Souza, The Ottawa Hospital, Canada
- Chantal Bornais, The Ottawa Hospital, Canada
- Denyse Richardson, University of Toronto, Canada
- Stephanie Sutherland, The Ottawa Hospital, Canada

ABSTRACT

Background: The 3-P model has been proposed as a good model for analysing IPE learning activities. It uses narrative descriptions of presage, process and product factors, and considers the complex and dynamic relationships between the different factors.

Summary of Work: The Ottawa Hospital (TOH) is a referral centre that provides centralized thoracic cancer care for 1.3 million population of Eastern Ontario, Canada. TOH thoracic cancer healthcare professionals participate in weekly Multidisciplinary Cancer Conferences (MCCs), which is the reification of this community of practice. The TOH Thoracic Oncology Interprofessional Retreat (Retreat) is a formal, full day, biennial CPD activity designed in 2012 with the goal of improving the collaborative practice of the MCC. Data from files of the 3 Retreats were analysed and semi-structured interviews were conducted with participants.

Summary of Results: **Presage:** The driver for interprofessional education was a need identified by members of the community of practice. The number of participants varied from 64 to 88, 70-80% post-qualification, including 4 professions and 10 medical specialties. The main learning theory underpinning the design was situated learning theory and teachers were members of the team with no training in interprofessional facilitation. **Process:** Participation was voluntary. Programme developers followed a systems approach to curriculum design. The IPE was secondary to the practice development needs, which were identified by observation and performance data. Behavioural learning objectives were developed to progressively achieve higher educational levels. Instructional methods and room setup were designed to create a simulated MCC experience. **Product:** Over 80% of the team attended the Retreats, with proportional representation of professions and disciplines. Five-point satisfaction surveys had an average score of 4.3-4.9. Most important aspects for overall effectiveness were: interprofessional approach, multiprofessional faculty, interactivity, collegial atmosphere, educational design, relevance and impact on practice. There were self-reported changes in attitudes, behaviours, organizational practice and patient benefits.

Discussion and Conclusions: This case study evaluated a successful IPE intervention using an evidence-informed model and identified factors associated with IPE effectiveness. It used a simulated community of practice experience to provide authenticity, which is an innovation in curriculum design for CPD activities.

Take-home Messages: The 3-P model is an easy-to-apply and effective framework for describing and analysing IPE initiatives.

An interprofessional approach to enhance safety and teamwork in the operating room: the STOR course

AUTHOR(S):

- **Malcolm Han Wen Mak, Tan Tock Seng Hospital, Singapore (Presenter)**
- See Yin Liew, Tan Tock Seng Hospital, Singapore
- Zean Jia Hui Ng, Tan Tock Seng Hospital, Singapore
- Sarah Qinghui Lu, Tan Tock Seng Hospital, Singapore
- Kaushal Amit Sanghvi, Tan Tock Seng Hospital, Singapore
- Terence Cheong Wei Huey, Tan Tock Seng Hospital, Singapore

ABSTRACT

Background: Human errors can easily occur in the operating room (OR) from poor teamwork and miscommunication. In surgical training, emphasis is often placed on technical ability and expertise. Non-technical skills e.g. teamwork, communication and crisis management are important components to minimize human error and improve patient safety, but not often formally taught in surgical residency programs. We designed a 4-hour Safety and Teamwork in the OR (STOR) course to address this.

Summary of Work: The course, led by faculty and senior residents, comprised two parts: lectures and teamworking exercises, followed by simulated scenarios. Participants worked in teams comprising residents from surgical disciplines and anaesthesia, as well as OR nurses. Four months post-course, data was collected through anonymized survey to determine course effectiveness, relevance to practice and obtain course feedback.

Summary of Results: We had 56 participants over 2 years, comprising 32 residents and 24 nurses. 29 (51.8%) responded to the post-course survey. The simulated scenarios was rated the most effective component, with 28 (96.6%) rating it effective. All participants (100%) found the course effective in improving communication in the OR. 28 (96.6%) and 27 (93.1%) reported effectiveness in improving interprofessional collaboration and teamwork respectively. Eleven (37.9%) responded that they applied more than 80% of what they learnt in the course, with 15 (51.7%) between 50-79%. In qualitative questions, teamwork and interprofessional provision of care was the most common response theme to examples of when knowledge gained from the course was applied. For course improvement, most participants suggested more simulated scenarios.

Discussion and Conclusions: Interprofessional teamwork and safety in the OR can be developed even with a short 4-hour course. The situated learning approach enhances learning and most participants found it effective and requested more. While almost all participants found the course effective in improving teamwork, communication and interprofessional collaboration, more can be done to improve course applicability.

Take-home Messages: Safety and teamwork in the OR is often difficult to impart and sometimes taken for granted. It involves both systemic and cultural issues. We believe a short 4-hour course can contribute towards a collaborative and safe environment in the OR.

Communication skills development: an interprofessional approach to patient management and handover

AUTHOR(S):

- Heidi Penrose, Mid-Wessex GP Education, UK (Presenter)
- Chris Beng, South Central Ambulance Service NHS Foundation Trust, UK
- Samantha Scallan, GP Education Unit, UK

ABSTRACT

Background: Interprofessional education (IPE) can be a powerful way for clinicians to learn with, from and about each other, and support the development of professional insights and knowledge. It can be particularly useful for clinicians working in the same care context, to better understand their overlapping perspectives on patient management and care. Previous research has indicated that areas such as communication skills, the patient pathway and risk assessment can benefit from an IPE approach. An interprofessional communication educational day was designed to bring nursing staff, paramedics and GPs together. The aim of the event was to enable participants to develop skills in inter-professional communication and handover using a range of educational activities. The day was facilitated by a GP and Emergency Medicine doctor.

Summary of Work: Eleven clinicians (6 paramedics, 4 nurses and 1 GP) attended. The day began with a focus on communication in the healthcare setting, specifically the importance of accurate and clear communication, and a discussion of difficult conversations. Next a structured approach to handover was presented, and in the afternoon the group worked through four simulation scenarios with actors to put into practice the approaches and strategies discussed earlier. Participants completed pre-session information sheets about their experience and expectations and a post-session evaluation of the day.

Summary of Results: Participants valued the day and reported improved confidence in managing handover and to undertake difficult conversations. The day was enjoyable and engaging, and the interprofessional approach was seen as enhancing this, particularly in terms of appreciating different clinical perspectives on care.

Discussion and Conclusions: The event helped participants to better understand each other's roles in managing patient care, to learn some new tools and to consolidate learning through simulation.

Take-home Messages: The educational day demonstrated that shared learning can be powerful and generate insights for clinicians. Participants also made suggestions as to how the event might be developed for the future.

Supervisors' pedagogies for supporting interns to learn intra- and interprofessional collaboration: a qualitative and quantitative ego network analysis

AUTHOR(S):

- **Mirte van den Broek, University Medical Center Utrecht, The Netherlands (Presenter)**
- Esther de Groot, University Medical Center Utrecht, The Netherlands
- Janneke Fokkens, University Medical Center Utrecht, The Netherlands
- Janneke Witte, University Medical Center Utrecht, The Netherlands
- Roger Damoiseaux, University Medical Center Utrecht, The Netherlands
- Dorien Zwart, University Medical Center Utrecht, The Netherlands

ABSTRACT

Background: Interprofessional collaboration is an essential competence for medical students to develop in order to prepare them for their future practice. Students have the opportunity to learn from interactions in the professional networks of their supervisors during their clerkships. This study aims to understand inter- and intraprofessional networks of generalists and specialists, and in what manner supervisors involve interns in their professional network to learn interprofessional collaboration.

Summary of Work: Semi-structured interviews were held with ten general practitioners (GPs) and ten ear, nose, and throat (ENT) specialists. An egocentric social network approach was used to collect and analyse qualitative data as well as quantitative data.

Summary of Results: GPs had significantly more interprofessional contacts than ENT specialists ($p < 0.001$), with no significant difference in the network sizes of both disciplines ($p = 0.05$). Two-way ANOVA showed a significant interaction effect between profession and type of collaboration ($p < 0.01$). All supervisors involve interns actively, discussing how collaboration with other professionals evolved, and more passively, assuming that an intern will learn from observation mainly. Many supervisors consider the interns' initiative essential in deciding to involve an intern in their network.

Discussion and Conclusions: Although the workplace of GPs differ notably from hospital settings where ENT specialists work, the network sizes of both are comparable. Internships at the general practice seem to provide more opportunities to learn interprofessional collaboration. Supervisors could involve interns more actively in their intra- and interprofessional network while interns could take more initiative to learn collaboration from their supervisors' network. This study contributes to the understanding of the window of opportunity for interns to learn interprofessional collaboration at the workplace.

Take-home Messages: The findings of this study suggest an important role for the general practice as learning environment for students to learn interprofessional collaboration. To materialise these opportunities, supervisors should involve interns in a more active manner in their own intra- and interprofessional interactions.

An analysis of sign-based teaching for clinical final examinations

AUTHOR(S):

- Jasper Vink, Guy's and St Thomas' NHS Foundation Trust, UK (Presenter)
- Thomas MacKinnon, St George's University Hospitals NHS Foundation Trust, UK
- Daniel Tuite, Chelsea and Westminster Hospital NHS Foundation Trust, UK
- Thomas Handley, Chelsea and Westminster Hospital NHS Foundation Trust, UK
- Javier Ash, Croydon Health Services NHS Trust, UK
- Norbert Banhid, Royal Free London NHS Foundation Trust, UK

ABSTRACT

Background: With rising tuition fees and increasing pressures in the postgraduate workplace, outcome-based education is gaining favour among medical schools wishing to attract students and train doctors equipped for the challenges of the modern NHS. Outcomes including practical skills and medical acumen have been identified as lacking, thus medical curricula reforms are balancing increased patient contact and learning in the hospital environment alongside theory-based lecturing. Traditionally, medical education centres around pathological processes and their clinical presentation (disease-based teaching), whilst in practice and exams, doctors encounter signs of diseases for which a wide list of differentials exists. We hypothesise that teaching focused on clinical presentation and symptomatology, with subsequent extrapolation to relevant pathology (sign-based teaching), is clinically more effective at preparing students both for final examinations and entering medical practice.

