Sunday 25 August 2019

Time	Location	Session Type	Session Code	Title of Session	Thread
1730-1915	Hall A/C, Level 2	Plenary	1	Plenary 1: Threshold Concepts and Troublesome Knowledge: a transformational approach to learning	

Monday 26 August 2019

Time	Location	Session Type	Session Code	Title of Session	Thread
0830-0945	Hall A/C, Level 2	Plenary	2	Plenary 2: Medical Work and Learning in Transition: Toward Collaborative and Transformative Expertise	
1015-1200	Hall A, Level 2	Symposium	3A	Activity Theory & Medical Education	
	Hall C, Level 2	Symposium	3B	Causes & Prevention of Cognitive Errors	
	Hall N, Level 1	Symposium	3C	Diversity Across the Globe	Diversity
	Room L3, Level 1	Symposium	3D	Adapting to the Changing Times in Health Sciences Education	
	Hall M, Level 1	Research Papers	3E	Learning Spaces & Environment	
	Room L6, Level 1	Research Papers	3F	Health Care Implementation	
	Room 1.85-86, Level 1	Point of View	3G	Point of View 1	
	Room 1.61-62, Level 1	Patil	3H	Patil Teaching Innovation Awards 1	
	Room L2, Level 1	Short Communications	3I	Assessment: Self Assessment, Peer Assessment & Portfolios	
	Room 0.31-32, Level 0	Short Communications	3J	Humanities 1	Humanities
	Room 0.14, Level 0	Short Communications	3K	CPD 1	CPD
	Room L7, Level 1	Short Communications	3L	Clinical Teaching	
	Room 0.94-95, Level 0	Short Communications	3M	Student Engagement	
	Room 2.15, Level 2	Short Communications	3N	Competency Based Education	
	Room 2.31, Level 2	Short Communications	3O	Patient Safety	Patient
	Room L1, Level 1	Short Communications	3P	Surgery 1	Surgery
	Room 0.15, Level 0	Short Communications	3Q	Simulated Patients	
	Room 0.16, Level 0	Short Communications	3R	Postgraduate Education 1	Postgraduate
	Room 0.51, Level 0	Short Communications	3S	Teaching & Learning 1	
	Room L5, Level 1	Round Table	3T	Faculty Development	
	Room L8, Level 1	Workshop	3U	Programmatic Assessment in Action	
	Room 0.11-12, Level 0	Workshop	3V	Collaboration in Lifelong Learning	
	Room 0.49-50, Level 0	Workshop	3W	Institutional Ethnography	

Time	Location	Session Type	Session Code	Title of Session	Thread
1015-1200	Room 0.96-97, Level 0	Workshop	3X	Effective Use of Technology to Capture & Report About EPAs	
	Room 2.17, Level 2	Workshop	3Y	How we used Threshold Theory to Address Challenges in Under and Postgraduate Training	Threshold Concepts
	Room 2.44, Level 2	Workshop	3Z	Context is Critical: exploring pedagogies of place in HPE	
	Room 2.61, Level 2	Workshop	3AA	Serious Games Development & Implementation in HPE	
	Room 2.83, Level 2	Workshop	3BB	Development of SJT for Selection, Development & Assessment	
	Room 2.95, Level 2	Workshop	3CC	Virtual/Augmented/Mixed Reality & the New Hologram Based Reality	
	Foyer B, Level 2	ePosters	3DD	Communication	
	Foyer C, Level 2	ePosters	3EE	Workplace-Based Learning	
	Crystal Lounge, Level 1	ePosters	3FF	Patient Perspective & Involvement	Patient
	Hall F and Hall F Foyer, Level 0	Posters	3GG	Empathy & Ethics	
		Posters	3HH	Postgraduate: Assessment/Feedback	Postgraduate
		Posters	3II	Curriculum Subjects 1	
		Posters	3JJ	Management & Leadership	
		Posters	3KK	Student: Self Directed Learning / Career Choice	
		Posters	3LL	Assessment: OSCE	
		Posters	3MM	Postgraduate: Specialty Training	Postgraduate
	Suite E, Level 0	Assessment Clinic	3NN	Assessment Policy, Practice and Research Clinic	
1400-1530	Hall A, Level 2	Symposium	4A	Every way of seeing is a way of not seeing: Critical Insights into the Blind Spots of Entrustment Language	
	Hall C, Level 2	Symposium	4B	How to train your dragon: Transforming Faculty Development in Social and Behavioural Sciences	
	Hall N, Level 1	Symposium	4C	From Simulation to Workplace: translating lessons for clinical event debriefings	
	Room L3, Level 1	Short Communications	4D	Teaching & Learning: Team-based Learning	
	Hall M, Level 1	Research Papers	4E	Selection in Health Professions Education	
	Room L6, Level 1	Research Papers	4F	Feedback in Health Professions Education	
	Room 1.85-86, Level 1	PechaKucha™	4G	PechaKucha 1	
	Room 1.61-62, Level 1	Patil	4H	Patil Teaching Innovation Awards 2	
	Room L2, Level 1	Short Communications	4I	Assessment: OSCE 1	
	Room 0.31-32, Level 0	Short Communications	4J	Ethics	
	Room 0.14, Level 0	Short Communications	4K	Curriculum: Social Accountability	
	Room L7, Level 1	Short Communications	4L	Career Choice	
	Room 0.94-95, Level 0	Short Communications	4M	Student in Difficulty	

Time	Location	Session Type	Session Code	Title of Session	Thread
	Room 2.15, Level 2	Short Communications	4N	Curriculum: Learning Environment	
	Room 2.31, Level 2	Short Communications	4O	eLearning 1	
	Room L1, Level 1	Short Communications	4P	Diversity & Gender	Diversity
	Room 0.15, Level 0	Short Communications	4Q	Threshold Concepts	Threshold Concepts
	Room 0.16, Level 0	Short Communications	4R	Postgraduate Education 2	Postgraduate
	Room 0.51, Level 0	Short Communications	4S	Management 1	
	Room L5, Level 1	Round Table	4T	Patient Engagement	Patient
	Room L8, Level 1	Workshop	4U	Reviewing for MedEdPublish – enhancing scholarship	
	Room 0.11-12, Level 0	Workshop	4V	Longitudinal Integrated Leadership Advanced Curriculum	
	Room 0.49-50, Level 0	Workshop	4W	Designing and Developing Shared Curricular Ecosystems	
	Room 0.96-97, Level 0	Workshop	4X	Using Conceptual Framework to Shape & Situate your Scholarly Work	
	Room 2.17, Level 2	Workshop	4Y	Managing & Supporting the Educator in Trouble	Postgraduate
	Room 2.44, Level 2	Workshop	4Z	Digital Health: Bridging the Gap in Medical Education	Postgraduate
	Room 2.61, Level 2	Workshop	4AA	Workplace-based Assessment & Entrustment in the AAMC Core EPA Pilot	
	Room 2.83, Level 2	Workshop	4BB	Writing MCQs to Assess Professionalism & Communication Skills	
	Room 2.95, Level 2	Workshop	4CC	Online Assessment with the Students' own Devices: an evidence based and practical approach to eAssessment	
	Foyer B, Level 2	ePosters	4DD	CPD / Life Long Learning	CPD
	Foyer C, Level 2	ePosters	4EE	Curriculum Development

TUESDAY 27 AUGUST 2019

Time	Location	Session Type	Session Code	Title of Session	Thread
0830-0945	Hall A/C, Level 2	Plenary	6	Plenary 3: A Call to Action: Patients as Partners in Healthcare Professions Education and Practice	
1015-1200	Hall A, Level 2	Symposium	7A	Expanding the Role of Patients as Partners in Education	Patient
	Hall C, Level 2	Symposium	7B	Understanding Student Behaviour: The role of digital data	
	Hall N, Level 1	Symposium	7C	Transformative Learning: a pedagogy for the health professions	
	Room L3, Level 1	Short Communications	7D	Interprofessional Education 1	
	Hall M, Level 1	Research Papers	7E	Diversity in the Curriculum	Diversity
	Room L6, Level 1	Research Papers	7F	Professionalism & Communication Skills	
	Room 1.85-86, Level 1	Point of View	7G	Point of View 2	
	Room 1.61-62, Level 1	Short Communications	7H	Curriculum: EPAs	
	Room L2, Level 1	Short Communications	7I	Assessment: Written & Progress Test	
	Room 0.31-32, Level 0	Short Communications	7J	Humanities 2	Humanities
	Room 0.14, Level 0	Short Communications	7K	CPD 2	CPD
	Room L7, Level 1	Short Communications	7L	Longitudinal Integrated Clerkships	
	Room 0.94-95, Level 0	Short Communications	7M	Student as Teacher	
	Room 2.15, Level 2	Short Communications	7N	Curriculum: Subjects in the Curriculum	
	Room 2.31, Level 2	Short Communications	7O	Clinical Reasoning	
	Room L1, Level 1	Short Communications	7P	Surgery 2	Surgery
	Room 0.15, Level 0	Short Communications	7Q	Selection: Methods	
	Room 0.16, Level 0	Short Communications	7R	Postgraduate Education 3	Postgraduate
	Room 0.51, Level 0	Short Communications	7S	Teaching & Learning 2	
	Room L5, Level 1	Round Table	7T	Learner in Difficulty	

Time	Location	Session Type	Session Code	Title of Session	Thread
1015-1200	Room L8, Level 1	Workshop	7U	Simulation Journal Club	
	Room 0.11-12, Level 0	Workshop	7V	To Self-Direct or not to Self-Direct? Shining a Light on Curriculum Dilemmas	
	Room 0.49-50, Level 0	Workshop	7W	From Young Teacher to Young Educator: Crystallising educational aspirations into practical steps	
	Room 0.96-97, Level 0	Workshop	7X	Medical Education: The Costs vs the Profits	
	Room 2.17, Level 2	Workshop	7Y	The Cultivation of Cognitive Curiosity: Key for learning, clinical competence, engagement and well-being	
	Room 2.44, Level 2	Workshop	7Z	Burnout Amongst European Junior Doctors	
	Room 2.61, Level 2	Workshop	7AA	Coaching for Professionalism Remediation: Tools for establishing trust, diagnosing learners & creating remediation plans	
	Room 2.83, Level 2	Workshop	7BB	An International Perspective on Testing Accommodations	
	Room 2.95, Level 2	Workshop	7CC	Quality through Innovation in Medical Education	
	Foyer B, Level 2	ePosters	7DD	Professionalism / Ethics / Career Choice	
	Foyer C, Level 2	ePosters	7EE	Simulation / Virtual Patients	
	Crystal Lounge, Level 1	ePosters	7FF	Technology Enhanced Learning 1

1045-1230	Hall A/C, Level 2	Plenary	11A	PechaKucha™ Presentations & Plenary 4	
		Plenary	11B	Plenary 4: ICAP: How to Promote Deeper Learning by Engaging Students Constructively and Co-constructively	

#1 Plenary 1

Date of Presentation: Sunday, 25 August 2019

Time of Presentation: 1800-1850

Location of Presentation: Hall A/C, Level 2

Threshold Concepts and Troublesome Knowledge: a transformational approach to learning

Professor Ray Land, University of Durham, UK

Summary: This presentation explores how the Threshold Concepts Framework might offer medical educators new perspectives in terms of how they design curricula, approach teaching and support learners. Threshold Concepts, akin to a portal, open up previously inaccessible ways of thinking about phenomena and lead learners into new conceptual, affective and ontological terrain. As 'jewels in the curriculum', they are central to ways of thinking and practising within a discipline. But this entails encounters with 'troublesome knowledge' and may leave learners in a state of 'liminality', a suspended state or 'stuck place' in which understanding might approximate to a kind of 'mimicry'.

Biography: Ray Land is Emeritus Professor of Higher Education and Emeritus Fellow of University College at Durham University. He has published widely in educational research, including works on academic development, learning technology and quality enhancement. He has acted as consultant for the OECD, the European Commission and the British Council and recently conducted projects in Europe, Latin America and India. He has presented on his research in over fifty countries across six continents. He is a Fellow of the Academy of Social Sciences, Fellow of the Royal Society of Arts and Principal Fellow of the Higher Education Academy.

Medical Work and Learning in Transition: Toward Collaborative and Transformative Expertise

Yrjö Engeström (Professor of Adult Education and Director of the Center for Research on Activity, Development and Learning (CRADLE) at University of Helsinki and Professor Emeritus of Communication at University of California, San Diego)

Summary: Drawing on cultural-historical activity theory, this talk recasts expertise as fluid collaboration on complex tasks requiring envisioning the future and mastering change. Expertise is increasingly taking the shape of collaboration between practitioners and patients from multiple backgrounds. Such collaborative expertise must also be transformative, able to tackle emerging new problems and changes in organizational frameworks. The transition toward collaborative and transformative expertise is led by three spearheads: collective object-oriented activity systems; flexible knotworking; and expansive learning of new patterns of activity. The presentation builds on 30 years of interventionist research in medical work and learning, summed up in the new book *Expertise in Transition: Expansive Learning in Medical Work* (Engeström, 2018).

Reference: Engeström, Y. (2018). *Expertise in transition: Expansive learning in medical work*. Cambridge: Cambridge University Press.

Biography: Yrjö Engeström is Professor Emeritus of Adult Education at University of Helsinki and Professor Emeritus of Communication at University of California, San Diego. He is Director of the Center for Research on Activity, Development and Learning (CRADLE), and serves as visiting professor at Rhodes University in South Africa and at University West in Sweden. In his work Engeström applies and develops cultural-historical activity theory as a framework for the study of transformations in educational settings and work activities, with a particular focus on health care. He is known for his theory of expansive learning and for the methodology of formative interventions, including the Change Laboratory method. Engeström's most recent books are *From Teams to Knots: Activity-Theoretical Studies of Collaboration and Learning at Work* (2008), *Learning by Expanding: An Activity-Theoretical Approach to Developmental Research*, 2nd Edition (2015), *Studies in Expansive Learning: Learning What Is Not Yet There* (2016), and *Expertise in Transition: Expansive Learning in Medical Work* (2018), all published by Cambridge University Press.

#3A Symposia

Date of Presentation: Monday, 26 August 2019

Time of Presentation: 1015-1200

Location of Presentation: Hall A, Level 2

Activity Theory and Medical Education: Foundations, findings and future perspectives

Presenters:

- Yrjö Engeström, The Center for Research on Activity, Development and Learning, University of Helsinki, Finland (speaker)
- Alan Bleakley, Faculty of Medicine and Dentistry, University of Plymouth, UK (speaker)
- Tim Dornan, The Queen's University, Belfast, UK (speaker)
- Loes Meijer, Julius Center for Health Sciences and Primary Care, University Medical Centre Utrecht, the Netherlands (speaker)
- Eeva Pyörälä, Center for University Teaching and Learning, University of Helsinki, Finland (moderator)

Summary of theme and why it is important: Professor Yrjö Engeström is an internationally leading figure in Activity Theory, which is one of the featured topics at AMEE 2019. He developed expansive learning, an interventionist and participatory research approach, to studying change in complex organizations. AMEE will have the privilege of hosting a plenary lecture by Professor Engeström during AMEE. He has kindly agreed, also, to join researchers who have drawn on his ideas in providing a symposium, which will allow delegates to learn more about Activity Theory from illustrative examples, ask questions in a plenary discussion, and consider its implications for their educational practice.

Participants will gain theoretical and practical insights into applying Activity Theory to education research in complex clinical workplace environments and to the education of healthcare professionals. These types of studies actively involve all stakeholders, including patients, in collective problem-solving and boundary-crossing. This advances the activities of organisations while positively changing their cultures.

Speakers will share their experience of applying Activity Theory to demonstrate applications of theoretical foundations accessible to participants, stimulating discussion about the future directions of socio-cultural research and expansive learning.

Professor Yrjö Engeström, whose expertise spans a wide range of educational contexts, will examine what Activity Theory and expansive learning have to offer our field. Professor Alan Bleakley will bridge Activity Theory and educational practice by examining the introduction of humanities into a medical undergraduate curriculum. Professor Tim Dornan will use Activity Theory as an interpretive lens to examine an educational programme, in which patients and members of the various clinical disciplines caring for them co-produced change. Doctor Loes Meijer will describe how she has used Engeström's change laboratory technique to study the learning of medical specialists and general practitioners during collaborative patient care.

We will encourage AMEE delegates to share their views of and passion for medical education research and explore new and revitalising directions for future studies.

Who should participate in the symposium? This symposium will be beneficial to all delegates interested in medical education research, and particularly for scholars interested in studying learning in complex organizations in change and involving participants in the research process. The symposium will be of interest to researchers and academics at all levels.

What will you gain from participating? Participants in the symposium will gain:

- Scholarly understanding of the potential Activity theory and expansive learning offer to medical education research.
- Insights into a powerful approach to exploring learning in complex settings such as clinical workplaces.
- Inspiration to involve patients and carers as active participants in medical education and research.

#3B Symposia

Date of Presentation: Monday, 26 August 2019

Time of Presentation: 1015-1200

Location of Presentation: Hall C, Level 2

Causes and prevention of cognitive errors (diagnostic error). How will they inform our methods of teaching this to our learners? Is this possible?

Presenters:

- Dan Mayer, Retired from Albany Medical College, USA
- Michelle Daniel, University of Michigan Medical School, USA
- Robin Hemphill, University of Michigan Medical School, USA
- Sorabh Khandewal, Ohio State University Medical College, USA
- Sandra Montiero, McMaster University, Canada
- Geoff Norman, McMaster University, Canada

Summary of theme and why it is important: Diagnostic errors frequently cause adverse outcomes in medicine. The causes of most diagnostic errors and proposed methods of preventing them should be taught to our learners across the medical curriculum. The current debate is whether we can give our learners adequate training in recognizing potential cognitive ‘traps’ that lead to diagnostic errors? Or, should we explore “just in time” approaches like content-specific checklists? Do we need to put more of our educational effort into honing the learner’s skills in ‘pattern recognition’ by increasing their experience in managing various cases? The workshop will present this debate through case presentations informing the discussion to explore competing approaches to this problem.

Who should participate in the symposium? This is aimed at medical educators at all levels of medical education (UGME, GME and CPD). It will specifically be useful for faculty who develop clinical reasoning courses in medical school and residency. It will also help those who supervise medical students, residents or practicing physicians in their clinical work. It will also help researchers interested in studying clinical reasoning and cognitive error prevention in diagnosis.

What will they gain from participating? Appreciation of the controversy between teaching cognitive science and causes of diagnostic errors (‘debiasing’ and ‘diagnostic time outs’) compared to ‘just in time learning’ and content specific checklists. The discussion will clarify how these perspectives could improve clinician diagnosis and what unforeseen consequence might occur. Create unique mechanisms to teach techniques to reduce diagnostic error in various educational environments. What current research is most likely to inform the optimal education our learners require to prevent diagnostic errors?

Location of Presentation: Hall N, Level 2

Diversity across the globe: Sharing experiences and challenges with equity and inclusion in medical education

Presenters:

- Anna Vnuk, School of Medicine, College of Medicine and Public Health, Flinders University, Adelaide, Australia
- Sabine Ludwig Charité - Universitätsmedizin Berlin, Institute of Medical Sociology and Rehabilitation Science, Germany
- Maaïke Muntinga, School of Medicine, Amsterdam UMC-location VUmc, the Netherlands
- Stephanie Okafor, School of Medicine, Amsterdam UMC-location VUmc, the Netherlands
- Arianne Teherani, Center for Faculty Educators, University of California, San Francisco School of Medicine, USA
- Brahm Marjadi, School of Medicine, Western Sydney University, Australia
- Margot Turner, St George's University of London, UK

Summary: We understand the need to address diversity in medical education and health care as a social justice issue and a basic tenet of quality of education and health care. Unfortunately, medical education lags behind in its efforts to create and sustain a diverse and equitable learning environment, and thus perpetuates structural and economic disparities. For instance, although many medical schools globally are committed to enrolling a diverse student body, increased diversity does not imply equity once students are enrolled; students from diverse backgrounds encounter obstacles to success including academic and learning environment pressures. At the curricular level, medical education is slow to critically investigate for whom and under which conditions the knowledge it incorporates is 'true', and many schools overlook the increasing body of knowledge on diversity and health, including but not limited to sex and gender issues, ethnicity/race, ageism, and (dis)ability, as well as their intersectionality. These absences indicate the presence of barriers manifested in policies, practices, and norms within our institutions. In order to create societal change and prepare a diverse body of future doctors to provide health care for a diverse body of patients, medical education itself needs to change. The aims of this symposium are to share and discuss initiatives, experiences, and research on the far-reaching ways medical schools promote equality and equity.

In this interactive symposium, a range of advocates for diversity in medical education from across the globe, including medical students, will address a range of issues in teaching and learning about a range of 'different differences' and their intersections. We present four topics in short presentations. First, Dr. Maaïke Muntinga and Stephanie Okafor will present experiences and challenges with involvement of students in medical education projects. Second, Dr. Arianne Teherani will discuss internal change in schools. Third, Dr. Brahm Marjadi will share experiences on mainstreaming diversity with the support of community partners and hospital-based clinicians. Finally, Margot Turner will present different approaches to assessing diversity, and the feedback on assessment from staff and students. Next, we will introduce practical examples, for instance video-art to discuss in- and exclusion in medical education, the critical-incident-in-the-classroom exercise, a checklist on diversity at the institutional level, or what an OSCE to assess diversity looks like. In doing so, we will have addressed diversity at three distinct levels (Schiebinger, 2008):

1. Fixing the numbers refers to the composition of the student body in medical schools or to the numbers of female and minority students and staff in education, teaching, research, and management, thus, to 'body counts' and equal opportunity.
2. Fixing the institutions refers to learning climates and organizational culture of medical schools: to legal regulations and professional standards, for instance whether admission policies are dedicated to equality, but also to unspoken assumptions and values behind ways of doing and behind claims of neutrality and objectivity.
3. Fixing the knowledge emphasizes exclusion in our knowledge base. At this level, we focus on curricular and knowledge content, on implementing knowledge in the curriculum, and on assessment.

The symposium will discuss experiences across the globe at each level and suggest several tried and tested approaches.

Who should participate in the symposium? Students, faculty, leaders, medical educators, researchers who

- are interested in and curious about learning about initiatives and programs to improve equity and inclusion in medical education;
- would like to address diversity and are in need of inspiration, ideas and tools;
- are willing to share and exchange their experiences in addressing diversity; and
- desire to be part of an international network (International Community of Practice on Diversity, Equity and Inclusion in Medical Education).

What will they gain from participating? Participants will

- gain insight and ideas in how to address diversity at different levels;
- gain the experience of sharing and listening to others about diversity;
- learn from global colleagues with different backgrounds and perspectives;
- bring back knowledge, reflections, tools and resources to their institution, and;
- have the opportunity to participate in an international network of researchers and educators who work on and have experience in diversity in medical education (ICoP Diversity, Equity and Inclusion in Medical Education).

Adapting to the changing times in health sciences education

Presenters:

IAMSE Symposium

- Peter GM de Jong
- Sandy Cook
- Neil Osheroff
- Cathy Pettepher
- Rick C Vari

Summary: Health sciences education is always in motion. New educational strategies are being explored, new technologies are being introduced and curricula are modernized. Also society is changing requiring different roles and skills of the future health care provider. As a result the roles of both educator and student in health professions education are constantly changing. This symposium will highlight a few of the current developments and will discuss its implications with the audience.

Presentations:

Cathy Pettepher: The Educational Roles of Basic Scientists in the Clinical Years

Richard C Vari: Curricular Innovations and their Impact

Sandy Cook: Using a Flipped Classroom Model to create an engaging learning environment

Neil Osheroff: Effects of changing educational roles on faculty identity

“I feel like I sleep here”: How space and place influence medical student experiences

AUTHOR(S):

- Lorraine Hawick, Centre for Healthcare Education Research and Innovation, University of Aberdeen, UK (Presenter)
- Jennifer Cleland, Centre for Healthcare Education Research and Innovation; School of Medicine, Medical Sciences and Nutrition, University of Aberdeen, UK
- Simon Kitto, Department of Innovation in Medical Education, University of Ottawa, Canada

ABSTRACT

Introduction: Buildings and learning spaces contribute in crucial ways to peoples’ experiences of these spaces. However, this aspect of context has been under-researched in medical education. We addressed this gap in knowledge by using the conceptual notions of space and place as heuristic lenses to explore the impact of a new medical school building on student experiences.

Methods: We carried out an exploratory case study to explore the impact of a new medical school building on student experiences. Data were collected from: archived documents (n=50), interviews with key stakeholders (n=17) and focus group data from students (n=17 [participants]); to provide context and aid triangulation. Data coding and analysis were initially inductive, using thematic analysis. After themes emerged, we applied the concepts of boundary objects, liminal space and Foucault’s panopticon to provide a framework for the data.

Results: There was a specific vision and intentions for the place (the location) and space (the facilities) of the new medical school building (e.g., positioned to facilitate flow between educational and clinical settings). However, the unintentional consequences of the planning were that students felt disconnected from the wider university, trapped on the healthcare campus, and under pressure to behave not like students but in a manner that they believed was expected by clinical staff and patients.

Discussion: Despite much effort and a focus on creating an idyllic space and place, the new medical school had both positive and (unintentionally) negative impact on student experiences. These findings highlight the importance of reflecting on, and exploring, how space and place may influence and shape students’ learning experiences during the formative years of their professional identity, a necessary consideration when planning new medical school learning spaces or changing these spaces.

Conclusions: The current study joins an existing conversation on the topic of the space and place of learning in medical education (1). Our empirical data expands this conversation, providing insight into the process of implementing the vision of a new learning space and the resultant experiences and perceptions of students studying in that place. We have shown that ‘place is remarkable, and what makes it so, is an unwindable spiral of material form and interpretative understandings or experience’ (2) (p.471). We urge those involved in planning medical school spaces to continue this discussion by considering how reflecting on, and exploring, how space and place may influence and shape students’ learning experiences.

The pedagogical encounters and learning environment on a student unit in Sweden: an observational study

AUTHOR(S):

- Anna Dyar, Department of Clinical Sciences Danderyd Hospital, Karolinska Institutet, Stockholm, Sweden (Presenter)
- Hanna Lachmann, Department of Learning, Informatics, Management and Ethics, Karolinska Institutet, Stockholm, Sweden
- Terese Stenfors, Department of Learning, Informatics, Management and Ethics, Karolinska Institutet, Stockholm, Sweden
- Anna Kiessling, Department of Clinical Sciences Danderyd Hospital, Karolinska Institutet, Stockholm, Sweden

ABSTRACT

Introduction: Worldwide, a growing number of healthcare students require clinical environments that enable high quality learning. Some inpatient wards are being adapted to become student units as a way of meeting this demand. Many benefits of student units have been reported from the students', supervisors' and patients' perspectives. However, little research has focussed on exploring what a student unit actually is. They are heterogenous and go by different names including: Clinical Education Wards; Inter-professional Training Wards; Dedicated Education Units; Student Training Wards. No formal definition of a student unit exists, and there is no specification of requirements for a ward to be a student unit. A deeper understanding of what student units are characterised by is necessary to identify their reasons for success, and to maintain and expand their use for clinical learning. The aim of this study is to describe the pedagogical encounters that occur on a student unit and what characterises the learning environment.

Methods: An observational study was performed on a student unit at an acute teaching hospital in Stockholm, Sweden. The student unit was set up in 2015 with a focus on student nurses, with increased staffing, a dedicated student room, and a supervision model where student nurses care for patients in pairs. The unit usually has 4 student nurses, a medical student, and sometimes a healthcare assistant student. Observations were combined with short, informal questioning and collection of audio-recordings of student reflections. Observations were non-participatory, performed by a single researcher, who had no connection to those being observed. This took place over a six-month period, including 85 total hours over 17 different shifts. In total, over 300 activities (for example conversations, learning events) were observed, with over 30 informal questionings and three audio reflections. Field notes and audio reflections were transcribed. Thematic analysis was used to identify themes that described the pedagogical encounters and learning environment in a student unit. The analysis was discussed among all four authors and consensus was reached.

Results: Four themes were identified that characterised the pedagogical encounters and learning environment on the student unit: "Real life learning" describes how students learned by actively doing clinical tasks, and that their learning was guided by actual clinical events rather than pre-selection, and that students took responsibility both for the patients and for their own learning. "Learning together" described the peer interactions between the students for learning, and the supervision of these peer interactions. "A personalised approach" described the personalised relationships between the students and staff, and the build-up of trust in the student-supervisor relationship. "Learning as an integral part of the daily life on the ward" described the unified inter-professional approach to teaching, the facilitation of learning by the dedicated student room and the staff's own lifelong learning.

Discussion & Conclusions: This study described features of one adapted student unit. Four themes describe features that were enabled through a community of practice: the shared view of learning as a priority for this community enabled staff to provide clinical care without compromising the students' learning environment. In addition, both physical features such as the presence of a student room, and a student-orientated organisational set-up were notable characteristics. This qualitative study at a single centre lays the groundwork for future research to investigate other student units and how these characteristics affect student learning.

#3E Research Papers: Learning Spaces and Environment

International partnerships for medical education: An evaluation of the International Institute for Medical Education Leadership (IIMEL)

AUTHOR(S):

- **Fabiola Aparicio-Ting, Cumming School of Medicine, University of Calgary, Canada (Presenter)**
- Angela Tucker, Anthropology, University of Calgary, Calgary, Canada
- Heather A. Baxter, Cumming School of Medicine, University of Calgary, Calgary, Canada
- Gwendolyn L. Hollaar, Cumming School of Medicine, University of Calgary, Calgary, Canada

ABSTRACT

Introduction: There has been an increased commitment to global partnerships to strengthen health systems in low- and middle income countries (LMICs) in the recent years. In particular, building medical professions capacity to reduce the high burden of disease in these countries depends on strengthening medical education pedagogy and leadership to empower LMIC partner institutions to design locally sustainable health solutions and medical training processes. The Cumming School of Medicine at the University of Calgary, Canada, has partnered with a number of LMIC institutions whom have identified a need for professional development of leadership in medical education. In response, the International Institute for Medical Education Leadership (IIMEL) brought together medical education leaders from several LMIC partner institutions for two weeks of intense faculty development. IIMEL was designed to develop leadership skills, improve medical education skills, and encourage collaboration between international partners through interactive workshops, site visits and one-on-one consultations around partner-identified needs and interests. To our knowledge, this event is the first of its kind; therefore, there was a commitment to evaluate IIMEL's effectiveness. More specifically we wanted to answer the following questions: 1) What were the learning experiences of IIMEL participants?; and 2) Were the various IIMEL activities effective?

Methods: Given the diversity in participant backgrounds, abilities, and needs, an evaluation framework was designed to evaluate IIMEL in ways that were holistic and ethnographic with a focus on capacity building in LMIC partner countries. The evaluation team included two medical educators, a social epidemiologist and education researcher, and a cultural anthropologist. Qualitative data from participant observations and semi-structured interviews were analyzed using thematic analysis. These data were triangulated with quantitative data collected using a validated workshop evaluation tool [1] to interrogate the contextual elements of IIMEL and the variation in experience between IIMEL participants.

Results: Nineteen medical education leaders from eight LMIC partner institutions attended IIMEL. Participants reported a positive learning experience and budding collaborations with other participants that they reported to have impacted their medical education approaches and leadership roles. Six overarching themes emerged that can inform the design of international partnerships for medical education capacity building: pre-event preparation, the potential for cognitive and scheduling overload, the importance of the physical learning environment, opportunities for relationship building, cultural considerations and locally relevant applications, and mitigating exhaustion.

Discussion & Conclusions: Initiatives like IIMEL can be an effective way of increasing medical education skills and capacity in LMIC institutions. Our findings indicate that there are important considerations when designing medical education capacity building interventions for international audiences, particularly with participants who have been teaching for many years in unique, resource limited settings. Strengthening medical education skills in LMIC partner institutions has the potential to improve the quality of medical training programs, furthering their ability to respond to local health challenges. Given that each global partnership is unique, institutions planning such capacity building initiatives should consider evaluating their effectiveness in their context. Our evaluation used a novel framework that focuses on an ethnographic understanding of an LMIC capacity building experience. The interdisciplinary evaluation team, and multiple sources and types of data were an asset and enhance the richness of the evaluation. The result is a holistic assessment of the outcomes and experiences related to participating in IIMEL, which can inform the design of similar medical education skills and leadership events.

Location of Presentation: Hall M, Level 1

International short-term placements in health professions education – A meta-narrative review

AUTHOR(S):

- Birgit Fruhstorfer, Warwick Medical School, Coventry, UK (Presenter)
- Frances Griffiths, Warwick Medical School, Coventry, UK
- David Davies, Warwick Medical School, Coventry, UK

ABSTRACT

Introduction: Globalisation has changed the context, in which health care is delivered. In order to be prepared for professional practice in a globalised world, health professions students need to be equipped with a new set of knowledge, skills and attitudes. Experiential learning gained during an international placement has been considered as a powerful strategy facilitating the acquisition of global competencies. Although international experiences have been shown to have a number of educational benefits, various challenges, such as ethical concerns and safety risks, may compromise the learning in such setting.

The aim of this review was to synthesize empirical studies examining the process and outcomes of international short-term placements in health professions education.

Methods: A systematic review was conducted using a meta-narrative approach. This relatively new method was developed by Greenhalgh (1) and draws on Kuhn's notion of a scientific paradigm. Within a paradigm researchers look at the world through the same lens, which shapes problems of interest and research approaches. The initial unit of analysis is the meta-narrative, which is a series of studies within a paradigm.

Six electronic databases were searched for eligible studies in September 2016: Medline, Embase, CINAHL, PsychINFO, Education Research Complete and Web of Knowledge. The search was further supplemented by backward and forward citation tracking. The literature search was updated in January 2018. Iteratively the review was focused on international placements in socio-economically contrasting settings in undergraduate education. Studies were grouped into 3 meta-narratives according to professional discipline: medical, nursing and allied health professions. Each meta-narrative was further subdivided into 4 sub-meta-narratives: educational effectiveness (positivism), educational effectiveness (interpretivism), critical perspective and complex systems/relationships. Eligible studies were first considered within their meta-narrative before comparing and contrasting findings between meta-narratives.

Results: The electronic search yielded 110 papers with a further 44 papers identified by other search methods. Whereas earlier studies have focused on the effect of international placements on the learner, more recent studies have been more concerned with the relationships between various stakeholder groups. Findings were then considered in 4 dimensions: learner, educational intervention, institutional context and wider context. International placements have a positive impact on personal and professional development in the undergraduate learner across all 3 disciplines. Challenges, such as emotional shock and language barrier, are part of the learning process. In the medical literature there has been a stronger emphasis on ethical dilemmas experienced by students. Studies in nursing and allied health professions provide evidence on the development of cultural competence and transformational learning. Strategies, which encourage the engagement with the learning environment, enhance learning, although evidence is limited. There is generally a positive attitude towards hosting students, which gives the opportunity for knowledge sharing. More equity between partners is desirable.

Discussion & Conclusion: In this review the topic has been considered from multiple perspectives with each meta-narrative providing a lens through which to view international placements. This educational intervention makes an important contribution to the preparation of health professions students for practice in a globalised world. Learning takes place in a complex environment, which requires careful consideration for the educational design. More research is needed on how to enhance the educational process at micro-level and macro-level.

Depth of Field© - enhancing nursing students' preparedness to care for older adults

AUTHOR(S):

- Michelle Kelly, Curtin University, Perth, Australia (Presenter)
- Gabrielle Brand, Monash University, Melbourne, Australia
- Susan Slatyer, Curtin University and Sir Charles Gairdner Hospital, Perth, Australia
- Pam Nichols, Curtin University, Perth, Australia
- Rebecca Osseiran-Moisson, Curtin University, Perth, Australia
- Richard Parsons, Curtin University, Perth, Australia
- Chris Toye, Curtin University and Sir Charles Gairdner Hospital, Perth, Australia

ABSTRACT

Introduction: In health professions programs, early clinical placements are often in aged care settings, however these residents often have complex care needs and some students may feel underprepared to work with older people. Unexplored assumptions or stereotypes about older people can constrain person-centred approaches to care. The Depth of Field: Exploring Ageing © (DOF) resource (Brand, Miller, et al., 2016) was trialled and evaluated with novice nursing students as preparation for their first placement, in aged care settings.

Methods: A mixed methods, cluster randomised control trial. First semester undergraduate nursing students were randomised to receive the intervention (DOF) in addition to usual clinical preparation or usual clinical preparation alone. The 45 minute workshop used photo-elicitation techniques, older adult narratives and collaborative small group work designed to prompt reflection to surface students' unconscious bias or perceptions towards older adults. The study comprised three phases: pre/post intervention survey (T1/T2); post clinical survey (T3); and post clinical focus groups. The survey included: the Geriatrics Attitude Scale (GAS) (Reuben et al., 1998); demographics and questions about experience. Semi-structured questions were used for the focus groups.

Results: There were nine classes in the control (n=161 students) and eight classes in the intervention cluster (n= 141 students) with a response rate of 74.83% (226/302). The majority of students were female and in their early twenties (range 17 – 50 years) and groups were equivalent at baseline. For the intervention group, statistically significant improvements (p< 0.05) were demonstrated at T2 in nine of the 13 GAS survey items, with small to moderate effect size (Cohen's d: 0.35 - 0.56). For post clinical surveys (T3) approximately 1.5 months following the intervention, group sizes were smaller but equivalent: intervention cluster 28 (28.28%), control cluster 26 (24.07%). Post clinical (T3) mean GAS scores remained the same or changed slightly (+/- 0.44 to 0.47). Themes from qualitative data included: preconceptions; translating context to practice; stigma; and applicability to more specific aspects of ageing.

Discussion: Significant, positive changes between T1 and T2 in the GAS survey questions indicated the intervention had impact in changing students' perceptions towards older adults. Focus group participants gave several examples of having translated the intervention into their practice. In particular, they identified the benefits of knowing the life history of residents as a means of developing a therapeutic relationship. Students' willingness to engage with residents, and, in a number of cases, to overcome potential barriers to communication arising from memory and language deficits, demonstrates an awareness of these aspects of practice as crucial in working effectively with older adults. Some nursing students were able to draw on their clinical experience and critically reflect on and reconstruct previous stereotypes and attitudes towards older people and aged care. Supporting students to have a more positive opinion about older people is critical considering the greater health care challenges and future care requirements globally for a rapidly ageing population. Reconstructing stereotypes about older people is critical for all health students and equally beneficial for clinicians.

Conclusion: The DoF program is an effective intervention as preparation for nursing students in caring for older adults. Surfacing and reconstructing stereotypes about ageing was achieved and beneficial for students in their subsequent clinical practice. The DOF intervention is ideally suited to other health curricula either within discipline or as an interprofessional learning experience.

A new instrument to measure attitudes regarding high value, cost-conscious care of healthcare stakeholders: development of the MHAQ

AUTHOR(S):

- **Serge Mordang, Maastricht University, Maastricht, the Netherlands (Presenter)**
- Karen Könings, Maastricht University, Maastricht, the Netherlands
- Andrea Leep Hunderfund, Mayo Clinic, Rochester, USA
- Aggie Paulus, Maastricht University, Maastricht, the Netherlands
- Frank Smeenk, Maastricht University, Maastricht, the Netherlands
- Laurents Stassen, Maastricht University, Maastricht, the Netherlands

ABSTRACT

Introduction: High value, cost-conscious care (HVCCC) is regarded crucial to counter the trend of progressively increasing healthcare costs and needs to be advocated in residents' training environment. As attitudes are important indicators for predicting behaviour, knowing important stakeholders' attitudes toward HVCCC, enables predicting how they act upon HVCCC. There is not yet a reliable instrument available for measuring attitudes towards HVCCC in residents' training environment. This study aims to develop an instrument that maps residents' training environment regarding high value, cost-conscious care, by reliably measuring residents', staff physicians', administrators', and patients' attitudes toward different facets of HVCCC.

Methods: The Maastricht HVCCC-Attitude Questionnaire (MHAQ) was developed through a four-phase process. First, we used original data from a survey conducted by Leep Hunderfund, et al (2017), which consisted of 21 items preliminary focused on cost consciousness. We conducted factor analyses to define underlying factors and examined internal consistency of constructs using Cronbach's alpha. Second, we added nine new items, preliminary focused on high-value care to conceptually balance items on value and costs in the MHAQ and to strengthen subscales. Moreover, we adapted items for use by residents, staff physicians, administrators, and patients. Third, we tested the questionnaire among four samples of these stakeholders, used factor analysis to identify subscales and examined internal consistencies, and developed the final version of the MHAQ, consisting of 25 items. Fourth, we used generalizability analyses to assess the number of respondents per specialty on a national level needed to reliably measure a specialty attitude score.

Results: Initial factor analysis identified three subscales with Cronbach's alphas between 0.64 and 0.66. After the addition of nine new items, 301 residents, 297 staff physicians, 53 administrators and 792 patients completed the new questionnaire between June 2017 and July 2018. The aforementioned analyses resulted in 25 items distributed among three partly different subscales, each covering an important aspect of HVCCC in clinical environments. Subscales were defined as providing high-value care (eight items), integration of healthcare costs (ten items), and drawbacks of HVCCC (seven items). We optimized the composition of subscales and thereby Cronbach's alphas for each stakeholder group, considering all items in all subscales had to fit every stakeholder. Cronbach's alphas were between 0.61 and 0.82 for all stakeholders on all subscales. Generalizability analyses indicated as from 14 respondents are sufficient to reliably assess a national specialty attitude.

Discussion and Conclusion: In this study, we developed the MHAQ, an instrument that measures HVCCC-attitudes of important stakeholders in residents' training environment. Found subscales align well with three key aspects of HVCCC as explained by Owens and et al (2011): value assessment, cost-effectiveness, and consequences of using these assessments. This supports the content validity of the MHAQ. These aspects need to be addressed by medical education to effectively implement HVCCC. The MHAQ can be used to identify frontrunners, who can help to prioritize HVCCC, to pinpoint aspects of HVCCC that need to be improved or changed in order to give HVCCC a higher priority in residency training, and to benchmark and compare specialties, regions, and potentially hospitals. The MHAQ can serve as a starting point and as an evaluation tool for educating future physicians to provide HVCCC.

How residents deal with HV3C-dilemmas: an ethnographic study

AUTHOR(S):

- **Lorette Stammen, Maastricht University, Maastricht, the Netherlands (Presenter)**
- Linda Janssen, Maastricht University, Maastricht, The Netherlands
- Erik Driessen, Maastricht University, Maastricht, The Netherlands
- Fedde Scheele, Athena Research Institute, VU University Amsterdam, The Netherlands
- Laurents Stassen, Maastricht University Medical Center, Maastricht, The Netherlands
- Renee Stalmeijer, Maastricht University, Maastricht, The Netherlands

ABSTRACT

Introduction: Increasing healthcare costs have a major impact on the sustainability of healthcare systems. Since physicians' behavior determines up to 80% of the total healthcare expenditures (1), training residents to deliver high-value, cost-conscious care (HV3C) is an important target for cost-containment. Additionally, physicians can use their medical expertise to eliminate care that does not contribute to the quality of care. Previous research demonstrated that residents acknowledge the importance of HV3C-delivery (2), yet experience difficulties identifying and seizing learning opportunities. Therefore, an ethnographic study was designed to explore how and if high-value, cost-conscious care is practiced throughout post-graduate medical training. The research question driving this study was formulated as: How do residents in the post-graduate learning environment deal with HV3C-dilemmas in clinical practice?

Methods: This ethnographic study builds on 175 hours of non-participant observations during which 21 gynecology residents were shadowed. Additionally, informal interviews, 5 semi-structured interviews and document analysis were performed. Observations focused on the occurrence, content and context of HV3C-dilemmas and how residents dealt with these. High-value, cost-conscious care-dilemmas were defined as events in which standard practice did not seem to fit the case at hand, for example due to patient characteristics (i.e. allergies or strong personal preferences) or the absence of a protocol or empirical evidence. Data collection and analysis occurred iteratively. Data analysis was performed by a multidisciplinary research team and followed principles of open coding, thematic analysis, in-depth questions and team-discussions.

Results: Observations demonstrated that care delivery often did not lead to dilemmas since standard practice (based on protocols and empirical evidence) provided ample directions towards what was considered high-value, cost-conscious care among health care teams of individual senior physicians. HV3C dilemmas arose in cases in which standard practice was not a match and residents dealt with these either by trying to solve them independently or by consulting others. Independent approaches included; copy-paste behavior, work-around strategies and searching for additional information. Consulting others as an attempt to solve the HV3C-dilemma at hand was aimed at para-medical staff including nurses, peers, or senior physicians. How residents applied these approaches solutions was influenced by the urgency to deal with the dilemma, the preferences of individual supervisors, and the department in general. The approach used by residents was the result of a strong socialization process.

Discussion & conclusions: Optimizing residency training in HV3C-delivery benefits from learning from HV3C-dilemma's in clinical practice. The prominent role of socialization is important in order to develop effective educational interventions aimed at workplace-based learning in residency training. Insight in the different approaches used by residents can help both supervisors and residents to verbalize explicitly how they determine HV3C and challenge residents to critically assess HV3C-dilemmas they encountered in daily practice. Awareness that residents used independent approaches that do not include supervisors in HV3C-dilemma's might be important to foster a more active role of both supervisors and residents in discussing HV3C-dilemmas.

A Randomised Controlled Trial of SAFMEDS to Promote Fluency in Interpretation of Electrocardiograms

AUTHOR(S):

- Louise Rabbitt, School of Medicine, National University of Ireland, Galway, Ireland (Presenter)
- Sinéad Lydon, School of Medicine, National University of Ireland, Galway, Ireland
- Paul O'Connor, Irish Centre for Applied Patient Safety and Simulation, National University of Ireland Galway, Ireland
- Mirosława Gorecka, St James's Hospital, Dublin, Ireland
- Alan Jacobsen, Osler Medical Residency, Johns Hopkins Hospital, Baltimore, USA
- Dara Byrne, Irish Centre for Applied Patient Safety and Simulation, National University of Ireland Galway, Ireland

ABSTRACT

Introduction: Deficiencies in Electrocardiogram (ECG) interpretation are apparent at undergraduate and postgraduate level. "Say All Fast Minute Everyday Shuffled" (SAFMEDS) is a flashcard-type behavioural intervention involving one-minute learning trials that has been widely used in higher education and other educational domains to produce fluency in target behaviours. Behaviours trained to fluency have been shown to maintain better over time, to transfer to other contexts and to endure despite distraction. This study examined whether SAFMEDS could produce behavioural fluency (i.e., accurate and rapid responding) in ECG interpretation among final year medical students, and whether this approach conferred a benefit beyond usual teaching.

Methods: A total of 32 final-year medical students were randomly assigned to either a "usual teaching" control group (n=16) or the SAFMEDS group (n=17), with the recognition of 15 specific cardiac conditions (e.g. atrial fibrillation, complete heart block) targeted for improvement. Both groups received a brief teaching session on the targeted conditions and all usual medical school teaching. However, the intervention group also got access to the SAFMEDS intervention and their performance was monitored over 8 weeks as they worked towards achieving the fluency criterion (17 correct ECG diagnoses per minute) by engaging in one-minute SAFMEDS trials. ECG interpretation accuracy was assessed using tests at baseline and post-intervention for both groups, and at two months post-intervention for the intervention group in order to assess retention of learning.

Results: In total, 7 of 15 intervention group participants achieved the fluency criterion, and completed an average of 45.7 one-minute trials (SD=19.61, range 26-76). There was no significant difference between the percentage improvement from baseline to post-test of participants who achieved fluency (M=327.14; SD=159.75) and the participants who did not achieve fluency (M=673.24, SD=576.69), $p=.21$. Although baseline performance was comparable among the two experimental groups, the intervention group significantly outperformed (M=61.5%; SD=12.1%) the control group (M=31.6%; SD=12.5%) at post-testing, $p<.001$, and a large effect size of the SAFMEDS intervention was discerned (partial $\eta^2=.41$). Improvements in ECG interpretation among the intervention group were demonstrated to persist at the two-month follow-up.

Discussion: A large effect size of the SAFMEDS intervention was observed as compared to usual teaching only. Learning persisted at a two-month follow-up. The degree of improvement evidenced is particularly notable given the brevity of the intervention (an average of 39.73 minute-long trials). These results suggest that SAFMEDS may comprise a useful adjunct to usual teaching that allows students to independently manage and improve their own learning. Engagement with the intervention appears to be of benefit even when the learner does not achieve the fluency, or expert, criterion or not.

Conclusion: These findings support the efficacy of SAFMEDS for training ECG interpretation. Further research could explore SAFMEDS' application to other clinical skills and assess whether learning transfers to clinical practice.

Fulfilling A New Obligation: Teaching and Learning About Sustainable Healthcare in the UK Medical School Curriculum

AUTHOR(S):

- SanYuMay Tun, Centre for Environmental Policy, Imperial College London, London, UK (Presenter)

ABSTRACT

Introduction: Doctors qualifying or registering in the UK will be required to understand and apply the principles of sustainable healthcare to medical practice. The General Medical Council's document 'Outcomes for graduates 2018' places a new obligation on medical schools to teach sustainable healthcare in the curriculum(1). Sustainable healthcare focuses on the improvement of health and better delivery of healthcare, rather than late intervention in disease, with resulting co-benefits to patients and to the environment on which human health depends. As sustainability is an emerging concept in the medical profession, this Master's thesis project aimed to make evidence-based recommendations on best practice for implementing this new learning.

Methods: A qualitative exploratory approach used grounded theory to generate themes through the triangulation and analysis of multiple sources of data. Informal interviews were held with key stakeholder organisations in the sustainable practice of medicine, such as the Sustainable Development Unit (NHS/PHE), the Centre for Sustainable Healthcare, and with an NHS sustainability manager. Informed by a literature review and document analysis, questions were developed and used in semi-structured interviews with medical educators of varying backgrounds, who have been teaching about sustainable healthcare through their own interest. These educators were from eight medical schools around the UK which have diverse approaches to curriculum structure, teaching methods and assessment.

Results: There was clear consensus from participants and the literature on the key barriers and enablers to implementing this new learning. Educators lack the knowledge and capacity to teach this new subject, which is also difficult to examine. However, many sources of support and learning resources are available. Of multiple suitable pedagogies, the most powerful impact on students' learning is through being taught by clinicians engaged in sustainability and in contexts directly relevant to patient care. Institutional prioritisation of sustainability is important. While there is continual pressure on space in the curriculum, there is a growing demand from university students for sustainability to be addressed in their education and future careers, and a new approach to healthcare delivery is required for the long-term sustainability of the health service.

Discussion: In 'Outcomes' the GMC has introduced to undergraduate medical education the concepts of over-diagnosis and over-treatment, cost effectiveness, and treatment as a burden on patients. Sustainability is already one of the seven domains used by the Royal College of Physicians to define quality(2). Educators less familiar with sustainability may be open to learning at the same time as they are teaching it to students, and even to learning from students who may already be better informed. As awareness develops of present unsustainability, the emotional resilience of both students and educators may need to be supported. An understanding of the wider drivers of disease should be embedded into assessment.

Conclusions: Educating new doctors to promote and practice sustainable healthcare may enhance satisfaction in clinical practice and has wider benefits for the healthcare system and the environment as well as for patients. Recommendations for implementing sustainable healthcare education include treating sustainability as a theme running through all subjects and year groups rather than as a topic, involving clinicians in the teaching as much as possible, sharing common learning resources among medical schools and embedding sustainability into assessment. There is a limited number of experts to access in this emerging field. Further research is needed to evaluate impact on students' learning.

Emotions matter in selection for medical school: Let's value more than students' IQ

AUTHOR(S):

- Jo Bishop, Bond University, Australia (Presenter)
- Kirsty Forrest, Bond University, Australia
- Amy Bannatyne, Bond University, Australia

ABSTRACT

In Australia, entry to a medical program is highly competitive. Presently, there is no gold standard for selecting medical students and the task of selecting candidates that will be 'successful doctors' is complex and multifaceted. Most medical schools use a combination of tools and scores to select applicants. Exceptionally high academic thresholds are, however, a prominent feature in most selection criteria and frequently applied before further assessment occurs. Predictive links between previous academic achievement and academic progression in medical school have been established. However, data from systematic reviews has revealed that while academic performance accounts for 23% of the variance in progress measures at medical school, it only accounts for 6% of the variance in progress beyond medical school. Furthermore, recent findings revealed that non-academic/non-cognitive qualities appear to be better at predicting students' performance later in their medical studies.

Scholars are increasingly claiming that medicine overemphasises general intelligence and underemphasises emotional intelligence (EI). In addition to being related to clinical performance and academic achievement in medical education, EI has been associated with improved empathy in medical consultations, enhanced doctor-patient relationships, and greater patient satisfaction. To date, consideration of EI when selecting medical students has been largely absent from admission criteria. In response, Bond University made the decision to include explicit measures of non-cognitive abilities, namely emotional intelligence as a standalone step of the selection process for the 2018 cohort.

Anecdotally, feedback from our stakeholders has been mixed. Some have expressed disagreement and scepticism with the decision to value a "different" intelligence, possibly highlighting stereotypes and prejudicial beliefs about EI. Other stakeholders have embraced and supported the decision. For example, a student from our 2018 cohort stated: "It's refreshing to know the university not only values our high grades but our ability to connect with people too." Our concern is that often selection does not reflect the values of an institution, and that students feel they are only valued for their IQ and not their EI. We would like to widen the discussion and talk about something other than cognitive testing for selection - something that is consistent with program values.

Sharing Accountability for a Cultural Shift in Lifelong Learning in Healthcare

AUTHOR(S):

- **Sophie Peloquin, AXDEV Group, Canada (Presenter)**
- Suzanne Murray, AXDEV Group, Canada
- Patrice Lazure, AXDEV Group, Canada
- Morgan Peniuta, AXDEV Group, Canada
- Pam McFadden, AXDEV Global, USA

ABSTRACT

There has been a lot of discussion around the transformations that are necessary for our health systems to continue to meet the evolving healthcare needs of an increasingly co-morbid and aging population. Over 18 years ago, the Institute of Medicine Report (2001) highlighted the importance of changes in the environment of care, to allow for an evolution in our healthcare systems. Indeed, professional behavior can only change when there are systematic and comprehensive changes to the culture in which providers operate (Depato et al., 2018).

Who is responsible for ensuring these changes occur? In the mid-nineties, the WHO suggested that medical schools lead this effort. The WHO defined social accountability as the obligation of medical schools to reorient their education, research and service priorities to respond to current and future health needs and challenges in society (Boelen and Heck, 1995). But beyond medical schools, is there also an individual, organizational or systemic responsibility?

Education and continuing professional development activities have traditionally been developed using a top-down approach, with curricula selection based on the opinions of subject matter experts and academic researchers (Davies, 1999). Life-long learning (from undergraduate to graduate education and continuing professional development opportunities) should be evidence-based and should reflect the needs of the learners (healthcare professionals and teams) as well as the population needs. Although progress has been made, there is an urgent need for a shift in organizational (sub)cultures, in order to support this evolution. This presentation will challenge our thinking about shared accountability between medical schools, specialty societies, government, health systems, and the private sector. We propose that stakeholders must work together effectively to bring about the cultural shift that is needed to improve the quality of the educational offering and positively impact health outcomes.

Gender perspective in medical education: Where?

AUTHOR(S):

- Laura Lalucat García-Valdés, IFMSA - International Federation of Medical Students' Association (Presenter)

ABSTRACT

When a female student is asked to get the doctor a coffee, when there are no women at all at the Operation Room and sexist jokes are the first thing to be said at 8am in the morning before going on rounds, those are invisible - and also visible - ways to teach all genders that are not men, that we are one step behind and furthermore, that is not an isolated case but that we'll be facing similar situations throughout our studies and professional careers in a systematic way.

This systematic oppression - understanding oppression as the fact of not being able to develop one's full potential - is present also when students interact with each other and the team dynamics are also affected by this gender axis that with no doubt, puts some members of the group at the very top and some others at the lowest part: Who mostly volunteers to try out a medical procedure during the rotations? Who is answering the questions when the professor asks? Mainly those situated at the top of this axis while others, even if they represent a higher percentage in the room, may think there are students that will perform better than them because of their position in the group and maybe they tried to intervene before but their replies were cut by others only because they spoke with a higher tone of voice.

The first step to transversalize this - very vertical - axis is to be aware it exists and putting the efforts on sharing good practices, creating manuals and guidelines that guarantee we can monitor our current efforts to build safer and fair spaces where coeducation can effectively take place by specific objectives and indicators that can be lead towards debunking gender inequities in our education systems.

What do you mean you've never failed before? The dangers of reframing failure

AUTHOR(S):

- Rachel Lewin, University of California, Los Angeles, USA (Presenter)

ABSTRACT

Failure is scary. So scary that we've come up with a lot of ways to "reframe" failure, casting it as the "first attempt in learning", "not a failure but an opportunity to learn", etc. And in one way, these reframes are true -- our failures are learning opportunities. But, critically, these reframes deny us the emotional experience of failure, and the opportunity to hear the important feedback that failure provides.

In medical education, our learners are often highly intelligent, very high achievers, and accustomed to success. Their first failure experiences may come late in life and be challenging for the learner to reconcile with their self-image. Immediately reframing failure into a positive experience robs the learner of the full breadth of growth opportunities that failure provides -- it is not only about learning from the experience, but also about feeling what it is like not to succeed, and identifying where you went wrong in preparation.

This talk will discuss why it is dangerous to seek ways to reframe failure that honor only the positive potential of the experience, as well as discuss ways that we can all implement frank and honest conversation about failure into our daily lives as learners and instructors in medical education.

The gut feelings perspective: Clinical intuition beyond guidelines. A challenging teaching topic

AUTHOR(S):

- Graziela Moreto, SOBRAMFA - Medical Education & Humanism, Brasil (Presenter)
- Pablo González Blasco, SOBRAMFA - Medical Education & Humanism, Brasil
- Ismael Ramirez Villaseñor, Escuela de Medicina y Salud, Tecnológico de Monterrey, Mexico
- Jorge Soler Gonzalez, Institut Català de la Salut, Spain

ABSTRACT

Clinical intuition, terminology long used in period before evidence-based medicine (EBM), is returning to the current medical scenario. Research shows that physicians, especially general practitioner (GP), sometimes experience the feeling that something is wrong with a patient during a consultation, although they do not know exactly what. This so-called “sense of alarm”, which is a feeling of sudden heightened awareness, is alerting physicians and causing them to worry about the patient’s health status. On the other hand, physicians can feel a sense of reassurance, hereto meaning confidence about the management plan and/or about the outcome, even though they are not certain about the diagnosis. This sense of alarm and reassurance is called “gut feelings” or qualified intuition.

Although evidence and skilled intuition may sometimes appear as irreconcilable opposites, the combination fits very well with the EBM concept that is based on the integration of scientific knowledge, patients’ preferences as well as physicians’ expertise and skills.

The “gut feelings” concept exists and it substantially contributes to the GPs’ diagnostic reasoning process, however the doctor often has difficulties explaining or sharing it because he considers this non-scientific. Another challenge that we face: Is it possible to teach about gut feelings? Or perhaps more than teaching the art of intuition, it would be better to make the learners aware of this issue which each one must build along their practice. It would be like saying: when you accumulate experience and intuition, value them. Do not delete them because of a new guideline.

In our point of view, medical schools should take into consideration that gut feelings perspective open a promising space for academic research. We recognize their existence and believe this topic is important to incorporate into the curricular content.

Teaching written communication to medical students

AUTHOR(S):

- Michael Unwin, University of Manchester, UK (Presenter)

ABSTRACT

Communication is integral to the 3rd domain of the UK General Medical Councils “duties of a doctor”. Telephone consultations now common in both secondary(1), and primary care, (2) and technological advances, and staff shortages, will make email consultations a thing of the future(3). It is important for tomorrow’s doctors to be skilled in writing for a lay audience. Most UK medical schools devote considerable time to verbal communication skills (over 30hrs in years 3-5 at my institution) but very little to written communication. A straw poll at a recent academic conference showed the situation is similar throughout the UK.

I receive many letters, from health professionals, that have been shared with patients, containing a level of jargon and acronyms that make them impossible for a lay audience to understand. All medical professionals need to be well-versed in writing for a lay audience and, as we must start somewhere, I suggest we begin with medical students.

As a doctor who has over 20 years of experience in writing medical features for the lay press I have developed a training programme for medical students and tutors, which I deliver outside the curriculum at Manchester University medical school. I believe that not having written communication skill embedded into the curriculum of all medical schools is a huge oversight and a lost opportunity to improve communication between the medical profession and their patients. I will show examples of both poor and excellent communication to illustrate my point, and give tips on how to teach written communication skills.

Stress Related Absence in Medical Trainees

AUTHOR(S):

- Mumtaz Patel, Health Education England North West (HEENW), UK (Presenter)
- Leila Dilamy, NHS/Health Education England North West, UK

ABSTRACT

As a medical education fellow for Health Education North West, I studied stress related absence and resilience amongst junior doctors, simultaneously undertaking my specialty training while also addressing significant personal challenges outside of the workplace. Reflecting on this experience prompted wider questions regarding the impact of work and life stressors, not only on doctors' well-being, but on personal career development. Academic endeavours and trainee progression are bound to suffer when an individual is focusing their energies on a taxing working day or emotional home circumstances.

Literature suggests that doctors with compulsive behavioural traits, high achievers and often perfectionists, have continual feelings of guilt surrounding 'not doing enough' and therefore can set themselves difficult to achieve targets in both life and the workplace. This leads to a pattern of overworking, and personal recovery is not permitted until work is complete (1, 2). These traits can be an asset, allowing individuals to succeed and become 'high-flyers', though they can be equally self-destructive.

Building resilience is a way to combat stress and burnout amongst doctors, supporting their well-being and encouraging ongoing career progression. The NHS has some innovative and targeted approaches to employee well-being, but there is lack of consistency (3).

Training of relevant individuals such as line managers, supervisors, and educational and departmental leads who can promote resilience and well-being is a good starting point. From here, at risk individuals can be identified and earlier intervention offered. Easily accessible services such as workshops and counselling, free from stigma, should be established in each trust. Appropriate follow up procedure should also exist to ensure these individuals do not get lost in the system.

Surgical Education is an Import-Export Business

AUTHOR(S):

- Douglas Wooster, University of Toronto, Canada (Presenter)
- Elizabeth Wooster, OISE/University of Toronto, Canada

ABSTRACT

Surgical education is often presented as a unique educational model separate from those used in other disciplines. As such, there are often specific dialogues and defined rhetoric around the special nature of surgical education. Clearly there are skill sets, cognitive domains and team interactions that define the context of surgical specialties' training and practice. Some of these are distinct from other specialties; there are, however, many overlapping domains. Surgical education is, in fact, an import-export business.

Trainee selection, stressors, curriculum, evaluations and training completion criteria may be considered to be special. They are, however, often developed by surgery programs and used elsewhere or brought in from general principles and practice. Teaching methods are based on general teaching and learning theory. The multidisciplinary nature of operations creates opportunities for team learning and requires an understanding of group theory that comes from psychology and a variety of allied health and other disciplines. Simulation learning borrows from engineering, electronic gaming, aviation and design theory and practice. The cognitive domains of surgery are not dissimilar to those of other disciplines. Education in clinical decision making and training in obtaining consent requires proficiency based in 'surgical' and other approaches.

The basic science of surgery is both 'home grown' and translated from other domains. The 'medical aspects' of surgery are consistent with other disciplines. Technical domains include skills that are not necessarily unique to surgery; equipment and devices are developed in concert with engineers, metallurgists, designers and surgeons. Professional and ethics considerations may carry some unique context but are consistent with other professions and practices. Research practices, guideline formulation and societal interactions are usually broad-based and applied in the surgical environment.

Surgical education is based on and continues to develop from multiple inputs from many sources. Insights from the surgical context are translated to other disciplines. Surgical education is an import-export business.

Aim: This point of view argues that 'surgical education' is not a discrete 'track' but rather uses a variety of educational strategies in a particular, surgical, context.

Should alternative medicine be taught in our faculties?

AUTHOR(S):

- **Frederic Lagarce, Faculty of Health Sciences - University of Angers, France (Presenter)**
- Cedric Annweiler, Faculty of Health Sciences, France
- Nicolas Lerolle, Faculty of Health Sciences, France

ABSTRACT

There is a strong demand for alternative health approaches from the public. With the popularization of health information in magazines, social networks and websites, the information on personal health management is wide, oversized, often non-validated, and may result in misunderstandings and errors. Health professionals, including general practitioners and community pharmacists, remain the population natural interlocutors and support an educational role. For this reason, teaching the possibilities and limits of alternative medicine in medical and pharmacy faculties should be considered in order to provide a reliable and true message. However, it is of note that this would also give credit to non-evidence-based approach of complementary therapies. In fact, holistic approaches such as homeopathy gained credits over years and have survived despite clear evidence of a lack of efficacy, because they were viewed as non-harmful and were taught in medical and pharmacy schools. In our faculty of Health Sciences, we propose a compromise between not teaching non-evidence-based medicine and leaving our patients without any response to their needs. The course is based on a global approach including psychology, communication and listening skills toward the patients, placebo understanding and also the message that every consultation should not necessarily end with a prescribed drug list. We also explain the difference between homeopathy, phytotherapy, aromatherapy and other complementary cares asked by the patients. This allows to teaching our students on alternative health care without giving credits to what is now called 'fake medicine'.

What I hope they would've taught me in Med School

AUTHOR(S):

- Aleksi Pajunen, Helsinki University, Finland (Presenter)

ABSTRACT

That evening the consulting radiologist was more like confrontationalistic radiologist. After suffering third verbal abuse over the phone something changed in me: I dont want to consult more experienced physicians anymore. I know this is the wrong conclusion, but they never taught me how to handle these situations.

That day I tried to bring up discrepancies in pharmacological records of the ward, they were constant and always same people. Our medical superintendent brushed it of and I left the conversation feeling humiliated. They did not teach me how to handle these situations. When I went home those nights, I did not feel like the professional I was supposed to be. And there are so many more days with so many more stories.

Even though there are many skills med school teaches for new physicians, beyond the understanding of anatomy, patophysiology, diagnoses and treatments there is a whole world of difficult situations new doctors might feel unequipped to face. These skills are not taught explicitly in the med school, but should we teach them?

Recently graduated (2,5 years ago) physician and young teacher Aleksi Pajunen will share stories about situations that med school did not prepare him at all. And few pointers on what we could do to better arm our students to face these kind of problems.

Transforming a Curriculum with Patient Illness Stories

AUTHOR(S):

- Carrie Elzie, Eastern Virginia Medical School, USA (Presenter)
- Russ Clark, EVMS, USA
- Phavon Sage, EVMS, USA

ABSTRACT

Background: Incorporation of narrative medicine into practice has shown great benefit to patients and clinicians. However there exists a dualism between narrative and evidenced based medicine that, with limited curriculum time, often prevents incorporation into training medical students. However, we have found that combining patient illness stories with basic science to teach clinical cases can transform a curriculum and increase all three learning domains: cognitive, affective, and psychomotor.

Summary of Work: The illness stories and medical records of a living anatomical donor, Mr. Clark, were used to create interactive cases to teach anatomy. Each case allowed students to delve into the patient's perspective while learning the underlying basic science and clinical principles. Follow-up sessions provided the students with the opportunity for personal connection and a forum to ask questions with the patient. Student reflections, exam performance and knowledge retention were analyzed compared to other case modalities. The impact on delivering serious news was analyzed using the Master Interview Rating Scale comparing students who either had Mr. Clark or a pair-matched standardized patient without a story. Qualitative feedback was also collected.

Summary of Results: One hundred fifty students completed five cases with Mr. Clark. Thematic analysis revealed two of the top three take-aways from each case were consistently humanistic rather than scientific/clinical with a focus on the patient's feelings, reactions and lifestyle. Performance on exams was similar to content taught in other modalities. Retention rates of patients' diagnoses were 50% higher for cases that contained personal narratives. Clinical encounters with Mr. Clark showed an increase in nonverbal facilitation (putting the patient at ease and facilitated communication), as well as, empathy and acknowledging patient cues. Feedback was overwhelmingly positive with 93% of the class expressing an appreciation for the humanistic elements of this teaching modality.

Discussion and Conclusions: Changing the curriculum to include illness stories has shifted the medical narrative toward a more compassionate and humanized conversation without sacrificing medical knowledge.

Take-home Messages: The addition of illness narratives into a first year medical student curriculum has the potential to foster interpersonal development in affective, cognitive, and experiential domains, thereby positively shaping the hidden curriculum into a more humanistic and empathetic message.

Medical Escape Rooms: A Novel Methodology in Undergraduate Medical Education?

AUTHOR(S):

- Paren Chohan, Royal Wolverhampton NHS Trust, UK (Presenter)
- James Holloway, Royal Wolverhampton NHS Trust, UK
- Benjamin Allen, Royal Wolverhampton NHS Trust, UK

ABSTRACT

Background: Gamification refers to the 'use of game design elements in non-game context'¹. In the learning environment, it has been shown to have a positive effect on motivation and subject engagement². 'Escape Room' games have gained popularity by creating a realistic environment that rewards players for working together, solving puzzles and completing challenging tasks in order to escape a room or scenario in a fixed amount of time. Minimal literature exists however to suggest if this format may be beneficial when incorporated into medical education.

Summary of Work: 24 MBChB students from the University of Birmingham across year's three to five were divided into 6 groups and undertook a 'medical escape room', based around the management of chronic asthma. Each session ran for 30 minutes.

Summary of Results: 92% of the participants thought the scenario was an effective way to learn new information. 100% of students thought the scenario was an effective way to consolidate knowledge. 92% of students did not feel the non-educational portions distracted them from learning about asthma. Open axial analysis revealed high student enjoyment, engagement and a strong opportunity to practice team working skills. 86% preferred this method for learning over didactic lectures. Students commented that this escape room model could be used to consolidate knowledge and saw it as an adjunct to higher fidelity simulation exposure.

Discussion and Conclusions: This data supports the suggestion that the use of Escape Rooms is an effective way of teaching medical students. When used alongside traditional teaching methods, it provides a novel method through which to teach new topics and to consolidate existing knowledge. Further work is needed to explore if this methodology can be extended to cover other topics in medical education and if it is effective for other healthcare professionals with varying levels of experience.

Take-home Messages: Medical escape rooms offer a novel teaching method of engaging students in the core principles of managing a patient's disease including an opportunity to demonstrate team working skills.

“BEEP-BEEP SIM” Pilot: Gamified On-Call Simulation Curriculum for Undergraduate Medical Education

AUTHOR(S):

- **Anthony Seto, University of Calgary, Canada (Presenter)**
- Jian Choo, University of Calgary, Canada
- William Kennedy, University of Calgary, Canada
- Mitchell Rohatensky, University of Calgary, Canada
- Sean Crooks, University of Calgary, Canada
- Mackenzie Margetts, University of Calgary, Canada

ABSTRACT

Background: “BEEP-BEEP SIM” prepares medical students to be paged for on-call situations. The innovation is part-game, with a goal (solve clinical puzzles), rules (work collaboratively), feedback system (answers unlock locks), and voluntary component (complete “rooms” in any order). The innovation is part-simulation, using low-tech items including locks and boxes: physically, learners move room-to-room to simulate being on-call; emotionally, students face time-pressures; conceptually, students review on-call topics. “BEEP-BEEP SIM” is grounded in the self-determination theory, which posits that learner motivation requires the needs of competence, autonomy, and relatedness met. Competence is achieved through puzzle participation, choice in the order to complete “rooms” embraces autonomy, and student collaboration promotes relatedness.

Summary of Work: 5 teams of 3-5 students (n=20) piloted “BEEP-BEEP SIM”. Teams completed 6 “rooms” in any order. Each room contained 4 puzzles regarding on-call clinical topics. If teams exceeded 10-minutes for a room, a facilitator assisted. Solving 4 puzzles enabled unlocking of a room’s box. Each box contained a summary card of teaching points for that room, which students reviewed. Once 6 rooms were completed, students were debriefed in the debrief room; this included a verbal quiz to promote retrieval of learned content and an instructor-facilitated summary to reiterate learning points.

Summary of Results: The average learner-reported confidence (n=20) in learning objectives for Hyperkalemia (2.24/5.00 to 4.02/5.00), Chest Pain (3.46/5.00 to 4.46/5.00), Hyperglycemia (2.86/5.00 to 3.98/5.00), Agitation (2.39/5.00 to 4.34/5.00), Fall (2.81/5.00 to 4.14/5.00), and Fever (2.81/5.00 to 3.96/5.00) significantly increased pre- vs post-session (all p<0.001, 1-tail repeated-measures t-test). “BEEP-BEEP SIM” was reported as “fun”, “interactive”, “engaging”, “low stakes”, and “high-yield”. On a scale of “not useful” (0) to “very useful” (2), students (n=19) rated gamification 1.89/2.00 and the 4-phase repetition design 1.92/2.00.

Discussion and Conclusions: “BEEP-BEEP SIM” is a curriculum that improves learner confidence, with advantages of being relatively low-cost and portable. This educational model may be adapted for training in any field, and have interdisciplinary potential, as objectives and associated puzzles are easily customizable.

Take-home Messages: A combination of escape game elements and low-fidelity simulation can be used to achieve learning for tailored objectives, drawing on the teaching strategies of gamification and repetition, and enhancing motivation through the self-determination theory.

All marking and no teaching makes a teacher a dull academic

AUTHOR(S):

- Alexandra Webb, Medical School, Australian National University, Australia (Presenter)
- Katherine Esteves, Medical School, Australian National University, Australia
- Krisztina Valter, Medical School, Australian National University, Australia

ABSTRACT

Background: Marking written assessments can be an onerous task for academics. The grading process requires a significant time commitment, within a limited deadline, that frequently exceeds the time devoted to teaching and learning. Meanwhile, students spend weeks preparing their assessment but after receiving their grade and feedback typically do not share or refer to their work again. Using student-created videos instead of written assessments offers new possibilities to enhance the assessment process for both academics and students.

Summary of Work: Undergraduate human anatomy students (n=126) were assigned an assessment task to create a 5-7-minute entertaining educational video on an anatomy topic of their choice in self-selected groups of five. Following submission, students were invited to rate the videos produced by their peers and participate in an online survey to evaluate their experience of creating the videos. The grading process was compared to a previous 2000-word written assignment.

Summary of Results: Seventy-five (60%) and 61 (48%) students participated in the peer-rating of videos and evaluation survey, respectively. Students preferred peer-videos that delivered pertinent content integrated within a story or drama. The most highly ranked videos incorporated an entertaining comic element. Most students enjoyed creating the video (93%) and reported that the process of creating a video improved their understanding of the topic (90%). The opportunity to research the topic in depth and consolidate their knowledge were the main factors that aided their learning. In contrast, the time-consuming process of the task and the need to learn how to use a new technology detracted from their learning. For teachers, the grading process was reduced from 50 to 5 hours, the feedback to students was increased and it was engaging.

Discussion and Conclusions: The process of creating videos provided students with a stimulating opportunity to work as a team to construct their own representations of anatomical concepts to aid their learning which could be utilised as a resource to aid the learning of their peers. The marking and feedback process was more efficient.