Summary of Work: A one-day course was organised, aiming to prepare final year medical students for clinical examinations. Junior doctors presented sessions covering core topics for medical and surgical examinations deemed most relevant to UK medical school finals. All attendees were asked to complete questionnaires before and after completing the course, evaluating preparedness and confidence levels for upcoming examinations.

Summary of Results: 126 students submitted all required questionnaires. Overall preparedness was assessed on a 10-point Likert scale, and increased from 4.78 pre-course to 6.54 post-course ($p < 0.0001$). Preparedness for medical and surgical exams was assessed on a 4-point Likert scale, both of which increased significantly ($p < 0.0001$). >95% of attendees rated our sign-based teaching model to be clearer, preferable and more relevant than traditional teaching methods.

Discussion and Conclusions: Students gained confidence in using strategies to approach commonly tested areas likely to be tested in finals examinations, and felt overall more confident at extrapolating clinical signs to diagnose conditions and develop management plans in an exam setting. Further research should aim to quantify the benefits of sign-based teaching in clinical examinations, and categorise what techniques are successful in preparing students at different stages of medical education.

Take-home Messages: Teaching based on clinical signs appears to be preferred over traditional medical school methods based on pathology.

The quality of written feedback in mini-Clinical Evaluation Exercise (mini-CEX) in foundation doctor's e-Portfolios

AUTHOR(S):

- David Faluyi, Royal Liverpool Hospital, UK (Presenter)
- Beth Shelvey, Royal Liverpool Hospital, UK
- Usman Hayat, Royal Liverpool Hospital, UK
- Chris Webb, Royal Liverpool Hospital, UK

ABSTRACT

Background: The mini-Clinical Evaluation Exercise (mini-CEX) is a supervised learning event introduced into the UK foundation program due to the lack of feedback doctors in training received. Concerns have been raised regarding the usefulness of the mini-CEX as an educational tool. Good quality feedback is essential for the mini-CEX to have a positive educational impact. Research shows good feedback should be specific, objective, focused on improvement and delivered in a timely manner. This study aims to assess the quality of feedback in mini-CEXs and the time taken to deliver it.

Summary of Work: 50 foundation year one (FY1) doctors at the Royal Liverpool and Broadgreen Hospital NHS Trust, employed between 01/08/2017 and 31/07/2018, were sent email invitations to take part in the study. 30 FY1 doctors gave their consent for their mini-CEXs to be analysed. Data were retrospectively collected from the e-portfolios. Following a literature search we designed an objective feedback review proforma consisting of 3 domains - 'specific', 'objective', 'focused'. Each domain was scored between 0 - 3 ('objective' was scored on a scale 0 - 1). Two independent clinicians reviewed each mini-CEX and scored each domain. A third independent clinician performed the statistical analysis.

Summary of Results: 281 mini-CEXs were collected from the trainees. 18 (6.7%) mini-CEXs submitted were not completed by the trainer and 20 (7.1%) mini-CEXs were completed incorrectly by the trainee, both groups were excluded from analysis. 242 mini-CEXs were analysed with good inter-rater reliability (weighted Cohen's kappa = 0.772). Pooled scores from both reviewers scored 27% poor quality, 62% medium quality and 11% high quality. 22 days was the mean number of days from date of clinical event to sign off by the trainer. There was no association between time and quality of feedback (Spearman's rank coefficient = 0.17).

Discussion and Conclusions: This study shows varying degrees of quality in the written feedback provided to foundation doctors, with a greater proportion of low quality written feedback than high quality. Additionally it demonstrates incorrect implementation of the feedback tool from trainers and trainees.

Take-home Messages: Further training on how to correctly implement the mini-CEX is required for both trainers and trainees to make it a useful assessment tool.

Enhancing Workplace-Based Assessments and Learning: LEAPing into the Future with Smartphone Applications

AUTHOR(S):

- Sabrina Lau, Tan Tock Seng Hospital, Singapore (Presenter)
- Selvia Kosim, National Healthcare Group, Singapore
- Faith Li-Ann Chia, National Healthcare Group, Singapore

ABSTRACT

Background: Workplace-Based Assessment (WBA) has been increasingly adopted to facilitate on-the-job learning and deliver timely feedback for residents. However, there have been reports of increasing trainee and assessor fatigue with the growing amount of evaluations over the years. The National Healthcare Group (NHG) Education Office set out to enhance the accessibility and efficiency of WBA by developing a smartphone application named Learning, Evaluation and Assessment Platform (LEAP). LEAP provides a user-friendly avenue for on-the-spot feedback, and encourages residents to participate in self-reflection and monitor training progress.

Summary of Work: WBA is traditionally conducted by supervisors via hardcopy forms following patient care encounters. Often, immediate feedback is not given, and few residents actively retrieve evaluations which have been submitted directly to the Residency Office. In 2016, the NHG Internal Medicine Residency Programme adopted LEAP as a platform for residents to submit WBA including CSR, Mini-CEX and case and procedure logs. LEAP allows submission of WBA directly via a mobile device during or immediately following a clinical encounter. Supervisors also deliver verbal feedback and key in action plans which are easily retrievable by the residents at their convenience. Post-implementation, we monitored residents' utilisation of LEAP through their compliance to submission deadlines. We also obtained feedback from residents and supervisors regarding their experience using LEAP.

Summary of Results: Both residents and supervisors shared that LEAP was user-friendly and easily accessible - both important features for busy clinicians. Residents also found the process of submitting assessments and self-reflection to be more efficient. However, supervisors who were not familiar with the application took longer to complete the smartphone-based assessments. There were also difficulties in submitting evaluations when network connections were unstable.

Discussion and Conclusions: Implementation of LEAP improved the compliance of residents' submission of assessments timely and made feedback and self-reflection more accessible. The use of smartphone applications could enhance WBA learning and encourage regular self-reflection, but may reduce value from the WBA session if too much time is spent typing into the devices instead of providing face-to-face feedback.

Take-home Messages: Smartphone applications enhance workplace-based assessment and learning. Enhancements may be required to ensure a more seamless learning process, and to improve assessor training and usability.

Supervisors' Perception of the Use of the Generic version of the Mini-CEX in Occupational Therapy Fieldwork Education in Taiwan

AUTHOR(S):

- Yi-chia Liu, National Cheng Kung University Hospital, Taiwan (Presenter)
- Pai-chuan Huang, College of Medicine, National Cheng Kung University, Taiwan
- Keh-chung Lin, National Taiwan University College of Medicine, Taiwan
- Wei-Yun Hsu, National Cheng Kung University Hospital, Taiwan
- Po-See Chen, College of Medicine, National Cheng Kung University, Taiwan

ABSTRACT

Background: The generic version of the mini-CEX has been adopted in occupational therapy (OT) fieldwork education in Taiwan. However, the appropriateness toward the needs specific to OT has not been examined. We investigated the perception of OT supervisors on the generic version of the mini-CEX in Taiwan.

Summary of Work: An online survey was developed by a senior occupational therapist. The survey was distributed to OT supervisors who administrated post-graduate year (PGY) trainings in 2018 based on the open access database of the Ministry of Health and Welfare, Taiwan. The survey composed of three sections: the perception on the match between the mini-CEX and OT training goals, the match between the mini-CEX and core OT competences, and the fairness/objectivity of the mini-CEX. The responses were based on a five-point Likert scale. A score of 4 or 5 indicated that the responder agreed or strongly agreed with the statement. A total of 79 surveys were returned, and 71 of them were analyzed.

Summary of Results: An estimated 66.2% of OT supervisors agreed on match between the mini-CEX and the training goals. Over 62% of supervisors perceived that the mini-CEX benefited the competence training (62.0%–76.3% agreement). Seventy-six point one percent of supervisors agreed that the mini-CEX judged the performance fairly, and 64.8% of supervisors perceived it as objective.

Discussion and Conclusions: Our results indicated that only 65% of the OT supervisors agreed that the generic version of the mini-CEX was an appropriate and objective tool for evaluating OT trainees. This finding reveals that a direct adoption of the generic version of the mini-CEX might be not ideal and should be used with caution. Further examination and revision for the use in OT education are needed.

Take-home Messages: Although a majority of OT supervisors perceive the generic version of the mini-CEX as a fair tool in judging OT trainees' performance, here is a need for further work to refine the generic version to match specific needs of individual fieldwork education programs.

The long case: an educational impact study

AUTHOR(S):

- Corinne Tey, The University of Melbourne, Australia (Presenter)
- Neville Chiavaroli, The University of Melbourne, Australia
- Anna Ryan, The University of Melbourne, Australia

ABSTRACT

Background: The traditional long case involves an unobserved clinical encounter (history and physical examination) followed by a case presentation to one or more examiners. Its summative use has been questioned due to poor reliability and case specificity. However, little is known about the educational impact of the long case - a crucial element in determining whether any assessment tool should be utilised.

Summary of Work: Qualitative methods were used to explore the impact of the long case on student learning, from the perspectives of students as well as examiners. Three focus groups of final-year medical students (20 volunteers in total) and six semi-structured interviews of long case examiners were conducted at various clinical schools affiliated with the University of Melbourne. Thematic analysis was used to interpret the data.

Summary of Results: Students and examiners acknowledged the variability inherent within the long case assessment process, with students finding long cases stressful though ultimately worthwhile. There was general consensus that the long case had a significant educational impact, with the allocation of marks being a necessary motivator for students. Both groups viewed the long case as a powerful driving force for students to spend extended periods of time with patients and having a vital role in the development of fundamental clinical skills. The long case was thought to be valuable, highly authentic, and the only assessment to promote a holistic approach to patients.

Discussion and Conclusions: This was the first in-depth qualitative study of the traditional long case's substantial educational impact, emphasising its important place within a program of clinical assessment. Further research is needed to determine how an instrument with such rich educational potential can be optimised for the advancement of student learning.

Take-home Messages: This study provides empirical evidence of the long case's positive educational impact, suggesting that the removal of this assessment tool is likely to decrease student engagement with patients on the wards. In spite of challenges around reliability and case specificity, this work emphasises that the long case assessment has an important function within a program of assessment.