Take-home Messages: Creatively designed assessment tasks can not only benefit student learning but be fun for both students and teachers.

Using medical students for innovation of education: a win-win!

AUTHOR(S):

- Richard Supheert, Radboud University Medical Center Nijmegen, The Netherlands (Presenter)
- Jeroen van Dillen, Amalia Childrens Hospital, Radboudumc, The Netherlands
- Lenno Dukel, Radboudumc, The Netherlands

ABSTRACT

Background: When graduated the young doctors are often asked to supervise and educate their interns in medical practice while being unexperienced. Most of them do not have any educational background within teaching which makes the quality of educating quite variable. In the Netherlands the Medicine study has a final 3 year period of clinically internships but normally no official educational training.

Summary of Work: As a pilot internship the educational committee of the department of obstetrics and gynecology of the RadboudUMC (the Netherlands) provided a senior medical student to enroll in a pilot medical education internship. The learning goals of this three-month educational internship were to teach a senior medical student how to participate and innovate within his/her own medical curriculum.

Summary of Results: In terms of participation, the student was involved in preparation and teaching within the existing curriculum. In terms of development and innovation the student was asked to update an existing module in physiological obstetrics. In collaboration with a large medical publisher the student developed two obstetric e-learning modules for national use by medical Universities and Dutch midwifery schools which will be implemented from August 2019. The same learning goals which came with self-study may now be achieved with the interactive e-learning modules and can prove to be a great innovative way to teach.

Discussion and Conclusions: We learned from all this that a student is well able to help improve his/her own medical educational program and bring new innovating ideas into mind. When being actively supervised a senior medical student can learn how to teach younger students and/or interns, but can also learn how to develop new educational material.

Take-home Messages: We propose to integrate an educational internship into the clinical internship program of senior medical students. On the one hand this will prepare them better for their future careers with better knowledge on how to teach younger students. On the other hand this will then automatically use the younger medical generation to keep on innovating our university educational program: a win-win!

Medical students' capacity for self-assessment in first and fifth year at the Lisbon Medical School

AUTHOR(S):

- Madalena Patricio, Lisbon School of Medicine, Universidade de Lisboa, Portugal (Presenter)
- Ana Isabel Lopes, Lisbon School of Medicine, Universidade de Lisboa, Portugal
- António Barbosa, Lisbon School of Medicine, Universidade de Lisboa, Portugal

ABSTRACT

Background: The results of a first year self-assessment pilot study (334 students) done in the context of Module III-I 'The Doctor, the Person and the Patient', were presented at the AMEE 2018 Conference confirming students' capacity for self-assessment in portfolio and final written exam.

Summary of Work: The aim of the current study was to replicate the above study at a later phase (5th year) in the context of Paediatrics with 164 students self-assessing their practical and written exams. For this purpose, a question was introduced at the end of both exams: 'What grade do you expect to get on the exam you just completed?'. Students were also asked to rate the level of their knowledge (high/medium/low) concerning Paediatrics.

Summary of Results: Results reconfirmed that students are capable of self-assessment. The average difference between 'expected-grade' vs 'real-grade' is only -0.14 for the practical and -0.19 for the written exam. When considering the three groups (high/medium/low knowledge) students assessing their knowledge as 'high' were more optimistic (average difference equal to .02 for practical and .47 for written exam). However, when looking at individual student performances we found, 29 students in the written and 24 in the practical exam, with discrepancies between 'expected-grade vs real-grade' of two or more grade points, reconfirming first year results from 23 students in portfolio and 64 in the exam.

Discussion and Conclusions: If students are capable of self-assessment in first and fifth year when looking at grades in the written exam, it appears that the tendency in first year is for students to over-assess their performance while in fifth year the tendency is for under-assessment. Global results confirmed that not only are students capable of self-assessment at an early and later stage but also that there is evidence of this capacity in the cognitive, practical and reflexive domains.

Take-home Messages: Despite both studies showing that students are globally capable of self-assessment it is crucial to identify their individual performance because for a high number (140) it may not be enough to give them a realistic insight of their weaknesses, which is fundamental when they will be acting as doctors.

The efficacy of peer assessment in Objective Structured Clinical Examinations for formative feedback

AUTHOR(S):

- **Kyong-Jee Kim, Dongguk University School of Medicine, South Korea (Presenter)**
- Giwoon Kim, Sooncheonhyang University School of Medicine, South Korea
- Bora Kang, Seoul National University Bundang Hospital, South Korea

ABSTRACT

Background: We explored the efficacy of a new format in Objective Structured Clinical Examinations (OSCEs), where students were exposed to each station twice both as an examinee and a peer assessor by investigating its impact on their performance.

Summary of Work: 42 four-year medical students participated in OSCEs on three stations (syncope, hemoptysis, and back pain). Each station was assessed both by a medical faculty and a student simultaneously. Students in group A (n=21) were tested on the station and then participated in that station as a peer assessor, and those in group B (n=21) participated in the station as a peer assessor first and then as an examinee later. Student performance scores were compared across the groups. Students were divided into two groups by their overall performance in OSCEs and their scores given to peers as peer assessors were compared with those assessed by faculty.

Summary of Results: There were no differences in their overall OSCE scores between the groups of different sequence of roles in OSCE stations, where p values were .489 or greater in each station. Group A performed better in the syncope station ($t = 3.02, p < .05$) but did worse in the hemoptysis station than their peers ($t = .66, p < .001$). Student performance in the back pain station did not differ between groups ($t = .71, p = .48$). There were significant associations between peer assessment and faculty assessment scores in one station both in higher-performing and lower-performing groups ($p < .05$) and no associations were observed in the other two stations.

Discussion and Conclusions: There were weak associations between the assessment scores conducted by faculty and students and higher-performing students in OSCEs were unlikely to better assess student performance in OSCEs than their peers. Student exposure to the OSCE station as a peer assessor may have a positive impact on his/her performance in some stations, but not in all stations.

Take-home Messages: Peer assessment is a feasible approach to give students more exposure to OSCE stations without consuming more resources, but its effectiveness likely differ across stations. Future research warranted on more effective use of peer assessment to enhance student performance in OSCEs.

Development of Medical Students' Self-Assessed Competency Levels as Part of a Longitudinal, Portfolio-Based Mentoring Programme

AUTHOR(S):

- Maria Farquharson, Competence Centre for University Teaching in Medicine - Baden-Wuerttemberg, University of Tuebingen, Germany (Presenter)
- Maria Lammerding-Köppel, Competence Centre for University Teaching in Medicine - Baden-Wuerttemberg, University of Tuebingen, Germany
- Tanja Mirjam Riess, Competence Centre for University Teaching in Medicine - Baden-Wuerttemberg, University of Tuebingen, Germany
- Jan Griewatz, Competence Centre for University Teaching in Medicine - Baden-Wuerttemberg, University of Tuebingen, Germany

ABSTRACT

Background: Competency-based medical education requires instruments which measure competency development as an outcome. As part of a longitudinal, portfolio-based mentoring programme a questionnaire to document and assess students' competency development (FKM, Freiburg Questionnaire to Assess Competencies in Medicine) was implemented at the University of Tuebingen. Research question: Do students' self-assessed competency levels significantly change between two times of measurement?

Summary of Work: The FKM is a valid and reliable self-assessment tool comprising 45 items in nine competency groups. Students complete the questionnaire in semesters 5 and 8 as part of an e-portfolio. Using an SQL database, data input is digitalised and primary data analysis is automated. Results are shown instantly, including self-assessment and mean cohort values, and in semester 8 a comparison between self-assessment values of both measurement points. Data from one cohort (N=90) was used to test for competency development in general and for each competency group. Wilcoxon signed-rank test was performed in SPSS with n=75 students, 15 of original sample were excluded due to lack of consent/missing data. Post-hoc power analysis was performed in G*Power.

Summary of Results: Significant differences between two times of measurement were found. In semester 8, students reported significantly higher perceived competency levels compared to semester 5 across all competency groups ($z = -33.988$, $p < .001$, $r = .51$). Significant changes were found in each competency group, with largest increases in medical expertise ($z = -19.163$, $p < .001$, $r = .61$), team competence ($z = -11.248$, $p < .001$, $r = .58$), health and prevention competence ($z = -12.162$, $p < .001$, $r = .57$), and management competence ($z = -15.646$, $p < .001$, $r = .57$).

Discussion and Conclusions: Longitudinal data on students' competency development provides valuable insights as basis for self-reflection and mentor feedback, e.g. addressing of individual deviations from cohort. Data of a second and third cohort is being analysed to compare development patterns. Further research is needed to determine which factors influence competency development.

Take-home Messages: A self-assessment tool to document and assess competency development integrated into an e-portfolio found significant changes in students' competency levels across two measurement points, providing a basis for self-reflection and mentor feedback.

Development of an e-portfolio to enhance feedback on medical students' learning progress

AUTHOR(S):

- **Yadira Roa-Romero, Charité-Universitätsmedizin Berlin, Germany (Presenter)**
- Jan Vincent Wyszynski, Charité-Universitätsmedizin Berlin, Germany
- Martin Dittmar, Charité-Universitätsmedizin Berlin, Germany
- Selcan Ipek-Ugay, Charité-Universitätsmedizin Berlin, Germany
- Harm Peters, Charité-Universitätsmedizin Berlin, Germany
- Mandy Petzold, Charité-Universitätsmedizin Berlin, Germany

ABSTRACT

Background: Feedback is important for the learning progress of medical students and their professional development. Yet, many faculties lack a comprehensive feedback system. The aim of this project is to develop a tailor-made e-portfolio for students that provides a comprehensive overview of all formative and summative exam results in conjunction with level of workplace-performance based on set of Entrustable Professional Activities (EPAs).

Summary of Work: To identify student's needs for better feedback on their learning progress, a questionnaire was sent to all students of the undergraduate medical curriculum at the Charité-Universitätsmedizin Berlin (total n=2974) end of 2017. The questions asked whether students wanted more feedback on their learning progression and whether they would use an e-portfolio for this purpose (5-point scale ranging from 1=fully disagree to 5=fully agree). In addition, they were asked which features an e-portfolio should include. On basis of the results, an e-portfolio system was developed that covered the identified main contents and features.

Summary of Results: 1022 students participated (response rate=34%, mean age of 25 (SD=4), with 65 % being female). 50% of students wanted more feedback on their learning progress (M= 3.4; SD= 1.1) and 63% were interested in using an e-portfolio (M= 3.7; SD= 1.2). 81% of students wanted a mode to identify their strength and weaknesses, 72% a comprehensive overview of all exam results, and 66% more feedback on their progress in clinical skills, respectively. Since April 2018, an e-portfolio system has been developed which provides a comprehensive overview of all exam results, identifies strength and weaknesses and allows feedback on students' EPA-based workplace place-based performance. Students have been continuously involved in the e-portfolio development to ensure a good match to their needs.

Discussion and Conclusions: Students are key user of the e-portfolio system for a comprehensive feedback on learning progress. A needs assessment in students and the multistage involvement of students in the development process is key to the tailor-made design.

Take-home Messages: The development of an e-portfolio for feedback on learning benefits from the perspective of multiple stakeholders and the involvement of the students.

Reflective practice promotion through electronic portfolio implementation in extramural dental internship

AUTHOR(S):

- Lorena Isbej, Pontificia Universidad Católica de Chile, Chile (Presenter)
- Claudia Véliz, Pontificia Universidad Católica de Chile, Chile
- Cynthia Cantarutti, Pontificia Universidad Católica de Chile, Chile
- Natacha Oyarzo, Pontificia Universidad Católica de Chile, Chile
- Daniel Ortuño, Pontificia Universidad Católica de Chile, Chile

ABSTRACT

Background: Portfolio is an assessment instrument that reports academic work in a period of time to demonstrate students' competences in the 'does' level in Miller's pyramid, with special emphasis on developing reflective practice. Particular needs were identified in the extramural internship at the School of Dentistry of Pontificia Universidad Católica de Chile. Methodologies and assessment were focused on the cognitive domain with lack of those that promote reflective thinking and professionalism. The aim of this study is to describe the implementation of an undergraduate electronic portfolio in a dental extramural internship, its evolution and perception after two years of experience.

Summary of Work: Implementation of an extramural internship electronic portfolio was analyzed including design, methodologies, assessment results, grades and students' perceptions.

Summary of Results: 104 students participated (2017 and 2018) supported by 5 tutors. Portfolio included different sections like standardized virtual clinical cases of adult and pediatric patients, reflection on action report, clinical activity record, honor commitment for plagiarism and confidentiality for clinical cases. Essays were used as methodology for promote reflection and a final work was assessed with rubrics. Formative and summative assessment accompanied by feedback were fundamental in the successful of the process. The grades improved between first and last work, with statistically significant difference ($p=0,001$). There were no cases of plagiarism, likely due to the implementation of a software to detect it.

Discussion and Conclusions: In general strengths and weaknesses of this electronic portfolio were consistent with previously published experiences, as an exception that the academic work load and allotted time were mostly well evaluated by the students. In addition, plagiarism - an issue frequently mentioned in medical education - was not detected. With these results the portfolio responds to the proposed aim: being pertinent, coherent and feasible to implement.

Take-home Messages: In health professions it is fundamental to promote reflective practice as part of professionalism. For this purpose the portfolio is an excellent tool which will be successful with active participation of the students, tutors' support and feedback also being careful not to overload with activities leaving schedules protected for their development.

Creating, launching and maintaining a new e-portfolio for foundation doctors in England

AUTHOR(S):

- Kata Várnai, Health Education England, UK (Presenter)
- Clare van Hamel, UK Foundation Programme Office (UKFPO), UK
- Angela Burton, Health Education England, UK

ABSTRACT

Background: All trainee doctors in England use an electronic portfolio (e-portfolio) to record their achievements. The content of e-portfolios is used to decide whether doctors progress to the next stage of training. Health Education England (HEE) replaced the e-portfolio for doctors in their first 2-years of training after university (foundation doctors) in August 2017. This is a business-critical service affecting over 100,000 NHS staff across England, as well as UK medical schools, the General Medical Council and Medical Royal Colleges.

Summary of Work: HEE replaced the commercial e-portfolio used for 10-years with an in-house product. Over 2-years a small regional HEE application ('NW Horus') was converted into a national e-portfolio service ('HEE Horus'). A multi-disciplinary project team - re-designed and built HEE Horus - transferred data from the old system - communicated with and trained new users. Feedback is regularly gathered from stakeholders using - surveys - workshops – email. This is used to inform detailed design/prioritisation decisions.

Summary of Results: 2016 Year 0: Pilot - 'light-touch' overhaul and roll-out to one region (mid-low satisfaction rating); 2017 Year 1: Full launch (low satisfaction rating); 2018 Year 2: First business as usual year (high satisfaction rating). Qualitative and quantitative analysis of user feedback and statistics from the e-portfolio during its first 2-years will be undertaken and the findings presented.

Discussion and Conclusions: Stakeholders were acutely affected by the changes and managing communication and dissenting voices was a significant challenge. The development of technical functionality led to an unanticipated and valuable review of local and national processes - many regional variations/misunderstandings were found. Involving users in planning and testing was central to the success of the project. We found that electronic systems drive behaviour both within and outside them and thus provide opportunities to encourage better engagement with the curriculum. Analysis of our processes, challenges and successes will be presented and used to explore how assessment system change management processes can be improved.

Take-home Messages: Scaling up a small local system proved more challenging than anticipated. Archiving was a significant endeavour and stakeholder apprehension added considerable complexity. A dedicated expert project team ensured that the e-portfolio has received the highest satisfaction rating in 7-years.

Can a collaborative art-anatomy educational environment encourage creative thinking and learning skills?

AUTHOR(S):

- **Krisztina Valter, Australian National University, Australia (Presenter)**
- Alexandra Webb, Australian National University, Australia
- Lillian Smyth, Australian National University, Australia
- Bethany Lincoln, Australian National University, Australia

ABSTRACT

Background: Being able to think creatively is a highly desired skill in medicine. Yet, many medical students struggle in tasks that require a more creative approach, specifically in problem setting and solving. There is growing concern among educators, that undergraduate science courses are often not conducive to the development of these necessary skills. Therefore, it is important to explore ways we can support our students in gaining skills, which will be central in their clinical practice.

Summary of Work: Students enrolled in premedical program at the Australian National University were offered an intensive 3-week art-anatomy course, where the two disciplines are taught synergistically, by presenting anatomy content and artistic techniques simultaneously. Students are free to explore these techniques to create art works with anatomical content. A student art exhibition concludes the course. Students are assessed on their ability to express their anatomical knowledge in creative artistic ways that reflects their personal journey. The course is taught collaboratively by anatomy academics and a practicing artist educator.

Summary of Results: We conducted a pilot study where we analysed student (n=23) written submissions, specifically comparing their course application paragraph and the post-course reflections. Thematic analysis identified 5 main themes - transferable gains, space for exploration, tolerance for uncertainty, resilience, and skills vs. knowledge. All of these themes have been linked to creativity and creative thinking in the literature.

Discussion and Conclusions: Premed students were clearly struggling at the start of the course, as free exploration was novel to them, however as the course progressed, they embraced the new learning environment. Their reflections show evidence that they recognise the value of such free explorations, gaining valuable skills and becoming more innovative and productive in their learning.

Take-home Messages: Learning environment providing freedom for exploration can help students develop invaluable skills which are essential in studying medicine and in clinical practice.

'But I'm not artistic!': How students' attitudes towards medical humanities change over time

AUTHOR(S):

- Lucinda Richards, Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore (Presenter)
- Tanya Tierney, Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore
- Lucy Rosby, Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore
- Michael Stanley-Baker, College of Humanities, Nanyang Technological University, Singapore

ABSTRACT

Background: Medical Humanities is part of the core curriculum at Lee Kong Chian School of Medicine (LKCMedicine). Medical humanities is becoming an integral part of many medical school curricula as it is recognised that the arts, and an understanding of narrative medicine, can deepen medical students' understanding of the human condition from the perspective of patient, family and doctor.

Summary of Work: Our IRB-approved study examines students' perceptions about the medical humanities curriculum at LKCMedicine. First year medical students completed an on-line questionnaire at four time-points over the course of an academic year. During this time period they attended three x 3-hour medical humanities sessions.

Summary of Results: Data analysis of a hopes and fears exercise revealed a broad range of attitudes prior to the start of the medical humanities course and widely held assumptions about the importance of being talented in that arts. Over time there were changes in students' views about medical humanities. These changes included the perceived importance of being talented in the arts, and attitudes towards the relevance of medical humanities in medical training. Students' appreciation of medical humanities developed over time.

Discussion and Conclusions: Our results provide evidence of change in student attitudes towards medical humanities over time, and how appreciation of medical humanities develops after starting the course.

Take-home Messages: LKCMedicine students' appreciation of core medical humanities teaching develops during the first year of the MBBS course.

Life education of hospital staff through humanistic works presentation

AUTHOR(S):

- Kang-Ju Chou, Kaohsiung Veterans General Hospital, Taiwan (Presenter)
- Yu-Ting Sun, Department of medical education, Kaohsiung Veterans General Hospital, Taiwan
- Ching-Shiung Wu, Department of medical education, Kaohsiung Veterans General Hospital, Taiwan

ABSTRACT

Background: Holistic care is believed to be able to bring better outcome of patients and have been the main goal of medical education in Taiwan. Although, the related knowledge is easy to understand, the corresponding behavior is difficult to build up. In this study, we conducted an exhibition of humanistic works of intern, PGY doctors and other hospital staffs about their experiences in caring for patients to help them reflect on the meaning of life.

Summary of Work: In May, July, and Dec. 2018, at the end of one year training, we carried out a one week exhibition of humanistic works of intern, PGY doctors and other staffs in Kaohsiung Veterans General Hospital (VGHKS). At the end of the week, we held an oral presentation. The authors needed to explain their works. After the whole activity, we conducted a e-questionnaire on hospital staff about their opinion of the meaning of life.

Summary of Results: There were 3357 staff in VGHKS in 2018, 1133 questionnaire were reclaimed, of them, 1114 (98.3%) were valid. Staff who submitted the humanistic work, or attended the exhibitions or oral presentations had more positive attitude in meaning of life than those who did not (44.8 ± 15.3 vs 37.5 ± 9.1 , $p=0.000$; 39.6 ± 10.8 vs 37.1 ± 9.3 , $p=0.000$, respectively). Medical students (including intern and PGY doctors) and medical personnel students had higher positive attitude than other physicians (40.4 ± 13.6 vs 35.4 ± 8.2 , $p=0.000$) and medical personnel (39.8 ± 9.3 vs 35.8 ± 7.7 , $p=0.000$). There were no significant differences among physicians, other medical personnel and non- medical staffs.

Discussion and Conclusions: Treat the patient, and not just the disease has been the consensus in modern medicine. To reach this goal, we need sincere reflection about the meaning of life. By proposing the humanistic works, the presenters needed to reflect their experiences in caring for patients and be deeply aware of the real demand of life. In our study, we found that either by presenting or attending the exhibitions of humanistic works could help hospital staffs have positive attitude towards human life.

Take-home Messages: Presenting humanistic works could effectively help hospital staff to think positively about the meaning of life.

Fairy Tales and Psychiatry: a Psychiatry Residency's Experience

AUTHOR(S):

- Zheala Qayyum, Harvard Medical School / Boston Children's Hospital, USA (Presenter)
- Ryan Wallace, Yale Department of Psychiatry, USA
- Maria Kaliambou, Yale, USA

ABSTRACT

Background: Fairy tales are universal, crossing cultural, social, and generational boundaries. They demonstrate important developmental and psychological concepts in an engaging and relatable way. They accomplish these tasks in a manner that typical textbook, didactic forms cannot. We created an elective course in an adult psychiatry residency to highlight themes of development in an engaging format and stimulate interest in child and adolescent psychiatry (CAP), an underserved field in need of practitioners.

Summary of Work: The elective was held for monthly 90-min sessions based on David Kern's six-step approach 1: Problem identification and needs assessment 2: Needs assessment of targeted learners 3: Goals and objectives 4: Educational strategies 5: Implementation 6: Evaluation and feedback. Fairy Tales used: Cinderella, Hans Labyrinth, Little red riding hood, The Juniper Tree, Snow White and seven dwarfs, Star Wars, Harry Potter Example of a session- The Little Red Riding Hood: Preparatory readings of various versions of the tale. In-class actress portrayal the story. Discussion topics: The mechanics of story-telling. How the audience shapes the story and how stories evolve over time. The Oedipal complex and splitting. Play therapy and role-playing; projection onto the big bad wolf.

Summary of Results: The elective was well-received by trainees in the Psychiatry and Medical School programs. Participant feedback was collected after each session. After each session trainees were asked to identify important themes related to developmental theory. Participants demonstrated their ability to identify core features of the developmental theories through their written explanations, showing improved understanding and comprehension of key concepts.

Discussion and Conclusions: A formal curriculum based on this course is in development to share with other psychiatry residency training programs, possibly providing an engaging and novel way to meet ACGME milestones. What was important, based on participant feedback and educator experience, was to provide trainees with diverse perspectives in a setting that fostered creativity and playfulness with the material.

Take-home Messages: Fairy tales offer an opportunity to explore the inner world of the child, providing a glimpse into the fears and fantasies central to development. For learners, they illustrate theoretical concepts and provide a framework for deepening the conversation about our clinical interactions and the meaning-making process in therapy.

Narrative perspective and reflective writing: A Longitudinal Elective in Health Humanities

AUTHOR(S):

- Alice Fornari, Donald and Barbara Zucker SOM at Hofstra/Northwell, USA (Presenter)

ABSTRACT

Background: Significant challenges facing medical education are the decrease in student empathy and increase in burnout over the course of medical school. Students need skills to maintain their ability to connect with patients and other health professionals, while also taking care of themselves. The Health Humanities (HH) addresses these challenges by focusing on the ways we absorb, interpret, and respond to stories in literature and other forms of art, offering a model focused on physicians' relationships with their patients, colleagues, society, and themselves. Various approaches and steps are being taken to reincorporate HH into medical education curricula. Even though a degree of consensus exists that HHs needs to be (re)introduced into medical education, the question still arises as to how?

Summary of Work: Our goal is to share the experience of offering a longitudinal elective and offer a curricular model specific to HHs and enable a protected space/time for students to explore HH and connect their professional experiences with patients and health professionals using narrative writing/reflective practice. This elective was placed in a central location in the evening of the final year to align with other required rotations and interviews for postgraduate training. Faculty, who are part of a CoP focused on HH and narrative writing, facilitate sessions. Logistics for optimum design/implementation will be described.

Summary of Results: 1. Pre/post student data to be reported: 1) Maslach Burnout Inventory scores and the 2) Connor Davidson Resilience Scale. Preliminary Data: Significant drop in Emotional Exhaustion Significant drop in De Personalization Personal Accomplishment increase "not statistically significant Resilience increased- not statistically significant . 2. Student and faculty feedback from exit interviews

Discussion and Conclusions: The purpose of this elective is to develop students' capacities for continuous reflection and self-regulation through the lens of HHs. Medical students who self-select to participate benefit from the content presented and the small group experience with peers and faculty. We anticipate students will continue to pursue this type of learning in their future and seek guidance to integrate HH into future learning environments they engage in as physicians.

Take-home Messages: Longitudinal electives can be successful. HH can frame teaching and learning specific to health, illness and professional identity formation.

Twelve tips to design a competency-based curriculum for continuing professional development

AUTHOR(S):

- Heather Lochnan, The University of Ottawa, Canada (Presenter)
- Simon Kitto, The University of Ottawa, Canada
- Robert Parson, The University of Ottawa, Canada
- Dianne Delva, The University of Ottawa, Canada
- Gary Viner, The University of Ottawa, Canada
- Paul Hendry, The University of Ottawa, Canada

ABSTRACT

Background: There is a growing worldwide awareness in the field of health professions education and research that successful implementation of competency-based medical education (CBME) requires embracing all stages of professional development (from undergraduate, through residency to continuing education). Despite increased levels of cognizance and even enthusiasm about the importance of the entire continuum for the ultimate goal of improved healthcare, much work still remains as CBME principles are not widely adopted in continuing professional development (CPD). If we expect a CPD curriculum to integrate CBME, competencies must be developed and clearly specified how they will fit into a coherent and implementable curriculum structure.

Summary of Work: This work was conducted to explore the current curriculum evaluation practices in an effort to identify effective strategies that could be used in the development of competency-based CPD programs. Most work to date is in the realm of CPD in family medicine, the best practices identified are transferable to and useful for other disciplines, educational contexts and countries.

Summary of Results: Based on published evidence, 12 practical tips were identified that can be used as a guide by all stakeholders involved in a competency-based CPD curriculum development.

Discussion and Conclusions: While CBME has been adopted in residency training programs, it has yet to be adopted by the CPD community. The CPD program at the University of Ottawa sought to fill this gap. Use of curriculum mapping for CPD and in particular for mapping to competencies (for the physician in practice) is still in its early stages. This study describes a strategy for curriculum development and evaluation as well as techniques to avoid the pitfalls we experienced. A systematic approach to curriculum mapping can be used to guide us in development of a comprehensive competency-based curriculum for health professionals. The eventual anticipated goal of our CPD curriculum mapping project is to create concepts that are transferable to other medical settings to inform the design and implementation of CBME in CPD.

Take-home Messages: In order to translate a competency-based approach into CPD, educational programs will have to refine curricula across health professionals education using curriculum mapping as an important tool of curriculum development and evaluation.

Development and Implementation of a Simulation-Based Short Course for Airway Management and Resuscitation during the First 5 Minutes of Cardiac Arrest in the Resource-Limited Primary Care Hospitals

AUTHOR(S):

- **Sung A Lee, The Catholic University of Korea College of Medicine, South Korea (Presenter)**
- Young-Min Kim, The Catholic University of Korea College of Medicine, South Korea
- Ji-Hoon Kim, The Catholic University of Korea College of Medicine, South Korea
- Young Min Oh, The Catholic University of Korea College of Medicine, South Korea
- Yeon Young Kyong, The Catholic University of Korea College of Medicine, South Korea
- Hyun Ho Jeong, The Catholic University of Korea College of Medicine, South Korea

ABSTRACT

Background: Continuing professional development (CPD) program of practical airway and resuscitation training (ART) for primary care practitioners has been limited in Korea. Based on the educational needs of local primary care practitioners, we developed a simulation-based short course for airway management and resuscitation during first 5 minutes of in-hospital cardiac arrest and have implemented to local practitioners worked in resource-limited primary care hospitals.

Summary of Work: Following several meetings and a focus group interview with local practitioners, we developed a 3-hour ART course and implemented to the primary care practitioners worked in various types of local hospitals. The course was consisted of 1) brief lecture on current resuscitation guidelines and crisis resource management concept; 2) hands-on workshop for related procedures such as basic airway maneuvers, bag-mask ventilation, chest compressions and automated external defibrillator use; and 3) patient simulation using the rapid cycle deliberate practice method including within event or stop-action debriefing. The tailored scenarios were used for the patient simulations according to the participants' specialties and hospital settings (outpatient clinic waiting area, endoscopy or procedure room). We evaluated the participants' responses on the course using a post-training questionnaire.

Summary of Results: During the 2-year implementation period, 7 courses have been implemented to 81 local primary care practitioners with various specialties. The participants' overall satisfaction (10-point scale) to the course were very positive [10 points in 73 (90%) and 9 points in 8 (10%)]. The level (5-point scale) of recommendation of the course to the other local practitioners was high [5 points in 72 (89%) and 4 points in 7 (11%)]. Many participants positively commented on the practical training through deliberate practice and realistic experience on the uncommon crisis situations in their resource-limited setting.

Discussion and Conclusions: A simulation-based ART course including tailored patient simulations using rapid cycle deliberate practice method was able to provide realistic experience to the local primary care practitioners.

Take-home Messages: This simulation-based short course is a good example of how patient simulations can be effectively used for the CPD program on a specific topic requiring practical skill acquisition and maintenance of local practitioners work in the resource-limited hospitals.

Advancing Wellness and Improving Joy at Work Through Professional Development

AUTHOR(S):

- Janine Shapiro, University of Rochester School of Medicine and Dentistry, USA (Presenter)
- Michael Privitera, University of Rochester School of Medicine and Dentistry, USA

ABSTRACT

Background: Research demonstrates a high incidence of clinicians stress, burnout, and depression. Wellness programs might not only benefit the individual clinician but also be vital to the delivery of high quality healthcare. Approaches to improving wellness must include Individual and institutional approaches.

Summary of Work: Twenty-nine one-hour long wellness seminars for faculty and clinicians were designed and implemented over a three-year period. Initial need analysis was performed using current literature on factors involved in burnout of physicians. Additional seminars were planned based on individual need analysis from attendees. Overall attendance, level of satisfaction, and self-reported changes in knowledge, skills and behavior/attitudes were analyzed. Using content analysis, written input from participants were analyzed inductively and then clustered into emergent themes.

Summary of Results: During the first year of implementation, there were 612 participants with an average of 56 attendees per seminar. Examples of topics included burnout overview, mindfulness, resilience, finding meaning, time management, cognitive load, managing challenging patient situations and dealing with difficult patients, building autonomy, and electronic medical record efficiency. Seminars were highly rated for content and presentation. Plans to transfer knowledge and wellness tools to existing roles were reported by attendees. Several themes emerged as recommendations to the organizational leadership to help reduce burnout through individual and institutional interventions. This has led to the design and implementation of additional professional development offerings to advance wellness. These include a new series on tips and tools on the use of the electronic health record, a series on mindfulness, and an educational program for leaders on human factors-based leadership for faculty and clinician wellness.

Discussion and Conclusions: These wellness seminars have served as an important venue to learn what is important to clinicians to help them in their resilience and for sustaining practice. Seminar discussions also helped give safe places for discussion of the need to change the path of the increasing incidence of high-level burnout.

Take-home Messages: The practice environment has been noted to have an important impact by hospital leadership, has opened the door to continued progress of our wellness efforts, and has emerged as an important new way of affecting the medical culture in the institution.

Authentic or demonstrated reflection? The reflection process of healthcare professionals during reflective conversations in a leadership development curriculum

AUTHOR(S):

- Anne van Tuijl, Radboud University Medical Center, the Netherlands (Presenter)
- Hiske Calsbeek, Radboud University Medical Center, the Netherlands
- Hub Wollersheim, Radboud University Medical Center, the Netherlands
- Roland Laan, Radboud University Medical Center, the Netherlands
- Petra van Gorp, Radboud University Medical Center, the Netherlands
- Lia Fluit, Radboud University Medical Center, the Netherlands

ABSTRACT

Background: Reflection is an essential skill of healthcare professionals (HCPs) being lifelong learners. Reflective writing assignments are common used in medical curricula to stimulate reflection. As reflection is a complex and multifaceted activity, there is a call to broaden the methods for stimulating reflection. In a national master on patient safety and quality improvement for HCPs, reflective conversations (RCs) between student and teacher on HCPs development in leading a quality improvement project are part of the curriculum. To obtain insight in the reflective process of HCPs during RCs, these conversations were analyzed.

Summary of Work: We qualitatively analyzed 16 RCs to get insight in the reflective process of HCPs (7 nurse specialists, 5 medical specialists, 1 allied health professional, 1 healthcare jurist, 1 pharmacist and 1 health scientist) based on Mezirow's reflection levels: content, process and critical level. Two weeks after the RC, semi-structured interviews with participants (N=16) were held to evaluate the RC.

Summary of Results: HCPs most often described their development instead of reflecting on it. Between one third and one fourth of the HCPs were unable to show reflection on their strengths and/or weaknesses on a content, process or critical level. Two HCPs showed critical reflection on strengths and/or weaknesses. In contrast with showing reflection during the RCs, most HCPs described themselves as reflective professionals during their work. Overall, HCPs experienced the RCs positive. Two HCPs described plans for practising new behaviour as a result of their RC.

Discussion and Conclusions: Reflection, especially critical reflection, during structured RCs does not occur in most meetings. However, most HCPs considered themselves as being reflective in daily practise. It can therefore be questioned whether structured RCs regarding leadership development which take place outside the workplace are a valid way to demonstrate reflective skills. Future research should focus how reflection actually takes place in practice.

Take-home Messages: Medical curricula need to find ways to help develop and measure real reflective skills instead of demonstrated reflection in uniform formats outside the workplace. By this, we are able to further stimulate reflection in a meaningful way, and in different contexts.

Framing Professionalism: A Comparison of Measurement Instruments versus Policy Statements: Implications for CPD

AUTHOR(S):

- **Betsy Williams, Professional Renewal Center, USA (Presenter)**
- Fred Hafferty, Mayo Clinic, USA
- Lowell Brown, Arent Fox LLP, USA
- Dillon Welindt, Wales Behavioral Assessment, USA
- Michael Williams, Wales Behavioral Assessment, USA

ABSTRACT

Background: The understanding of professionalism in medicine has moved from mastery of rules concerning professional behavior to development of professional identity. Professional identity involves the development of an overarching schema that provides guidance in situations where a specific rule may be ambiguous. This process is grounded in an evolving series of interactions between the individual and their social contexts/learning environments. As a lifelong process, developing a professional identity requires understanding the relationship between social structure and professionalism as a formal construct necessary for effective lifelong learning. However, how organized medicine sees this construct-individual-content relationship is not well understood. In this study we examine whether the organizational structures that constitute the medical industry are consistent with support of medical professionalism from an identity formation perspective.

Summary of Work: We sampled legal statutes, human resources policies, and medical staff and specialty board policies/codes to abstract themes and behavioral indicators of professionalism. We applied the same thematic analytic approach to a sample of professionalism measurement instruments. We then compared and contrasted these sets of professionalism descriptors.

Summary of Results: Results suggest that consistent with a hierarchical structure of professionalism that is founded in behaviors and progressing to a hierarchy of constructs to a broad position of identity, the social-institutional codas move from specific to general descriptions.

Discussion and Conclusions: The understanding of professional behavior is grounded in specific social requirements that specify a minimal level of acceptable professional behavior. As physicians practice becomes increasingly integrated into formal organizational settings, behavioral expectations must be reflective of and consistent with bureaucratic, institutional and market considerations suggesting that professionalism is an active process in which social institutions influence practitioners' sense of professionalism across their career. It also consistent with the view that continuous professional development/educational support structures should provide learning environments and lifelong learning opportunities that support the professional identity formation of physicians.

Take-home Messages: 1. Professionalism is founded in behaviors progressing from a hierarchy of constructs to a broad position of identity and social-institutional codas. 2. Professionalism is dynamic. 3. Practitioners can be supported through CPD opportunities that are culturally/socially sensitive and support professional identity development.

Development of innovative clinical care competency program for nursing students

AUTHOR(S):

- **Shu-Fen Shen, National Yang-Ming University, School of Nursing, Taiwan (Presenter)**
- Heng-Hsin Tung, National Yang-Ming University, School of Nursing, Taiwan
- Li-Chiu Lin, Hungkuang university, School of Nursing, Taiwan
- Chia-Ju Hsieh, Cardinal Tien Junior College of Healthcare and Manage, School of Nursing, Taiwan

ABSTRACT

Background: The main learning outcome of nursing education is clinical practice competency and cultivate qualified and reliable nurses who are capable to work in clinical side. However, we found that novice nurses quit quickly due to reality shock in Taiwan. The leader and senior nurses also identify the novice nurses' skills and critical thinking need to be improved to provide good quality of care. To enhance clinical competences, scenario simulation was used to facilitate student's critical thinking and build their abilities to manage patients' health related problems.

Summary of Work: This study was conducted by historical comparative research design which aimed to examine efficacy of scenario simulation of enhancing clinical competency. This historical comparative study was conducted from May 2016 to Jan 2017. The scenario simulation education intervention has four stages, including (1) Establish task force, (2) Development of case scenario, (3) OSCE (Objective Structure Clinical Examination), (4) Examine outcome of the intervention.

Summary of Results: 1. The quantitative outcome of course is the average satisfaction score, which was around 4.5 out of 5. The qualitative outcome of course evaluation was that many students expressed this curriculum made learning more interesting and had positive impact on their clinical competency. However, they felt more stressed in comparison with traditional lecture course. 2. Compared to other students, these students who underwent the intervention gained much better clinical competency and critical thinking skills evaluation by clinical preceptors. 3. Notably, the employment rate of this group who underwent scenario simulation education is 90%, compare to the employment rate was around 47-52% in past three years.

Discussion and Conclusions: Although the scenario simulation course required much more resources compare to traditional lecture, the course should be implemented since the outcome of the course is inspiring and outstanding. The nursing faculty involve the simulation course were volunteer with enthusiasm. How to use the scenario simulation course and examine by OSCE should be roundly use with limited resource is the next step.

Take-home Messages: Combing Concept map, scenario simulation and OSCE is good teaching strategy to develop the nursing students' critical think and nursing skills. The program can bridge the gap between education and clinic.

Teaching normal - teaching physical examination skills on healthy patients

AUTHOR(S):

- Wern Ee Tang, Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore (Presenter)
- Teck Yee Wong, Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore

ABSTRACT

Background: Physical examination skills training is a fundamental component of medical education. There are many different methods of teaching physical examination techniques with no clear evidence to support one particular model over another. At the Lee Kong Chian School of Medicine (LKCMedicine), physical examination skills training begins in the first year of medical school with the teaching of physical examination techniques on healthy volunteer patients and simulated patients. Students' physical examination skills are assessed during their Year 2 Objective Structured Clinical Examinations (OSCEs) (which includes communications, physical examination and procedural skills stations) before they progress to their clinical years.

Summary of Work: We reviewed the pedagogical principles underpinning the Clinical Methods course at LKCMedicine, the course delivery, student and faculty feedback and students' performance in the physical examination stations at the Year 2 OSCEs over 4 years.

Summary of Results: Communications of expectations for students was established via Physical Examination Guides (which outlined the steps for the physical examination stations) and Physical Examination Videos. Clear communications to learners at the outset of the course that the learning outcome of the course was the acquisition of physical examination techniques and the recognition of normal signs was important to students. Feedback from Year 3 clinical faculty on student performance in bedside physical examination during their clinical postings has been positive. However, faculty teaching the physical examination course in Year 1 & 2 have highlighted some challenges encountered when teaching physical examination techniques without the presence of abnormal signs and the formulation of differential diagnoses. Performance in the physical examination stations at the Year 2 OSCEs has been satisfactory with more than 70% of students passing the physical examination stations.

Discussion and Conclusions: The OSCE results and feedback from students and clinical faculty suggest that this approach is effective in developing psychomotor skills in physical examination. Further faculty development to address the challenges raised by faculty will be beneficial.

Take-home Messages: Teaching physical examination techniques on normal subjects is an effective way of developing physical examination skills in medical students in the pre-clinical years.

Dignity during work-integrated learning: what does it mean for supervisors and students?

AUTHOR(S):

- Paul Crampton, Hull York Medical School & Monash Centre for Scholarship in Health Education, UK (Presenter)
- Oliva King, Monash Centre for Scholarship in Health Education, Monash University, Australia
- Corinne Davis, Monash Centre for Scholarship in Health Education, Monash University, Australia
- Allie Clemans, Monash Centre for Scholarship in Health Education, Monash University, Australia
- Charlotte Rees, Monash Centre for Scholarship in Health Education, Monash University, Australia

ABSTRACT

Background: Work-integrated learning (WIL) is becoming a key component of higher education. While the educational benefits of WIL are well-recognised, literature indicates that healthcare students commonly experience dignity violations during WIL. Dignity relates to treating someone with respect in a way that acknowledges their worth, but what this means depends on context. In order to address concerns about student dignity during WIL, an important first step is to identify what dignity means to students and supervisors. This research seeks to answer the question: what are supervisor and student understandings of dignity during WIL across multiple disciplines?

Summary of Work: Seven group and 58 individual semi-structured interviews were undertaken between June 2017 and May 2018, with 30 supervisors and 46 students from medicine, nursing, counselling, education, business, and law disciplines. Participants were asked to describe their understandings of workplace dignity. A team-based, five-stage framework analysis was used to examine the data.

Summary of Results: Although the majority of participants struggled to articulate their understandings of dignity, 826 understandings were captured categorised into 23 conceptualisations. The ten most common conceptualisations were (descending order): respect, freedom from abuse, equality, care, inclusion, right for learning opportunities, value, comfort, freedom of expression and acknowledgement of person. In terms of concept valence (e.g. positive, negative), supervisors used more positive terms, whereas students used more negative terms for articulating dignity. Regarding levels (i.e. individual, relational or environmental), workplace dignity was described most frequently at the relational-level: a 'two-way street'. Subtle differences were found between disciplines (e.g. inclusion more common for health, equality for non-health).

Discussion and Conclusions: Our findings align with existing literature conceptualising workplace dignity as a multi-faceted and co-constructed concept. Our findings add to this literature by highlighting how dignity is conceptualised during WIL. We suggest the need for clearer understandings and expectations of dignity ahead of WIL.

Take-home Messages: These findings raise awareness of what dignity during WIL means for supervisors and students across six disciplines. This knowledge is a first crucial step towards designing education initiatives that aim to encourage dignified workplace learning in order to enhance the experiences of both supervisors and students and ultimately protect end-users (i.e. patients/clients).

Facilitating Affective Elements in Learning - in a Palliative Care Context

AUTHOR(S):

- Janet Mattsson, Red Cross Red Crescent University College, Sweden (Presenter)

ABSTRACT

Background: The affective domain is very present in the activities of the healthcare environment but has remained as a relatively unrecognized phenomenon. The aim of this study was to explore ways clinical supervisors facilitate the learning of the affective elements of professional competence in a clinical palliative care environment.

Summary of Work: The affective and transformative learning processes taking place requires special support. However, little is known about how clinical supervisors facilitate this learning processes. A qualitative, explorative study was designed to capture supervisors perceptions of their supervision using semi-structured interviews. Six experienced clinical supervisors working within a palliative care context were recruited using convenience sampling. Data were analyzed using inductive content analysis.

Summary of Results: The overall results of this study, which aimed at exploring and make hidden knowledge on how clinical supervisors facilitate the affective elements of learning, visible, in the palliative care context, show how the affective elements were viewed as the foundation for learning, clinical supervision, and professional competency. The core of learning in the affective domain derived from the supervisors' experience of the elements gained in a clinical context. Four main themes were identified; building a relationship, creating space for learning, creating a pedagogical environment, and mirroring, **Discussion and Conclusions:** The context of informal workplace learning becomes interesting when analyzing palliative home care. The student is allowed to become a part of the everyday living of the patient with the exclusive opportunity to obtain information on the patient's condition, home life, activity reactions to medications, change in relationships, coping strategies and much more. It is clear that both physical and mental learning environment is created at homes, as well as in the car, and a social and emotional climate where the students can learn safely are created as well.

Take-home Messages: experienced clinical supervisors use multiple different ways to facilitate learning of affective elements. and are willing to use themselves, their lived experiences, challenges and examples of coping as a learning resource for the students. However, the facilitation processes take place within the hidden curriculum and are based on the hidden knowledge and experiences of the clinical supervisors.

Teachers' perspectives on student-staff partnership: Limited space for students or co-creation?

AUTHOR(S):

- **Samantha Martens, Maastricht University, the Netherlands (Presenter)**
- Ineke Wolfhagen, Maastricht University, the Netherlands
- Jill Whittingham, Maastricht University, the Netherlands
- Diana Dolmans, Maastricht University, the Netherlands

ABSTRACT

Background: An upcoming interest in student-staff partnerships for improving medical education is going on. Student-staff partnerships are collaborations in which students and teachers contribute to improving education by adding each their unique perspective in decision-making and implementation processes (Cook-Sather, Bovill and Felten, 2014). Teachers have subject-matter expertise and pedagogical knowledge; students on the other hand provide the perspective of experiencing education in daily practice. Combining these perspectives can contribute to educational development and improvement. Students are willing to participate in these partnerships, but teachers remain hesitant.

Summary of Work: This study addressed the following questions: 'What are teachers' perspectives about student-staff partnership for improving educational quality?' and 'Under which conditions can student-staff partnership contribute to educational quality from the teachers' perspective?'. We have conducted a semi-structured interview-study among fourteen course coordinators of four health bachelor programs. We used Bovill and Bulley (2011)'s levels of student participation as sensitizing concepts when analyzing the data.

Summary of Results: Three main perspectives were identified: teachers teach and students study (i.e. teacher have expertise and students acquire knowledge), teachers teach and value student feedback (i.e. teachers use student feedback to improve their teaching), or teachers and students co-create (i.e. they both contribute substantially to improving education and learn from each other). In order to reach the co-create level of partnership the following criteria were discussed: Teachers are open and aware to involve students, they create dialogues with students, students are motivated to co-create, the organization is supportive, and teachers have the final responsibility.

Discussion and Conclusions: Teachers' perspectives on developing a partnership with students seem to shift: from more traditional approaches in which students have limited space, to perspectives in which student input is valued, and finally a setting in which both students and teachers co-create education and learn from each other when improving education. Struggles reported deal with perceived differences in responsibilities.

Take-home Messages: The contribution of student-staff partnership on the continuous improvement is a topic that gains interest. Teachers' perspectives about involving students in co-creating education differ from providing limited space and value to student input towards a co-creation in which students and teacher collaborate equally and learn from each other.

AMEE Students: an example of where student engagement is really meaningful!

AUTHOR(S):

- Basil Ahmad, Jordan University of Science and Technology, Jordan (Presenter)
- Evangelos Papageorgiou, European Medical Students' Association - EMSA
- Aikaterini Dima, International Federation of Medical Students' Association - IFMSA
- Beatriz Atienza Carbonell, University of Valencia Medical School, Spain
- Tessa Noijons, University of Utrecht, the Netherlands
- Mohsna Bhiri, International Federation of Medical Students' Association - IFMSA

ABSTRACT

Background: The AMEE Student Task Force is a group of enthusiastic health professions' students that travel from all over the world to make a change in their own education by participating in the annual AMEE Conference.

Summary of Work: Each year, EMSA and IFMSA, organisations that represent medical students in European and international level collaborate with AMEE to facilitate the process of selecting a group of students called the AMEE Student Task Force (STF). Students from all health disciplines are welcomed to participate to promote the interprofessional aspect of AMEE. The selection process follows objective criteria based on each students' application in addition to regional and gender representation, while being anonymous to ensure the objectivity of the process. Each year, the STF is getting more and more popular, exceeding 1200 applications in 2018. After selection, the students are explained their tasks and are paired into groups that will help enhance the team building between the members of the STF. During the conference, the students dedicate half of their time in helping the meeting run smoothly and half of their time in participating actively in the conference sessions.

Summary of Results: More than 700 health professions' students had the chance of being an AMEE STF member since the creation of this tradition back in 2007. Students have the chance to participate in the biggest Health Professions' Education conference and explore their full potential in the field of Medical Education. During the past years, the STF evaluations from the AMEE Conference are getting better and better, with 53% of the people considering the students' contribution to the conference as 'excellent' in 2018.

Discussion and Conclusions: Through their partnership, AMEE, EMSA, and IFMSA have managed to build a community of medical education leaders, the AMEE Students. With this experience, they are empowered to give back in their local settings advocating for better education. The continuous support they get from AMEE, EMSA, and IFMSA through other initiatives (Grants, Courses, ASPIRE Awards, Fellowship Program) is shaping the educators of tomorrow.

Take-home Messages: Meaningful student involvement can come in many forms and should not only be encouraged at an institutional level but at an organizational level as well.

Teaching and learning interdisciplinarity: a student-driven project

AUTHOR(S):

- Shams Ribault, Faculté de Médecine Lyon Est, France (Presenter)
- Félix Boivin, Faculté de Médecine Lyon Est, France
- Quentin Paulik, Faculté de Médecine Lyon Est, France
- Tasnim Fareh, Faculté de Médecine Lyon Est, France
- Gilles Rode, Faculté de Médecine Lyon Est, France
- Jérôme Etienne, Faculté de Médecine Lyon Est, France

ABSTRACT

Background: It is common knowledge that interdisciplinary approach plays a major role in medicine and medical education in order to better understand complexity. Moreover, medical research is fuelled by innovation, which requires openness to various specialist fields. However, despite this evolution, French medical students are not taught to deal with these issues due to the lack of tools allowing us to think outside the medical box.

Summary of Work: A teaching and learning interdisciplinarity student-driven project was conducted by a team of fifteen health students in a French medical school. We had two objectives: on one hand, to raise health students' awareness to the importance of working with other disciplines in healthcare and scientific research, and on the other hand to provide interested students with the material and human resources to develop their own interdisciplinary projects and creativity within the Faculty (prototyping, education projects, research projects). To answer these objectives, we organized conferences involving researchers, health professionals, and workshops to train students in other skills, like 3D printing. We organized a summer school focusing on teaching innovation in health studies and in general practice. To promote student-driven interdisciplinary projects, we worked in partnership with an engineering school's FabLab. We contacted students from other fields (humanities, paramedical) and mentor teachers.

Summary of Results: With the support of the Faculty, four conferences, three workshops, and a summer school were organized. 40 students attended our first conference in January 2019. The aim of this conference was to introduce students to interdisciplinary work, based on experiments and research carried out by students in different areas such as technical devices, immunology, biostatistics, connected tools or technology adapted to disabilities. Conferences about medicine and astronauts, artificial intelligence, arts were planned.

Discussion and Conclusions: We believe this project helped health students to appreciate interdisciplinary practice in healthcare and scientific research.

Take-home Messages: Alone, we go faster ... But together, we go further! This is exactly what this project illustrates: in a world of perpetual improvement we need to go beyond the barrier of self-sufficiency in medicine. Opening to other fields is necessary to be a part of the progress in healthcare.

The effect of admission year and effort-reward imbalance model on medical students' engagement

AUTHOR(S):

- Jung Eun Hwang, The Catholic University of Korea, College of Medicine, South Korea (Presenter)
- Na Jin Kim, The Catholic University of Korea, College of Medicine, South Korea
- Nani Kwon, The Catholic University of Korea, College of Medicine, South Korea
- Su Young Kim, The Catholic University of Korea, College of Medicine, South Korea

ABSTRACT

Background: Engagement is believed to be a positive index of academic well-being, but not widely studied in medical education. Under the assumption that characteristics of medical students admitted each year might not be the same, we tried to investigate the relationship between admission year and engagement. This research also re-examined association between effort-reward imbalance (ERI) model and engagement.

Summary of Work: Ninety-nine students in 2017 (response rate: 18.97%) and 65 in 2018 (12.38%) completed an online questionnaire that measured demographic variables (sex, age, affiliation, survey year, and grade), ERI, over-commitment, negative affect, and engagement in the Catholic University of Korea, College of Medicine. We figured out their admission years based on grades that they responded. In a process of checking assumptions of multiple regression, affiliation and grade were removed from input variables. Categorical regression analysis was carried out.

Summary of Results: It was found that explanatory variables accounted for 31.2% of engagement variance (Adjusted R square = .255). Admission year (Beta = .290), ERI (Beta = .254), over-commitment (Beta = .339), and negative affect (Beta = -.363) were significant at significance level of .05. As for relative importance, admission year and ERI accounted for 13.4% and 27.9% of the importance in the model. Based on quantification of nominal variables, students admitted in 2013 showed the lowest engagement, and students admitted in 2018 reported the highest engagement, which was different from the pattern across grade. When effort and reward were balanced, engagement was higher than when effort and reward were imbalanced.

Discussion and Conclusions: Most research has assumed that study variables show similar levels across admission year. However, this research found that a group of students admitted in a particular year might be actively involved or less involved in study. Admission process which changes every year might affect academic or psychological characteristics of admitted students. It also reaffirmed our unpublished data that reward for academic effort was significantly related to medical students' engagement.

Take-home Messages: Admission year could be one of demographic variables in explaining medical student engagement. In addition, focusing on offering reward for students' effort could boost engagement.

Medical students as promoters of academic training in the undergraduate level: A view of medical students' scientific societies from Peru

AUTHOR(S):

- **Anderson Soriano-Moreno, Sociedad Científica de Estudiantes de Medicina de la Universidad Peruana Unión, Peru (Presenter)**
- Milton A. Romero-Robles, Sociedad Científica de Estudiantes de Medicina de la Universidad Nacional del Santa, Peru
- Jhosuny Perez-Fernandez, Sociedad Científica de Estudiantes de Medicina Veritas, Peru
- Alexander Mayor-Vega, Sociedad Científica de Estudiantes de Medicina de la Universidad de San Martín de Porres, Peru

ABSTRACT

Background: Peruvian Medical Student Scientific Society (SOCIMEP) is an organization led by medical students with the aim to promote research and academic training at the undergraduate level. It was founded in 1992 and currently, 40 medical schools of different Peruvian universities have a local scientific society affiliated to SOCIMEP. Inside the structure of each local society, the Academic Committee is in charge to promote the planning and realization of continuous medical education activities, such as conferences and workshops, based on medical student's needs. This study aimed to describe academic activities organized by the Peruvian medical students scientific societies during the last years.

Summary of Work: Retrospective observational study. We reviewed 119 Single Records of Activities (SRA) corresponding to years 2015-2018. The SRA is the document where the local's societies report periodically their organized activities to SOCIMEP describing the main characteristics. For the data analysis, absolute and relative frequencies were calculated. Activities with incomplete variables and not related to medical topics were excluded.

Summary of Results: During the period analyzed, 729 academic activities were performed involving a total of 3520 hours and 23192 attendees. We observed that the number of organized activities increased from 59 in 2015 to 362 in 2018. All the activities had the aim to reinforce basic and clinical medical sciences. Most of the activities were lectures (68.3%), 14.5% workshops and 10.3% theoretical courses. Activities based on peer learning were frequent (29.4%) and we observed an increase in the activities based on this methodology (8.5% to 31.2%).

Discussion and Conclusions: This study shows that medical students thought Peruvian scientific societies can organize a big amount of academic activities to complement preparation in medical schooling. From 2015 to 2018, the number of activities multiplied six-fold, showing that there is a great commitment of the students belonging to the societies with medical education. In addition, it was observed that the number of registered attendees to the activities was not negligible, demonstrating that there is great acceptance from the medical student population.

Take-home Messages: In Peru, medical students perform a great number of medical education activities that would be helpful to complement undergraduate training.

ASPIRE Student Engagement Criteria as a tool for promoting educational leadership with Brazilian Medical Students

AUTHOR(S):

- Ugo Caramori, UNICAMP, Brazil (Presenter)
- Eliana Martorano Amaral, UNICAMP, Brazil
- Henry de Holanda Campos, UFC, Brazil
- Jacqueline Costa Teixeira Caramori, UNESP, Brazil
- Maria Helena Senger, PUC-SP, Brazil

ABSTRACT

Background: The concept of student engagement for Brazilian students still assumes great political perspective. It's seen as adherence to political positions and little to their involvement in the multiple spheres of the academic world. This perspective contrasts with definitions of student engagement in the literature. Students often understand their opinion and participation as opposition, or fighting to political rights, not as collaborators focusing on the improvement of the educational programs, complimentary to faculty members and academic administrators

Summary of Work: The FAIMER-Brasil Regional Institute promoted the initiative FAIMER Jr. - Educators of Tomorrow, an itinerant series of 4-8hs workshops held in conjunction with national and regional congresses of the Brazilian Medical Education Association (ABEM) focusing on expanding, discussing and provoking the concept of student engagement, making use of the criteria used in the ASPIRE-to-Excellence award for Student Engagement, AMEE - An International Association for Medical Education. We made an explicit call to the Brazilian medical student leaderships, in order to build an audience capable of conducting, at the forefront, the proposal of bringing faculty development to the student spectrum.

Summary of Results: Participants were encouraged to guide their thoughts by their context, locally and nationally. It is observed that through this moment, the students come to understand the engagement as a concept, and integrate the socio-cultural perspective to it. Understanding the conjunctures that make one of the criteria appropriate or not to the Brazilian reality is a creative stimulus for them to think of proposals on how to reformulate the idea of engagement in the face of the possibilities they have at hand.

Discussion and Conclusions: There is a good dialogue with the characteristics of Brazilian students and their history of representativeness and activism. It is a look to the horizon because it establishes a path where we can succeed preserving the inherent cultural and social characteristics around medical degree pathway. It also outlines the perspective of leadership in the face of different realities (truly represented by the diversity of participants) and empowers the capacity to understand student engagement as the first step towards building a tomorrows educator

Take-home Messages: Education doesn't transform the world, it changes people. People transform the world.

Reflections of Program Directors on a National Education Transition: Insights for Competency-Based Medical Education Implementation

AUTHOR(S):

- Bryce Bogie, McMaster University, Canada (Presenter)
- Kelly Dore, McMaster University, Canada
- Karen Saperson, McMaster University, Canada
- Karen Finlay, McMaster University, Canada
- Parveen Wasi, McMaster University, Canada

ABSTRACT

Background: Outcomes of national policy change (i.e. CBME or competency framework implementation) are felt by all levels of the organizational hierarchy. Within medical education, literature is sparse on how the levels of the educational systems interact to effect change. In the era of competency-based medical education (CBME), it is important for educators and researchers to understand the challenges faced by reflecting on past wide-scale policy changes.

Summary of Work: We developed an anonymous online survey to investigate program directors' (PDs) opinions of, and experiences with, accreditation and the implementation of the CanMEDS framework. The CanMEDS framework is an outcomes-based approach to CBME that requires residents to demonstrate mastery of specific competencies before progressing to independent practice. The survey was sent to all former Canadian specialty medicine PDs (N=684). Descriptive analysis was performed on the quantitative data; thematic analysis was performed on the qualitative comments; and mixed-methods analysis was completed to identify areas of convergence and/or divergence between the quantitative and qualitative results.

Summary of Results: A total of 265 (38.7%) former PDs responded to our survey. Quantitative analysis revealed that 52.8% of respondents did not feel involved in decision-making regarding policy changes, 45.1% of respondents did not feel prepared to assess the CanMEDS Roles, and PDs were divided on the reasonableness of accreditation documentation. Qualitative analyses produced four themes: Communication, Resources, Expectations of Outcomes, and Buy-In, as well as nine subthemes. Mixed-methods analysis noted a high level of convergence across content, with four areas of divergence. The analysis also highlighted areas of expansion where the qualitative and quantitative strands provided additive insights to each other.

Discussion and Conclusions: This national mixed-methods study provides insights on the nature and process of large-scale policy change from the perspective of those charged with operationalizing the change. The combined approach yielded robust insights applicable to international efforts of policy change, including CBME initiatives.

Take-home Messages: PDs reported unique challenges to policy change implementation. Future policy change initiatives in CBME should emphasize program-level considerations to promote the successful understanding and implementation of new CBME policies by PDs across all medical specialty programs.

Coordinating a nation-wide introduction of a new competency framework for the Swiss undergraduate medical curricula: development of a common implementation guide

AUTHOR(S):

- **Marc Sohrmann, University of Lausanne, Switzerland (Presenter)**
- Mathieu Nendaz, Unit of Development and Research in Medical Education, University of Geneva, Switzerland
- Raphael Bonvin, Medical Education Unit, University of Fribourg, Switzerland
- Christoph Berendonk, Institute for Medical Education, University of Bern, Switzerland

ABSTRACT

Background: In 2018, Switzerland introduced a new version of its nation-wide framework of reference for the undergraduate medical curriculum named PROFILES. It is based on the 7 CanMeds roles, 9 EPAs and 265 situations as starting points; but in contrast to previous editions it does not list diagnoses or disciplines. To accompany the implementation process the medical faculties created a joint, national working group.

Summary of Work: Delegates of the medical schools and the federal licensing exam met regularly over one year. The resulting implementation guide, based on a thorough review of the current literature, describes contextualized strategies to support the implementation of the different elements of PROFILES. This non-binding approach respects the autonomy of each Swiss medical school, allowing them to adapt the implementation process to their specific context and challenges.

Summary of Results: The PROFILES implementation guide covers four main chapters: *Curriculum organisation:* the transition from a content-oriented to a competency-based teaching program needs an integrated curriculum, active teaching formats and a longitudinal clinical exposure. *Assessment:* the introduction of EPAs along the CanMeds roles requires a 'program of assessment' combining different assessment strategies, rather than a collection of isolated assessment events. *Faculty development:* such a profound change can only be achieved if faculty members are trained and informed, and eventually adhere to the new educational orientations. *Strategies of implementation:* the last chapter emphasizes the importance of developing a change management approach to support a successful implementation of PROFILES.

Discussion and Conclusions: The framework of reference for the undergraduate medical curriculum in Switzerland has recently undergone an in-depth update. A collaborative work with delegates from all medical schools resulted in an implementation guide with strategies to address the challenging shift to a competency-oriented curriculum based on CanMeds and EPAs.

Take-home Messages: A nation-wide, collaborative approach to define strategies and conditions for the implementation of a new framework of reference has the potential to lead to a clearer appreciation of the challenges and an increased effort towards using common processes and tools to modify the current undergraduate medical curricula.

Development and Implementation of a Workplace-Based Assessment System to Inform Competency Decisions and Encourage Self-Regulated and Mastery Learning Behaviors in Post-Graduate Medical Education

AUTHOR(S):

- Daniel West, University of California, San Francisco, USA (Presenter)
- Duncan Henry, University of California, San Francisco, USA
- Ellen Laves, University of California, San Francisco, USA
- Margaret McNamara, University of California, San Francisco, USA

ABSTRACT

Background: Workplace-based assessments in Competency-Based Medical Education (CBME) usually are designed to inform high-stakes competency decisions but not encourage self-regulated (e.g. feedback seeking) and mastery learning (e.g. deliberate practice) behaviors. We sought to develop and test the feasibility of a workplace-based assessment system to fill this gap.

Summary of Work: As part of a larger program of assessment, we developed a workplace-based assessment system based on the American Board of Pediatrics Entrustable Professional Activities (EPAs) for General Pediatrics designed to provide frequent, brief assessments initiated by residents that provides high quality feedback to support deliberate practice and inform competency decisions. Assessment forms contained 3 domains: demonstration of key skills/behaviors; entrustment/supervision level; and free-text comments providing rationale for the entrustment level supervisors assigned and skills/behaviors that a resident would need to further develop to achieve higher levels of entrustment. After pilot testing and training, we implemented the program from July 2017 to Dec 2018. To assess implementation, we measured key process indicators, surveyed residents, and used a previously validated instrument to measure the extent to which a random sample of written comments (pre- and post- implementation) contained high-quality feedback (scored range, 0-7).

Summary of Results: We developed assessment forms for 12 of 17 EPAs. We implemented the program for 80 residents in 75% of our training environments. In the first year of implementation, the total number of assessments per resident varied by year of training: 1st year (median number [inter-quartile range]) (16.5 [16]); 2nd year 10 [6.5]; 3rd year 6.5 [3]. All residents (100%) initiated at least one assessment; 45% initiated an assessment 1-2 times per clinical rotation. Most residents found feedback useful (71%), applicable to their learning (62%), and informed deliberate practice (56%). Quality of written comments were markedly improved post-implementation (Pre = 3 [1] median score [inter-quartile range] vs Post = 6.5 [1]; $p < 0.00001$ [Mann Whitney U]).

Discussion and Conclusions: Preliminary evidence suggests that implementation of this program was feasible and provided higher quality feedback to better support deliberate practice. Further optimization is needed to increase frequency of feedback-seeking and goal-setting behaviors.

Take-home Messages: Implementing EPA-based assessments was feasible, acceptable, and associated with specific self-regulated and mastery learning behaviors.

The development of a roadmap for the implementation of competency-based postgraduate medical education: A qualitative study

AUTHOR(S):

- Tim Dubé, McGill University, Canada (Presenter)
- Carlos Gomez-Garibello, McGill University, Canada
- Maryam Wagner, McGill University, Canada
- Marco Zaccagnini, McGill University Health Centre, Canada
- Evelyn Constantin, McGill University, Canada
- Armand Aalamian, McGill University, Canada

ABSTRACT

Background: Postgraduate medical education in Canada is undergoing significant educational reform toward competency-based approaches. With increasingly more residency training programs transitioning to competency-based medical education (CBME), there is a need to communicate direction and progress to better inform stakeholders (e.g., program directors, learners, and educational and administrative leads) which steps should be taken when, and what is the ideal sequence of implementation processes. The purpose of our study was to gather data regarding the implementation of CBME to develop a roadmap, which included guidelines and strategies for ongoing and future implementation.

Summary of Work: We undertook a process evaluation of the implementation of CBME in two residency programs at a large urban university: Anesthesia and Otolaryngology. Through purposive convenience and snowball sampling, we conducted 17 interviews with multiple stakeholders including residents, department chairs, program directors, faculty, educationalists, and program administrators. We used inductive thematic analysis to interpret the data. We also employed a reflexive component throughout the research process to document our insights, reflections, and conversations regarding the implementation process.

Summary of Results: The participants' perspectives organized around seven key themes including: a) communication strategies, b) capacity building for faculty and residents, c) curriculum and assessment planning, d) administrative and logistical planning, e) change management, f) hidden curriculum, and g) continuous quality improvement. We will present findings related to each stakeholder group and those integrated across all stakeholders.

Discussion and Conclusions: The roadmap resulting from this research is based on two case studies with residency programs that were early adopters of CBME in the context of a large urban university in Canada. Our findings highlight important steps and processes related to implementing CBME in any residency training program including curriculum and assessment, faculty development and change management, and administration and logistics.

Take-home Messages: CBME implementation is an opportunity to advance practice with research. The roadmap resulting from this research might orient other residency programs preparing for, or transitioning to, CBME. We will share important lessons learned among programs in terms of differences with respect to program size, readiness for CBME implementation, and compliance with accreditation requirements.

Development of interprofessional education in paediatric cancer: a Nordic Delphi study to establish consensus on content and learning objectives

AUTHOR(S):

- **Martha Krogh Topperzer, Department of Paediatrics and Adolescent Medicine, Rigshospitalet University of Copenhagen, Denmark (Presenter)**
- Line Thellesen, Department of Gynaecology and Obstetrics, Herlev Hospital, Denmark
- Mette Weibel, Department of Paediatrics and Adolescent Medicine, Rigshospitalet University of Copenhagen, Denmark
- Hanne Bækgaard Larsen, Department of Paediatrics and Adolescent Medicine, Rigshospitalet University Of Copenhagen, Denmark
- Marianne Hoffmann, Department of Paediatrics and Adolescent Medicine, Rigshospitalet University Of Copenhagen, Denmark
- Jette Led Sørensen, Juliane Marie Center, Rigshospitalet, University of Copenhagen, Denmark

ABSTRACT

Background: Complex treatment and care of children and adolescents with cancer require collaboration between healthcare professionals with various skills. Authors of this abstracts conducted a scoping review and found that there is a lack of well-structured, interprofessional education in paediatric cancer that has undergone evaluation. Specific and measurable learning objectives are essential in education planning and evaluation. Learning objectives developed based on group consensus such as the Delphi methodology can increase the reliability and credibility of a new education program. The aim of this on-going study is to define learning objectives for interprofessional education in paediatric cancer based on a Nordic Delphi study.

Summary of Work: A three round Delphi survey was conducted using electronic questionnaires. The Delphi panellists were appointed by chief physicians and head nurses from paediatric cancer departments in 14 hospitals in Denmark, Sweden and Norway and consisted of one or more healthcare professionals from own department with an interest in education. In the first round (Dec 2018-Jan 2019) panellists were asked to describe competencies within 17 predefined subjects relevant when working in an interprofessional team in paediatric cancer. The panellists' answers were analysed with direct content analysis and learning objectives using Blooms taxonomy were developed. Panellists were encouraged to suggest new subjects. In the following two rounds the panellists will rate the relevance of the learning objectives as part of an interprofessional education in paediatric cancer.

Summary of Results: Twelve Nordic departments participate (85 %) with eleven nurses, ten physicians, five social workers, two physiotherapists, two educators and one teacher. The panellists' qualitative answers cover comments on knowledge, skills and attitudes to interprofessional treatment and care of children and adolescents with cancer.

Discussion and Conclusions: The Delphi study will result in a prioritized list of learning objectives for interprofessional education in paediatric cancer. Selected learning objectives will be tested at the paediatric cancer department in Copenhagen and could potentially be tested in all twelve participating departments.

Take-home Messages: The Delphi method is suitable to synthesize expert opinions and support decision making when no consensus exists in areas i.e. as interprofessional education in paediatric cancer.

#3N Short Communications - Competency Based Education

First impressions - An evaluation 6 months in to the Outcome Based Education pilot in Basic Specialist Training for Paediatrics

AUTHOR(S):

- Aisling Smith, Royal College of Physicians of Ireland, Ireland (Presenter)
- Micheal A Boyle, RCPI and The Rotunda Hospital, Ireland

ABSTRACT

Background: The development of expertise in medicine in a fast changing workplace is a key focus of post graduate medical education in Ireland. The Royal College of Physicians of Ireland (RCPI) is moving curricula to an outcome based approach. A pilot curriculum for basic specialist training in paediatrics was developed. This was drafted after systematic review, a survey of trainers regarding the importance and frequency of tasks and hospital based focus groups. A new ePortfolio was designed. In July 2018 a pilot of 40 trainees, 33 trainers and 16 training sites was launched.

Summary of Work: After the first 6 month rotation we evaluated the impact that the changes in approach have had to clarity of requirements for trainees, feedback in the workplace and goal planning. Portfolio interactions were monitored and a short questionnaire was completed, follow up calls and semi structured interviews took place to identify learning from the pilot.

Summary of Results: During the 6 months 35/40 (87.5%) had completed a Directly Observed Procedure (DOPs) form with 195 separate DOPs recorded by this group. Trainers have signed off 88/195 (45%) of the submitted forms. 19/40 (47.5%) of trainees responded to the questionnaire. 63% of respondents agreed that they could 'easily identify opportunities for learning in [their] current post'. Over 80% agreed or strongly agreed that they developed new clinical and professional skills. Follow up calls took place with those missing documented requirements for this time period.

Discussion and Conclusions: Early data indicates that using OBE is an effective method of facilitating better workplace feedback and evaluation in post graduate training. These findings demonstrate a successful introduction to the workplace and it has been well received. More training of Trainers appears to be needed and support for Trainees in using the ePortfolio and recognising their training opportunities. Monitoring and evaluation of the pilot are key to implementing an effective and realistic programme of workplace learning.

Take-home Messages: The outcome based education pilot appears to facilitate self-directed learning and feedback,. Learning from the pilot can be applied to the methodology for reviewing other programmes.

A qualitative study of complex intervention for CBME across specialties in an Asian country

AUTHOR(S):

- Hsiao-chuan Lin, China Medical University Hospital, Taiwan (Presenter)
- Po-Chang Wu, China Medical University Hospital, Taiwan
- Te-Fa Chiu, China Medical University Hospital, Taiwan
- Chia-Der Lin, China Medical University Hospital, Taiwan
- Fremen Chihchen Chou, China Medical University Hospital, Taiwan

ABSTRACT

Background: Competency-based medical education (CBME), defined as training medical professionals to achieve medical practice in accordance with local needs, has become the mainstream of international medical education reform. Taiwan society of emergency medicine has successfully stepped on this reform trend with an approach of globalization and shared its implementation experience with other specialties in Taiwan. Through the brainstorming of experts from various medical societies, this study aimed to reveal the common strategies through analyzing the five-year action plan to implement CBME among specialties.

Summary of Work: This study enrolled medical educators from seven medical societies, including family medicine, emergency medicine, otolaryngology, obstetrics and gynecology, anesthesiology, internal medicine and pediatrics. We collected every specialty group's five-year action plan, the products of the in-depth brainstorming with troika consulting activity and the following group co-creation. Qualitative content analysis was applied to reveal the common strategies of implementing CBME.

Summary of Results: This study revealed common themes around three core concepts. First, on the development of the progressive framework of competencies: The participants agreed to set up working groups by the medical societies, incorporate into the accreditation, formulate a national CBME marketing strategy for buy-in and develop localized CBME training. Secondly, in the teaching and learning experience tailored to competency, participants thought that the voluntary participation of residents, the development of tailored clinical curriculum, faculty development with reward systems, and communication platforms were keys to success. Finally, in terms of programmatic assessments and decision of competencies progression, participants believed that hospital investment resources, technology-supported platforms, faculty development, and consistency with licensure were needed.

Discussion and Conclusions: This study shows that building consensus and national marketing strategies for buy-in, developing localized training system, establishing a nationally consistent assessment system, faculty development, promoting voluntary participation of residents and hospitals investing resources, and developing technology-supported tool will be the major strategies to facilitate CBME in Taiwan.

Take-home Messages: The aim of implementing CBME is to ensure patient safety and healthcare quality of global standard. However, this complex intervention of medical education should consider a series of sequential action plan with thoughtful local efforts.

Setting high standards from the start: An experiential faculty orientation to introduce institutional expectations around communication and patient safety

AUTHOR(S):

- Kinga Elias, New York University School of Medicine, USA (Presenter)
- Mara McCrickard, New York University, USA
- Deborah Cooke, New York University School of Medicine, USA
- Katherine Hochman, New York University School of Medicine, USA
- Andrew Wallach, New York University School of Medicine, USA
- Sondra Zabar, New York University School of Medicine, USA

ABSTRACT

Background: Newly recruited clinicians have heterogeneous backgrounds and need an introduction to their new institution's patient communication expectations and safety culture. We describe an onboarding program designed to ensure that newly hired clinicians receive actionable, behaviorally-specific feedback from the patients' perspective to support the transition to a new work environment, enhance patient experience, and reduce the need to react to complaints once they have started.