Effective Auto-Evaluation of Clinical Competence in Undergraduate Oversized Groups Using Low-Cost Technology

AUTHOR(S):

- Edgar Israel Herrera Bastida, Anahuac University - Health Sciences Faculty, Mexico (Presenter)
- Montserrat Urban, Facultad de Ciencias de la Salud - Universidad Anáhuac México Norte, Mexico
- Diana Jimenez, Facultad de Ciencias de la Salud - Universidad Anáhuac México Norte, Mexico

ABSTRACT

Background: Currently, undergraduate student groups are very numerous and the time to evaluate and measure these skills is increasingly limited and more expensive. Undergraduate students always expect to have evidence of their performance and feedback. In order to obtain and maintain accreditations, medical schools need evidence of teaching and assessment of objective evaluations in clinical competencies of undergraduate students.

Summary of Work: Throughout their undergraduate studies, students can access the simulation center (SC) website; to receive online training before practical sessions in the SC (videos, rubrics, VR). It is common that there is not enough time for personalized feedback, so upon signing the consent of the participants, the students use their telephones, to videotape their performance and upload the video that they consider represents their best performance. Participants realize without know it a self-evaluation of their performance; the professor then has the opportunity to evaluate the performance of each participant and send privately the result of their rubric with comments aimed at improving their performance. The economic cost of this methodology is zero for the university and the students.

Summary of Results: This methodology has been used since 2017, 1140 students have been evaluated in more than 15 different basic skills such as taking vital signs, clinical questioning, application of medicines. Students performance has been compared using an OSCE that uses the same reference rubrics, a positive relationship was found in a linear regression study between performance improvement and the number of videos uploaded on the website ($p = 0.002$).

Discussion and Conclusions: This methodology helps to generate objective evidence of performance and will allow identifying later changes throughout the academic life of the participants in an objective manner; although the economic cost is zero or very low, it still requires time on the part of the teachers and training on the most appropriate way to offer feedback that motivates the participant to identify and strive to improve their performance.

Take-home Messages: The use of low-cost technology and tools like smartphones that undergraduate students are familiar with has proven to be a strategy that has proven effective in fostering self-evaluation thinking and improving on later assessments such as the OSCE.

Theoretically and empirically-informed narrative descriptions of competency development

AUTHOR(S):

- **Jacqueline Raymond, University of Sydney, Australia (Presenter)**
- Rebecca Sealey, James Cook University, Australia
- Deborah Pascoe, Federation University Australia, Australia
- Fiona Naumann, Queensland University of Technology, Australia
- Sue McAllister, University of Sydney, Australia

ABSTRACT

Background: Determining whether a student has demonstrated readiness to enter their profession, particularly in professions where semi-autonomous practice is required on graduation, is challenging. Discourse regarding performance assessment has moved from measurement and psychometric validity towards the value of qualitative approaches and narratives to support sound judgement of readiness for practice. The objective of this study was to develop narrative descriptions of competency development. The research questions were: (i) how do experienced clinicians describe students who are developing their clinical competency, and (ii) how do they describe a student who is ready for semi-autonomous professional practice? We investigated these questions within the profession of clinical exercise physiology (CEP). CEP is a role emerging health profession in Australia and therefore is in the early stages of articulating its understanding of readiness for practice and related assessment of performance.

Summary of Work: A social constructivist theoretical perspective informed the methodology. Across three focus groups, 17 CEP clinicians with clinical educator experience were asked to describe (i) what students who are developing their clinical competency 'look like' and (ii) what students who were ready for professional practice 'look like'. Data saturation was reached at the third focus group. A thematic analysis identified the behavioural constructs describing competency development which were then used to write three narrative descriptions of points along a competency continuum. These narrative descriptions were further evaluated and refined through semi-structured interviews.

Summary of Results: The behavioural constructs which informed the narrative descriptions included: consistency, managing complexity, flexibility, safe practice, independence and insight into own performance. Participants considered the narrative descriptions to accurately describe the continuum of competency development and a student who is ready for professional practice.

Discussion and Conclusions: The narrative descriptions fit with contemporary discourse on assessment in clinical workplace settings. The narrative descriptions may be useful in providing support for quality judgements of students' performances in the workplace setting. That is, the narrative descriptions could be used as reference points by those constructing their judgements of student performances.

Take-home Messages: The broad behavioural constructs in the narratives may be relevant to other health professionals' practice.

TOSCE in Obstetric Emergency: Good for improved IPE

AUTHOR(S):

- Prakarn Ongartboon, Phrae Hospital, Thailand (Presenter)

ABSTRACT

Background: In conducting a practical exam for a multidisciplinary team, TOSCE: Team OSCE is a teaching method which enhances individual clinical ability skills and improves understanding between roles, relationship building and teamwork.

Summary of Work: A group exam was organized with teams of five, consisting of one internship doctor and four nurses. The exam was in the subject of obstetrics and was conducted in the form of TOSCE, which consists of several case problem-base stations including PPH / shoulder dystocia / Eclampsia / prolapsed cord / Breech presentation and neonatal resuscitation. The examiners provided the team with questions to study and perform multidisciplinary treatments. Each base exam took 30 minutes. Evaluators consisted of medical and nursing professors. Once completing all of the exams, a summary was provided and each person commented on this type of exam.

Summary of Results: It was found that each person achieved a high score in medical treatment subjects. Furthermore it was found that group's scored well in communication, planning and providing information. Everyone had fun and were satisfied with this type of exam. Most people commented that this type of exam made the importance of their role very clear.

Discussion and Conclusions: This experiment found that using TOSCE exams in obstetrics is useful in developing multidisciplinary teaching skills in clinical competency and understanding the role of other professions involved in the care and treatment of patients, especially in a profession that requires teams to work such as emergency obstetrics / surgery/ Trauma. TOSCE can be used in exams to evaluate both the individuals ability and teamwork skills to develop inter-professional teaching techniques for becoming a multidisciplinary professional.

Take-home Messages: TOSCE is a method that will useful to the development of teaching and learning in IPE.

Do CREOG exam scores reflect performance in local assessments and Arab board exams in an AGCME-I residency program?

AUTHOR(S):

- Hessa Al Suwaidi, SEHA, UAE (Presenter)
- Neha Gami, Healthplus Clinic, UAE

ABSTRACT

Background: The Council on Resident Education in Obstetrics and Gynecology (CREOG) in-training examinations has been used to predict the successful performance on ABOG written examination for residents in AGCME programs. Obstetrics and Gynecology residents in Abu Dhabi also perform the CREOG exams annually. During their residency, the residents have to pass Arab Board Part 1 and Part 2 get their medical license. There are also periodic exams based on the guidelines of local bodies to assess the knowledge of residents. The aim of this study was to see if there was any correlation between the CREOG score and Arab Board and local Departmental Exam performance of Obstetrics and gynecology residents in Abu Dhabi.

Summary of Work: CREOG scores of Obstetrics and gynecology residents in Abu Dhabi were retrospectively studied. The data from 2014-2017 was included in the analysis. These scores were correlated with Arab Board and Departmental exam of the residents. The correlation was assessed using Pearson's Coefficient.

Summary of Results: Data for CREOG scores was available for only 22 residents over 2014-2017. The mean score of CREOG was 40.9% while mean score of the Departmental exam was 70.8%. We found positive correlation between CREOG scores and Arab board exam with the Pearson's Coefficient being 0.733 ($p = 0.001$). The Pearson's Coefficient for CREOG scores and the performance in Departmental exam was 0.960 ($p = 0.000$).

Discussion and Conclusions: Our study has similar results to the findings of other studies, where they found positive correlation between USMLE and CREOG scores. Thus, just like CREOG scores can be used to identify the residents who will pass ABOG written examination, similarly in the context of UAE, CREOG scores can be used to predict which residents will pass the ARAB board part one exam in the first attempt. Larger studies are needed to support these initial results.

Take-home Messages: Our study, although very small, shows a correlation between the performance of the residents on CREOG exams and the Departmental and Arab board examinations.

Validity Evidence Supporting Computer-Based Test and OSCE Scores at 4th-Year Predicting National Board Examination Performance Following 6-Year Undergraduate Medical School in Japan

AUTHOR(S):

- Shoko Horita, The University of Tokyo, Japan (Presenter)
- Yoon-Soo Park, University of Illinois College of Medicine, USA
- Daisuke Son, The University of Tokyo, Japan
- Masato Eto, The University of Tokyo, Japan

ABSTRACT

Background: In Japan, the National Board Examination (NBE) is a key examination that determines the qualification for training doctors. Some studies in Japan suggest that results of Computer-Based Test (CBT) scores, administered prior to clinical clerkship (CC) predicts the result of NBE. However, there are few studies that comprehensively analyze the longitudinal predictive associations between the CBT, pre-CC OSCE, post-CC OSCE and NBE. This study identified factors that predict the result of NBE by integrating the high-stakes examinations before graduation.

Summary of Work: Data were analyzed using 69 medical students graduated at The University of Tokyo. Students were invited to answer surveys asking their daily activities and study behaviors, such as meals, sleeping, self-studying hours, part-time job hours, and social activity hours. Survey responses were merged with performance on pre/post-CC OSCE, computer-based test (CBT), CC scores, the results of Japan Residency Match Program (JRMP) and the results of National Board Examination and were analyzed using the statistical software JMP(R).

Summary of Results: Performance of CBT was significantly predictive of NBE placement (Odds ratio: 19, $R^2=0.0830$, $p < 0.001$). Furthermore, performance on pre- and post- CC OSCE were also substantially correlated to NBE placement (Odds ratio divided by ROC threshold: 14.7/31.5, $R^2= 0.197/0.234$, $p < 0.05$ each). However, daily activities including meals, commuting time, sleep, social activities, and part-time-job-hours did not have significant relationship with NBE placement. On the other hand, multiple regression analysis of post-CC OSCE against pre-CC OSCE and CBT revealed that these two factors were closely related to post-CC OSCE scores ($F=12.77$, $p < 0.001$).

Discussion and Conclusions: The placement on NBE is significantly related to high-stakes examination scores such as pre-CC OSCE, CBT (both executed before CC) and post-CC OSCE (administered after CC, before graduation and NBE). Moreover, performances on pre-CC OSCE and CBT scores predict the performance on post-CC OSCE. These findings suggest that the placement on pre-CC OSCE and CBT predict the outcome at NBE.

Take-home Messages: To deliver excellent educational outcomes, findings from this study promote educators to encourage medical students to achieve acceptable and competent performance prior to beginning their clinical clerkships.

Lecturers' conceptions of assessment and other factors influencing how they practice assessment

AUTHOR(S):

- Danica Sims, University of Cape Town, South Africa (Presenter)
- Francois Cilliers, University of Cape Town, South Africa

ABSTRACT

Background: Assessment is universally practised in health professions education and has profound consequences, ultimately affecting patient care and public safety. In some institutions, lecturers enjoy considerable autonomy when designing assessment. Efforts to enhance assessment practice are ubiquitous but not always effective and might be enhanced by understanding what factors influence lecturers' assessment practice. While research suggests that conceptions are one such factor, there is little published literature regarding either lecturers' conceptions of assessment or what other factors influence how they design assessment. This begs the question: What spectrum of conceptions do lecturers hold about assessment and what influences how they design assessment?

Summary of Work: Semi-structured interviews were conducted with 18 lecturers responsible for managing assessment of final-year undergraduate medical students at two institutions. Phenomenographic analysis to explore lecturers' conceptions of assessment at one institution was completed before undertaking data collection and analysis at the second. Thematic analysis guided by health behaviour theory was undertaken to explore factors influencing assessment practice.

Summary of Results: Phenomenographic analysis identified a spectrum of conceptions on a continuum of "Clinician"- "Clinician-Educator"- "Educator". The dimensions of lecturers' conceptions include identity (clinician to educator), knowledge (naive to sophisticated), practice (unquestioning and rules-based to critical and evidence-based), agency (defer to authority to empowered) and perspective/purpose (today and task-driven to future practice and competency-driven). In addition to conceptions, thematic analysis revealed that assessment practice is also shaped by personal and contextual factors such as perceived self-efficacy, response-appraisal, attitude and barriers.

Discussion and Conclusions: Conceptions and factors gleaned from data at one institution have been partially validated by data from a second. Further validation is currently underway. Lecturers' conceptions of assessment appear to be an important factor in shaping assessment practice. The variations of the dimensions and categories, as well as other personal and contextual factors, could thus be considered in the design of faculty development programmes and assessment development programmes that seek to transform assessment design and practice.

Comparison of the reliability of three methods used for peer assessment

AUTHOR(S):

- Pongpol Jameekornkul, Chulalongkorn University, Thailand (Presenter)
- Thanin Rianpairoj, Faculty of Medicine, Chulalongkorn University, Thailand
- Danai Wangsaturaka, Faculty of Medicine, Chulalongkorn University, Thailand

ABSTRACT

Background: Teamwork is an important competency of health professions in the 21st century. Peer assessment is undoubtedly instrumental in assessing teamwork as it belongs to the 'does' level in Miller's pyramid. However, the utility of assessment in each context should take reliability into consideration as well. Therefore, this study aims to compare the reliability coefficients obtained from three methods of peer scoring.

Summary of Work: Data of peer assessment in 'Doctor and Society' course in 5 academic years (2014-2018) were analysed (123 groups with 10-16 members in each group). After working together for a semester, Year 1 students were asked to rate their group members using 3 methods: (A) 'Free Rating Method' using 11-point rating scale (0-10); (B) 'Alphabet Method' using 5-point rating scale (outstanding, very good, good, borderline and unsatisfactory) with limited numbers of peers whom raters could give outstanding and very good ratings; and (C) 'Percentage Method' which raters were asked to distribute a score of 100 to their group members. Reliability coefficients of peer assessment were calculated by G-String V programme. The G-coefficients obtained from the three methods were compared using Wilcoxon signed-rank tests.

Summary of Results: 'Free Rating Method' resulted in the G-coefficients ranging from 0.14 - 0.96 with 21% of the coefficients more than 0.90. The G-coefficients obtained from 'Alphabet Method' ranged from 0.64 - 0.95 with 86% of the coefficients greater than 0.90. The G-coefficients from 'Percentage Method' were from 0.34 - 0.96 with 88% of the coefficients higher than 0.90. Overall, the 'Alphabet Method' yielded the highest reliability coefficient with statistically significant difference between this method and the 'Free Rating Method' ($Z=-9.451, p<0.001$); and between this method and the 'Percentage Method' ($Z=-8.173, p<0.001$). There was also statistically significant difference between the 'Free Rating Method' and the 'Percentage Method' ($Z=-7.860, p<0.001$).

Discussion and Conclusions: The 'Alphabet Method' is the most reliable for peer assessment of teamwork in our context. Rater orientation together with an appropriate context for group work is fundamental to attain this.

Take-home Messages: Peer assessment for summative purpose in undergraduate medical education can be of high reliability.

#10LL Posters - Assessment: Clinical, Peer and Self Assessment

The acceptability of peer assessment of group work participation among medical students

AUTHOR(S):

- Apisit Rungruengsirichok, Faculty of Medicine, Chulalongkorn University, Thailand (Presenter)
- Thodsawit Tiyaratannachai, Faculty of Medicine, Chulalongkorn University, Thailand
- Danai Wangsaturaka, Faculty of Medicine, Chulalongkorn University, Thailand

ABSTRACT

Background: Peer assessment was developed as a tool to facilitate authentic assessment among students in group work settings. It has been implemented at Faculty of Medicine, Chulalongkorn University in various courses throughout 6-year curriculum. A key to successful implementation of the tool is the acceptance by students. This study was conducted to evaluate the perception of students on peer assessment.

Summary of Work: Self-administered questionnaires were distributed to Year 3 students at the end of Respiratory System II courses from academic year 2014 to 2018. Students rated items in the questionnaire on 5-point rating scale (1=strongly disagree, 5=strongly agree). The students were categorized by GPAX into 3 groups (<3.00, 3.00-3.74, >=3.75) for ANOVA to be used to demonstrate statistically significant difference in the responses among them.

Summary of Results: The response rate was 92% (1,406/1,530). Seventy-two percentages of the participants were comfortable to assess their peers. Almost all of them claimed that they assessed other students fairly (95%); and peer assessment did not increase their own group work participation (92%). Half of them (50%) believed that it encouraged others to contribute more to group work with only 24% believing that peer assessment caused conflicts among group members. However, only 55% agreed/strongly agreed that there should be peer assessment.

There was no statistically significant difference among students in different GPAX groups in acceptance of peer assessment (p-value 0.18 - 0.68) except for the item 'there should be peer assessment'. Students with high GPAX seemed to agree with this statement more than the others (3.72 vs 3.49 vs 3.39; p = 0.013).

Discussion and Conclusions: Peer assessment was, in some degree, accepted by the medical students as a tool to assess contribution to group work. Further study on other factors which might affect their acceptance of peer assessment is crucial.

Take-home Messages: Although peer assessment has been implemented in your institution for many years, we recommend periodic evaluation in order to ensure the utility of peer assessment.

Usefulness of PBL peer evaluation as a predictor of performance after graduation

AUTHOR(S):

- Ye Ji Kang, Sungkyunkwan University, South Korea (Presenter)
- Hyewon Jang, Sungkyunkwan University, South Korea
- Sanghoon Lee, Sungkyunkwan University, South Korea
- Yon ho Choe, Sungkyunkwan University, South Korea

ABSTRACT

Background: Peer evaluation is often utilized to measure students non-cognitive competency as well as cognitive competency during PBL curriculum in medical school. The former is usually related to communication skills, cooperation, responsibility, and so on, which are similar to the competencies necessary for the successful outcome during internship and residency program. This study examined the usefulness of PBL peer evaluation as a tool to predict internship performance after graduation.

Summary of Work: Among the 44 graduate students of Sungkyunkwan University School of Medicine in 2017, this study was conducted on the 26 students who completed internship at Samsung medical center. The main data used for the study were the following: (1) the PBL peer evaluation (PPE) score in year 4 (2) the result of comprehensive clinical knowledge assessment (CCA) in year 6 and (3) the grade after completing one-year internship program (A, B, and C).

Summary of Results: The mean of CCA and PPE were 65.15(SD=4.06) and 168.68(SD=7.23) respectively. Male students (N=14) tended to score higher than female (N=12) in PPE (mean =169.48, SD=6.02 vs. mean = 167.75, SD=8.61 P>0.05), however, lower than female in CCA (mean=64.07, SD=4.29 vs. mean =66.42, SD=3.53, P>0.05). Among the 26 study members, 5 students got A (group A), 15 received B (group B), and 6 got C (group C) for the internship grade. On the spearman correlation analyses, PPE score and internship grade showed significant positive correlation ($r = 0.441, p < 0.05$), while there was no significant correlation between CCA score and internship grade.

Discussion and Conclusions: The result of medical students' peer assessment during PBL curriculum has shown positive correlation with clinical performance during internship program, while their academic score showed no correlation.

Take-home Messages: Therefore, the PBL peer evaluation could have the potential as a tool to predict students clinical performance after graduation.

Evaluating the impact of the implementation of self-assessment in PBL tutorials: Does it improve students' learning?

AUTHOR(S):

- Umatul Khoiriyah, Faculty of Medicine Universitas Islam Indonesia, Indonesia (Presenter)

ABSTRACT

Background: Self-assessment is believed as one of assessment method that could enhance students' learning. Faculty of Medicine Universitas Islam Indonesia has employed self-assessment in PBL tutorials as an attempt to increase the learning quality in PBL tutorials. This study was aimed to evaluate the impact of the implementation of self-assessment in PBL tutorials.

Summary of Work: The study was a mix method study. First-year student (n=95) during the second block (Neuromusculoskeletal) evaluate their own tutorial performance in each learning unit using a self-assessment tool (Self-assessment Scale on Active Learning and Critical Thinking/ SSACT). Tutors then provided written feedback on each students' self-assessment form. Students filled MSLQ (Motivated Strategies for Learning Questionnaire) form before and after the block running. This data was analysed quantitatively. At the end of the Neuromusculoskeletal block, students filled an open questionnaire regarding their experience in applying self-assessment. Qualitative analysis using thematic analysis was then conducted.

Summary of Results: Based on the analysis of MSLQ, students' motivation was increased significantly after the implementation of self-assessment ($p < 0.05$); however, the implementation of learning strategies such as cognitive-meta cognitive strategies and the use of learning resources did not significantly change ($p > 0.05$). Qualitative data indicated that self-assessment enhanced learning motivation, facilitated self-reflection, provided direction to conduct self-improvement and stimulated to apply various learning strategies.