Summary of Work: In 2-hours, participants completed three, 10-minute Objective Structured Clinical Exam cases designed to assess addressing a medical error, managing the patient's discharge goals of care, and responding to an impaired learner. During each encounter, participants interacted with Standardized Patients (SPs) or Standardized Learners (SLs) who used behaviorally-anchored checklists to evaluate communication and case-specific skills. Following each encounter, participants completed a self-assessment while the SPs/SLs completed a checklist that was shared with the learner. Participants also set individual learning goals to implement in their daily work, completed a program evaluation, engaged in a debrief, and received an institutional resource guide.

Summary of Results: 57 faculty representing 6 clinical sites participated across two years. Faculty was heterogeneous with respect to general and case-specific performance. For example, 86% adequately elicited the SPs/SLs story during the discharge case compared to 66% in the other two cases, 77% addressed pain management, while 44% did not discuss medication side effects. Participants have universally found this onboarding to be useful/relevant; 98% agreed/strongly agreed that the program was an effective way to reinforce good habits in communication, 96% felt it enhanced confidence in their ability to communicate effectively, and 96% felt it reinforced the institutional safety culture. All 56 participants who completed the evaluation agreed/strongly agreed that the event was engaging and well-designed, and 93% felt it was a good use of their time and would recommend the program.

Discussion and Conclusions: Traditional orientations are not well recalled and do not address knowledge and skills in real-time. Participants were enthusiastic about our introduction to the institution's expectations.

Take-home Messages: This program sets high standards and introduces a new model for skills-based onboarding, which may lead to improved patient outcomes.

Medical error in power different situation - how would medical students respond and could we train them to face it?

AUTHOR(S):

- Jen-Chieh Wu, Taipei Medical University Hospital, Taiwan (Presenter)
- Che-Wei Lin, Taipei Medical University, Taiwan
- Hui-Wen Chen, Taipei Medical University, Taiwan
- Yi-Chun Chen, Taipei Medical University Hospital, Taiwan

ABSTRACT

Background: Medical error, a critical global issue, is associated with major adverse health outcomes or even death. As part of the medical team, medical students are expected to speak up for medical error in their curriculum but it may be difficult for students if there exists hierarchy difference. The goal of this study is to understand students' speaking-up behavior and determine the efficacy of an integrated simulation training.

Summary of Work: This study enrolled 154 sixth-year undergraduate medical students of Taipei medical university. An integrated simulation course consisted of two scenarios with a minor and a major medical error initiated by a standardized supervising doctor was developed. All students passed the knowledge test before entering simulation scenario to ensure participants' knowledge readiness. Each student encountered a first medical error scenario, followed by a faculty-lead debriefing for exploring their thinking process and developing effective response strategy, and then engaged in second medical error scenario. Participants were divided into two groups where group one (n=75) started with a minor medical error scenario and group two (n=79) beginning with a major medical error scenario.

Summary of Results: 76/154 (49%) students spoke up when they encountered their first medical error scenario. Students had significant lower rate of speaking-up when encountering minor medical error compared to those started with major medical error (group 1, 21/75, 28% vs. 55/79, group 2, 69.6%, $P < 0.001$). After debriefing session, all students in both groups spoke up in both minor and major medical error scenario and there were significant increased rate of speaking-up behavior compared to their baseline responses (MD, 0.5, t-value 12.288, $p < .001$).

Discussion and Conclusions: Our study shows that even students has the adequate professional knowledge to notice a medical error occurring, half of them may not speak-up about medical error when facing their supervising physician. Students tend to speak up more frequently in major event but using some inadequate language behavior during the scenario, indicating further communication training is warranted for future work. A structured simulation training incorporated with faculty-lead debriefing would be a solution to improve students' speaking up behavior.

Take-home Messages: Simulation training is effective in improving medical students' confidence and competence to respond to medical error.

A Longitudinal Simulation to Teach Safety Tools and Behaviors in a US-based Postgraduate Training Program

AUTHOR(S):

- John Delzell, Northeast Georgia Health System, USA (Presenter)
- Gretchen Holmes, Northeast Georgia Health System, USA
- Zach Dunkerly, Northeast Georgia Health System, USA
- Donna Brown, Northeast Georgia Health System, USA
- Janeane Walker, Northeast Georgia Health System, USA
- Michael Appel, Northeast Georgia Health System, USA

ABSTRACT

Background: Health care delivery has evolved significantly since the 2001 Institute of Medicine report Crossing the Quality Chasm: A New Health System for the 21st Century, but despite substantial changes quality and safety remain problematic in many health systems. Graduate medical education has not adapted to a changing landscape, often leaving graduates insufficiently prepared for today's practice environment and expectations. Postgraduate training is not included in many institutional efforts to address quality and safety. Few postgraduate programs provide preparation for leadership roles in quality and safety. The overall goal of this project is to create resident leaders in patient safety.

Summary of Work: We developed a six-month longitudinal error prevention simulation. Stage 1: residents participate in a case-based, interactive training session to teach 12 institutional Safety Tools and Behaviors (ie: Escalate Concerns). This session is two hours in length and is taught by a physician safety champion. Residents are given pre- and post- testing of knowledge acquisition. Stage 2: there is a Standardized Patient case in which the resident makes a medical error and must report the event. The scenario includes informing a family member of the error. Stage 3: residents have an interactive role-play session to learn skills for giving bad news. Stage 4: residents participate in a root cause analysis reviewing the (fake) error that they had made. Stage 5: in the final stage, there is self-reflection on errors, group discussion, and debriefing session.

Summary of Results: This project is a multi-year study, with preliminary data. Research question: do residents participating in a case-based learning activity demonstrate use of safety tools and retention of knowledge of those tools. We will present demographic and academic performance data of our resident physicians from Post-graduate Training year 1.

Discussion and Conclusions: Organizations seek safety champions yet struggle to find physicians with the necessary expertise. The overall goal of this project is to create resident leaders in the areas of safety and quality.

Take-home Messages: Post graduate trainees can be taught institutional Safety Behaviors The simulation environment is a safe place for residents to learn and practice safety tools.

Influence of observing errors and receiving feedback on performance

AUTHOR(S):

- Portia Kalun, McMaster University, Canada (Presenter)
- Jennifer Zering, McMaster University, Canada
- Ranil Sonnadara, McMaster University, Canada

ABSTRACT

Background: Competency-based curricula emphasize observation and feedback. This creates an opportunity to explore how individuals learn through observation, and how feedback on an observed performance influences learning. We explored the value of observing errors, and how receiving feedback on the model's performance (MP) influences the performance of an observer.

Summary of Work: Participants watched a model build a LEGO structure, and then replicated the structure. Next, participants either watched a performance with no errors, a few errors, or many errors. Half of the participants in each group were provided with feedback on the MP; all participants were then asked to replicate the correct structure. Each participant re-watched the performance, received feedback on the MP if they had previously, and made a third attempt to replicate the structure. Data were analyzed using a 3x6 mixed-measures ANOVA, with attempt as the within-subjects factor and group as the between-subjects factor.

Summary of Results: Performance on the LEGO structure differed by attempt across all of the groups [$F(2,224)=42.27, p<0.001$]. Participants who observed the error-free performance made significantly fewer errors over each attempt, while participants who received feedback on the error-free performance did not. The two groups who observed the performance with a few errors made significantly fewer errors over time. Participants who simply observed the performance with many errors did not make fewer errors over time. Interestingly, participants who received feedback on the performance with many errors made significantly fewer errors overall.

Discussion and Conclusions: Performance on the task depended on the number of errors in the MP, and whether observers received feedback on the MP or not. When observing an error-free performance, observers did not benefit from receiving feedback on the MP. However, when observing a performance with a few or many errors, feedback was helpful.

Take-home Messages: This study emphasizes the importance of feedback in skill learning for not only the trainee practicing the skill, but also for trainees who are observing a performance containing errors. Our results also suggest that while an error-free performance does provide a good model for novices, receiving feedback on that performance may be redundant. Future studies will explore the influence of observing errors for intermediate learners as well.

The Prescribing Safety Assessment (PSA) - Improving Confidence in Prescribing. An Assessment 'Pill' which is worth swallowing

AUTHOR(S):

- **Matthew Gittus, Health Education England, UK (Presenter)**
- Clare van Hamel, United Kingdom Foundation Programme Office, UK
- Simon Maxwell, UKPSA, UK

ABSTRACT

Background: Prescribing is a significant part of a foundation doctors' workload. It is a complex task that can be associated with a high risk. Most prescribing is undertaken by foundation doctors, they are also associated with the highest number of prescribing errors (Ryan et al., 2014). The EQUIP study showed that 9% of hospital prescriptions contained errors (GMC, 2009). Furthermore, other research has shown that prescribing is one of the areas that foundation doctors find most difficult (GMC, 2014). The Prescribing Safety Assessment (PSA) was introduced in 2016 to allow undergraduate medical students and foundation doctors to demonstrate their competencies in prescribing. The introduction was resisted by some students, trainees and trainers concerned about increasing the assessment burden.

Summary of Work: The annual induction survey was open to all newly appointed F1 doctors with 962 responses received. They were asked whether they had taken the PSA and their level of confidence prescribing different types of common medications on a Likert scale. We examined the correlation between undertaking the PSA and confidence in prescribing different common medications.

Summary of Results: Overall, 93.3% of F1s had completed and passed the PSA at the time of the survey. An increased confidence prescribing the different medication groups was reported by F1 doctors who had undertaken the PSA compared to those who had not. The difference was statistically significant for most medication groups except anti-coagulants, IV fluids and oral anti-diabetics.

Discussion and Conclusions: The results of the induction survey have demonstrated an increased confidence in prescribing after passing the PSA. This may be explained through increased practice and knowledge in preparation for an assessment. Additionally, successful completion of the PSA could reassure F1 doctors. Further research may ascertain whether increased confidence is associated with fewer prescribing errors.

Take-home Messages: F1 doctors undertaking the PSA report increased confidence in their prescribing ability for common medications.

Ryan, C. et al. 2014. Prevalence and causes of prescribing errors: PROTECT study. Public Library of Science. 9(1).

GMC. 2009. An in-depth investigation into causes of prescribing errors by foundation trainees in relation to their medical education: EQUIP study.

Japanese medical students' knowledge of diagnostic errors and beneficial learning effects from workshop-style education

AUTHOR(S):

- Yu Yamamoto, Jichi Medical University School of Medicine, Japan (Presenter)
- Shuji Hatakeyama, Jichi Medical University School of Medicine, Japan
- Masami Matsumura, Jichi Medical University School of Medicine, Japan

ABSTRACT

Background: Acquisition of knowledge relating to diagnostic errors, methods to reflect on such errors, and error factor analysis are all important if future diagnostic errors are to be prevented. However, medical students have few opportunities to learn these skills during undergraduate medical education.

Summary of Work: We provided a workshop for Japanese medical students to learn about diagnostic errors and error factor analysis methods used for reflecting on errors. The first half of the workshop comprised a lecture on cognitive bias and diagnostic errors, while the second half consisted of group work to analyze factors relating to cases of diagnostic errors. Knowledge about diagnostic errors was evaluated using a Diagnostic Error Knowledge Assessment Test (D-KAT) consisting of a 13-item multiple-choice questionnaire, administered before and after the workshop. We compared the scores with those of Japanese postgraduate year two (PGY-2) resident physicians from a previous study.

Summary of Results: A total of 32 medical students participated in the workshop (14 pre-clinical clerkship and 18 in clinical clerkship). The mean (\pm SD) D-KAT scores among medical students before the workshop were similar to those among Japanese PGY-2 residents (6.2 ± 2.8 vs. 6.2 ± 1.6). The score tended to be higher in the clinical clerkship group compared with the pre-clinical clerkship group, but this was not significant (5.7 ± 2.1 vs. 6.6 ± 3.2 ; $p = 0.14$). However, participants' scores of post-workshop were significantly higher than those of pre-workshop (6.2 ± 2.8 vs. 8.4 ± 1.5 ; $p < 0.01$).

Discussion and Conclusions: It may be difficult to notice the underlying factors of diagnostic errors based on clinical experience alone, as reflected by the similar D-KAT scores seen for both Japanese medical students and residents. Medical students were able to effectively learn about diagnostic errors by analyzing the underlying factors of diagnostic error cases using the knowledge they gained during the lecture.

Take-home Messages: Learning about diagnostic errors, and methods for reflecting on them, during undergraduate medical education can increase awareness of diagnostic error factors. This can contribute to the avoidance of diagnostic errors in future clinical settings.

Exploring female surgeon identity constructions: A qualitative study with female surgeons, their colleagues and patients

AUTHOR(S):

- **Gozie Offiah, RCSI, Ireland (Presenter)**
- Stuart Cable, School of Health and Social Care, Edinburgh Napier University, Scotland
- Charlotte Rees, Monash Centre for Scholarship in Health Education (MCSHE), Monash University, Australia
- Susie Schofield, Centre for Medical Education, University of Dundee, Scotland

ABSTRACT

Background: While some countries (e.g. UK) have seen an increase in female surgeons and consultant surgeons over the last decade, others (e.g. Ireland) have seen figures remain static. Worldwide, the numbers of women represented in surgery at consultant level remain low compared to other specialities. While research has shown challenges and barriers for women in surgery, this current research explores the perceptions of female surgeons, as well as the colleagues and patients of female surgeons, on the issue of gender in surgery. Indeed, the current work aims to provide multiple views on female surgeon identity constructions.

Summary of Work: A qualitative research approach drawing on biographic narrative interviewing was used to provide a comprehensive picture of the multiplicity of issues existing for female surgeons in two countries (UK and Ireland). This approach was employed as it emphasises the socially constructed nature of reality and helps provide a rich and complex understanding of women's issues. We explored multiple stakeholders' perspectives around gender issues in surgery. Our sample included 27 female surgeons, 10 male and 8 female colleagues (e.g. surgeons, nurses, anaesthetists) and 5 male and 2 female patients. Thematic framework analysis was used to identify initial key themes for coding the data including identity constructions.

Summary of Results: The overarching themes identified across all stakeholder groups were of surgical culture, career choices, career interruptions and identity. Noting the prominence of identity talk in participants' narratives, we explored this theme further drawing on intersectionality theory, exploring female surgeons' intersecting personal (e.g. ethnicity, motherhood) and professional identities (e.g. doctor and female surgeon) and how those intersections interplayed with their surgical careers.

Discussion and Conclusions: While others have argued that it is challenging to be both a successful woman and a successful surgeon, novel findings from our study highlight how participants narrate intersecting personal and professional identities for female surgeons, emphasising that a balance between 'successful woman' and 'successful surgeon' can be achieved.

Take-home Messages: While the processes of cultivating professional identity in female surgeons is complex as it is interlaced with many personal commitments, it is possible to achieve the balance.

Heart of a lion, hands of a lady: A literature review on gender-based discrimination in General Surgical specialist training

AUTHOR(S):

- **Sunder Balasubramaniam, Tan Tock Seng Hospital, Singapore (Presenter)**
- Marc Ong Wei Jie, Khoo Teck Puat Hospital, Singapore
- Terence Huey Cheong Wei, Tan Tock Seng Hospital, Singapore
- Kaushal Sanghvi Amitbhai, Tan Tock Seng Hospital, Singapore
- Sarah Lu Qing Hui, Tan Tock Seng Hospital, Singapore

ABSTRACT

Background: Previous studies have shown that female surgeons face gender-based discrimination at work. This affects their choice of specialty, satisfaction at work and increases the likelihood them giving up training prior to completion. Given the increasing number of female trainees in our programme, we aim to perform a study that is currently awaiting Ethics Board approval. The results of the literature review are presented here.

Summary of Work: Method: A structured literature search was performed on medical, educational and social science databases. The studies were on surgeons and trainees but not restricted to specific specialties. Returned abstracts were screened for relevance, and full text of selected articles were obtained. References in these studies were screened as well.

Summary of Results: Findings are organised into common themes encountered: 1. Entry into specialist training: a. Proportionally less female senior professors in surgery are seen despite near parity in medical school; b. Lack of role models was a barrier to aspiring female trainees. 2. Experience during training: a. More females reported being treated differently due to their gender (54% vs 16% in one study); b. This difference was more marked amongst surgeons compared to general medical school faculty. c. Females reported concerns over having children due to demands from work - this was rarely an issue for male surgeons. d. A 'leaky pipeline' thus develops, where progressively more females drop out at each stage of the journey from medical student to full professor. e. Female residents were more likely to have thoughts of quitting training. 3. In the workplace: a. Patients did not show an overt preference for either gender, although they demonstrated preferences for specific characteristics that are associated with gender for different types of surgery; b. Objective evidence of gender-based differences exist, with women receiving lower pay and delays in promotion despite being of equal ability.

Discussion and Conclusions: Conclusion: Gender-based discrimination remains a problem in surgical training today. Addressing these issues will produce better surgeons (of both genders) who have delicate hands and leonine hearts, among other virtues.

Take-home Messages: Gender-based discrimination is alive in surgery and exacts a heavy toll on female trainees and surgeons.

Busy surgeons in the mirror - Does it help to reflect? Qualitative analysis of surgical trainees on reflective writing

AUTHOR(S):

- Qiantai Hong, National Healthcare Group, Singapore (Presenter)
- Sanghvi Kaushal, National Healthcare Group, Singapore
- Cheong Wei Huey, National Healthcare Group, Singapore
- Sarah Lu, National Healthcare Group, Singapore

ABSTRACT

Background: Reflection is a metacognitive process that allows for individuals to analyse and understand situations so that future actions can be informed by this process. However, the time and space required for proper reflection process can often be scarce in General Surgery training; and stopping to think often runs contrary to the stereotypical image of a confident and assured surgeon. As part of an evolving curriculum in residency training, compulsory written reflection every 6 months with subsequent individualised discussion with the programme director was introduced 3 years ago and we were curious to assess its progress.

Summary of Work: We performed a qualitative analysis on current and ex-trainees within our general surgery residency training programme to assess their feedback on the role of written reflection during their training.

Summary of Results: 20% of surgical trainees found reflective writing to be unhelpful in their development as surgeons. For the 80% that did, the reasons were generally because they feel it helps to consolidate knowledge and clinical algorithm when they next encounter similar situations, allows exploration of individual blind spots and weaknesses, as well draw on encouragement from milestones. Approximately 50% found the interval to be too frequent for comfort or just about right. The general themes encountered included that it takes too much time to physically write a reflection, and that people often prefer alternative methods and timing for reflection. Enforced reflective writing also comes across as a chore to some. One third of the trainees reported negative emotions during reflective writing, with the most common feeling being regret. About half of the participants reported mixed feelings, and only a small proportion of the group came away feeling positive.

Take-home Messages: Reflection as a process is appreciated by surgical trainees. Among the many ways of performing reflections, reflective writing is not a surgical trainees first choice. Reflections are best done with designated mentor in private, and there is a need to look out for the trainees emotional well-being following a reflection session.

Does the patient make the difference? Influence of simulated patients versus real patient on students' empathic behavior in undergraduate medical training in surgery

AUTHOR(S):

- Yannic Koch, Department of trauma-, hand- and reconstructive surgery, University hospital Frankfurt, Germany (Presenter)
- Jasmina Sterz, Department of trauma-, hand- and reconstructive surgery, University hospital Frankfurt, Germany
- Maria-Christina Stefanescu, Department of pediatric surgery and pediatric urology, University hospital Frankfurt, Germany
- Aleksandra Germanyuk, Department of trauma-, hand- and reconstructive surgery, University hospital Frankfurt, Germany
- Miriam Rüsseler, Department of trauma-, hand- and reconstructive surgery, University hospital Frankfurt, Germany

ABSTRACT

Background: Empathic behavior is a key factor related to therapeutic outcome in the physician-patient relationship. Studies affirmed that empathic behavior can be acquired. One way to teach empathic behavior in the context of medical education is the use of simulated patients. At the medical faculty of the Goethe University in Frankfurt, simulated patients have so far mainly been used in examinations and infrequent in teaching sessions. The present study investigates, if the use of simulated patients influences the empathic behavior of undergraduate medical students. Furthermore, it analyses the effect of whether the students talk to a real or a simulated patient.

Summary of Work: The study design was prospective. Undergraduate medical students were randomized into 3 groups. All students had the same theoretical input regarding communication in surgery, in particular regarding taking a patient's history and getting informed consent. Followed by practical training. Here, the first group of students knew that they were talking to a simulated patient, the second group talked to a simulated patient, but assumed to speak with real patients and the third group talked to real patients. The patients rated the empathic behavior using a standardized questionnaire.

Summary of Results: 146 students participated in this study (group 1: 49; group 2: 44; group 3: 53). Results of group 1 and 2 differed significantly, as well as the results of group 1 and 3. There were no significant differences between group 2 and 3. In this connection, the simulation patients rated those studies that spoke to a real patient or believed they were doing so significantly worse.

Discussion and Conclusions: Regarding the acquisition of competence, it seems necessary, that students speak with real patients during their studies on a regular basis and need to get feedback by these patients. To assess the empathic behavior, the use of simulated patients seems reasonable, as long as students expect to talk to real patients. Furthermore, it seems necessary to assess the empathic behavior while talking to real patients during medical examinations.

Take-home Messages: Students seem to behave less empathetic when they expect to talk to a real patient. Regarding the acquisition of competence, it seems necessary, that students speak with real patients during their studies on a regular basis and need to get feedback by the patients. Furthermore it seems necessary to assess the empathic behaviour while talking to real patients in medical examinations.

What Makes Surgical Boot Camps Effective? Using a Mixed Methods Approach to Bridge the Gap Between Medical School and Residency

AUTHOR(S):

- **Natalie Wagner, McMaster University, Canada (Presenter)**
- Nalin Amin, McMaster University, Canada
- Stephen Kelly, McMaster University, Canada
- Ranil R Sonnadara, McMaster University, Canada

ABSTRACT

Background: Many training programs are now implementing a surgical skills course, or 'boot camp' at the onset of residency. While research suggests boot camps (BCs) can improve some technical skills for a short period of time (Sonnadara et al., 2012), those skills tend to vary between studies, and many studies omit critical information on why that may be the case. This study used a convergent parallel mixed methods (CPMM) approach to examine the efficacy of a surgical BC for incoming residents.

Summary of Work: A two-week simulation-based BC was developed and implemented in July 2016. OSCE performance of residents who completed traditional training was compared with residents that completed the BC, at one- and two-years into training. Surveys, focus groups, and interviews were also conducted with a variety of stakeholders to explore the perceived utility of the BC. Qualitative data was analyzed for themes and integrated with the OSCE results using a CPMM approach.

Summary of Results: OSCE data suggested that at one- and two-years into training the BC cohort performed significantly better than the traditional training cohort; however, there were significant group by station interactions. When triangulated, qualitative data suggested that skills in which no differences were observed between cohorts were those that did not adhere to the intended plan, or 'may just take time to grow experience'. Participants also reported that OSCEs fail to capture factors that are essential to the usefulness of a BC (e.g. explaining hospital logistics), and that testing some of the skills in the OSCE environment 'felt contrived'.

Discussion and Conclusions: Our data suggest incorporating a BC at the onset of residency can improve residents' confidence, technical and nontechnical skills, and ease the transition into residency. Adherence to sound pedagogical principles such as constructive alignment and deliberate practice is critical. Additionally, OSCEs may not always be the best way to measure BC effectiveness.

Take-home Messages: Using a CPMM approach can offer valuable insights into curriculum effectiveness. The results from this study will provide educators with useful information on how to create and evaluate BC programs, ensuring that time spent away from the clinical environment is being used as efficiently as possible.

Development and validation of an instrument to evaluate competences in Pediatric Surgery Residency based on milestone project

AUTHOR(S):

- **Giovana Camargo de Almeida, Faculdades Pequeno Príncipe, Brazil (Presenter)**
- Izabel Meister Coelho, Faculdades Pequeno Príncipe, Brazil
- Elaine Rossi Ribeiro, Faculdades Pequeno Príncipe, Brazil
- Adriana Buechner de Freitas Brandão, Faculdades Pequeno Príncipe, Brazil
- Elisangela Mattos e Silva, Faculdades Pequeno Príncipe, Brazil

ABSTRACT

Background: The competences required for training the pediatric surgeon are the acquisition of knowledge of the specialty, the improvement of clinical skills and surgical techniques in pediatric surgery and the refinement of medical attitudes. For an adequate training during residence in pediatric surgery, the training institution must constantly evaluate and monitor the acquisition of competences and for this it needs a specific instrument as an evaluation tool.

Summary of Work: Develop an evaluation instrument based on 'Milestone Projects' with the competences determined by the Brazilian Association of Pediatric Surgery, for use in the Pediatric Surgery Residency Programs. Method: Methodological research developed in three stages: Development of the initial instrument, its qualification by a focal group of experts of the specialty and evaluation of the instrument by Brazilian pediatric surgeons; with the objective of validating and quantifying the acceptance of the instrument as to reliability, applicability, reproducibility, relevance of the topics addressed, adequacy from the technical point of view and from a theoretical point of view.

Summary of Results: The initial instrument was created with 4 general competences and 13 specific sub-competences, each one with 5 milestones to be achieved. Four experts performed the initial qualification, resulting in 44 adaptations, finalizing the instrument with 4 general competences subdivided into 10 sub-competences, each one with 5 levels of assessment. In the next phase the instrument was submitted to the evaluation of the Brazilian Pediatric Surgery Group and the Brazilian Pediatric Urology Group. There were 40 expert responses, with a total of 2394 responses from the 50 assessment items. The instrument had general acceptance of 91.2%, being considered applicable (96.7%), reproducible (93.3), with relevance of the topics covered (96%), technically adequate (93.6%), (93.3%), reliable (85.5%) and reliable (79.8%).

Discussion and Conclusions: An auxiliary instrument was developed to evaluate the acquisition of competence milestones during residence in pediatric surgery according to the 'Milestone Projects'. This instrument was validated by pediatric surgeons and considered applicable, reproducible, relevant, adequate from a technical point of view, adequate from a theoretical, reliable and reliable point of view.

Take-home Messages: Development of validated instruments to evaluated competences in Residency, with special care to local characteristics, allow best results in health outcome.

#3Q Short Communications - Simulated Patients

Can health professional students become effective simulated patients? Student reflections from an intensive for-credit training course

AUTHOR(S):

- Gary D. Rogers, Griffith University, Queensland, Australia (Presenter)
- Nicole Evans, Griffith University, Queensland, Australia
- Pit Cheng Chan, Griffith University, Queensland, Australia

ABSTRACT

Background: Human patient simulation is a complex educational process with cognitive, psychomotor and affective dimensions. Untrained health students have been considered a poor substitute for professional simulated patients (SPs) because of their perceived inability to set aside professional understandings in order to play patients or clients authentically. Little is known about the affective development of SPs-in-training, especially in relation to their prior professional backgrounds.

Summary of Work: Participants in a for-credit SP training course came from a variety of backgrounds, including health professional and theatre- or screen-performance-based training and experience. They journalled daily about the emotional impact of large- and small-group practical learning experiences. Their accounts were analysed utilising an established phenomenologically-informed hermeneutic method focused on learning in the affective domain, taking account of their professional backgrounds.

Summary of Results: There was evidence of high-level affective learning in most journals. Learners from health backgrounds made sense of their experiences in particular ways and appeared to gain a deeper appreciation for the importance of human capabilities in their own health practice, as well as an understanding of SP methodology and the performance techniques that optimise its effectiveness. Students from performance backgrounds appeared to benefit from working with health-background students in relation to their awareness of the human dimensions of health care and their appreciation of the value of SP-based learning activities for health professionals.

Discussion and Conclusions: Our study suggests that, with appropriate training, both health-background and performance-background learners can become effective SPs. There may be added value in training the two groups together.

Take-home Messages: With appropriate training, both health-background and performance-background learners can become effective SPs though each group may have distinctive learning needs. Educating potential SPs from both backgrounds together affords opportunities for each to learn from the other.

#3Q Short Communications - Simulated Patients

Augmented assessment: a proof-of-concept experience on the use of auscultation simulators in the context of objective structured clinical examinations

AUTHOR(S):

- **María Ferreira, Faculdade De Medicina Da Universidade Do Porto, Portugal (Presenter)**
- Pedro Grilo Diogo, Faculty of Medicine - University of Porto, Portugal
- Ana Rita Ramalho, Faculty of Medicine - University of Porto, Portugal
- Joao Sergio Neves, Faculty of Medicine - University of Porto, Portugal
- Rui Coelho, Faculty of Medicine - University of Porto, Portugal

ABSTRACT

Background: Auscultation simulators (AuS), using equipment such as digital stethoscopes (DS), show new possibilities for teaching auscultation skills given their improved acoustic quality and ability to record and replay sounds. The role of AuS on skills assessment is less explored. We describe a pilot experience on a mock-OSCE where abnormal heart and lung sounds were integrated in standardized patient (SP) clinical cases.

Summary of Work: A mock-OSCE was created where two stations had SPs portraying typical heart failure and pneumonia presentations. Volunteer fourth-year and fifth-year medical students collected clinical histories and performed heart and lung auscultation.

Summary of Results: A MedSounds AuS was used, with previously recorded normal and abnormal heart and lung sounds on all regular auscultation foci, which were embedded in each SP case. The abnormal sounds included a holosystolic murmur on tricuspid and mitral foci (heart failure case) and right basal inspiratory crackles (pneumonia case). Students used a 3M™ Littmann® to perform cardiac and lung auscultation on both SPs. A controller was in the exam room together with the student, SP and assessor, replaying the recorded sounds directly into the DS when students listened to each auscultation foci. The controller used an App running offline on an Android tablet, which included a realistic interface displaying all regular heart and lung auscultation foci.

Discussion and Conclusions: This proof-of-concept experience shows how AuS can be integrated on a high-stakes exam format. Embedding abnormal auscultation sounds on OSCE clinical cases can increase the psychological fidelity of the SP clinical simulation for students. AuS add new possibilities for assessing auscultation skills as well as the interpretation of sounds in their clinical context. The use of offline platforms avoid problems with poor internet signal, while tablets with user-friendly interfaces make the control dynamics easy for lay users. The use of a controller is not necessary as assessors can replay the heart and lung sounds with simple training.

Take-home Messages: AuS are a promising technology in the context of assessment, increasing the authenticity of SP clinical cases and raising new assessment possibilities such as the interpretation of auscultation findings in a clinical context.

#3Q Short Communications - Simulated Patients

Making the Subjective, Objective?: Examining standardized patients' decision-making and assessment of medical trainees' communication skills

AUTHOR(S):

- Laura Hirshfield, University of Illinois at Chicago, College of Medicine, USA (Presenter)
- Katharine McCabe, University of Illinois at Chicago, USA
- Kelly Underman, Drexel University, USA

ABSTRACT

Background: Standardized and simulated patients (SPs) are frequently used to teach medical communication. One key aspect of SPs' work is the use of checklists to provide a standardized format for evaluating medical trainees' performances. While numerous studies have been conducted to validate the use of SPs, little is known about how SPs use checklists and make decisions about how to rate trainees' performances. This is of particular interest given that certain aspects of medical communication, such as displaying empathy, rely upon subjective feelings experienced by the SPs. In this study, we ask, how do SPs maintain standardized forms of evaluation and assessment?

Summary of Work: This study draws on data from qualitative interviews with 27 SPs employed at a large, Midwestern medical school in the US. Interviews focused on the process of assessing and providing feedback about students' communication, interpersonal skill, and emotional expression or empathy. The research team analyzed the data using a constructivist, inductive approach.

Summary of Results: Though our participants highlighted the rigorous training they received and the standardization of the checklists they used, they also acknowledged the subjective nature of their work. Three main themes emerged. First, interactional dynamics which cannot be named. Second, the interjection of gut feelings in the assessment of interactions. Finally, how personal reactions and feelings must be tabled to fairly assess students.

Discussion and Conclusions: This study is one of the first to center SPs' voices and experiences in the medical education process. Our findings highlight the strategies and techniques utilized by SPs as they worked to transform their subjective assessments into objective evaluations in line with the values of standardized medical science and training. We argue that SPs perform underexplored work in order to create or produce standardization in these types of educational encounters.

Take-home Messages: Despite their 'standardization', SPs rely on a combination of unnamed interactional dynamics and gut feelings to assess students. At the same time, they work hard to set aside their own emotions in order to be fair.

#3Q Short Communications - Simulated Patients

What aspects need to be improved in simulated patient training for a formative OSCE?

AUTHOR(S):

- Giselle Myer, Universidad Católica Del Norte, Chile (Presenter)
- Claudia Behrens, Universidad Católica Del Norte, Chile

ABSTRACT

Background: For more than one decade the Universidad Católica del Norte has used professional actors as simulated patients (SP) in OSCEs to evaluate students' communication and clinical skills. It is well known that the SP's patient representation in clinical simulation is essential so that students can demonstrate their clinical abilities. This study's purpose is to evaluate aspects of the SP's performance that need to be improved during the training for a formative OSCE.

Summary of Work: A total of fifty-two students underwent during their third year of medical school a formative OSCE in Internal Medicine. During this OSCE, each student was asked to complete the Maastricht Assessment of Simulated Patients (MaSP) at the end of their last clinical case (station). This survey consisted of 12 items distributed in a Likert-type scale.

Summary of Results: The data gathered from these fifty-two surveys was analyzed using distribution frequency. Students rated as positive in over 70% the following factors: SP authenticity, maintaining the role as a patient, naturality in answering questions, appearance fitting the role, friendliness and listening ability. However, the items related to the SP clearly representing a role during the evaluation, withholding information and testing the student were rated as positive in 51%. The SPs obtained a mean of 8,8 out of 10 as overall mark during this OSCE.

Discussion and Conclusions: Simulated patients perform well in an OSCE setting and are considered by the students to reflect a true patient, but we need to train them better in their ability to feel the role more than to play it, and not give the students the sensation that information is being withheld from them or that they are being challenged.

Take-home Messages: The use of a validated assessment tool like the MaSP allows us to determine the flaws of SP performance during an OSCE, permitting us to consider these for improving future training sessions.

#3Q Short Communications - Simulated Patients

“The most important thing is the safe and encouraging environment where you feel you can screw up” - Students’ views on simulations and debriefings

AUTHOR(S):

- Asta Toivonen, University of Helsinki, Department of Public Health, Finland (Presenter)
- Eeva Pyörälä, University of Helsinki, Centre for University Teaching and Learning, Finland

ABSTRACT

Background: At the University of Helsinki, fourth year medical students practice challenging encounters in their communication skills studies with professional actors as simulated patients (SPs). A reflective debriefing discussion follows each simulation. The simulations are organized in small groups facilitated by a clinical teacher. All students take the role of a doctor once. We aimed to explore students’ views on learning challenging patient encounters by means of actor simulations and debriefing.

Summary of Work: We collected the data in 2014 and 2015 from the 4th year medical students as an online assignment at the end of the communication skills course. The students were asked how they perceived SPs and debriefing discussions in learning communication. The informed consent to using the answers in the study was inquired. The open-ended answers concerning simulations and debriefing were examined using qualitative content analysis.

Summary of Results: 209/228 (92%) students participated reflecting both what they had learned and how they experienced simulations. They valued the use of SPs in preparing for patient encounters. They learned in simulations both by taking the doctors role themselves and observing their peers. Students emphasized the importance of empathy and identifying emotional reactions. Debriefings offered valuable perspectives from SPs, constructive feedback and views of experienced clinicians. Reflection brought up multifaceted views and raised awareness of one's own behavior. These supported students’ self-efficacy beliefs.

Discussion and Conclusions: The goal of the communication skills studies is to prepare medical students to face versatile patient encounters. Students considered learning challenging communication with SPs and reflective debriefing safe and effective. Simulations revealed the emotional sides of the communication skills practices whereas the debriefing discussions provided the opportunity to reflect. Reflection-on-action after simulations was essential to enhance learning.

Take-home Messages: SPs and reflective debriefing discussions provide an effective method for learning challenging communication. Both taking the doctors role and observing their peers is valuable for the students. Reflection in the debriefing discussions is crucial for learning communication.

Using Standardized Clinical Skills Assessment (CSA) Metrics to Predict Student Clinical Performance

AUTHOR(S):

- Michael Allen, The Albert Einstein College of Medicine, USA (Presenter)
- Felise Milan, The Albert Einstein College of Medicine, USA

ABSTRACT

Background: Objective Structured Clinical Examinations' (OSCEs) quantitative data may not comprehensively capture the level of students' clinical skills as students with similar scores exhibit wide variability in their future clinical performance. The purpose of this study is to explore how standardized patient's (SPs) written comments on second and third-year student OSCE performances help to explain clinical performance differences for those students with similar quantitative OSCE scores.

Summary of Work: Standardized patients (SPs) write comments in the categories of: history, physical exam, communication/interpersonal skills, and global rating in OSCEs occurring at the end of second and third-year at the Albert Einstein College of Medicine. We analyzed approximately 32,400 OSCE performance comments made from 2010-2018. The authors reviewed these comments for themes and applied a scale rating their relative positivity or negativity. Analyses to evaluate the correlation between the themes and ratings with student's quantitative OSCE scores as well as the correlation between these comments and the students' future clinical clerkship grades (honors, high pass, pass, fail) are ongoing.

Summary of Results: A total of 158 unique themes were identified from each domain as follows: interpersonal/communication skills (n=66) by global rating (n=50), physical exam (n=23) and history (n=19). The presence or lack of empathy was the most common theme while other recurring themes included: student's organization, use of questions, establishment of rapport, and display of emotional intelligence. Correlation with quantitative OSCE scores and clinical clerkship grades are ongoing with results expected by the 2019 AMEE conference.