Discussion and Conclusions: Self-assessment in PBL tutorials could motivate students to learn better. Even though the quantitative analyzed indicated that there was no significant improvement in students' capability to apply learning strategies, the qualitative data showed that students obtained many learning benefits from self-assessment. Students experienced that it could help them to identify the learning gap by which they activated their cognitive and meta cognitive process. Self-assessment also gave them direction to take learning improvement. All of these impacts might increase when self-assessment is applied longer in PBL tutorials.

Take-home Messages: Self-assessment could be one alternative method to assist students' learning in PBL tutorials.

Verify a performance assessment rating scale for evidence-based healthcare evaluation

AUTHOR(S):

- Chien-Chih Wu, Taipei Medical University Hospital, Taiwan (Presenter)
- Yi-No Kang, Taipei Medical University Hospital, Taiwan
- Chien-Yu Chen, Taipei Medical University Hospital, Taiwan
- En-Yuan Lin, Taiwan Adventist Hospital, Taiwan

ABSTRACT

Background: Many studies investigated the assessment of EBHC, yet most of them were standardized assessment. There is a performance assessment rating scale (EBHC-PARS) that was used on national EBHC competition, but no study verified the quality of EBHC-PARS. Therefore, this study aimed to verify the EBHC-PARS.

Summary of Work: Our study team designed a mock evaluation for tool verification. In this mock evaluation, experts evaluate 12 EBHC reports by using the EBHC-PARS. The expert selection was based on two criteria that defined beforehand. The two criteria are (1) expert should publish systematic review and meta-analysis, and (2) experts should have teaching experience in evidence-based healthcare. According to the criteria, we invited potential experts. Then, five physicians and two nurses participated in our study. To explore the tool quality, we did not call for consensus meeting before the mock evaluation. We also prohibited experts to communicate with each other before they complete the evaluations. The 12 EBHC reports presented full steps including asking a question, acquiring evidence, appraising evidence, and applying evidence in clinical practice. The EBHC-PARS consisted of 16 items. Three of the 16 items are about asking a structured question; four items are evidence acquiring, and the other four items are appraising. The final five items are applying evidence in clinical practice. The rating scale is from 1 (very poor) to 5 (excellent). We conducted intraclass correlation (ICC) and discrimination analysis for quality of the tool.

Summary of Results: In overall, the ICC value was .519, and the t-value for discrimination was 5.117 ($p < .01$). In stratification, the ICC value from physicians was .508, and the t-value of discrimination was 4.234 ($p < .05$). In nurse part, the ICC value was .565, and the t-value of discrimination was 10.322 ($p < .001$).

Discussion and Conclusions: Our test found that the EBHC-PARS leads experts to achieve moderate reliability and also have good discrimination in EBHC performance reporting. However, how to improve reliability should be discussed in future.

Take-home Messages: The EBHC-PARS is choice for assessing EBHC ability. Consensus meeting may be needed before teachers use EBHC-PARS.

ABSTRACT

Background: Interprofessional collaborative practice (ICPC) is a key element of our healthcare system, indispensable for optimal patient care, proven by international studies. Latest developments in academic and health policy are focusing on strengthening interprofessional education (IPE). Nevertheless, interprofessional skills are no compulsory part in German medical curricula and most trainings occur mono-professionally. The aim of this project is a nationwide establishment of Interprofessional training wards (IPWs) as a fixed component of the education in the final year of medical students.

Summary of Work: The German medical students' association (bvmd) founded a student taskforce in collaboration with the German National Institute for state examinations in Medicine, Pharmacy and Psychotherapie (IMPP). The taskforce, consisting of ten medical students from six medical faculties, is involved in the whole implementation process of IPWs nationwide.

Aims: - connecting executing faculties and students - A "How-to"-Guide for student-led implementation - Standardized interprofessional EPAs and SOPs - A standardized scientific evaluation of student benefits and patients' outcome A relevant part of IPW has to be formative feedback optimally referred to uniform Entrustable Professional Activities (EPAs). Based on the concept of assessment drives learning these EPAs, building the fundament for future national licensing examinations, will lead to an improvement of know-how and skills.

Discussion and Conclusions: As medical students are the changemakers of tomorrow, they need to be empowered to take part in development processes and thus acquire new skills, which were not taught in recent curricula. The collaboration between engaged students and the IMPP offers great opportunities for both, by learning from each other and finding correlating aims, such as the implementation of nationwide IPWs.

Take-home Messages: IPE is the key for current challenges in health care system, thus needs to be an essential part of medical education and has to be trained in a multi-professional approach. To ensure the long-term establishment and support of IPWs to train next generation health workers, the collaboration, which created a student taskforce with know-how, structure and connections to all German faculties, is a great solution.

Correlation in the student-generated asking question and Level of Bloom's Taxonomy in the medical students

AUTHOR(S):

- Narongwit Nakwan, Division of Pulmonology, Department of Medicine, Hatyai Medical Education Center, Songkhla, Thailand (Presenter)

ABSTRACT

Background: Asking question helps either student or teacher targeting to learning objectives and outcomes, promoting a higher-ordered thinking and encouraging personal learning skills. Bloom's Taxonomy (BT) is a level of intellectual behaviour in learning process, moreover it helps to generate phrasing suitable challenging questions. The aim of study is to evaluate the correlation of asking question in medical students and level of BT.

Summary of Work: We performed a paper survey inviting 87 medical students to participate. They were asked to complete the questionnaire. Questions asked included whether what type of question they do prefer based on BT, whether what action verb do they use in asking question.

Summary of Results: We found 100% medical students were unfamiliar to the level in Bloom's hierarchy. According to the level of BT, 63.2% preferred the asking question on application, 14.9% on understanding, 13.8% on analysis, 4.6% on creativity and 3.1% on remembering. In the same way, 67.8% thought that the asking question on application is the most powerfully stimulated question for learning. The action verbs which they selected in asking question were for; application (22.7%), understanding and knowledge (21.7%), analysis (21.6%), evaluation (19.4%) and creation (14.6%). The action verbs commonly using in asking question were for apply, reason, compare, utilise, conclude and explain, respectively.

Discussion and Conclusions: Although the level of BT is essential in intellectual activity of learning, no medical student familiar this hierarchy. Thus, unsurprisingly, they are quite prefer asking question for application and knowledge. According to BT, the most effective asking question developing higher-ordered critical thinking and promoting deep learning should be asking question for evaluation and creation. The medical teacher might guide and facilitate the student's mindset on action verb leading to high ordered critical thinking question. All students are unfamiliar to TK and the asking question for evaluation is the most common question type which our students prefer.

Take-home Messages: We believe that type of student generated-asking question, particularly in high ordered critical thinking question, will help our medical students developing effective answer and creative thinking in either self-active learning or group-learning classroom.

Should student-led teaching be incorporated into the medical school curriculum?

AUTHOR(S):

- Edward Fenby, King's College London, UK (Presenter)
- Eugene Ace McDermott, King's College London, UK
- Mariam Koronfel, King's College London, UK
- Afra Jiwa, King's College London, UK

ABSTRACT

Background: Teaching is a core requirement for newly-qualified doctors as per the GMC's 'Outcomes for graduates' 2018. The importance of doctors being effective teachers should not be overlooked; one study has shown that medical students in the USA attribute... " of their learning to teaching from hospital staff (Bing-You and Sproul, 1992). This skill is often overlooked in the medical curriculum, leading to doctors taking on a new role as teachers with little to no experience. Student-led teaching programmes have been used to successfully supplement the core curriculum and provide teaching skills and experience.

Summary of Work: A primary literature search of peer-reviewed articles on MEDLINE was conducted to investigate how student-led teaching has been used and ways in which this could be incorporated into the curriculum. A secondary search was carried out to identify recognised methods of assessing teaching skills.

Summary of Results: To date, most schemes have had no formal involvement of medical schools. One key finding is that objectively measuring teaching programs is difficult to achieve. Literature has highlighted common key areas which make an effective teacher, and ways in which this can be achieved. Examples include self-reflection, and feedback from both students and experienced teachers.

Discussion and Conclusions: Teaching should form part of the formal, compulsory medical curriculum. Although student-led schemes may be effective to develop high-quality teaching skills, feedback and mentoring from experienced teachers is required, which students cannot accomplish alone (Ralhan et al., 2012). In addition, Ralhan et al. highlight the importance of standardised assessment methods, which would be required if this were to form part of the official curriculum. As such, input is required from the medical schools themselves. Using these recommendations, we suggest a standardised method of assessment for schools, overcoming a major barrier to university-run student-led teaching implementation (Topping, 1996).

Take-home Messages: A standardised assessment tool should be used to help incorporate student-led teaching into the medical curriculum in order to improve teaching skills.

Keep calm and plan properly! What medical students on a research project course recommend their peers in order to succeed

AUTHOR(S):

- Riitta Moller, Karolinska Institutet, Sweden (Presenter)
- Maria Shoshan, Karolinska Institutet, Sweden

ABSTRACT

Background: In order to provide high-quality health care, the skills of searching, reading and critically appraising literature have to be established already during undergraduate education. Therefore, many medical schools worldwide have integrated formal training in scientific and research-related skills within the core curricula. The quality of supervision but also students' attitudes and qualifications are of importance for the accomplishment of the projects. Here, we have explored which student qualities medical students themselves perceive as necessary for a successful research project course.

Summary of Work: A cross-sectional questionnaire study. 650 students registered on a compulsory research project between 2011 through 2013 were e-mailed a questionnaire after completed course. 452 (70%) returned the questionnaire; 309 students (mean age 26 years; 60% females) answered an open-ended question about important characteristics of a successful student. The answers were analyzed by manifest content analysis.

Summary of Results: In total 7 categories emerged as perceived key qualities in a successful student: Time management, Curiosity, Responsibility, Organizational skills, Willingness to learn, Commitment, and Initiative. In addition, forthright communication with supervisors and courage to ask for help or advice were also brought up.

Discussion and Conclusions: Few studies have examined medical students' own perceptions of key qualities in students. This study is unique in that it gathers such data directly from students who have just finished a mandatory research project. Medical students who start scholarly projects often lack the experience to carry out an entire research process and may often find it difficult to understand what is required of them in order to successfully complete the projects. We show here that the students themselves perceive that executive functioning skills such as time management, organizational skills and communication skills as well as qualities such as curiosity and a willingness to learn are central for success. We and others have shown that supervisors appreciate the same qualities in students.

Take-home Messages: To gain the most from a scholarly project, students recommend their peers to be proactive, curious and well-organized.

Can National Licensing Board and medical students' associations work together? IMPPULS-Group - a nationwide students' task force at the German National Institute for state examinations in Medicine

AUTHOR(S):

- Aurica Ritter, German Medical Students Association (bvmd), Germany (Presenter)
- Jeremy Schmidt, German Medical Students Association (bvmd), Germany
- Peter Jan Chabiera, German Medical Students Association (bvmd), Germany
- Jonathan Gavrysh, German Medical Students Association (bvmd), Germany
- Ute Schlasius-Ratter, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Germany
- Jana Junger, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Germany

ABSTRACT

Background: Students' engagement in development of competency-based education and assessment is important. However, student initiatives are often local and depend on the involved actors. So far, there was no cooperation between the IMPP as regulatory body and the medical students' association. Aiming at increased visibility of students projects as well as their consolidation and nationwide implementation, both institutes started a cooperation. The German Medical Students Association (bvmd) as a politically, religiously and ideologically unaffiliated institution, comprises and represents the approximately 90,000 medical students of 38 medical faculties in Germany. The IMPP provides the written parts of the national licensing examinations (NLE), and assesses 26,000 students each year. In 2016, the collaboration between bvmd and IMPP was founded and titled 'IMPPULS-Group'.

Summary of Work: During two workshops an innovative strategy was developed to empower students' projects and involve students in development and implementation of competency-based teaching and assessment methods. In regular meetings at the IMPP students' work is discussed and can be integrated into developmental process of medical education and NLE. Main subjects of the students' taskforce are the enabling of projects focusing on communication, competencies, or interprofessional collaboration to enhance medical skills, ensure patients safety and develop new examination concepts.

Summary of Results: By now, the IMPP collaborates closely with about 60 students of approximately 20 faculties on four projects: - Evaluation of medical NLEs - Designing OSCE-stations about organ donation - Extensive implementation of Interprofessional Training Wards - National standardized communication training

Discussion and Conclusions: In the past, the IMPP and the students association worked separately and perceived themselves rather negative. IMPPULS shows that the transformation into an extensive exchange is possible and allows to take the important students' perspective into account.

Take-home Messages: A strong cooperation between IMPP as regulatory body and the medical students' association is possible and fruitful for both sides. We hope this leads as an example for stronger involvement of students in the development of innovative teaching and assessment methods.

Student Engagement in Curriculum Development: A first for The University of The West Indies Faculty of Medical Sciences, Jamaica

AUTHOR(S):

- Nikolai Nunes, UWI Mona Campus, Jamaica (Presenter)
- Christine Walters, UWI Mona Campus, Jamaica
- Tomlin Paul, UWI Mona Campus, Jamaica
- Colette Cunningham-Myrie, UWI Mona Campus, Jamaica

ABSTRACT

Background: Commensurate with increasing global health workforce demand, the Faculty of Medical Sciences (FMS), Mona has doubled its physician output in the last decade. This shortage impacts the English-speaking Caribbean, our neighbors in Latin America, and traditional West-Indian immigrant North American cities with abundant native Spanish speakers. FMS, Mona has embarked on an innovative student engagement approach in the ongoing development of a medical Spanish curriculum. An important step in any curriculum development is a needs assessment.

Summary of Work: In a first for curriculum development at the FMS, Mona, student engagement was employed via student leaders of the Jamaica Medical Students' Association and class presidents working with faculty to develop a student survey that sought students views and input into the structure and delivery of a medical Spanish course. Student leaders refined the survey with respect to potential course structure and integration by Delphi analysis, followed by publicizing the online survey which was delivered via REDcap software to approximately 1200 first to fourth year medical students.

Summary of Results: 141 students responded, the majority being third and fourth year (59%), aged 18-38 (median 22), and female (75%) in keeping with the medical school's demographics. For the majority, English was the native language (94%), 12% were bilingual, 2% trilingual. About 90% had been taught Spanish in high school (6 weeks to 11 years). Approximately 80% expressed an interest in increasing their Spanish literacy, 14% potentially open to the opportunity for such, and 6% were not interested. Three main themes emerged from the open-ended portion of the survey: 1) concerns regarding timing and placement of the course into the current curriculum, 2) an awareness of the general benefits of this added knowledge and cultural exposure and, 3) enthusiasm with respect to increasing marketability and career prospects.

Discussion and Conclusions: This pilot process of student engagement in curriculum development gauged student interest in introducing a new course and opinions on design, delivery, and expected outcomes.

Take-home Messages: This example of student engagement provides a possible template for future establishment of joint faculty-student teams. However, a follow-up enquiry to determine factors limiting student engagement would be of value in designing future faculty-student collaboration.

Factors affecting Medical Student Engagement in Institute of Medicine

AUTHOR(S):

- Areerat Siripongpan, Suranaree University of Technology, Thailand (Presenter)
- Theeranit Namkune, Suranaree University of Technology, Thailand

ABSTRACT

Background: Student engagement is an important domain for medical education, which is a concept that involves preparing and creating readiness for adaptation to the university's academic life. It is one of the factors that contribute to student success. Student engagement is defined as an expressing opinions or attitudes and behavior of students which is a predictor of the quality of educational experience with interaction between teachers and students. In this study, we explored the level and factors affecting engagement.

Summary of Work: Participants were 229 medical students (1st, 2nd, and 3rd year medical students) by collecting data between 20 September - 3 October 2018. Student engagement was measured by using questionnaire for engagement assessment by used Likert 5-point scale. Also for academic assessment by used Likert 7-point scale. The statistical methods used to analyze the data included percentage, mean, standard deviation, and step-wise multiple regression.

Summary of Results: Student engagement was 3.73. Factors affecting medical student engagement were teacher ($P = 0.01^*$), personnel ($P = 0.01^*$), friends ($P = 0.02^*$), and seniors ($P = 0.03^*$) with significantly. Academic engagement in 1st, 2nd, and 3rd year medical students were 5.21, 4.87, and 4.22, respectively.

Discussion and Conclusions: Student engagement was at high level. Engagement is clearly predictive for academic achievement, and can influence of factors such as relationship between teacher, staff, their friends and seniors. In contrast, academic engagement tended to decrease in higher year, may causing from more complicated curriculum. The way to increase levels of student engagement such as being a role model teacher, developing the advisor system and creating an environment that encourages the relationship with all teacher, personnel, friends and seniors.

Take-home Messages: Medical institution should realize and set a policy in support of enhancing the quality of the student engagement.

Peer-to-peer small group tutoring improves knowledge and confidence for undergraduate clinical exams in both tutors and tutees

AUTHOR(S):

- **Urvi Karamchandani, Imperial College London, UK (Presenter)**
- Daniel Huddart, Imperial College London, UK
- Lasith Ranasinghe, Imperial College London, UK
- Husein Rajabali, Imperial College London, UK
- Adeela Ashraf, Imperial College London, UK

ABSTRACT

Background: Knowledge for Objective Structured Clinical Examinations (OSCEs) at medical school are largely attained through curricular-based activities during hospital placements. However, early clinical students find transition from pre-clinical lectures challenging. Peer-assisted learning provides a platform for additional support, where social and cognitive congruence allows fluid participation, leading to better learning environments. Concurrently, senior students benefit through development of their teaching and assessment skills.

Summary of Work: Third-year medical students at a UK university voluntarily enrolled into a peer-to-peer OSCE tutoring programme and matched to small groups with voluntary older students (average 2:1 respectively). Teaching schedules and content were formulated by individual groups to allow tailored tutoring. Feedback forms were collected from tutors and tutees to assess benefits of the programme after one academic year and retrospectively analysed. Students ranked responses to statements with a 5-point Likert-scale from strongly disagree to strongly agree.

Summary of Results: 182 tutees and 76 tutors completed feedback forms. 70% of groups met weekly, 14% met fortnightly, and <4% met less than once monthly. Sessions covered clinical examinations, focussed history taking, and clinical skills in order of decreasing frequency. Tutee responses: 92.7% found the programme identified gaps in their knowledge, 90.8% claimed it familiarised them with the OSCE format, and 96.2% felt more confident about their OSCE. Moreover, 81.9% found the programme better than lectures and 61.5% found it better than hospital-based bed-side teaching. Overall, 96.1% found OSCE tutoring useful and 91.2% were satisfied with their tutors. Tutor responses: 76.7% of tutors had prior teaching experience. 89.4% found peer-tutoring identified gaps in their knowledge, 92.1% claimed it consolidated knowledge and 89.4% felt more confident with teaching.

Discussion and Conclusions: The OSCE tutoring programme was effective in improving confidence in preparation for OSCEs for tutees and helped consolidation of knowledge and teaching skills for tutors. Students found this more useful than lectures and curricular-based bed-side teaching within hospitals as it familiarised them with the examination format and allowed individual practise and feedback.

Take-home Messages: A peer-to-peer small-group tutoring programme is a useful learning adjunct during early clinical years and should be implemented across other medical schools. Further work is required to correlate this with real assessment scores.

Peer learning - Medical students learn from and with each other in placement training at the primary health center

AUTHOR(S):

- Carl Göranson, Brickebackens Primary Health Center, Sweden (Presenter)
- Marie Lidskog, School of Medical Sciences, Orebro University, Sweden
- Fernando Freire, Brickebackens Primary Health Center, Sweden
- Stefan Jansson, School of Medical Sciences, University Health Care Research Centre, Orebro University, Sweden

ABSTRACT

Background: Peer learning is an emerging educational concept in health education in Sweden and in other countries. Students, as peers, learn from and with each other. Studies show that students develop increased self-confidence, increased independence and confidence in their skill to solve problems and improve the ability for clinical reasoning. The aim of this pilot study was to further develop forms for clinical training which stimulate student active learning and to make the best use of available supervisor resources.

Summary of Work: During 2018, a peer learning activity was tested for medical students during their clinical training at a primary health center. Before the placement, students were informed of the peer learning project. Two students worked together. Before the meeting, the supervisor introduced the students to the tasks to be performed. The students prepared the reception together. At the patient meeting, one student took the active part and the other observed. The students took turns so that they were the active part in every two patient meetings. Feedback with supervisor and between students took place continuously after the visits and at the end of the day. The project was evaluated by a questionnaire to students and supervisors, and a student diary.