Discussion and Conclusions: Interpersonal/Communication skills' themes were most numerous and often found in the comments of other domains, implying a greater impact on all parts of the encounter. Consistent with prior literature, global rating's most common positive and negative comments center on empathy suggesting that it's perceived as the most remarkable aspect of both good and bad encounters.

Take-home Messages: Qualifying student's performance affords educators the opportunity to provide students richer, more actionable feedback. Furthermore, the identification of themes that can reliably predict the future clinical performance of students may identify students struggling in ways that quantitative assessments do not. This permits efficient use of an institution's limited remediation resources and augments educators' ability to help students progress.

#3Q Short Communications - Simulated Patients

Balancing between realism and feedback: How students value the role of simulated patients in their learning process

AUTHOR(S):

- **Annelies Lovink, University of Twente, Technical Medicine, The Netherlands (Presenter)**
- Marleen Groenier, University of Twente, Technical Medicine, The Netherlands
- Anneke van der Niet, Maastricht University, SHE, The Netherlands
- Heleen Miedema, University of Twente, Technical Medicine, The Netherlands
- Jan-Joost Rethans, Maastricht University, FHML, The Netherlands

ABSTRACT

Background: In medical education simulated patients (SPs), lay persons who are trained to portray patients, are used extensively (Barrows, 1993). Although research shows that using SPs improves learning outcomes of students (Kaplonyi et al., 2017), it is unknown how students feel about the contribution of the SP during the SP-student encounter. This study explores students' perceptions of the influence of SP interaction on their learning process.

Summary of Work: Following ethical approval, 15 bachelor students were recruited. Students' perceptions of meaningful learning experiences during SP-student encounters were explored through in-depth, semi-structured interviews. Also, the specific contribution of the SP to these experiences was examined. Transcribed interviews were qualitatively analyzed using the grounded theory method (Watling & Lingard, 2012). Three researchers independently coded the first data using general principals of open coding. Themes emerged through an iterative process of discussion among all researchers about the coded data.

Summary of Results: A preliminary analysis revealed the following themes: 1) Realism. This seems to depend on the timing of the SPs actions and reactions. The encounter feels more realistic for students when the SP is open to students' interventions. 2) Incorporated feedback. Feedback as part of the (non-)verbal behavior of the SP during role-play is considered as corrective and calming. For appropriate feedback it might be important that the SP can adapt to the students' level during the encounter. 3) Self-reflection. Interaction with a SP seems to contribute to self-reflection and identity development of healthcare professionals. A full analysis will be presented.

Discussion and Conclusions: Based on the preliminary results we conclude that students seem to perceive realism to be important for their learning experience. Students also valued the feedback of the SP as part of the interaction. A meaningful learning experience, that contributes to identity development, seems to depend on the right balance between realism and incorporated feedback.

Take-home Messages: The right balance between realism and feedback during SP-student interactions contributes to meaningful learning experiences. These experiences might play an important role in students' self-reflection and identity development.

Becoming a medical specialist in Europe in the 21st century: Comparative Analysis of Postgraduate Medical Education in Estonia, Latvia and Lithuania

AUTHOR(S):

- Rille Pihlak, University of Manchester, UK (Presenter)
- Helen Reim, Estonian Junior Doctors Association, Estonia
- Marta Velgan, Estonian Junior Doctors Association, Estonia
- Eva Antsov, Estonian Junior Doctors Association, Estonia
- Saara Sadrak, Estonian Junior Doctors Association, Estonia
- Aleksandr Michelson, Praxis Centre for Policy Studies, Estonia

ABSTRACT

Background: Accreditation of postgraduate training (PGT) is not mandatory in many countries and there have been no studies analysing PGT in the Baltics. This trainee led three year long project aimed to assess the current state of PGT and give clear guidance of changes needed. Due to the lack of national expertise on medical education, partnership was formed with Praxis Centre for Policy Studies who assisted in conducting the research. Quantitative and qualitative methodologies were combined to compare training to the WFME Global Standards.

Summary of Work: The project consisted of five parts: 1)comprehensive benchmarking study 2)Estonian workshops, interviews and focus groups with stakeholders 3)surveys, workshops and focus groups in Latvia and Lithuania 4)Baltic and Nordic junior doctors meetings 5)international conference on PGT. First 3 parts of the project were to gather information for the benchmarking study. The 4th and 5th parts helped to put the results in a larger international context and see if the themes arising from the Baltics are also present in other European countries. Meetings between Estonian, Latvian, Lithuanian, Finnish, Swedish and Norwegian junior doctors organisations served as focus groups and the final international conference aimed to bring together stakeholders and provide potential solutions.

Summary of Results: The main results show that practices differ across countries, institutions and departments. Rarely does PGT in the Baltics fully meet the international standard. Major concerns pertain to improper application of regulations, inconsistency of supervision, lack of assessment of competencies, unsystematic teaching of soft skills, inconsistent appraisals, and absence of a comprehensive feedback system. Key policy recommendations to improve the current situation were developed and proposed. The results of the benchmarking study were presented internationally and locally and in Estonia this project has led to major discussions, media coverage and forming of a national taskforce on PGT.

Discussion and Conclusions: This first-ever systematic mapping of PGT in the Baltic countries showed that partnering with an independent research organisation can help take on large research projects and come up with impartial solutions.

Take-home Messages: Comprehensive analysis and solution oriented collaboration with international partners can lead to durable improvements in PGT.

Postgraduate training in Europe - results of a European Survey

AUTHOR(S):

- Francisco Ribeiro Mourão, European Junior Doctors' Association (Presenter)
- Svenja Moser, European Junior Doctors' Association
- Brigita Jazbar, European Junior Doctors' Association
- Agostinho Moreira de Sousa, European Junior Doctors' Association
- Josephine Elliott, European Junior Doctors' Association
- Kitty Mohan, European Junior Doctors' Association

ABSTRACT

Background: The organisation of Postgraduate training (PGT) varies between countries, despite conferring the same European qualification at the end of training.

Summary of Work: The 22 members of the European Junior Doctors' (EJD) Association (represented by national medical associations or junior doctors' committees) were surveyed online between 2017 and 2018.

Summary of Results: In 50% of countries, application for residency occurs directly after Medical School, with 41% applying for residency via a centralised national system. The responsibility for the regulation of the number of residency posts varies between countries, with no regulation of residency posts reported in 2 countries. PGT is time-based in approximately half of the countries surveyed, with 32% reporting combinations of time and competency-based training. In 42%, junior doctors (JD) have a double status of student and employee, whilst in other countries JD have a status only as an employee. Supervision of residency quality is the responsibility of the Medical chamber/council in 36%, the Ministry of Health in 18%, and universities in 18%. 1 country reported no implemented quality assurance systems. Assessments form an important part of PGT and examinations at the end of a year or module take place in the majority of countries surveyed. However, 4 countries reported no assessment during residency. A National Specialist exam was reported in 55%. Importantly, JD were found to share legal responsibility for clinical decisions with their supervisor in 60% of countries. In 18%, the supervisor has full legal responsibility throughout residency, and, in 9%, JD are fully responsible for their clinical decisions if already signed off on that specific competency. In 1 country, JD are fully legally responsible. Finally, the length of residency training varies between different countries and specialties and, in 73%, JD can undertake their residency working less than fulltime.

Discussion and Conclusions: Medical PGT is carried out in different forms across Europe and application to PGT, posts' number regulation and organisation greatly varies.

Take-home Messages: There are important variations in PGT evaluation and quality assurance systems that should be carefully addressed in different countries.

Learning Analytics from Milestones Data: Impetus for Change at the National Specialty Level

AUTHOR(S):

- Stanley Hamstra, Accreditation Council for Graduate Medical Education, USA (Presenter)
- Laura Edgar, Accreditation Council for Graduate Medical Education, USA
- Kenji Yamazaki, Accreditation Council for Graduate Medical Education, USA
- Nicholas Barbaro, Indiana University School of Medicine, USA
- Kim Burchiel, Oregon Health and Science University, USA
- Nathan Selden, Oregon Health and Science University, USA

ABSTRACT

Background: Accreditation systems that have embraced a competency-based approach rely increasingly on analysis of outcomes data at the level of the learner, or learning analytics. Specialty societies can be effective partners in interpreting these data to maximize impact for improvement and change. While some early studies of Milestones data have suggested how they might be useful to program directors for curricular improvement, there have been no reports of cooperative analysis between the central accreditation body and specific stakeholders for systems-level change.

Summary of Work: Level 4 Milestones represent substantial fulfillment of residency training but are not mandated as a graduation requirement. This allows for meaningful variance in patterns of data, a key requirement for learning analytics. We analyzed academic year-end Milestone ratings for over 1300 neurosurgery residents from 2015-2016. For each of the Patient Care sub-competencies, we determined the percentage of graduating residents who attained Level 4 across all training programs nationally. These (aggregate) data were then presented to the Residency Review committee for accreditation and the Society of Neurological Surgeons, representing academic department chairs and residency directors, for interpretation (i.e. 'co-creation' of meaning). We then followed up with these stakeholders two years later to examine what changes they had made.

Summary of Results: Analysis of Level 4 attainment by sub-competency revealed clues to variation in training or experience that required attention. These data were instrumental in helping educational leaders in neurosurgery confirm which subspecialty areas were within core training and which were not. In addition, these data helped these leaders modify the next iteration of their specialty Milestones to identify core versus subspecialty competencies.

Discussion and Conclusions: Partly in response to these data, the neurosurgery community significantly revised their Milestones, which amounts to changes in national curricular expectations. Working in partnership with specialty stakeholders, we were able to assist in creating meaningful educational change at the national level regarding standards of training.

Take-home Messages: This study illustrates how learning analytics can be applied in health professions education to better understand meaningful variation in learner progression, and to assist stakeholders at the national level regarding standards of training.

Working Conditions of Residents-in-training - A Taiwan National Survey after Imposing Working Hours Restriction

AUTHOR(S):

- Mei-Yi Chou, Joint Commission of Taiwan, Taiwan (Presenter)
- Su-Hua Lee, Joint Commission of Taiwan, Taiwan
- Chung-I Huang, Joint Commission of Taiwan, Taiwan
- Pa-Chun Wang, Joint Commission of Taiwan, Taiwan
- Chii-Jeng Lin, Joint Commission of Taiwan, Taiwan
- Chung-Liang Shih, Ministry of Health and Welfare, Taiwan

ABSTRACT

Background: To ensure the quality of education and to protect essential off-work rest for the residents (including PGY) in training, the Ministry of Health and Welfare of Taiwan granted the Guideline of Resident Working Hour Restriction (GRWHR) in August 2017 that limit regular daytime, on-duty shift, and weekly total working hours. In this study we conducted a national survey, with aims to understand the status and difficulties in the execution of GRWHR.

Summary of Work: In this cross-sectional, nation-wide questionnaire survey study, we collected data from 3,342 trainees (127 teaching hospitals) who worked in either medical center, regional hospitals, or local hospitals. The questionnaire surveys the working hours and the impacts of GRWHR on patient care, clinical training, and patient safety.

Summary of Results: The mean daytime work is 8.5 ± 0.6 hrs (6.5~10 hrs/day, family medicine ~ orthopedic); All comply with GRWHR (10 hrs/day). The mean on-duty shift working time is 26.5 ± 3.4 hrs (16~32 hrs/day, anesthesia ~ radiation oncology). Finally, the weekly total working hours is 68.9 ± 13.5 hrs (41~100 hrs/week, clinical pathology ~ rehabilitation). The on-duty hour violation (>28 hrs/day) rate is 15.6%; and the weekly total working hour violation (>80 hrs/week) rate is 9.9%. The violation rates are different among specialties of on-duty hour (highest: anatomical pathology, 33.3%, $p < 0.001$) and hospital level (highest: local hospitals, 24.1%, $p < 0.001$). The violation rates are different among specialties of the weekly total working hours (highest: plastic surgery, 33.3%, $p < 0.001$) and hospital levels (highest: medical centers, 12.0%, $p < 0.001$). The qualitative survey data shows that, the most common reasons for over-time are: insufficient manpower, scheduling operation, writing medical record, or handling emergency cases... etc.

Discussion and Conclusions: The effect GRWHR is largely satisfactory, the majority of education programs complied with regulations. However, residents of specific specialty working at local hospitals are at higher risk of overwork. Hospitals can use more supporting staffs or nurse practitioners to cope with manpower shortage problems.

Take-home Messages: Audiences will understand the effect of restriction on resident working hour, and the impacts to education and patient safety.

Can junior doctors work less than full time whilst undertaking their residency in Europe?

AUTHOR(S):

- Kitty Mohan, European Junior Doctors' Association, Belgium (Presenter)
- Piotr Kolczyński, European Junior Doctors' Association, Belgium
- Josephine Elliott, European Junior Doctors' Association, Belgium
- Brigita Jazbar, European Junior Doctors' Association, Belgium

ABSTRACT

Background: With increasing numbers of women embarking on a career in medicine, as well as a rise in doctors undertaking a 'portfolio career', it has never been more important for doctors to be able to work less than full time (LTFT). Working LTFT during residency is permitted in the EU under Article 25 of the Mutual Recognition of Professional Qualifications Directive. However, it is unclear how individual, competent authorities interpret this legislation.

Summary of Work: A survey was sent to all national delegations of the European Junior Doctors Association (EJD) in August and September 2018. The survey asked whether it is possible to undertake residency training whilst working LTFT in their country. 21 responses were received and analysed using descriptive methods.

Summary of Results: In over three-quarters of EJD countries, it is possible to undertake residency training working LTFT. The exceptions to this are Italy, Greece, Estonia, Latvia, Lithuania and Turkey. The Netherlands have the largest proportion of their junior doctor workforce working LTFT (40%), however Dutch doctors are not allowed to work less than 70% full-time hours. In comparison, most doctors in EJD member countries are allowed to work at 50% of full time hours. In ten of the countries surveyed (Portugal, Greece, France, Ireland, UK, Austria, Croatia, Malta, Spain, Slovenia), doctors must fulfil eligibility criteria prior to working LTFT. In 9 countries (Sweden, Portugal, Greece, France, Ireland, Norway, Spain, the Netherlands and the UK), it is necessary to reapply for LTFT status, however, the period of time before reapplication varies considerably. In all EJD member countries, postgraduate training is prolonged when a junior doctor works LTFT.

Discussion and Conclusions: The ability to work LTFT can enable junior doctors to remain in their residency whilst caring for children or other dependents, or whilst pursuing academic interests. This study highlighted that despite being permitted by EU legislation, in over a quarter (28.5%) of EJD member countries, working LTFT is currently not possible.

Take-home Messages: We call on educators, decision makers and Governments to work together to overcome the barriers to LTFT working across Europe.

How Internal Medicine Residents Experience Their Daily Work: A Qualitative Study

AUTHOR(S):

- **Matteo Monti, Centre Hospitalier Universitaire Vaudois, Switzerland (Presenter)**
- Céline Bourquin, Centre Hospitalier Universitaire Vaudois, Switzerland
- Friedrich Stiefel, Centre Hospitalier Universitaire Vaudois, Switzerland
- David Gachoud, Centre Hospitalier Universitaire Vaudois, Switzerland
- Vanessa Kraege, Centre Hospitalier Universitaire Vaudois, Switzerland
- Antoine Garnier, Centre Hospitalier Universitaire Vaudois, Switzerland

ABSTRACT

Background: In a 2015 time-motion study, we showed that internal medicine residents spent a large amount of their time performing administrative tasks and using computers. This prompted major reforms aimed at increasing residents' work efficiency and satisfaction. We introduced secretaries for residents, and a new daily organisation in an attempt to reduce non-added value tasks and unnecessary interruptions. In this study, we explore how internal medicine residents experience their daily work organization.

Summary of Work: 40 residents participated in four focus groups (FG). Each FG lasted about 90 minutes and was conducted by two experienced moderators with no professional link to the participants. FG discussions were audio-recorded and transcribed verbatim. Data were analyzed with qualitative content analysis.

Summary of Results: Residents expressed positive attitudes towards work organization. Initial analyses indicate that residents' experience is concurrently characterized by (1) a sense of individual agency - referring to how residents come to alter, though not necessarily intentionally, the general structure and organization of work -, and (2) a sense of constraint or restricted agency. For instance, with regard to the sense of individual agency (1), a number of residents do not take the opportunity to delegate tasks to the medical secretary, arguing that they tend to rely on themselves or find the added value of the delegation process to be low as well as time consuming. As another example, some residents use a significant part of the time planned for the preparation of the ward round to take a coffee break with their colleagues. Conversely, a sense of restricted agency (2) was manifest in narratives of residents feeling pressured and constrained by the daily schedule, with an experience of being overwhelmed by the tasks to accomplish and the looming danger of unforeseen incidents as the day progresses.

Discussion and Conclusions: Exploring the effects of the reforms necessitate complementing the observation of the residents' daily activities by an in-depth engagement with their experience.

Take-home Messages: Beyond the intended goal of increasing work efficiency and satisfaction, the consequences of a change in work organization in a medical Department have profound effects on residents' experience and feeling towards their work.

Watch and learn? Exploring the impact of using medical reality television as an adjunct to case-based learning with undergraduate medical students

AUTHOR(S):

- Fiona Osborne, Northumbria Healthcare NHS Trust, UK (Presenter)
- Miles Harrison, Northumbria Healthcare NHS Trust, UK
- James Fisher, Northumbria Healthcare NHS Trust, UK
- Belinda Bateman, Northumbria Healthcare NHS Trust, UK

ABSTRACT

Background: Over the last decade, the use of technology to enhance undergraduate medical learning has rapidly expanded and diversified. One area yet to be explored is using medical reality television to facilitate clinical learning. This strategy does not feature in published medical educational literature, but promising research is emerging from other disciplines.

Summary of Work: A teaching session was developed using clips from medical reality television as a focus for case-based learning for undergraduate medical students. The research questions were: - To what extent does using reality TV as part of case-based learning stimulate an emotional response in students? and - To what extent does using reality TV within case-based learning develop medical students' understanding of their learning needs in the clinical environment? A case-based methodology was used to address the research question from an interpretivist perspective. The theory of 'anchored instruction' was applied as a framework for interpreting students' experiences. Data was triangulated from two sources. Two experienced educationalists observed a teaching session of 20 students who took field notes. Five students then took part in semi-structured interviews. Data was analysed through an inductive thematic analysis.

Summary of Results: A diverse range of emotional responses to the reality television clips was expressed including: excitement, amusement, concern, nervousness, sadness and joy. Interviewees reported the reality television cases made the clinical scenarios more memorable and realistic. Key themes identified were that students felt more engaged and were stimulated to reflect on their future practice. Several students also identified gaps in their clinical knowledge such as interpreting results, practical aspects of prescribing and end of life care. However, they considered the reality television clips inferior to real patient interaction.

Discussion and Conclusions: Students perceived reality television as a highly realistic and relatable medium and a fun, memorable way to contextualise learning from the classroom to real life, a finding mirrored in previous studies in other fields. The high degree of emotion expressed may explain the improved subjective memorability of the cases according to the established link between memory and emotion.

Take-home Messages: Medical reality television can be a useful adjunct to case-based learning by empathetically engaging students with clinical scenarios and facilitating self-identification of learning needs.

Switched on learning using reality TV - a how to guide

AUTHOR(S):

- Miles Harrison, Northumbria Healthcare Foundation Trust, UK (Presenter)
- Fiona Osborne, Northumbria Healthcare Foundation Trust, UK
- Belinda Bateman, Northumbria Healthcare Foundation Trust, UK
- James Fisher, Northumbria Healthcare Foundation Trust, UK

ABSTRACT

Background: Technological advances have allowed new avenues to be explored in undergraduate medical education, in particular the use of television. This appeals to recent generations of medical students born in the digital age. Television can improve engagement and develop emotional responses, promoting learning. The use of fictional medical dramas has been widely reviewed however there is no published data on using medical reality television (MRT) to teach medical students in the UK or elsewhere.

Summary of Work: An innovative teaching session was developed using the UK MRT series '24 Hours in A&E'. We selected patients whose level of acuity made student exposure less likely: abdominal aortic aneurysm, fast atrial fibrillation and acute pulmonary oedema. We searched for the conditions using the 'learning on screen' resource (this allows educational use of programmes to UK universities with an ERA licence). The episodes were edited to two-to-five minute clips, following the patient from admission to discharge. After each clip the students were given a task: prescribing, requesting investigations, interpreting results or role-playing communication. The three-hour session was pitched at final year medical students with tasks similar to those expected of a first year doctor.

Summary of Results: Students fed back via existing university processes and tutors via debrief. The clips were beneficial in giving context and relevance to the cases, however these were time consuming to produce. Improved engagement with the tasks was seen and reported, but required intensive faculty input.

Discussion and Conclusions: MRT mirrors the true multi disciplinary team and encourages accurate role modelling, this was supported by facilitators from a range of clinical backgrounds; doctors, nurses and pharmacists. The urgency of prescribing anti-arrhythmics and analgesia when faced with a patient in extremis was clearer. Students critically reflected on clinician communication with implications for their own communication. However production of teaching materials was time consuming. Students required significant tutor support to accurately complete tasks. Although they expressed a preference for this over paper based teaching, they still found real patient encounters the most memorable.

Take-home Messages: MRT appears to bridge the gap between knowledge and clinical practice. This case provides insight for replication in other learner groups and countries, with local copyright considerations.

Teaching neurology using movies in junior occupational therapy students

AUTHOR(S):

- **Ping-Keung Yip, School of Medicine, Fu-Jen Catholic University, Taiwan (Presenter)**
- Yen-Ying Liu, School of Medicine, Fu-Jen Catholic University, Taiwan
- Chia-Hwa Chou, Department of Occupational Therapy, Fu-Jen Catholic University, Taiwan
- Vinchi Wang, School of Medicine, Fu-Jen Catholic University, Taiwan
- Jen-Hung Yeh, School of Medicine, Fu-Jen Catholic University, Taiwan
- Kun-Lung Hung, Fu-Jen Catholic University Hospital, Taiwan

ABSTRACT

Background: Remodeling neurology education for medical or paramedical students through effective pedagogical strategies to reduce 'neuophilia' have been advocated. Practical discussions of systemic curriculum planning of teaching neurology by using movies are very limited. The present study is tried to enhance learning motivation of clinical neurology, to introduce the psycho-social aspects and caring issues of neurological patients via systemic use of Cinemeducation.

Summary of Work: From 2013 to 2018, students of the second year of Occupational Therapy (OT) took the course of General Medicine (focused on Neurological and Pediatric subjects). According to the learning objectives of the syllabus, the course was composed of 14 to 16 topics. 1-2 selected and recommended movies for 9 topics related to neuroscience were listed at the beginning. Ten movies were considered compulsory for the course and ask the students to watch the movies before the classes. A study guide of each movie was supplemented to help the students for better understanding of the correlation of movies and the learning subjects. In order to ensure the students have watched the movies before or immediately after the classes, a few questions are designed for evaluation to the knowledge of the movies content and story. The evaluation was incorporated in the formal term examination.

Summary of Results: The overall course satisfaction was good to excellent, ranged from 4.3 to 4.4 which were quite constant as teaching using similar teaching method and adjunctive strategy, i.e., Cinemeducation. For the same period the satisfaction of movie teaching was increasing yearly 4.3+/-0.8 (2015), 4.6+/-0.6 (2016), 4.7+/-0.6 (2017), 4.8+/-0.5 (2018) as the supplementary measure and movie watching guides were improving. The feedback for the section designed of movies in 2018 was the followings: (1) overall movies teaching satisfaction 4.8+/-0.5; (2) watching and study guide 4.8+/-0.4; (3) movies can enhanced knowledge learning 4.8+/-0.5; (4) humanistic care learning 4.8+/-0.5; (5) ethical learning 4.7+/-0.5.

Discussion and Conclusions: With the help of proper selection of films, providing movies study guides, group discussion and movies-oriented examination, we have created an holistic approach, movies-assisted neurology curriculum for junior OT students.

Take-home Messages: The use of films in conjunction with classroom instruction make neurology teaching easier for junior OT students.

Case Based Learning; but does 'Cake Based Learning' drive better learning?

AUTHOR(S):

- Zarabeth Newton, Cardiff University, UK (Presenter)
- Marcus J Coffey, Cardiff University, UK
- Simon Atkinson, Bristol University, UK

ABSTRACT

Background: It is a challenge to generate dynamic and productive learning environments in Case Based Learning (CBL) small group tutorials with large cohorts of students. Enabling students to discuss their misconceptions and de/reconstruct their knowledge without judgement or fear from their peers requires the fast establishment of a functional group dynamic. Cardiff and Bristol University have looked into a way that these barriers can be overcome, productive learning communities and groups quickly become 'norming'. To promote a social component to CBL, students were encouraged to bring snacks to their small group tutorials, generating the term 'Cake Based Learning'.

Summary of Work: To review differences in group dynamics when snacks were included in the tutorials, students were asked to complete a voluntary online survey regarding their group dynamic and learning environments.

Summary of Results: The majority of students in groups with good dynamic felt food/refreshments helped promote a positive learning environment. Results indicated a clear correlation between groups that brought food/refreshments with an improved group dynamics as defined as feeling part of a productive team and having a good learning environment. Some students specifically indicated that their group dynamic was not a result of the 'Cake Based Learning'. Students in groups with strained dynamic felt that food/refreshments did not improve or 'cure' the more difficult learning environment.

Discussion and Conclusions: It was previously identified that the provision of snacks in teaching sessions had a positive effect on course evaluation. This did not investigate whether the snacks had a positive correlation on group 'forming' and in generating a positive learning environment. We have demonstrated here that 'Cake Based Learning' is a characteristic of groups that quickly created a productive learning dynamic. However, it did not solve a poor group dynamic so alternative interventions or resolutions should be sought.

Take-home Messages: 'Cake Based Learning' is a quick and enjoyable way of generating a good learning community and develop a productive group dynamic in small group tutorials. Thereby, improving student evaluations of their learning, irrespective of their tutors.

Meeting of Minds: Exploring Medical Literature and Critical Analysis through a Student-Led Undergraduate Journal Club

AUTHOR(S):

- Benjamin Hui, University Hospitals Birmingham, UK (Presenter)
- Rajan Pooni, University Hospitals Birmingham, UK
- Kathryn Waite, University Hospitals Birmingham, UK

ABSTRACT

Background: Journal club demonstrates a forum which can make medical literature more accessible, incorporating critical thinking and positive reading skills while fostering professional colleague relationships. A student-centred journal club may offer a safe environment where learners can develop these skills, although there is a lack of literature on the subject. We aimed to implement an undergraduate journal club for students to learn and apply critical analysis of medical literature.

Summary of Work: The 'Student Led Undergraduate (SLUG) Journal Club' was created for final year students. The initial session gave students an overview of journal club, introducing PICO, GATE frame and RAMMbo as tools for critical analysis. An example presentation was delivered allowing students to observe the application of these frameworks. Subsequently, students would take the lead for each weekly meeting, identifying a paper of interest and preparing a presentation, while guided by a teaching fellow. The lead student would present to the rest of the group and then engage in questioning/ discussion. After the session, the presenter would receive feedback on their presentation and audience interaction from the teaching fellow.

Summary of Results: When surveying students, there was increased confidence in the use of critical analysis frameworks following the introductory session, compared to before. Surveying presenters found the opportunity to prepare, present and engage in discussion useful towards their clinical and professional development, and confidence in future presentations at a journal club. Presentation feedback from teaching fellows demonstrated a high quality of literature identification and critical analysis using the introduced frameworks.

Discussion and Conclusions: The SLUG Journal Club demonstrates a positive environment offering students the opportunity to learn about evidence-based practice and critical analysis while contributing to their development as future clinicians. A high level of presentation demonstrates successful application of critical analysis tools. Integrating journal club into the core curriculum would be the next stage in its development, allowing for formal evaluation by the medical school.

Take-home Messages: An undergraduate journal club can be an effective means of exploring critical analysis of medical literature. It establishes an intellectually stimulating environment which contributes towards medical students' development as future clinicians.

How To Make Faculty Development “Pay” For Itself?

AUTHOR(S):

- Candace Smith-King, Spectrum Health/Helen DeVos Children's Hospital/Michigan State University College of Human Medicine, USA (Presenter)
- Monica van de Ridder, Spectrum, USA
- Michael Werkeme, Spectrum Health/Helen DeVos Children's Hospital/Michigan State University College of Human Medicine, USA
- Lisa Lowry, Spectrum Health/Helen DeVos Children's Hospital/Michigan State University College of Human Medicine, USA

ABSTRACT

Faculty development of medical educators is an important requirement for program accreditation. It also has the potential to improve the teaching and learning environment, affect physicians' wellness and collaboration, and culture of patient safety. Teaching hospitals worldwide have different approaches and expectations for faculty development. Some regulate and require it; some systems provide financial support; some systems leave it up to the faculty member to decide their level of participation; and some systems do not provide any support. In the context of teaching hospitals that don't encourage and support faculty development, organizing and implementing it for medical education (under)graduate programs can be a challenge.

The presenter will discuss best practices, solutions and experiences related to faculty engagement, institutional engagement, and finances/return on investment in faculty development courses in a challenging context.

Educating Future Educators: Designing and Implementing Elective Courses in Health Professions Education

AUTHOR(S):

- **Monika Kvernenes, University of Bergen, Faculty of Medicine, Norway (Presenter)**
- **Stuart Lubarsky, McGill Centre for Medical Education, Canada (Presenter)**

ABSTRACT

Most clinicians will at some point in their careers take on the role of educator, facilitating learning amongst students, patients or other target groups (Dandavino 2007). During the last decade or so, several schools and universities have started to offer elective courses in health professions education with the overall aim of helping students gain insight into how learning can be facilitated on a variety of levels (Pasquinelli 2008, Khamisa 2016). Most health professions training programs, however, do not have key curricular structures in place to adequately prepare learners for their roles as teachers, supervisors and assessors. Scholars at University in Bergen (Norway) and McGill University (Montreal, Canada) have independently developed and implemented elective courses with health professions education and teaching & learning as key topics.

We will share some of our experiences developing and implementing elective courses in medical education, including evaluation results and examples of outputs from the courses.

How to break barriers? International faculty development collaboration

AUTHOR(S):

- **Che-Wei Thomas Lin, Wanfang Hospital Taipei Medical University, Taiwan (Presenter)**
- S. Barry Issenberg, University of Miami Gordon Center for Simulation and Innovation In Medical Education, USA
- Benjamin Berg, University of Hawaii, John A Burns School of Medicine, USA
- Gen Ouchi, University of the Ryukyus, Okinawa Clinical Simulation Center, Japan
- Daniel Salcedo, Taipei Medical University, Center for Education in Medical Simulation, Taiwan
- Chien-Chih Wu, Taipei Medical University Hospital, Taiwan

ABSTRACT

We have successfully implemented a faculty development collaboration among simulation educators in Taiwan, Japan and the United States. We will describe the process of creating and fostering international partnerships for the development of simulation faculty and will share a model for collaboration and cooperation between different countries and cultures. Successful approaches that support these types of international activities will be discussed, together with an analysis of potential difficulties and barriers to the globalization of faculty development efforts in simulation education for healthcare providers.

The role of Host Organizations in improving ethical practice in mentoring within medicine: A systematic scoping review

AUTHOR(S):

- Wan Ying Elisha Chia, Yong Loo Lin School of Medicine, National University of Singapore, Singapore (Presenter)
- Kuang Teck Tay, Yong Loo Lin School of Medicine, National University of Singapore, Singapore
- Mien Chew Annelissa, Medical Library, National University of Singapore Libraries, National University of Singapore, Singapore
- Ying Pin Toh, Department of Family Medicine, National University Hospital Singapore, Singapore
- Lalit Kumar Radha, Division of Supportive and Palliative Care, National Cancer Centre Singapore, Singapore

ABSTRACT

The abuse of mentoring processes has become an increasing source of concern. Host organizations play an important role in providing supervision and oversight to prevent and mitigate toxic mentoring practices. At present, little is understood about the nature and role of host organizations in mentoring processes, and how effective oversight of mentoring programs can be implemented. To address this gap, a systematic scoping review of prevailing accounts of the role of host organizations in mentoring was carried out.

The presenter discusses a strategy to avoid abuse in mentoring processes.

Programmatic Assessment in Action: Are We Taking Full Advantage? Theory and Practical Applications

PRESENTER(S):

- Dario Torre, Uniformed Services University of Health Sciences, USA
- Marjan Govaerts, Maastricht University, The Netherlands
- Cees van der Vleuten, Maastricht University, The Netherlands

ABSTRACT

Background: Programmatic assessment (PA) has renewed the way we think about assessment in a post psychometric assessment era. PA is an holistic approach to assessment that combines assessment of learning with assessment for learning. Programmatic assessment seems to readily embraced by educators. The theory appears to be able to fit practice, however there are dilemmas that need to be considered and the implementation needs to be carefully designed. The understanding of the PA model can be helpful in conceptualizing assessment for the purpose of optimizing learning while arriving at a credible final assessment decision. This workshop provides participants a conceptual framework and a model to design an assessment system that allows educators to gain insight into students' growth and learning trajectories, provide ongoing meaningful feedback and utilize multiple data points from different sources to make a final decision about learners' progress. This workshop offers the opportunity for participants to discuss the usefulness of PA for the local context and the potential pitfalls during implementation

Who Should Attend? Teaching faculty (both junior and senior) should attend.

Structure of Workshop: We will provide a brief overview of the PA model, and its main theoretical concepts. We will describe how the main elements of the model, learning, assessment and supporting activities, are longitudinally integrated and complemented by intermediate and final evaluations. Next participants, using a structured worksheet, will develop an outline of how they would apply PA at their own institutions. In small groups, participants will share and discuss practical aspects, challenges, and benefits about the use of this assessment model. The workshop will conclude with a large-group discussion about practical strategies, applications challenges and potential solutions of utilizing this assessment approach in specific learning contexts.

Intended Outcomes: At the end of this workshop, participants will be able to:

1. Understand the PA model and its main theoretical perspectives
2. Apply the PA model to their own institution's curriculum, identifying opportunities for students' learning, growth and remediation
3. Recognize and discuss practical strategies to mitigate implementation challenges of PA.

Level: Introductory, no prior knowledge of topic required

#3V Conference Workshop

Collaboration in lifelong learning: Making it work

PRESENTER(S):

- Lisa Sullivan, Global Alliance for Medical Education, Australia
- Dale Kummerle, Global Alliance for Medical Education, USA
- Celeste Kolanko, Global Alliance for Medical Education, UK
- Sherlyn Celone, Global Alliance for Medical Education, USA

ABSTRACT

Background: For the last 20 years, The Global Alliance for Medical Education (GAME) has been collaborating across various stakeholders in professional lifelong learning. In working across multiple regions, GAME has engaged with different learning communities to share education and best practices in Continuing Medical Education (CME)/Continuing Professional Development (CPD). In mid-2018, the GAME board of directors revisited its vision and mission, and crafted a new statement that reflects the current needs of the organization and, in general, lifelong learning globally. The vision is that GAME be seen as a global leader in facilitating best practices and collaboration in life-long learning translation into improved healthcare, through engaging global leaders and providing opportunities and resources to share evidence-based best practice translation, while addressing barriers and developing solutions for collaboration in lifelong learning. It can be said that Europe is at a crossroads in CME/CE/CPD, with many different interests among professions vying for dominance and/or control while in other regions globally, needs and evidence-based best practice translation in CME/CE/CPD is still in its infancy. Key stakeholders of lifelong learning are either not collaborating, or do not know how to best collaborate with groups often considered to be competitors. GAME believes that all stakeholders that benefit from lifelong learning in healthcare should work together in a collaborative fashion for the best impact on patient care.

Who Should Attend? All those working in the CME/CPD space who wish to effectively collaborate internationally.

Structure of Workshop: In small groups, participants will explore how best to collaborate. Topics investigated include

1. defining collaborative partnerships and establishing a collaborative culture
2. exploring how to incorporate the core value of transparency into collaboration
3. discussing barriers that inhibit collaboration across multi-organization stakeholder groups and review strategies to overcome them
4. identifying resources needed for successful collaboration in lifelong learning.

Participants will explore these topics and brainstorm solutions in the CME/CE/CPD context.

Intended Outcomes: Following participation in this workshop, learners will be able to:

1. incorporate transparency into their collaborative activities and relationships
2. ascertain and manage barriers to successful collaboration across different stakeholders
3. develop resources for encompassing successful collaboration in lifelong learning

Level: Intermediate and advanced

#3W Conference Workshop

3W (857)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1015-1200

Location of Workshop: Room 0.49-0.50, Level 0

Institutional Ethnography: demystifying its use for Health Professions Education Research

PRESENTER(S):

- Grainne Kearney, Queen's University Belfast, UK
- Fiona Webster, Western University, Canada
- Gerry Gormley, Queen's University, UK
- Nancy McNaughton, Michener Institute of Education at University Health Network, Canada
- Robert Paul, The Wilson Centre, University of Toronto, Canada
- Eleni P Kariki, Queen's University, UK

ABSTRACT

Background: Institutional Ethnography (IE) is an approach to research developed by sociologist Dorothy Smith that allows examination of the social relations that organize peoples' everyday lives. Within Health Professions Education (HPE) it has been used to study topics such as the hidden curriculum and the demonstration of 'competence.' IE makes use of the same methods as other ethnographic or qualitative approaches - interviewing, focus-groups, textual and discourse analysis - but differs quite significantly in its process of analysis. It is grounded on the political commitment that research should be undertaken not to understand the world but to change it (praxis). Its focus on understanding how social relations shape our everyday lives means that non-experts can understand IE; it can be taken up by non-social scientists. IE has been gaining popularity amongst HPE researchers. This workshop will give practical guidance in how to use IE in participant's own settings.