Summary of Results: Ten students agreed that they were completely instructed for the task, two agreed partly. Ten supervisors felt they gave instructions completely, five agreed partly and one didn't answer. On a scale of 1 to 5, students agreed on average 4.3 or more for questions regarding preparation, constructive feedback, facilitated learning and time for reflection and feedback. Supervisors agreed on average 4.1 or more for the same questions with focus on student learning.

Discussion and Conclusions: Although this is a pilot study, the results show that arranging a peer reception, both from student and supervisor perspective, has a positive effect. Diary writing in combination with peer reception contributes to the students gaining a deeper insight into their learning process and skills development. Larger studies are needed to confirm this.

Take-home Messages: A peer reception can create a deeper understanding of the learning process and its guidance.

Impact of near-peer tutoring weekly sessions on academic performance of first year medical students

AUTHOR(S):

- **Mohammed Khalil, University of South Carolina School of Medicine Greenville, USA (Presenter)**
- Emily Northey, University of South Carolina School of Medicine Greenville, USA

ABSTRACT

Background: Many medical schools implement near-peer tutoring (NPT) programs. Several studies have demonstrated the substantial benefits of NPT to both tutors and tutees. This study correlated the frequency of attending NPT weekly sessions to students' performance, and also compared academic performance of high attending and low attending students.

Summary of Work: Twenty-one weekly NPT sessions were delivered across all modules in the first-year (M1) by fourth and third-year medical students. The NPT weekly sessions lasted for about 90 minutes and covered around 30 questions per session. The 30 multiple-choice questions that follow USMLE Step 1 format were used to assess previous week materials. Attendance was recorded, and accordingly students were divided into three groups, high (15-21 sessions), moderate (7-14 sessions), and no-low (0-6 sessions) attendance groups. Pearson product-moment correlation coefficient was computed to assess the relationship between students' frequency of attendance and their overall performance in M1 year. Students' performance at the end of M1 year was also analyzed using ANOVA and Scheffé post hoc test ($P < 0.05$) to compare difference between the three groups. In addition, students were asked to assess the academic value of NPT weekly sessions.

Summary of Results: An increase in number of attended NPT weekly sessions corresponds with an increase in students' performance ($r=0.302$, $n=104$, $p=.002$). High attending students performed significantly higher than low attending students, $F(2,101) = 8.876$, $p = 0.00028$. Students highly rated the weekly peer tutoring experience in improving their understanding of difficult concepts (4.5/5), monitoring the progress of their learning (4.5/5), helping with their academic progress in M1 year (4.5/5), and almost all agreed to recommend the peer tutoring sessions to their fellow M1 students (4.9/5)

Discussion and Conclusions: Attending NPT weekly sessions is a valuable experience that is associated with an improvement in students' academic performance. However, students who need to attend these sessions they usually don't attend.

Take-home Messages: Low performing students tend to miss attending NPT weekly sessions, although these sessions were effective in improving students' performance.

Developing a Near-Peer Led Medical Innovation Programme for Preclinical Medical Students

AUTHOR(S):

- George Choa, UCL Medical School, UK (Presenter)
- See Chai Carol Chan, UCL Medical School, UK
- Oziegbe Eboime, UCL Medical School, UK
- Ahmed Rashid, UCL Medical School, UK

ABSTRACT

Background: Healthcare is a constantly changing environment and innovation is an important part of the work of medical professionals. Although this is recognised by the World Federation of Medical Education global standards for basic medical education, UK-based medical schools have not integrated the teaching of innovation as much as those in North America, for instance. A recent example of innovative practice by medical schools is the introduction of Near-Peer Teaching (NPT), where senior students teach junior students with the advantage of social and cognitive congruences. For junior students, NPT has been shown to have similar or better outcomes than teaching delivered by faculty members. For senior students, it allows the development of greater proficiency in the topic and improvement of professional and communication skills.

Summary of Work: Under the Student Selected Component scheme, three senior medical students led and delivered eight weekly sessions on topics of medical innovation, including education, technology and entrepreneurship. Qualitative data from semi-structured focus groups, led by an academic, conducted on the near-peer tutors and first-year medical student tutees are coded and analysed thematically using NVivo. Structured evaluation questionnaires for tutees, completed at the end of the module, are also used for analysis.

Summary of Results: Teaching sessions are currently ongoing, with formal data to be collected and analysed before the end of March. Informal feedback shows tutees recognise the importance of learning innovation to supplement their core curriculum. Tutees also appreciate being taught by near-peers, and report development of transferable skills. Similarly, tutors describe greater confidence, improved teaching competence and increased understanding of the subject matter.

Discussion and Conclusions: We believe our findings on Near-Peer Teaching will encourage senior students to take on teaching roles and prompt medical schools to support these endeavours.

Take-home Messages: Innovating a medical school curriculum by adopting a near-peer teaching method to teaching can better engage students in their education by providing a safe learning environment.

Goal-Directed Near-Peer Led Clinical Skills Programme for Third Year Medical Students

AUTHOR(S):

- Umair Khan, Nobles Hospital, Isle of Man, UK (Presenter)

ABSTRACT

Background: Clinical skills training is a critical component of medical education, in particular for third year medical students who have not been exposed to clinical teaching previously. It is widely described that formal teaching on clinical skills is lacking in the standard medical school curricula. Near-peer teaching is a novel concept, whereby the teachers are senior than their learners, but are still peers. Junior doctors represent an untapped workforce to help develop clinical skills of medical students.

Summary of Work: We present the establishment of a unique immersive clinical skills bootcamp for third year medical students, with formal teaching under five key themes: procedural skills day, examinations, imaging, data interpretation and prescribing. Lastly a simulation event was developed to allow participants to bring the different themes together, in order to successfully manage an acutely unwell patient using the newly learnt skills.

Summary of Results: The bootcamp was delivered to 15 students who showed an interest. Feedback was overwhelmingly positive with a 100% success rate. All students feel more equipped to take opportunities that arise on medical wards as a result of the skills learnt. 93% of students agree a combination of OSCE, lectures and group discussions approach was useful in their learning. Most students (87%) agree the length of the course was appropriate. Average overall tutor teaching score throughout the bootcamp ranged from 9.5-10. All students would recommend this bootcamp to their peers.

Discussion and Conclusions: Early-year clinical students successfully received an immersive, goal-directed course with formal teaching delivered by junior doctors. The near-peer teaching model improved course evaluation by students.

Take-home Messages: We were able to successfully demonstrate that near-peer teaching is effective when it is goal directed, and further when it addresses areas of medical education whereby there is disparity in the formal teaching available.

A peer-led introductory session for the first cohort of students at a new UK medical school

AUTHOR(S):

- **Ronak Shah, University of Cambridge School of Clinical Medicine, UK (Presenter)**
- Keerthi Senthil, University of Cambridge School of Clinical Medicine, UK
- Zaki Manan, Anglia Ruskin School of Medicine, UK
- Diana Wood, University of Cambridge School of Clinical Medicine, UK
- John Kinnear, Anglia Ruskin School of Medicine, UK
- Stephen Hughes, Anglia Ruskin School of Medicine, UK

ABSTRACT

Background: Anglia Ruskin University (ARU) is the first of five new medical schools in the UK. The first cohorts face establishing themselves without senior peers to offer guidance, especially on the “hidden curriculum”.

Summary of Work: Four medical students from Cambridge University gave a presentation to the first intake of students at the new ARU Medical School followed by a Question & Answer (Q&A) session, where students asked questions in person or anonymously via an online platform, Slido®. A retrospective evaluation form was distributed. By reporting the results and logistical insights, we hope to inform peers at established medical schools who wish to run similar sessions for other new medical schools.

Summary of Results: Thirteen responses to the form were obtained. Common questions before the session surrounded “student societies” (6 responses) and “learning/revision” (4). The majority, 11 students, considered the presentation and Q&A as equally helpful though 2 thought the Q&A was more helpful. Students chose the preferred stage of the medical students presenting (multiple responses allowed). The frequencies of each stage selected were as follows: first years: n=6, second years: n=9, third years: n=8, fourth years: n=9, fifth/sixth years: n=6. All, bar one, thought it convenient holding the session in the evening. Six students thought the 1.5 hours session was too long in duration. Slido®’s helpfulness was rated as 4/5 on average. Five students felt more confident about their studies following the session, with 8 still unsure and nobody feeling less confident. Overall, the session was rated 8.3/10 (range: 7-10) on average. All students considered it a valuable session.

Discussion and Conclusions: This session was rated well and was a useful contribution to ease anxieties of new students. Follow up including academic, social and sporting contacts have been arranged. Limitations include small sample size and retrospective dissemination of the form.

Take-home Messages: 1. This session was considered valuable 2. Key topics to cover: learning techniques and student societies 3. Helpful features include shorter sessions, evening scheduling, use of Slido® and Q&A sessions.

#10MM Posters - Students: Engagement/Peer Assisted Learning/Student as teacher

10MM14 (841)

Date of Presentation: Wednesday, 28 August 2019

Time of Session: 0830-1015

Location of Presentation: Hall/Foyer F, Level 0

Committing to change - what do students want to improve after a peer teaching course with cases from general practice?

AUTHOR(S):

- Julia Freytag, Charité Universitaetsmedizin Berlin, Germany (Presenter)
- Susanne Lueck, Charité Universitaetsmedizin Berlin, Germany
- Maike Buchmann, Charité Universitaetsmedizin Berlin, Germany
- Fabian Stroben, Charité Universitaetsmedizin Berlin, Germany
- Peter Eberz, Charité Universitaetsmedizin Berlin, Germany
- Tanja Hitzblech, Charité Universitaetsmedizin Berlin, Germany

ABSTRACT

Background: Peer-assisted learning is widely used in medical education and represents an important opportunity for students to practice different skills. At Charité Berlin a peer teaching course about general practice cases allows students to train their skills in history-taking and physical examination. To study the effect of this course on the students, we use the concept of commitment to change (C2C). Since the training of communication skills is one of the main goals of the course, we are especially interested in commitments regarding this area.

Summary of Work: In this course participants have the opportunity to talk to, examine and diagnose a simulated patient (SP). Students receive feedback on their communication skills from the SP and on their technical skills and their treatment plan from the tutor and their peers. Afterwards the participants name up to three aspects of their behavior they commit to change and rank their level of commitment (LOC) to integrate these changes (scale: 1-5, very weak to very strong). These commitments are classified into different categories, using the CanMEDs framework. After 6 weeks, the participants are asked if they had succeeded in implementing the changes.