Who Should Attend? We are aware of increasing curiosity in the AMEE community regarding IE. Those interested in theory are keen to understand why Smith considers it as an alternative to mainstream sociology. For those whose research is located on the front-line of healthcare, its emphasis on informing meaningful change is appealing. We hope to provide participants with a practical understanding of IE and the beginning steps to engage it in their scholarship.

Structure of Workshop:

- Introduction to IE and its unique concepts, such as the "generous conception of work" and approach to texts
- Small group problem solving exercise incorporating practical examples of use in HPE research by those presenting the workshop
- Exploration of perceived benefits and difficulties using IE
- Interactive discussion where delegates can generate ideas for potential projects

Intended Outcomes: By the end of this workshop, attendees should have:

- Enhanced understanding of the fundamental concepts underlying IE
- Increased knowledge of existing IE research in HPE
- Practical understanding of how to begin an IE study

Level: Introductory - despite interest in its philosophical underpinnings and potential practical applications, IE is currently underused in HPE. This workshop should appeal both to research novices and those who are experienced in other qualitative methods/theories.

#3X Conference Workshop

3X (378)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1015-1200

Effective Use of Technology to Capture and Report About Entrustable Professional Activities

PRESENTER(S):

- Mabelle Linsenmeyer, West Virginia School of Osteopathic Medicine, USA
- Olle ten Cate, University Medical Center, Utrecht, The Netherlands
- Carrie Chen, Georgetown University School of Medicine, USA
- Claire Touchie, Medical Council of Canada and University of Ottawa, Canada

ABSTRACT

Background: Entrustable professional activities (EPAs) facilitate translation of competency expectations into practice. Framing competencies in the context of what physicians do in daily practice allows for assessments that align with observations in the clinical environment. Capturing real-time clinical observations and level of supervision to inform trainee progression over time can be challenging. This workshop will outline several initiatives related to electronic technology (e.g. mobile applications, ePortfolios, etc.) that can be used to capture and report this abundant data in a useful manner and minimize the administrative burden for faculty and students. This workshop will provide opportunities for audience members to discuss EPA implementation and reporting using technologies and outline a plan for using technologies successfully at their own institutions. Several mobile solutions will be demonstrated.

Who Should Attend? This workshop would be suitable for any attendee interested in EPA implementation and reporting.

Structure of Workshop: This workshop will be very interactive with the majority of the time spent sharing advanced technologies and discussing/analyzing what works and what doesn't, advantages/disadvantages, etc. The audience will have the opportunity to share their experiences and use one of the technologies.

Workshop Outline:

1. Introductions- 10 minutes
2. Flow of WBA for EPAs and how technology might change to suite the type of assessment- 15 minutes
3. Example and Discussion of Technologies from Utrecht- 10 minutes
4. Example and Discussion of Technologies from WVSOM- 10 minutes
5. Live data collection and reporting with audience; participants will rate each other, give dictated feedback and see the aggregated data in a dashboard - 20 minutes
6. Discussion and outline of own institutional plan- 10 minutes
7. Questions and Wrap-Up- 15 minutes

Intended Outcomes:

1. Outline different types of assessment and how technology might change to suite the assessment type.
2. Describe mechanisms to enhance the flow of work-based assessments for EPAs using technology.
3. Review different technologies for capturing and reporting work-based assessment for EPAs.
4. Discuss advantages and disadvantages of different technologies.
5. Discuss the various components of an ePortfolio that make EPA assessment data useful and impactful.
6. Develop plans for using technology at own institutions.

Level: This workshop is suitable for all attendee levels.

#3Y Conference Workshop

3Y (559)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1015-1200

Location of Workshop: Room 2.17, Level 2

How we used threshold theory to address challenges in under and postgraduate training

PRESENTER(S):

- Ralph Pinnock, Otago University, New Zealand
- Anne O'Callaghan, Hospital Palliative Care Service, Auckland District Health Board, New Zealand
- Katherine Hall, Department of General Practice, Otago Medical School, New Zealand
- Louise Young, College of Medicine and Dentistry, James Cook University, Australia

ABSTRACT

Background: Threshold concepts and skills are novel and important ways of thinking and performing in a discipline. Until these are mastered students are unable to progress. Threshold concepts and skills are transformative, troublesome initially when students are first exposed to them, require integration of recently acquired with previously acquired knowledge and are mastered by repeated practice under supervision. Identifying threshold concepts and skills in the clinical environment must involve students. Though threshold theory has been developed in many areas of tertiary education it has only recently attracted attention in medical education. The presenters have published on threshold concepts and skills in both under and postgraduate training.

Who Should Attend? Clinical teachers who are interested in seeking new ways of responding to the challenges of teaching in their daily clinical practice. Participants are encouraged to bring examples of topics and situations from their environment. Where do your students particularly struggle and might benefit from a new teaching approach?

Structure of Workshop: The workshop will

- Enable participants to identify a learning experience that has been a threshold concept for them
- Demonstrate the features of threshold concepts and skills that have been identified within threshold concept theory
- Explain the pivotal role that students play in the identification of threshold concepts and skills
- Explore how threshold concepts were identified and introduced into a postgraduate training course in palliative care and into an undergraduate course in clinical reasoning
- Support participants with tools to identify threshold concepts in their own clinical practice.
- Explore the strengths and limitations of threshold theory in medical education.

Intended Outcomes: Workshop participants will be able to:

1. Identify and describe threshold concepts in medical education
2. Apply threshold concepts in their teaching in medical education

Level: All

#3Z Conference Workshop

3Z (1695)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1015-1200

Location of Workshop: Room 2.44, Level 2

Context is Critical: exploring pedagogies of place in health professions education

PRESENTER(S):

- Roger Strasser, Northern Ontario School of Medicine, Canada
- Ian Couper, Ukwanda Centre for Rural Health, Faculty of Medicine and Health Sciences, Stellenbosch University, South Africa
- Rachel Ellaway, Office of Health and Medical Education Scholarship, University of Calgary, Canada
- Paul Worley, Prideaux Centre for Health Professions Education Research, Flinders University, Australia
- Susan Van Schalkwyk, Centre for Health Professions Education, Faculty of Medicine and Health Sciences, Stellenbosch, South Africa
- Clare Morris, Institute of Health Sciences Education, Queen Mary University of London, UK

ABSTRACT

Background: Context in health professions education (HPE) is a threshold concept, which has the potential to catalyse transformative learning. Gruenewald proposes a critical pedagogy of place, an idea that has been underexplored in HPE. We need to acknowledge contexts role in learning, and challenge the idea that knowledge is context-independent. Bates et al suggest that, while it is ‘intrinsic to the field of medical education, the concept of context remains troubling to scholars and those running medical education programmes’. Awareness of the ‘pedagogy of place’ can help guard against practices being directed solely from a single (dominant) position, thus being responsive to the needs and dynamics of different contexts. In this workshop, we will explore perspectives on HPE from a range of different contexts guided by principles of social accountability and community engagement, and discuss why context matters in our teaching practice.

Who Should Attend? Educators and students with an interest in the role of context in HPE (undergraduate and postgraduate) across professional groupings, from any region or geographic area.

Structure of Workshop:

1. Introductions
2. Brief inputs: • Ian Couper - Overview of context in HPE • Rachel Ellaway - Key theories of context • Roger Strasser - The NOSM experience • Paul Worley - The Flinders network • Susan van Schalkwyk - The Stellenbosch University Rural Clinical School longitudinal study. • Clare Morris - Institute of Health Sciences Education, Queen Mary University of London.
3. Small group discussions will focus on the following: • What is important in participants’ contexts and how that shapes teaching and learning; • How these contexts can be utilised more effectively for learning and in addressing social accountability issues; • How to use the lenses of social accountability and community engagement to support context-focused innovation, evaluation, and research in HPE
4. Plenary feedback

Intended Outcomes: By the end of this session participants will:

- describe the critical role of context in HPE and its value in their own context;
- outline the value of ‘place’ when developing curricula, particularly for clinical training;
- be able to plan research to evaluate context, taking into account their local program and societal needs.

Level: Intermediate

#3AA Conference Workshop

3AA (1040)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1015-1200

Location of Workshop: Room 2.61, Level 2

Serious Games Development & Implementation in Health Professions Education

PRESENTER(S):

- Todd Chang, Children's Hospital Los Angeles & Keck School of Medicine, University of Southern California, USA
- Elizabeth Kachur, Medical Education Development Global Consulting, USA
- Gerald Stapleton, University of Illinois at Chicago, USA
- Chaoyan Dong, Sengkang General Hospital, Singapore
- Martin Pusic, New York University Langone Health, USA

ABSTRACT

Background: Games - in any format - are frequently used as adjuncts to education. Theoretical frameworks of how games provide learning transfer and successful game elements have been described, though far less so within health professions education and adult learners. The workshop provides both a theoretical framework of game design as it pertains to health professions education, as well as a practical discussion on how to develop and implement games into a curriculum.

Who Should Attend? Undergraduate Health Professions Educators, Postgraduate Medical Educators, Instructional Designers, Simulation Enthusiasts. Participants with game ideas or prior game development are encouraged to share their experiences

Structure of Workshop:

10min Lecture: Introduction and overview of Games in Health Professions Education. Following introductions, we present the variety of games and examples in the literature.

20min Discussion: Theoretical Frameworks on Game Elements in Education. We present Garris' game elements, Gees Game mechanics, and Bedwell's taxonomy of game elements. Concrete examples are also provided.

30min Small Group Problem Solving: Design a Game to teach a difficult concept. In small groups of 3 - 4, each group is required to design a game to teach 1 of 4 difficult concepts in medicine. They will choose the most appropriate game elements and style of play, and the modality.

20min Small Group Problem Solving: Plan the Implementation of the Game. Small groups return to write an implementation plan, including intended audience, and which curricula to integrate the game, as well as an assessment plan.

10min Discussion: Summary and Take-Home Points

Intended Outcomes:

1. Learners will list types of games and game elements used in medical education, with examples
2. Learners will design a game tailored to a concept, objective, and target audience
3. Learners will develop an implementation & evaluation plan for their game

Level: Beginner to Intermediate. Some exposure to games & simulation in education is helpful, but not required.

#3BB Conference Workshop

3BB (2005)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1015-1200

Location of Workshop: Room 2.83, Level 2

Development of Situational Judgement Test Approaches for Selection, Development & Assessment

PRESENTER(S):

- Emma-Louise Rowe, Work Psychology Group, UK
- Máire Kerrin, Work Psychology Group, UK
- Victoria Roe, Work Psychology Group, UK
- Fiona Patterson, Work Psychology Group, Derby, UK

ABSTRACT

Background: Situational Judgement Tests (SJTs) are a measurement methodology designed to assess non-academic attributes relevant to a target role. SJTs are becoming increasingly popular within healthcare, in both selection and education contexts. Within selection, there is now a wealth of validity evidence for their use, not only within medicine but for other healthcare roles (dentistry, pharmacy etc.) In recent years there has also been a renewed interest in the use of SJTs for in-training formative assessment, particularly in the development context. Formative assessments that seek to develop professional skills for trainees can be challenging and costly to implement. Using a scenario based approach can enhance individuals' knowledge of effective behaviours and attitudes at work relating to, for example, resilience and empathy. Through self-reflection and personalised feedback, trainees can be supported in the development of these important non-academic attributes.

Who Should Attend? This workshop is relevant for all who are interested in selection into medicine and other healthcare professions, specifically, anyone who is interested in the assessment of non-academic attributes and keen to understand more about a Situational Judgement Test approach.

Structure of Workshop: To begin, delegates will be provided with the latest research evidence regarding SJTs, before discussing some of the key principles in SJT design, implementation and evaluation. This will include considering both the practicality and implications of text versus video-based approaches. For the second half of the session, delegates will have the opportunity to develop their own scenarios and receive expert feedback and guidance. This may also include where they could implement an SJT within their own course/institution.

Intended Outcomes:

- Understand the latest research evidence regarding selection processes within healthcare, including evidence for Situational Judgement Tests.
- Understand the possible approaches to assessing non-academic attributes at the point of selection.
- To gain knowledge in best practice Situational Judgement Test item writing principles.
- Understand how Situational Judgement Tests can be used for selection, assessment and development within healthcare
- Have the opportunity to develop own Situational Judgement Test items, receiving feedback on approach from facilitators

Level: Introductory

#3CC Conference Workshop

3CC (3118)

Date of Workshop: Monday, 26 August 2019

Location of Workshop: Room 2.95, Level 2

Virtual/Augmented/Mixed reality and the new hologram based reality... What are the prospects in MedEd?

PRESENTER(S):

- Panagiotis Bamidis, Aristotle University of Thessaloniki, Greece, & Leeds Institute of Medical Education, University of Leeds, UK
- James Pickering, University of Leeds, UK
- Evdokimos Konstantinidis, Aristotle University of Thessaloniki, Greece
- Panagiotis Antoniou, Aristotle University of Thessaloniki, Greece

ABSTRACT

Background: Diffusing innovation into medical education is a continuous process. The emergence of cutting-edge digital media, such as Augmented, Virtual, and Mixed Reality (AR/VR/MR), as well as the more futuristic Hologram based reality offer new challenges for enhancing the curriculum content.. This workshop will expose such already created learning resources to support the teaching of specific modules in medical education. More specifically, neuroanatomy, in one hand, and elderly healthcare and practice on the other. These two contents are created in two different modes: (a) the Hololens approach (used in Leeds Medical School Neuroanatomy course) and (b) the holographic micro-projector approach (used in the CAPTAIN H2020 project). This will provide participants an opportunity to interact with the novel technology and discuss the logistics (both positive and negative) or developing and exploiting such resources. The workshop therefore aims to provide participants to interact with a cutting edge resource but also openly discuss the implications of integrating such a resource into the curricula along three themes. 1) how difficult and expensive is it to develop such resources? 2) why does medical education need to utilise such resources, 3) how is such a resource best integrated.

Who Should Attend? 1. Medical educators and teachers 2. Medical innovators and technologists 4. Curriculum developers

Structure of Workshop:

1. Presentation - Introduction to the development of a virtual reality learning tools
2. Activity - Time to experience and use the two virtual reality learning tools
3. Discussion - answering the why, when and how questions to integrate a VR tool into medical education
4. Group discussion and opportunities for networking

Intended Outcomes: By the end of this workshop, participants will be able to:

- familiarise themselves with a novel virtual Reality learning tools
- discuss and share ideas of developing such tools that require a diverse range of stakeholders, including educators, students, developers and project managers
- discuss the logistics (positive and negative) of integrating a resource of this type into a medical programme discuss and share approaches to its effective evaluation, implementation and future directions
- network with likeminded colleagues and initiate interdisciplinary collaborations and future projects

“We just want realism don’t we?” A focus group exploration into student perception of the use of simulated patients in clinical communication skills training

AUTHOR(S):

- Diane Owen, Swansea University Medical School, UK (Presenter)

ABSTRACT

Background: Consultation and communication skills learning for most medical students involves interviewing Simulated Patients (SP's). While evidence abounds that this is effective, little research exists as to student perception of the role of SP's and their attitudes toward them.

Summary of Work: A qualitative focus group study was conducted, with students in the second and third years of the medical undergraduate course at Swansea University Medical School. Their views of SP's were analysed by thematic analysis of the data obtained.

Summary of Results: Students consider these interactions to be useful to their learning, however they do regard them as false and 'not really a true representation' of the clinical encounters they have with patients. They find the simulated encounters safe and less stressful than real life encounters, and feel as if they have the licence to 'mess up', try different techniques, and in so doing find that their confidence in the process increases. Students discussed the importance of verbal interaction and rapport, but felt at times that they also were acting a role in front of others and any empathy conveyed was impeded by the perception that it was false and dishonest. This resulted in a perception that empathy and other emotions may be easily faked in the clinical setting. Students also spoke about factors which they feel are effective in making simulated encounters more akin to the real life clinical setting.

Discussion and Conclusions: However we try to increase realism in class, the students recognise the falseness of the situation and change their behaviour in response, many times intentionally. Despite being aware of the limitations of interviewing in this way, they actively engage with the learning process, experiment, and feel that they learn important skills from it. The simulation and real life experiences are different but effectively complement each other in the learning process.

Take-home Messages: Students outline requirements that should be considered to increase the effectiveness of these encounters.

#3DD ePosters - Communication

Evaluation of the attitude of students from medical faculties of the Medical University of Warsaw and University of Basel towards the development of communication competence

AUTHOR(S):

- **Mariusz Panczyk, Medical University of Warsaw, Poland (Presenter)**
- Lucyna Iwanow, Medical University of Warsaw, Poland
- Mariusz Jaworski, Medical University of Warsaw, Poland
- Joanna Gotlib, Medical University of Warsaw, Poland

ABSTRACT

Background: Modern medical education should not only strengthen communication skills, but should also be adapted to the current health care system; for example, the system of medical care in Switzerland, which is based on private benefits. The opposite of the Swiss system is the system of state health care, which dominates, for example, in Poland.

Summary of Work: In connection with different health care systems, a study was designed to assess the attitudes of medical students towards shaping communication skills depending on the prevailing health care system - private (Switzerland) or state (Poland). Study covered a population of 261 students from the Medical University of Warsaw (MUW), Poland and University of Basel (UB), Switzerland. A voluntary and anonymous survey was carried out using a standardised CSAS questionnaire, consisting of 26 items presented in two subscales - positive (PAS) and negative (NAS).

Summary of Results: Polish and Swiss students presented a neutral attitude towards learning communication skills and towards their own skills in this area. At the same time, the attitudes of UB students were slightly more positive than those of MUW students (UB: 90.4/130 versus MUW: 88.9/130, $t = 2.555$, $p = 0.011$).

Discussion and Conclusions: The obtained result confirms the validity of the implementation of elements of work in groups made up by students of various majors in an early stage of study. Shaping a positive attitude towards the acquisition of communication skills can be achieved by using the Social Learning Theory (SLT) in practice. The SLT was developed by Bandura. According to this concept, using observations and direct experience, students can demonstrate the importance of communication skills in clinical practice. However, in order for modelling learning to have a positive effect, tutoring-based teaching should be introduced. Tutoring is a didactic method based on not only developing communication skills in direct contact, but also strengthening the creativity for students' independence.

Take-home Messages: The educational process will be able to strengthen positive attitudes towards acquiring and improving communication skills among medical students.

#3DD ePosters - Communication

Intern Satisfaction with Breaking Bad News Training

AUTHOR(S):

- **Mariana Searle, Universidad Andrés Bello, Chile (Presenter)**
- Verónica Silva, Universidad Andrés Bello, Chile
- Verónica Escobar, Universidad Andrés Bello, Chile
- Peter Mc Coll, Universidad Andrés Bello, Chile
- Carolina Perez, Universidad Andrés Bello, Chile
- Jessica Goset, Universidad Andrés Bello, Chile

ABSTRACT

Background: Breaking bad news training with simulated patients is a valuable teaching tool in medical education. Role rehearsal, self-reflection and acting upon feedback provided by peers and tutors, are activities best suited for a core skill that requires 'hands on' continuous practice and feedback to be acquired. Objective: Evaluate intern satisfaction with simulation applied to train bad news delivery, for 7th year interns, at Universidad Andrés Bello, Viña del Mar, Chile.

Summary of Work: Descriptive study with 80 interns (8 small groups), who consented to participate in a 4 hour workshop consisting of: communication role rehearsal with simulated patients (sensible loss, diagnosis of a life threatening illness), self-reflection, peer and tutor immediate feedback and previously assigned readings. Pre and post Likert type (1 to 5) tests were administered anonymously evaluating satisfaction with the learning process and methodology. Cronbach's Alpha and T test were used.

Summary of Results: Median post-test (4.36) results were meaningfully superior to pre-test (3.12) for all questions and total results ($p < 0.001$). With respect to the learning process students valued: receiving immediate constructive feedback, simulated role rehearsals, acquiring 'practical' and theoretical knowledge on how to deliver bad news and to deal with emotionally challenging communication scenarios. Methodology median (4.85) was meaningfully superior to 3 points ($t=63.25$ with $p \leq 0.001$). Survey's internal consistency: Cronbach's Alpha 0.853.

Discussion and Conclusions: Simulation, immediate peer and tutor feedback, opportunities to self-reflect are key features as interns demonstrate their satisfaction with this breaking bad news training methodology. The experience to learn how to deliver bad news, which also entails handling highly emotional situations, although challenging for students who react to public exposure, is positively evaluated as it happens in real time, is not graded and interns can identify their personal strengths and weaknesses.

Take-home Messages: Communication skills constitute a permanent training need, although however understated as 'soft skills', should be explicitly taught through non-graded, progressively complex simulated scenarios throughout the medical career. Interns satisfaction with methodology demonstrated that bad news satisfactory delivery is a skill that can be best taught in 'protected' simulated scenarios.

#3DD ePosters - Communication

3DD04 (2530)

Date of Presentation: Monday, 26 August 2019

The teaching and assessment of triadic communication - a collaboration from 2 UK Medical Schools

AUTHOR(S):

- Rachel Williams, University of Cambridge, UK (Presenter)
- Deborah Critoph, University of Cambridge, UK
- Andrew Ward, University of Leicester, UK
- Rachel Westacott, University of Leicester, UK
- Nisha Dogra, University of Leicester, UK
- Diana Wood, University of Cambridge, UK

ABSTRACT

Background: Triadic consultations occur frequently in clinical practice but teaching in this area is rarely included within the medical students curriculum.

Summary of Work: In 2015, in response to student feedback requesting specific teaching in this area, a collaboration between Leicester and Cambridge Medical Schools led to the implementation of a teaching session for students, framed within authentic clinical scenarios. Learning objectives were set by student focus groups. In Leicester the teaching sits in the 2nd year, and in Cambridge the 4th year. Further collaboration (2018) led to the development of OSCE marking grids, to assess process skills for triadic communication. Examiners were trained according to local practice. OSCE stations incorporated 2 role players to simulate a triadic consultation in standardised format. Marking proforma were domain-based in both Schools and included elements such as the explicit introduction of both parties and attending to the agendas of both parties, whilst prioritising the patient. The process grid closely mapped to the learning objectives from the teaching session. Examiners were trained that students should not be scored above the pass in each domain, unless they explicitly demonstrated skills of triadic consultation.

Summary of Results: The teaching session has evaluated well with students and tutors in both schools since its introduction (overall satisfaction scores above 4.5 / 5). The triadic OSCE station demonstrated good reliability in both schools, with decreases in the overall Cronbach's alpha for both OSCEs when the triadic station was removed from the analysis. Proforma scores and station pass marks were similar in both Schools. Fail rates were low (7% in Cambridge and 8% in Leicester) supporting efficacy of teaching.

Discussion and Conclusions: Triadic consultations form over 30% of clinical encounters and students should be provided with these skills as part of their routine training. We have shown that by collaborative working to generate resources, consensus on learning objectives and assessment can be agreed and implemented within 2 institutions in an effective way, despite students differing clinical experience.

Take-home Messages: Collaboration between institutions effectively generates novel teaching and assessment material which can be implemented across different institutions.

#3DD ePosters - Communication

Does audio recording of a referral/consult in addition to a personalized feedback improve communication skills (A pilot study)?

AUTHOR(S):

- **Khalid Bashir, Hamad Medical Corporation, Qatar (Presenter)**
- Saleem Farook, Hamad Medical Corporation, Qatar
- Shahzad Anjum, Hamad Medical Corporation, Qatar
- Stephen Thomas, Hamad Medical Corporation, Qatar

ABSTRACT

Background: Appropriate communication is an indispensable skill and is endorsed as a core competency of resident education by the Accreditation Council for Graduate Medical Education. Appropriate and timely feedback is essential in improving communication skills. Unfortunately majority of the residents get inadequate feedback from the supervising faculty. The primary aim was to evaluate that an audio recording of a telephone consult to other specialty physicians in addition to a personalized feedback by the supervising faculty improve communication skills. The secondary aim was to gauge residents opinion about this approach.

Summary of Work: This was a pilot, prospective, mixed-method study that included 9 emergency medicine (EM) residents in current training program. From October to December 2018 one senior faculty (KB) with experience of giving feedback supervised the residents during normal clinical shifts. At the beginning of each clinical shift there was an agreement between the faculty and the resident to assist in improving communication skills as part of the 'shop floor' teaching. The telephone consult was directly observed by the supervising faculty and also audio recorded on the resident own smart phone. The direct personalized feedback was provided immediately after the consultation in a private area. The residents were asked to provide comments about this method of feedback.

Summary of Results: 12 residents agreed to participate but only 9 were able to complete the study. 3 others could not complete due to busy clinical areas. There were 2 female and 7 males. 8(out of 9) really liked this method of feedback 'eye opener', 'really helped me to reflect' and 8 of them of them would like to self-record some of their future consultations for self-improvement. While one resident felt she was extremely nervous and her communication skills was less than optimum due to direct observation and audio recording.

Discussion and Conclusions: Appropriate reinforcing and corrective feedback is important to improve the communication skills of residents. Audio recording of the consultation and personalized feedback may be useful in improving communication skills.

Take-home Messages: Audio recording is a useful tool and can complement direct feedback in improving communication skills.

It's still challenging! - New concepts for training simulated patients (SP) in the art of giving feedback

AUTHOR(S):

- **Susanne Lück, Charité Berlin, Simulated Patients Program, Germany (Presenter)**
- Julia Freytag, Charité Berlin, Simulated Patients Program, Germany
- Peter Eberz, Charité Berlin, Simulated Patients Program, Germany
- Tanja Hitzblech, Charité Berlin, Simulated Patients Program, Germany

ABSTRACT

Background: Being able to give highly qualitative feedback is one of the most important skills an SP needs to support learning. Yet despite constant practice, SP still struggle sometimes to transfer the concepts into their daily work. That's why we developed additional training concepts with the goal of deepening feedback skills and focussing on particularly challenging parts of giving feedback.

Summary of Work: We developed two new training courses (4,5 hours each, two trainers, 10 SP) and offered each of them once by now: 1. 'Reflections: Self-assessment via video recordings' The first workshop aims to give the SP a better appraisal of their own strengths and weaknesses. It starts by discussing feedback standards and getting to know an assessment tool we use for quality assurance. Afterwards, SP analyse a video of themselves giving feedback. 2. 'The challenge of giving dialogic feedback' The goal of this presentation is to give the SP practical tools for creating a feedback dialog instead of giving a one-sided lecture. We use a variety of training methods to offer theoretical input and give the SP the chance to practice the tools in various communicational settings. In the end the participants evaluated the workshops on continuous scales and answered open questions.

Summary of Results: The participants' reaction to the new courses was overall very positive. After the first workshop SP stated they found it helpful to see themselves on camera and felt more comfortable in giving feedback. After the second workshop the SP claimed to feel better equipped to evoke a feedback dialog.

Discussion and Conclusions: Developing new training concepts requires resources, but SP are signalling a huge interest in new ways of practicing feedback. A quantitative evaluation of the courses is planned and additional workshops on topics like 'How attitude influences feedback' and 'feedback after emotionally charged interactions' are in development.

Take-home Messages: By offering a variety of training concepts, SP can be helped to overcome their difficulties in giving feedback and improve their skills. Giving feedback training courses on a regular basis also helps SP trainers to stay aware of the SPs' challenges.

A nationwide qualification program for peer tutors in training of communication skills

AUTHOR(S):

- **Louisa Hecht, German Medical Students' Association (bvmd e.V.), Germany (Presenter)**
- Erika Fellmer-Drüg, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Germany
- Nicole Deis, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Germany
- Jana Jünger, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Germany

ABSTRACT

Background: As the role of education in communication for medical students increases in recent times, educational services of trainings in this field equally do. Faculties have come out with communication courses in many different ways. Several of these services are based on peer-teaching. However, they differ in quality leading to heterogeneous communication skills amongst the graduates. To counter this issue a multifaceted communication training had been designed in 2015 by the Institute for Medical and Pharmaceutical Exam Items (IMPP), addressing the role of student tutors within the field of education in communication. The aim of this initiative is a national standardized qualification of student tutors for medical communication in content and didactics on a high quality level.

Summary of Work: Each year, about 20 tutors receive training within two three-day sessions by an experienced and multidisciplinary team of experts. The program consists of two basic units with lectures in didactics of medicine, fundamentals of communication, group-leading and doctor-patient communication skills. Overall, since the program has started, nine faculties in Germany served as cooperating hosts to perform these trainings. Additionally, graduates get the opportunity to sign up for a continuing qualification program to learn more about e.g. interprofessional communication and cooperation. In the end, the learning process will be evaluated by observations in peer tutor lessons, local supervision sessions and portfolio works of the students. In total, 200 class lessons are necessary to receive the national certificate.

Summary of Results: To picture a clear and profound impression of the project, we are not only characterizing the idea and realization of the concept but also performing a critical SWOT analysis of the qualification program. To gain a supplementary glimpse in the student perspective, we compile the main results of the participants' evaluation. A brief initial review already shows a highly positive response to the training.

Discussion and Conclusions: Many valuable experiences have been gathered throughout the course of the program. Pointing out the strengths and limitations of the program, as well as its threats and opportunities amidst current developments, can encourage similar upcoming ideas.

Take-home Messages: We would like to convey how to combine the resources of student tutorials with a high level education.

#3DD ePosters - Communication

Addressing the elephant in the room: Improving healthcare professionals' confidence and ability communicating in difficult scenarios

AUTHOR(S):

- Aira Beniusyte, South Tyneside NHS Foundation Trust, UK (Presenter)
- Riem Alkaissy, South Tyneside NHS Foundation Trust, UK
- Laura Murphy, South Tyneside NHS Foundation Trust, UK
- Anna Zornoza, South Tyneside NHS Foundation Trust, UK
- Lucy Baxter, South Tyneside NHS Foundation Trust, UK

ABSTRACT

Background: In 2017-2018 hospital and community health services received 28,263 written complaints because the patient (or the patient's advocate) felt they did not receive the appropriate level of communication by healthcare professionals. A survey in this trust showed healthcare professionals did not feel confident in discussing end of life care, DNACPR, capacity and complaints. Capacity was cited as one of their weakest areas.

Summary of Work: A multidisciplinary team (MDT) communication simulation session was designed for healthcare professionals of varying levels of experience. Four scenarios centred on conversations with patients and their relatives regarding DNACPR decisions, end of life care, capacity and complaints. Each scenario lasted 10 minutes followed by a 25 minute discussion. Participants were surveyed before and after the session to establish their self-assessed confidence and ability in communicating in these four scenarios.

Summary of Results: Participants reported an increase in confidence for all areas. The results show a greatest increase in confidence in communication at end of life with an increase in self rated mean confidence and ability score (/5) from 2.6 to 4.5. Mean confidence and ability score increased from 3.2 to 4.7, 3.6 to 4.4 and 3.0 to 4.5 in DNACPR, capacity and complaints respectively. All participants reported they would make changes to their clinical practice based on what they had learnt in the session.

Discussion and Conclusions: The MDT communication session was successful with participants reporting an increase in confidence and ability in all topics covered in the session. Feedback also showed that all participants felt they would modify their clinical practice based on this experience, indicating that they felt there was practical benefit from attending the session.

Take-home Messages: There is concern that if healthcare professionals do not have confidence discussing these issues, they will avoid doing so, which would be detrimental to patient care, therefore, improving the communication skills are essential.

- Simone Moreira, Universidade Federal of Rio Grande do Norte (UFRN), Brazil

ABSTRACT

Background: Throughout the world, most of the medical schools traditional curriculum experience a scarcity of formal instruction in bad news communication. Therefore, facing this worrisome reality, the university extension project 'Dying: A Human Thing' from Universidade Federal do Rio Grande do Norte (UFRN), Brazil, comes to address this issue. The main purpose is to provide to undergraduate students training in delivering bad news, allowing them to obtain this relevant skill which is essential to a great professional medical journey.

Summary of Work: The project accomplished semiannually and occurs in five theoretical-practical meetings, of which two use the Objective Structured Clinical Examination (OSCE) methodology to evaluate the ability to communicate bad news through simulated clinical situations, which were accomplished in university hospital outpatient clinics, with an evaluator and an actor for each of the 3 stations. Then there are the individual and collective feedbacks conducted by invited teachers. Between the practical moments, there is a theoretical qualification based on the SPIKES protocol. There are still two meetings focused on the termination of life with professionals from different areas.

Summary of Results: Between 2016 and 2018, the project reached 100 Brazilian medical students from different periods of the Universidade Federal do Rio Grande do Norte (UFRN). It is notable the professional maturation of the participants throughout the project, more confident as they get more lessons and practices. For the undergraduate coordinators, the learning is always remarkable and unique, given the considerable challenge of setting up two activities with great mobilization of resources and people.

Discussion and Conclusions: The making of communication competences in the academic environment is a challenging and inspiring activity, for technique and empathy at delivering bad news support relieving human suffering. On this regard, Dying consists of an innovative implement which must be improved and expanded, since it contributes substantially to the formation of more prepared and confident physicians at their tough roles with humanity and respect.

Take-home Messages: The Dying project is an example of how undergraduates can lead improvements on medical education, and strengthen communication skills of the future doctors.

What is the role of the use of video recordings in medical education for the teaching of communication skills?

AUTHOR(S):

- Ana Leite, Associação Hospitalar Moinhos de Vento - AHMV, Brazil (Presenter)
- Carmen Daudt, UFCSPA, Brazil
- Melissa Fortes, UFCSPA, Brazil
- Vivian Duarte, GHC, Brazil

ABSTRACT

Background: Good doctor-patient communication is essential in clinical practice, and its importance is well established in the literature. Several tools have been developed for evaluation and teaching of communication skills. Video recording is a gold standard for communication teaching. The objective of the study is to map and analyze the role of the use of videorecordings for the teaching of communication skills in medical training.

Summary of Work: Integrative literature review based on 6 steps. Two databases were searched with the descriptions communication skills, medical education and videorecording. 26 articles were selected for analysis. An instrument for collecting data from the studies was developed. Subsequently, a qualitative analysis of the studies about the role of the use of videorecordings for the teaching of communication skills was carried out.

Summary of Results: Videorecordings were used as three different tools: teaching, summative evaluation and formative evaluation; in 14 studies were used as formative evaluation tool; 9, as summative evaluation; in 1 as both types of evaluations; and 2 as teaching.

Discussion and Conclusions: Traditionally, in the health area, evaluations have been done in a timely and objective way (summative evaluation). On the other hand, formative evaluation presupposes that the act of evaluating must be an integral part of the whole teaching-learning process, with feedback as a fundamental action in the process. Currently, it is believed that the ideal form of evaluation of students has complementarity of the two forms: formative and summative.

Take-home Messages: Video recordings should be widely used, as they allow the student to observe in practice, in addition to being analyzed continuously, at various moments in the teaching-learning process, thus becoming a great tool to be used.

Does Prior Performance Information Impact Feedback; Implications for Learner Handover?

AUTHOR(S):

- Timothy Wood, University of Ottawa, Canada (Presenter)
- Yousef Almuhanha, University of Ottawa, Canada
- Susan Humphrey-Murto, University of Ottawa, Canada
- Tammy Shaw, University of Ottawa, Canada
- Claire Touchie, University of Ottawa, Canada
- Debra Pugh, University of Ottawa, Canada

ABSTRACT

Background: Learner handover (LH) is the sharing of information about trainees between faculty supervisors involved in their education. With the move to competency-based education, longitudinal assessment and feedback are taking on a more important role. There have been concerns raised that LH may bias future assessment leading to inaccurate evaluations. Prior research on numeric scores has demonstrated assimilation i.e. there is bias toward the direction of the previous performance information (PPI) provided. There are currently no studies that examine the effect of LH on feedback. The purpose of this study is to examine the impact that indirect (indirect source) within-subject PPI has on narrative feedback.

Summary of Work: Participants (n=42) were randomly assigned to 3 groups (positive PPI, negative PPI or control group), where they viewed 6 videos of simulated clinical patient-resident encounters. The PPI was provided as written LH from the program director summarizing the resident's performance. Each rater completed a mini-CEX and was asked to provide comments. These narrative feedback comments will be coded using content analysis. Coding will include content (inductively developed) and valence (how positive or negative the comments were). Data analysis will compare the content and valence between the 3 groups, as well as determine the relationship between LH content and feedback content.

Summary of Results: Data analysis is ongoing to date. Content analysis is being conducted using NVivo 12. Narrative comments were categorized into communication, knowledge, humanism, physical examination, directive, organization, technical and overall clinical competence. Preliminary impression showed that the most commented on category was communication, followed by knowledge. These categories are further sub-grouped into positive, negative, neutral, and directive.

Discussion and Conclusions: Discussion and conclusions will be generated upon completing data analysis.

Take-home Messages: Sharing of information about the learner between faculty supervisors could potentially help guide feedback to enhance learning. Understanding how learner handover impacts the feedback is a first step in determining how best to implement this process.

Formation and Communication in Health Care

AUTHOR(S):

- Fernanda Novaes, FAIMER, Imip, Inss, Brasil (Presenter)
- Marcelo Ribeiro, UNIVASF, Brasil

ABSTRACT

Background: National and International Guidelines value teaching - learning methodologies that produce satisfaction during the professional formation in healthcare. The objective of this paper is to share the formative experience that integrates the fields of Health and Education.

Summary of Work: The educational experience has occurred in the elective subjective Communication in Healthcare offered by the course of Medicine and Interfaces Health and Education offered by the Psychology course. The point of convergence of the disciplines is the sense of caring from what we call living methodology in the formation process. This approach prioritizes life histories, ludic classes, relationships in the classroom, and previous experiences. The work involves undergraduate students in the healthcare area. The educational choreography includes 10 steps: 1-Class Project, 2-Discussion Circle, 3-Reflection, 4-Categorization, 5-Articles, 6-Integrative Dynamics, 7-DocCom.Brasil, 8-Student Videos, 9-Dramatization, 10-Conclusion with Art.