Summary of Results: 44 students (16 courses) agreed to take part in the study and came up with a total of 99 commitments. 24 of those C2Cs cover medical knowledge or examination skills and reflect the CanMEDs role of the 'medical expert'. The remaining commitments included different aspects of communication skills (CanMEDs 'communicator'), reflecting mostly key competencies 1 ('professional therapeutic relationship'; 29 C2Cs, mean(LOC)=4) and 2 ('elicit and synthesize information', 26 C2C, mean(LOC)=3.9). 13 students (29.5%) answered the follow-up, claiming they could integrate the changes partly.

Discussion and Conclusions: After participating in the course, students identified areas for improvement regarding communication skills, medical knowledge and technical skills, with a clear focus on different communication skills. These results are in line with the course's learning objectives.

Take-home Messages: Participants of the course mainly committed to changes regarding their communication behavior. C2Cs represent a helpful way to investigate a peer-led training's effects on its participants and their accordance with the learning objectives.

#10MM Posters - Students: Engagement/Peer Assisted Learning/Student as teacher

To what extent are medical students' motivations to seek teaching experience impacted by their recognition that their future role as a doctor will involve teaching?

AUTHOR(S):

- Henry Mitchell, Queen Mary University of London, UK (Presenter)
- Siobhan Cooke, Queen Mary University of London, UK
- Daisy Champion, Queen Mary University of London, UK

ABSTRACT

Background: The proficiency of a doctors teaching skills impacts the quality of teaching they deliver. Exposure to teaching experience plays a strong role in the development of novice teachers yet the extent to which medical students engage with extracurricular teaching opportunities is varied. This project will explore students perceived importance of their preparation for their role as a teacher and their motivations for seeking out teaching experience. Research has explored clinicians' motivations to teach but overlooked medical students' motivations. By uncovering medical students' motivations to teach it may help to encourage more students to develop as teachers. This in turn would improve the quality of teaching students receive and facilitate an increase in the size of the medical education faculty to meet the demands of the UKs growing medical student population.

Summary of Work: The research question was answered through semi-structured qualitative interviews of twelve medical students who have undertaken some form of teaching experience, either through peer group teaching or through an intercalated degree in medical education. The topics explored involved discussion of reasons for undertaking teaching experience and beliefs surrounding the role of a doctor as a teacher. Interview data was analysed using thematic analysis.

Summary of Results: Results of this research project may show a variation in medical students' motivations to pursue teaching experience, including a recognition of the importance of the role of a doctor as a teacher and a need to prepare for that role. However, it is anticipated that other motivations will be uncovered such as a desire to benefit the student community or to improve the strength of students' CVs.

Discussion and Conclusions: The research may reveal that not all medical students undertake teaching experience as a way to prepare themselves for becoming a teacher. This understanding can be used to encourage more students to pursue teaching by doing more to help them understand the roles importance and that teaching experience offers a way of preparing them for that role.

Take-home Messages: By exploring medical students' motivations to teach and awareness of their need to develop teaching skills there is scope to encourage more students to prepare themselves for their role as a teacher.

Starting Early: Can a peer teacher training program (PTT) help to develop medical students' teaching and feedback skills?

AUTHOR(S):

- Chiraag Thakrar Karia, University Hospitals of Leicester NHS Trust, UK (Presenter)
- Andrew Hughes, University Hospitals of Leicester NHS Trust, UK
- Judith West, University of Leicester Medical School, UK
- Joanne Kirtley, University Hospitals of Leicester NHS Trust, UK
- Annette Burgess, University of Sydney, Australia
- Sue Carr, University Hospitals of Leicester NHS Trust, UK

ABSTRACT

Background: Skills in peer teaching, assessment and feedback are increasingly documented as important graduate attributes for healthcare students in the UK. In Leicester, the General Medical Council (GMC) National Trainee Survey and the National Student Survey have highlighted the need to improve feedback given to medical students and doctors in training. This study sought to evaluate the implementation of a new blended learning Peer Teacher Training program, designed to support the development of teaching and feedback skills.

Summary of Work: The PTT program for healthcare students was developed by the University of Sydney in 2016, and run for University of Leicester undergraduate medical students in May 2017 and November 2018. The program was evaluated using a combination of qualitative and quantitative data. Students were invited to complete 18 pre-course questions and 25 post-course questions (using self-rated Likert scale (0 (low) - 10 (high), and open-ended questions) on their understanding and confidence in teaching. Semi-structured focus groups were run after each course to gain insight on students' perceptions. Quantitative data was analysed using descriptive statistics and qualitative data was analysed using thematic analysis.

Summary of Results: Twenty (10 male) fourth-year medical students, median age 23 (range 21-30) years, self-selected to participate in the PTT program across the two dates. Seventy percent of students had previous informal training in teaching and 90% stated previous teaching experience. All participants completed the pre- and post-course questionnaires. Nine (4 male) students attended the focus groups. Students reported 37% increased confidence when planning a learning activity, 25% improvement in their ability to provide structured feedback and 36% improvement in ability to apply basic educational principles. Students with less experience self-reported higher levels of improvement.

Discussion and Conclusions: The program was an effective way for medical students to gain competence and confidence in teaching and feedback. Students welcomed the idea of involving other healthcare students and we plan to extend the course to include different healthcare roles.

Take-home Messages: The PTT program provides an early, modular approach for medical students to gain confidence in supervision, teaching and mentoring as required in the GMC's good medical practice.

A case study of higher education student volunteer mentors within the charity SHINE Mentoring

AUTHOR(S):

- Sonia Akrimi, Brighton and Sussex Medical School, UK (Presenter)
- Elizabeth Anderson, King's College London, UK

ABSTRACT

Background: The UK General Medical Council (GMC) highlights the importance of professional skills for graduate doctors including good communication, collaborative practice, and leadership, but limited capacity exists in undergraduate curricula for training in these skills. Extra-curricular activities (ECAs) offer experiences outside the curriculum which may develop these skills, but the benefits are under-studied. SHINE Mentoring, a charity supporting students mentoring schoolchildren, is popular with medical students. This study explored the experience of students in SHINE, particularly whether ECAs complement undergraduate training.

Summary of Work: We used a case study design to explore in-depth the experience of students in SHINE. All student volunteers from across degree programmes were invited to participate, enabling insight into interdisciplinary learning. Data were collected through 7 recorded group interviews (2-5 students in each group, totalling 18) and observation of 1 student-led team review meeting (5 students), providing data about their experiences unmediated by researchers. Of 23 participants, 9 studied medicine, 5 other health-degrees. Data were coded concurrently with data collection and themes identified inductively.

Summary of Results: The context of this study is a cross-disciplinary ECA and results are reported for all students even though primarily focussed on skills needed for graduate doctors. Three themes emerged: 1) Personal development. Students developed new social networks. They valued working with students from other degree programmes, and learned about social challenges among mentored children. 2) Formal learning. Students identified links to degree-learning, particularly clinical students who highlighted experience working with children and explaining concepts when communication was challenging. 3) Learning for the future. Students gained workplace skills including leadership, multidisciplinary teamwork, and personal organisation. Students agreed that professional practice was expected of them as a mentor and project leader, including reflection, which related to professional practices required in employment.

Discussion and Conclusions: Students believed ECAs supported learning, personal and professional development regardless of degree programme. Multiple links existed between medical students' experiences and outcomes required of graduating doctors. Experiences gained from group-learning were identified, linking to GMC outcomes regarding collaborative learning and multi-disciplinary team-working.

Take-home Messages: This study provides new insight into specific contributions ECAs can make to undergraduate training, particularly development of important non-technical skills required of a graduate doctor.

#11A PechaKucha™ Presentations

Date of Presentations: Wednesday, 28 August 2019

Time of Presentations: 1045-1135

Location of Presentations: Hall A/C, Level 2

- **Topic 1:** The crossroads of residency: The present tough decisions of a young doctor - Agostinho Sousa (*European Junior Doctors*)
- **Topic 2:** The values we teach - Teodor Blidaru (*IFMSA Liaison Officer to Student Organizations (LOSO) and a medical student at the Carol Davila University of Medicine and Pharmacy, Bucharest*)
- **Topic 3:** Health literacy and medical students - Beatriz Atienza Carbonell (*Medical Education Director, European Medical Students Association, Spain*)
- **Topic 4:** Creating the Future Workforce - Jennene Greenhill (*Flinders Rural Health South Australia, Flinders University College of Medicine and Public Health, Australia*)
- **Topic 5:** These Ideas Must Die: The Zombies of MedEd - Jason Frank (*Royal College of Physicians and Surgeons of Canada*)
- **Topic 6:** The Thinking Sidecar: Five Thoughts on Machine Learning, Medicine, and Future Physicians - Ruben R. Puenteadura (*Hippasus, USA*)

#11B Plenary 4

Date of Presentation: Wednesday, 28 August 2019

Time of Presentation: 1135-1220

Location of Presentation: Hall A/C, Level 2

ICAP: How to Promote Deeper Learning by Engaging Students Constructively and Co-constructively

Michelene Chi (Arizona State University, USA)

Summary: ICAP is a theory of active learning that differentiates students' engagement based on their overt behaviors and the products they generate. ICAP postulates that Interactive engagement, demonstrated by co-constructive collaborative behaviors, is superior for learning than Constructive engagement, indicated by generative behaviors. Both kinds of engagement exceed the benefits of Active or Passive engagement, marked by manipulative and attentive behaviors, respectively. ICAP's predictions are supported by numerous studies in the literature. ICAP can also be used as a tool to dictate how learning activities should be designed, including how instructional videos should be created to maximize student learning.

Biography: *Michelene (Micki) Chi is Foundation Professor and Regents' Professor at Arizona State University (ASU), and the Dorothy Bray Endowed Professor in the Mary Lou Fulton Teachers College at ASU. A cognitive and learning science researcher, Dr. Chi's Learning and Cognition Lab carries out three lines of funded research on how students learn. Dr. Chi has published widely and her work has been cited well over 50,000 times. She received the Distinguished Contributions to Research in Education Award from the American Educational Research Association in 2016, and the prestigious David Rumelhart Prize from the Cognitive Science Society in 2018.*