Summary of Results: The record of the experience on Formation and Communication in Health Care, it was observed that the training process is closely associated with the issue of care / self-care as fundamental for professional development. Life and care stories have indicated that students have neglected self-care or perceived that the university context has been less sensitive to care relationships and how much this impacts on the quality of professional formation. In relation to life histories, the students reveal that they understand that the educational processes are integrated with those of health so that one does not happen without another. Finally, the students indicated that these reflections occurred because the teachers conducted the classes and valued the experiences and reflections.

Discussion and Conclusions: The Living Methodology creates conditions for self-care and care, which is a convergent theme between health and education. Kirkpatrick's program evaluation revealed good results at level 1, satisfaction, demonstrated by the increased number of participants.

Take-home Messages: This experiences help to think better about the professional formation in health care.

Virtual Reality - a Novel Approach to Teach Communication and Collaboration Competencies in Undergraduate Medical Education: An Experimental Study

AUTHOR(S):

- **Lama Sultan, King Abdulaziz Medical City, Saudi Arabia (Presenter)**
- Wesam Abuznadah, King Abdulaziz Medical City, Saudi Arabia
- Hatim Al-Jifree, King Abdulaziz Medical City, Saudi Arabia
- Muhammad Anwar Khan, King Abdulaziz Medical City, Saudi Arabia
- Basim Alsaywid, King Abdulaziz Medical City, Saudi Arabia
- Faisal Ashour, King Abdulaziz Medical City, Saudi Arabia

ABSTRACT

Background: Undergraduate medical education is constantly evolving with curricular shift from simple knowledge acquisition to competency-based medical education. According to SaudiMED, communication and collaboration is the core domain. Literature shows that repeated practice followed by feedback is mandatory for behavioral changes. Nowadays, we live in the era of digital natives generations; different technologies can be used to cope with them, such as Virtual Reality which supports experiential learning by Kolbs.

Summary of Work: Experimental study was conducted where 4th year medical students participated in a workshop. They were divided into two groups according to the educational tool: group one utilized 360° virtual reality videos and group two utilized interactive lectures. The outcome factors were all quantitative variables: Perception level (a questionnaire was given before the session), MCQs score (20 MCQs pre and post session to assess knowledge retention), OSCE score (to assess skill acquisitions), satisfaction level (a questionnaire was given after VR session), All the 169 (male and female) medical students were included in the study.

Summary of Results: The response rate was 88% for 169 participants, 57 (VR) and 112 (Lecture). Majority of students (93%) think that VR can be used in medical education. Post MCQs score (out of 20) was significantly higher in VR group when compared to the lecture group (17.4±2.1 vs. 15.9±2.9, p-value <0.001). The OSCE score was also better with VR group (12.9±4.1 vs. 9.8±4.2, p-value <0.001). Overall rating of VR satisfaction experience showed a mean of 7.26 out of 10.

Discussion and Conclusions: Virtual Reality provides a rich, interactive, engaging educational context, thus supporting experiential learning-by doing. In fact, it raises interest and motivation for student and effectively supports knowledge retention and skills acquisition.

Take-home Messages: Health professional educators might look into integrating Virtual Reality technology in medical curriculums in order to make the material more interesting, easier to learn and to adapt to the new generations' needs. Also, Virtual Reality could play a role in interprofessional education to allow undergraduate health professions learn about each other roles to improve collaboration and communication skills for a better health care delivery accomplishing Saudi Vision 2030.

Are there differences between student performance after rotations at tertiary and community Emergency Medicine teaching sites?

AUTHOR(S):

- Carolyn Rotenberg, Dalhousie Medical School, Canada (Presenter)
- Simon Field, Dalhousie Medical School, Canada

ABSTRACT

Background: Undergraduate medical Emergency Medicine (EM) rotations are often completed at either tertiary care centres or regional community hospitals. While the latter offer students exposure to different practice settings and population needs, many students perceive that teaching at tertiary care EM departments is superior to that in community hospitals. At our institution, third year undergraduate medical students complete a three-week EM rotation at either a tertiary centre or a community hospital. We compared academic and clinical performance between students trained in these settings.

Summary of Work: Academic performance in EM was evaluated based on the results of an EM-specific multiple-choice examination (MCQE). The 40-question MCQE is administered quarterly and includes both old and new questions to ensure consistency. Clinical performance was evaluated using an annual Objective Structured Clinical Exam (OSCE) assessing competency in a range of clinical scenarios commonly addressed in EM. The OSCE is a validated assessment tool scored on a pass/fail basis. We reviewed MCQE and OSCE scores from three consecutive cohorts of students. Students were pooled into two groups, tertiary and community, based on their EM training site. Mean MCQE and OSCE performance were compared between groups using two-tailed unpaired T tests. Chi squared tests were used to identify significant differences in scores between cohorts.

Summary of Results: MCQE and OSCE scores from 312 students over three consecutive cohorts were analyzed. Cohorts included 104, 100, and 108 students with 61% trained in tertiary centres (N=191). Students trained in tertiary centres had a mean MCQE score of 77%. Students from community centres had a mean score of 78%. There was no significant difference in MCQE scores between groups ($p=0.6099$). The OSCE pass rate was 97% for students trained in tertiary centres and 98% for students trained in community centres. OSCE pass rates were not significantly different between groups ($p=0.8145$).

Discussion and Conclusions: There was no significant difference in MCQE and OSCE performance between medical students training in tertiary and community hospitals.

Take-home Messages: Despite student perceptions that training in tertiary care EM centres was superior, objective analysis showed similar academic and clinical performance regardless of training site.

Assessment of the Clinical Pharmacology Domain of Veterinary Students in a Clinical Workplace: A Grounded Theory Approach for Development of a Cognitive Framework

AUTHOR(S):

- Paul Gordon-Ross, Western University of Health Science, USA (Presenter)
- Jennifer Buur, Western University of Health Sciences, USA
- Martina Haupt, Western University of Health Sciences, USA
- Peggy Barr, Western University of Health Sciences, USA

ABSTRACT

Background: The Entrustable Professional Activity (EPA) of Patient Management includes the clinical pharmacology domain. Within this domain students are expected to synthesize and apply basic and clinical pharmacology knowledge and skills as they progress through clinical instruction. In a distributive model of clinical education, the assessment of trainees is often performed by third party clinical instructors who may not be trained to assess specific domains like clinical pharmacology. We designed this study to determine how clinical instructors evaluate learners during clerkships, when considering EPA-specific domains like clinical pharmacology.

Summary of Work: The paucity of specific milestone data made review of the clinical pharmacology domain and its corresponding milestones impossible; thus, the purpose of this study is to fill in the gaps by developing a cognitive framework to explain the decision-making process of clinical instructors when they are assessing Year 3 students in the clinical pharmacology domain. Using a modified systematic grounded theory approach, we conducted and analyzed semi-structured interviews with third party clinical instructors in a Year 3 veterinary curriculum. Transcribed interviews were coded, and emergent themes were discussed and refined until a cognitive framework was reached.

Summary of Results: Clinical instructors predominantly use question-answer sessions of various formats to evaluate the knowledge, skills and attitudes of students. Previous student experience both within and between clerkships feed back into the assessment process. Clinical instructors assess students often while simultaneously teaching clinical pharmacology content.

Discussion and Conclusions: We developed a cognitive framework to explain how clinical instructors assess students in the clinical pharmacology domain. This cognitive framework is applicable in a variety of clinical contexts and is likely to apply broadly to many clinical domains and across the spectrum of professional health care curricula.

Take-home Messages: Clinical instructors rely heavily on question-answer sessions with students when assessing the clinical pharmacology domain of the Patient Management EPA. Clinical instructors base their assessment on a combination of student knowledge, clinical skill, and attitude. Assessment opportunities are often intimately associated with teaching opportunities in the clinical setting, making it difficult for the clinical instructor to differentiate between the two modalities.

Service, clinical exposure and clinical department influence on House Officers (HO) / Post Graduate Year 1s (PGY1) training satisfaction

AUTHOR(S):

- Swee Han Lim, SingHealth, Singapore (Presenter)
- Joseph Li, SingHealth, Singapore
- Choon Pooh Heng, SingHealth, Singapore

ABSTRACT

Background: HOs/PGY1s rotate through 3 x 4-monthly postings to the departments of Internal Medicine (compulsory), General Surgery and/or Orthopedics (1 compulsory surgical posting), O&G or Pediatrics. We experience fluctuation in number of PGY1s allocated to various departments throughout the academic year 2017. We aimed to elucidate factors that influence HOs/PGY1s training satisfaction to further improve our training program.

Summary of Work: A standardized HO/PGY1 rotation evaluation form with 50 questions was administered to all HOs/PGY1s through an online learning management system (New Innovations) at the end of their postings between May 2017 and June 2018. The evaluation form assessed factors such as duty hours, faculty supervision and education activities. Rotation evaluation results across training institutes and disciplines were compared. The data was analyzed using IBM SPSS Statistics software.

Summary of Results: 406 PGY1s responded to the evaluation. We found that there were no differences in the PGY1 posting evaluation results between HOs/PGY1s who graduated from local medical schools and those who graduated from overseas medical schools, as well as between HOs/PGY1s who were rotated in the same Sponsoring Institute for the entire PGY1 year and those who had rotations in other Sponsoring Institutes. The satisfaction level of Discipline D (anonymized discipline) from Training Institute 3 (anonymized Institute) was significantly lower than Discipline D in Training Institute 1 (anonymized Institute).

Discussion and Conclusions: The data shows that the HOs/PGY1s were less satisfied with their posting experience in their 3rd posting compared to their 1st posting. The satisfaction level of Discipline D from Training Institute 3 was significantly lower than Discipline D in Training Institute 1. A focus group discussion has been scheduled to identify the differences between Training Institute 1 and Training Institute 3. We will remove the rotation evaluation forms question 10 and 11 from future studies, as they are not significant.

Take-home Messages: We need to identify the factors that caused the satisfaction level of Discipline D from Training Institute 3 to be significantly lower than Discipline D in Training Institute 1, so as to further improve our training program.

Singapore Neuroimmunology Rounds - developing a Community of Practice for education and improved management of neuroimmune disorders

AUTHOR(S):

- **Simon Ling, KK Women's & Children's Hospital, Singapore (Presenter)**
- Sing Yee Hoh, KK Womens & Childrens Hospital, Singapore
- Kevin Tan, National Neuroscience Institute, Singapore
- Janis Tye, National Neuroscience Institute, Singapore
- Amy Quek, National University Hospital, Singapore
- Derek Soon, National University Hospital, Singapore

ABSTRACT

Background: A Community of Practice (CoP) is a group of people who share a concern or a passion for something they do and learn how to do it better as they interact regularly (Beverly & Etienne Wenger-Trayner.) This aptly describes a group of Singaporean neurologists and nurses who started with ad hoc neuroimmune case discussions and decided to continue meeting up.

Summary of Work: Objective: To describe Singapore Neuroimmunology Rounds as a community of practice and its benefits to treatment, education and collaboration. Methods: Descriptive analysis of our experience with the evolution and development of the Singapore Neuroimmunology Rounds.

Summary of Results: Rounds have been occurring every two months since end 2013. These were initially informal case discussions involving a few neurologists. Since then they have evolved to organised grand rounds, rotating between 5 specialist hospitals. Average group attendance now is 15-20 people with paediatric and adult neurologists, trainees, nurses and ophthalmologists represented. Cases include but are not limited to multiple sclerosis (MS), neuromyelitis optica (NMO) and autoimmune encephalitis.

Discussion and Conclusions: Benefits of CoP have included tackling complex diagnostic and management cases with collective group wisdom, sharing patient safety and treatment protocols. Interprofessional education opportunities spawned naturally - eg neuroscience nurse-led education meetings. Innovations in practice have been shared such as MS care quality and addressing fatigue in NMO and MS. Peer review has evolved into best practice as a Community. Just as Wenger describes, we continue growing as a Community of Practice - this group of people who share a passion for neuroimmunology and are learning how to do it better as we interact regularly.

Take-home Messages: For complex, multi-discipline neuroimmune disorders, a Community of Practice is a very good model for enhancing education Combining deliberate organisation and spontaneous growth is the most beneficial A community of practice fosters interprofessional education.

An evaluation of an introductory integrated clerkship in a new medical college in the Middle East: What are the perceived barriers to clinical learning?

AUTHOR(S):

- Alison Carr, Qatar University College of Medicine, Qatar (Presenter)
- Ayad Al-Moslih, Qatar University, Qatar
- Tanya Kane, Qatar University, Qatar
- Suhad Daher-Nashif, Qatar University, Qatar
- Banan Al Arab, Qatar University, Qatar
- Suzannah Hart, Qatar University, Qatar

ABSTRACT

Background: In 2019 our first cohort of 46 medical students entered an integrated introductory clerkship in medicine and surgery in 2 district general hospitals in year 4 of a 6 year program. Neither hospital has previously regularly taught medical students. The clerkship was designed to gain familiarity with the hospital setting and services for patients and encourage students to clerk and learn from patients. In preparation for clinical care, students attended regular clinical placements (2-3 hours) in the primary health centres since year 2 and completed a weekly comprehensive clinical skills program.

Summary of Work: To better understand challenges faced on embarking on clinical experiential learning in hospital placements, we performed a detailed evaluation (questionnaire and focus groups) early (two weeks after introducing the clerkships) and at the end of the 14 week clerkships. We surveyed students about the perceived barriers to clinical learning in the hospital setting.

Summary of Results: A preliminary early evaluation completed by 24/46 students to date showed placements support learning about clinical care, multidisciplinary teams, the management of common clinical problems and ethical and professional dilemmas. 67%, 54% and 67% felt hospital placements had already improved their history taking, physical examination and clinical reasoning skills respectively. Preliminary results indicate the main perceived barriers to learning about clinical care were: Doctors too busy to teach (54%); doctors not seeming interested in students' learning needs (33%), a lack of understanding of clinical medicine at this stage (63%); and learning outcomes being unclear (83%). In addition, 63% reported at least one of shyness, embarrassment in talking to patients, lack of assertiveness at gaining learning opportunities and/or preferring to learn from doctors.

Discussion and Conclusions: Early feedback on hospital clinical placements in a new medical program is useful to allow proactive input into improving hospital clinical experience as the program evolves. We have identified early that students' personal qualities and perceptions are additional important areas requiring support.

Take-home Messages: Introducing a clerkship in a new medical program in the Middle East requires attention to the core elements and support for students transitioning into learning in the clinical environment.

A Study on the Value of Clinical Attachments in Enhancing the Competency of Medics

AUTHOR(S):

- Daphne Aik Gi Tan, Singapore Armed Forces Medical Training Institute, Singapore (Presenter)
- Kaihui Colin Tan, Singapore Armed Forces Medical Training Institute, Singapore

ABSTRACT

Background: A pilot quasi-experimental study was conducted by the Singapore Armed Forces Medical Training Institute (SMTI) to examine the value of cross-attachment of Emergency Medical Technicians (EMTs) to the National Emergency Ambulance Service (EAS) operated by the Singapore Civil Defence Force. As EMTs do not undergo clinical attachments during the course of their training, this study serves to elicit the value of such unstructured clinical attachments in enhancing the clinical competency of medics.

Summary of Work: 10 EMTs (treatment group) who recently completed their training in SMTI were selected to participate in a 12-week on-job-training attachment to the National EAS, where they will function as part of the ambulance crew. A further 10 medics (control group) were matched to the treatment group and underwent routine deployment in military medical centres over the same period. All participants underwent the same pre- and post-attachment tests consisting of a theory test, a medical emergency practical test and a trauma emergency practical test designed specifically for the study. They were also provided with a logbook to record the number and type of cases encountered during their attachment. Data was analysed using statistical techniques.

Summary of Results: Pre-attachment scores between the two groups showed no significant differences, which demonstrated adequate matching. At the end of the study period, the treatment group performed significantly better than the control group in the trauma emergency practical test ($p=.014$) and medical emergency practical test ($p=.030$). The control group demonstrated no significant differences in test results at the end of the study period. The study also revealed that the treatment group was exposed to a significantly larger number of cases during the study period ($p=.00018$).

Discussion and Conclusions: This study indicates that the attachment programme significantly contributes to the EMTs performance in emergency scenarios. Further experimental research with a larger sample size and randomized selection design would be essential to provide more insights. Regardless, the study provides strong justification for clinical attachments to be included as part of the EMT's training, and is an excellent example of evidence-based policy decision-making applied in the military medicine context.

Take-home Messages: Clinical attachments expose trainees to various emergency scenarios and therefore, optimise their clinical performance.

Challenges of designing and implementing teaching rounds in the emergency department: A survey of Chinese Emergency Medicine attending physicians

AUTHOR(S):

- Di Shi, Peking Union Medical College Hospital, China (Presenter)
- Jihai Liu, Department of Emergency Medicine, Peking Union Medical College Hospital, China
- Jiangshan Wang, Department of Emergency Medicine, Peking Union Medical College Hospital, China
- Li Li, ShenZhen Municipal Health Commission, China

ABSTRACT

Background: Teaching round (TR) faces significant challenges in the emergency room (ER) due to the unique clinical environment and patient case mix. This study aimed to evaluate the confidence level and perceived challenges of emergency medicine (EM) attending physicians when designing and implementing TR in the ER.

Summary of Work: We distributed a pre-course survey to a cohort of EM attending physicians who enrolled in an educational TR workshop in the Peking Union Medical College Hospital (PUMCH). We examined consent participants of their confidence/perceived challenges in designing/conducting ER TR, and by baseline characteristics. We presented categorical measures in raw counts and percentages with the Fisher's exact test used for statistical significance test.

Summary of Results: The workshop enrolled 64 EM attending physicians (30 hospitals) interested in improving bedside TR. 60/64 provided answers to the pre-course survey, with 88% from third-tier centers, 65% being age 36 or above, 50% female, 37% senior. Most physicians saw the benefit of TR for trainees (75%), however, less saw the benefit for patients (53%). Although most physicians had experienced TR as trainees (85%) or instructors/co-instructors (72%), only 33% had designed or felt confident in designing TR (17%). Top three frequently identified challenges were lack of formal training in design (63%), followed by lack of trainee participation (43%), and conflict with clinical work (32%). Senior physicians were more confident in designing and implementing TR than young and junior colleagues, and they had different perceived challenges in TR. However, we did not achieve statistical significance.

Discussion and Conclusions: Our survey has quantitatively evaluated Chinese EM attending physicians regarding the perceived value, challenges and confidence in design/conduct TR in EM. We identified the large knowledge gap in designing effective TR, and the commonly shared concern over TR's conflict with clinical work and lack of benefit for patients.

Take-home Messages: Most EM attending physicians in China are not equipped with the knowledge to design effective TR. While most of them see the great value of TR, they are also aware of the negative impact of TR on clinical work and patient benefit.

Evaluation of bedside teaching programme in surgical clerkship

AUTHOR(S):

- Samanchit Samakprakhon, Sunpasitthiprasong Hospital, Thailand (Presenter)

ABSTRACT

Background: Bedside teaching is an important means to enhance student's clinical experience as well as psychosomatic skills. Group size and scenario learned are key success factors. There was a change in teaching ward round in the last 4 years, and this needed to be evaluated.

Summary of Work: In 2013-14, student morning ward rounds were carried out in a group of 14-16 4th year students led by a single instructor, while in 2015-16 word rounds were co-instructed by four different instructors on different rotation and a ward round group were reduced to four students. At the end of the clinical clerkship, the students assessed by MCQ and OSCE. We compared the MCQ/ OSCE scores between the students receiving different methods of teaching word round using Mann-Whitney-U test.

Summary of Results: There were 32 and 29 4th year students in Years 2013-14 and 2015-16 respectively. The two cohorts had comparable GPA. The mean MCQ score significantly increased from 89.43 to 93.03 ($p=0.01$), while OSCE scores were not changed ($p=0.31$)

Discussion and Conclusions: Small group and exposure to different patients' conditions under supervision of different instructors helped enhance learning outcomes. Additionally, actively educating instructor is an importance factor of effectively bed side teaching and providing practical essential to the students.

Ward Round: Education Time or Punishment?

AUTHOR(S):

- Amy Woods, St George's University Hospitals NHS Foundation Trust, UK (Presenter)
- Holly Emms, St George's Hospital, UK

ABSTRACT

Background: Ward round attendance is a fundamental part of a student's clinical experience and offers an abundance of learning opportunities. Despite being a ubiquitous part of clinical life, these learning opportunities are not always accessed, with students often remaining passive observers. Additionally, doctors have to complete a clinically safe ward round whilst also attempting to teach, often without any formal teaching training.

Summary of Work: We surveyed 77 undergraduate students and 50 junior doctors about their experiences of teaching on ward rounds. Based on these results we designed a unique 7-point learning tool: 'The Ward Round Dissected' asking students to consider and reflect on aspects such as important diagnoses, interpreting investigations and ethico-legal issues that they may encounter. Students are given the tool at the start of the round and asked to use it for critical observation and reflection with a short follow-up session led by a doctor after the round.

Summary of Results: Over a fifth (21%) of students described ward rounds as 'not valuable' and only 2% described them as 'very interesting', with over a quarter describing them as 'not at all interesting'. When asked which words best describe their feelings about ward rounds: 72% said tedious and only 35% described them as educational and 15% as engaging. Nearly three-quarters (72%) of students felt their experience would improve if they were allocated a task and 25% felt a learning tool would be helpful. For doctors the biggest barriers to giving teaching were 'workload' and 'difficulty structuring'. When given our tool to use during ward round students and doctors gave positive feedback in terms of improved interest, usefulness and engagement.

Discussion and Conclusions: It is clear there are significant barriers to teaching and our results are damning in their view of ward rounds as a learning opportunity currently. Our tool structures ward round teaching in the face of high doctor workloads and can help promote both self-directed learning and reflective practice by students. It helps students consider oft-overlooked areas, such as ethico-legal, communication and teamwork factors; giving them a framework for critical analysis and thereby helping them consolidate theory into practice.

Take-home Messages: Isn't it time you dissected your ward round?

Empathy Self-Assessment is Not Enough: Physicians and Students Can Benefit from Patients' Perspectives to Grow

AUTHOR(S):

- **Monica Bernardo, School of Medical Sciences, University of Campinas, Campinas, São Paulo, Brazil (Presenter)**
- Dario Cecilio-Fernandes, Center for Education Development and Research University Medical Center Groningen, Brazil
- Alba R. A. Lima, Medical Faculty of São Jose do Rio Preto, São Jose do Rio Preto, São Paulo, Brazil
- Hugo D. Ceccato, School of Medical Sciences, University of Campinas, Campinas, São Paulo, Brazil
- Manuel João Costa, Life and Health Sciences Research Institute, School of Health Sciences, University of Minho, Braga, Portugal
- Marco A. Carvalho-Filho, School of Medical Sciences, University of Campinas/University of Groningen, Brazil

ABSTRACT

Background: Physician empathy is crucial for patient care, impacting patients' satisfaction and outcomes. Empathy enhances professional fulfillment, diminishes physicians' burnout, and contributes to medical students' clinical competence. Modern medicine may change medical practice. Undergraduate medical curricula should provide learning opportunities to nurture student empathy towards patients. Studies rely mostly on self-assessment instruments, which may not reflect the reality. Perhaps, the key to improving empathy in professional caregiver is to include the patient's perspective as an educator. Few studies have chosen this type of analysis.

Summary of Work: Objectives: Investigate the relationship of relationship in training empathy self-assessment compared with the evaluation of the medical empathy assessed by their corresponding patients. Analyze possible factors that may influence medical evaluations by patients. Correlate two psychometric scales in order to measure to from the patients perspective. Methodology: Multicenter observational study involving 566 outpatients and 89 senior medical students and residents in ambulatory care settings of various specialties from three universities. Patients completed the following scales: Consultation and Relational Empathy scale (CARE) and a Portuguese Validated version Jefferson Scale of Patients Perceptions of Physician Empathy (JSPPPE). The physicians in training answered the Jefferson Scale of Physician Empathy (JSE), International Reactivity Index (IRI). Pearson correlation, confirmatory factor analysis, and Cronbach alpha were conducted to correlate physicians and patient's scales, and analyze the validity and reliability of the scales, respectively.

Summary of Results: There was no significant correlation between patients' measures with students and residents self-assessment, except for a weak correlation (0,241, $p < 0.01$) between the JSPPPE score and the JSE Compassionate Care sub-score. Medical students demonstrated higher levels of empathy than residents in both self-assessment and patients' measures. CARE and JSPPPE scales proved to be valid and reliable instruments. Female gender showed higher empathy's score.

Discussion and Conclusions: This study demonstrated a mismatch between physicians in training empathy self-assessment and their patients' assessments. This finding may have two implications: (1) patients' instruments may be measuring a different component of empathy, and (2) the self-assessment of empathy probably is not enough to foster more humanistic patient care. This information may result in new educational strategies.

Take-home Messages: Patients perception may be a goal to educational strategies in patient care.

Cancer Survivors as Educators in the Middle East: A Medical Student-Authored Narrative Medicine Educational Book

AUTHOR(S):

- Alan Weber, Weill Cornell Medicine Qatar (Presenter)
- Abdulrahman Abdulmalek, WCM-Q, Qatar
- Hanof Ahmed, WCM-Q, Qatar
- Mountasir Eltohami, WCM-Q, Qatar
- Sulaiman Alshakhs, WCM-Q, Qatar

ABSTRACT

Background: Health Humanities and Narrative Medicine researchers suggest that patient stories may be valuable in medical education to teach the social determinants of health and the patient point-of-view.

Summary of Work: The research employed mixed-methods (questionnaire, audiotaped interviews) to measure student learning from a narrative medicine service-learning project in which medical students in the State of Qatar interviewed persons living with cancer and wrote patient stories for a peer-peer educational book published by the Qatar Cancer Society.

Summary of Results: Students contributed an average of 7.5 hours to the project with less than 1 hour previously spent with patients. This was the first cancer patient encounter for 80.0% of the students. 60.0% of students agreed and 20.0% strongly agreed that the experience changed their view of cancer patients. 80.0% of students strongly agreed, and 20.0% agreed that service learning should be incorporated into medical education.

Discussion and Conclusions: The following representative themes were identified through Grounded Theory analysis (9 total themes identified) using NVivo 11.0 qualitative analysis software, summarizing the student learning: 1. cancer in the Qatari community: 'I learned that cancer affects the community as a whole, that it commonly affects the mothers, fathers, the grand parents, and care givers...there are still the remnants of distress caused by the disease whether that is psychological, social or financial.' 2. contribution to the patient and society: 'The patient told me that he wanted to share his story and he thought this booklet was a great idea because he wanted other people to realize that it isnt the end of the world if theyre diagnosed with cancer.' 3. attitudes to cancer in Qatar: 'I understand that in [this] culture people are afraid to even mention the term - I think her family didn't really understand': at one point she had to remove her uterus, and they said, 'what do you mean, how are you going to get married in the future?'"

Take-home Messages: The results suggest that both narrative medicine and service-learning may be valuable in medical school elective courses for students to contribute to the community and to teach them about the patient-perspective-of-disease and social determinants of health, establishing trust and empathy with patients.

Integrated family-centeredness questions into acute inpatient care report writing during pediatric rotation: Can this enhance holistic mind in medical students?

AUTHOR(S):

- Noppawan Pongsopa, Pediatric Department, Thailand (Presenter)
- Arunee Tipwong, Family-Medicine Department, Thailand

ABSTRACT

Background: Suratthani Medical Education Center has been promoting the faculty staffs to emphasize medical students on holistic care. Nevertheless, the setting of overcrowded service-based practices causes the faculty staffs facing challenges to achieve the desirable teaching environment for this task. This study aimed to evaluate the students' attitudes on holistic care after been assigned to fill a family-oriented form in their report writing during pediatric rotation.

Summary of Work: A one-page family approach form was created and implemented in report writing of twelve 4th and 5th year medical students during their pediatric rotation, November - December, 2018. A mixed-method study using questionnaire and focus group interviewing was conducted to evaluate the tools.

Summary of Results: All 12 students affirmed that writing acute care report using this tool could promote their ideas of holistic care. Some students reflected their deep understanding of how acute ill children can effect on the family. One student said 'when the child is sick, the family is also sick.' The students reported three factors they thought that could effect on pediatric care which were caregiver, home environment, and socioeconomic status at 58.3%, 25% and 16.7% respectively. The fifth-year students could determine and fill-in holistic information better than the forth-year. All interviewees suggested on integrating holistic approach into bedside teaching and case conference, 83.3% and 16.7% respectively. They also suggested on adding this idea in all rotations.

Discussion and Conclusions: Socioeconomic status was rated as less effect on patient care may due to the Thai universal health coverage campaign for children age 0 - 12. Fifth-year medical students have better holistic approach than the fourth-year that probably because of their previous experiences in family medicine rotation which already enhanced them on holistic mind. Integrating one-page family-oriented form into acute care report writing could help enhance holistic mind in medical students. Implementing the tool in all clinical rotations could be beneficial.

Take-home Messages: Continuing use of family-oriented form is needed to enhance medical students' holistic mind.

Patients as educators: What we can learn from the patient--An amazing story from a multiple sclerosis patient

AUTHOR(S):

- **Min-Huei Hsu, Taipei Medical University, Taiwan (Presenter)**
- Ju-Chuan Yen, Department of Ophthalmology, Department of Teaching and Research, Ren-Ai Branch Taipei City Hospital, Taiwan

ABSTRACT

Background: Reflective medicine or narrative medicine or an oral history of the patient is a form to honor the patient through their oral presentation of their illness life story pertaining to their sufferings to help us to understand the whole picture of the sickness landscapes that taking up the patient, and it was believed to help the patient's and physician's resilience as well. Based on this theory, a storytelling of a multiple sclerosis patient first presenting as acute left optic neuritis twenty-seven years ago in Taiwan was revealed in a chronicle.

Summary of Work: After the attainment of this patient's consent, an in-depth interview with audio recording was done and was transcribed into verbatim accordingly. Grounded theory was used to develop the themes of this interview verbatim.

Summary of Results: Themes surfaced after practice of grounded theory, which were 'how Chinese culture forged decision of 'delayed treatment of total loss of left vision for five days', 'what were rationales behind treatment decision discrepancy between kinships', 'what were real impacts of the disease', 'how resilience built in patients and physicians' and 'how trust built on this relationship'.

Discussion and Conclusions: Through her storytelling, we have learned a lot; not only the physical sufferings but also from the cultural, psychological perspectives of the illness. How the traditional Chinese culture has forged the patient's mental status and even helped to build the resilience in an astonishing way was disclosed in a narrative. And hopefully, this narrative will help us better understand what and how the patient was suffering and how she recovered physically, mentally and socially later; in this way, what we have learnt from her will be applied to our daily practices and also help us and the patient to be resilient while facing the patients' sufferings.

Take-home Messages: This narrative helped us understand what the disease landscape has been for a multiple sclerosis with presentation of acute left retro-bulbar optic neuritis based on a psycho-physic-social context. It would lead us to learn authentic patients' perspectives, further quality of care and better help patients and physicians in clinical practice.

Patient opinion towards clerkship student involvement in patient care and building a long-term relationship with students: a preliminary result in a hospital in Korea

AUTHOR(S):

- Cheol Woong Jung, Korea University College of Medicine, Korea (Presenter)
- Young-Mee Lee, Korea University College of Medicine, Korea

ABSTRACT

Background: The longitudinal integrated clerkship (LIC) has been adopted many medical schools to overcome the limitation of traditional block clerkship rotation and to achieve 'continuity' of patient care. However, LIC has not been widely adopted in Asian countries. To successful implementation of LIC, patient participation is crucial. However, patient's reluctance to be seen by students or junior doctors has been increasing in Korea. This trend hinders the adoption of novel program which requires patient engagement such as LIC.

Summary of Work: The authors conducted a survey to investigate patient opinion towards students' involvement in patient care and building a long-term relationship with student. Thirty-six kidney transplant patients who had previous hospitalization with long-term disease history were participated.

Summary of Results: Mean duration of having diagnosed as chronic kidney disease was 182.0 ± 110.6 months. Surprisingly, 30.6% of respondents did not know that medical students were training at the authors' hospital and 88.9% had never been interviewed or examined by a medical student. 41.7% of patients showed negative responses to the practice of medical students. However, 25 patients (69.4%) agreed that medical student participate in their care for a long period time. 16 patients (44.4%) thought that medical students would not be helpful in taking care of their disease.

Discussion and Conclusions: Compared with previous studies in Western countries, a fair number of patients in this study hold less favorable attitudes towards the practice by medical students. This might be explained that patients rarely contacted with medical students and thought medical education was completely independent from their care. We should make an effort to persuade patients that one of important roles of university hospital is 'teaching and training' to cultivate future doctors and for to do this, patient participation is crucial. Based on this preliminary survey, the authors will conduct a further study to explore how we can encourage patient willingness to meet medical students and what should be prepared in advance for building a long-term relationship between patients and students.

Take-home Messages: In order to overcome the negative patient perception towards students' involvement in patient care and to make favorable atmosphere to LIC, medical educators should listen to patients' voices and identify their needs.

An effective patient as educator initiative to reduce stigmatizing attitudes towards mental illness among medical students

AUTHOR(S):

- **Beatriz Atienza Carbonell, University of Valencia Medical School, Spain (Presenter)**
- Helena Hernández-Évole, University of Valencia Medical School, Spain
- Vicent Balanzà -Martínez, University of Valencia Medical School, Spain

ABSTRACT

Background: Despite recent studies suggesting improved negative attitudes toward the mental ill among the general population, growing evidence supports that stigma remains among clinicians, whereas fewer studies have focused on medical students. A positive attitude towards mental illness among future clinicians is desirable as it may impact on their professional attitudes and provision of healthcare.

Summary of Work: A pre-post, online survey was conducted to evaluate the efficacy of a 'patient as educator' intervention to reduce attitudes and degree of stigma towards mental illness among pre-graduate students. All second-year students were invited to complete the CAMI, RIBS and MAKs questionnaires before and after taking the Psychological Medicine module. During the semester, a subgroup of students was invited to attend a workshop led by two patients and a peer student suffering from mental illnesses. Participation was voluntary and responses were anonymized.

Summary of Results: From a total population of 296 students, 254 and 154 completed the survey before and after the module (response rates = 85.8% and 52.02%, respectively). From the study sample (n=154 respondents), 24 students attended the workshop. After the intervention, participants attending the workshop significantly improved in the social restrictiveness, benevolence and authoritarianism attitudes. However, students taking the module (n=130) significantly improved only in the authoritarianism attitudes. Both groups showed an improvement in their willingness to live with someone suffering from a mental illness and in supporting the statement that mental illness is like any other disease.

Discussion and Conclusions: Overall, the results of the Patient as Educator intervention suggest that formal and goal-directed activities including direct contact with patients with a mental illness have a great potential to reduce medical students' stigmatizing attitudes on top of formal medical education.

Take-home Messages: Student and patient engagement activities shown to be a key factor in anti-stigma preventative efforts. Implementation of Patient as Educator workshops throughout the medical curriculum may directly improve the attitudes of future healthcare professionals.

Pooled Patients' Clinical Data as a Transformative Agent

AUTHOR(S):

- Thammasorn Jeeraaumponwat, Medical Education Center, Khon Kaen Hospital, Thailand
(Presenter)

ABSTRACT

Background: Real patients, as well as simulated and standardized patients, participating as teachers, have important educational benefits for medical students. Engaging the students with evidence from the patients' pooled data set from research can generate new insights as a transformative agent for integrated learning. This study aimed to evaluate students' learning experiences through pooled clinical data.

Summary of Work: Ten fifth-year medical students in the 4-week research and evidence-based medicine course using pool patients' clinical data set from a tuberculosis clinical research involving more than 5000 patient records and 100 variables were asked to participate in the focused group discussion using semi-structured interview list. Emerging themes were collected using thematic analysis.

Summary of Results: The thematic analysis process that was employed to the transcripts evoked key concepts that were evident in the data. These themes were observed as crucial of all participants. These categories included 'Variety of Clinical Encounters', 'Data Aid Decision Making', 'Pool Data as an Encyclopedia', and 'Competency Reflection.' Our results highlight the connection between themes. The findings also support the concept of early exposure of medical students to clinical research to learn clinical encounter through the pooled clinical data set.

Discussion and Conclusions: Pooled patients' clinical data can be used as a transformative agent for integrated learning of clinical encounter in the undergraduate. However, the orientation of the data set is required especially where time is limited.

Take-home Messages: Not only individual patient encounter but the pooled patients' clinical data also have a teaching role in the medical curriculum.

Fostering patient-centeredness by following patients outside the clinical setting: an interview study

AUTHOR(S):

- Charlotte Eijkelboom, UMC Utrecht, The Netherlands (Presenter)
- Christel Grau Canét-Wittkamp, University Medical Center Utrecht, The Netherlands
- Dorien Zwart, University Medical Center Utrecht, The Netherlands
- Saskia Mol, University Medical Center Utrecht, The Netherlands
- Esther de Groot, University Medical Center Utrecht, The Netherlands

ABSTRACT

Background: Patient-centeredness is considered a core competency for health professionals. To support faculty in designing interventions focused on patient-centeredness, an understanding about how educational interventions lead to patient-centeredness is required. This study aims to understand how learning mechanisms, which potentially contribute to patient-centeredness, are triggered.

Summary of Work: Thirty-five third year medical students at the UMC Utrecht followed four different patients for three years. The intervention took place in an out-of-hospital setting, students visited patients at their homes. Twelve students were interviewed. The realist approach was used to construct CIMO-configurations, in order to relate components of the intervention to context and learning mechanisms.

Summary of Results: Our data suggest that following patients in their personal environment for a prolonged period supports the development of meaningful relationships between students and patients. Furthermore, following patients for a prolonged time provided continuity. In the context of a meaningful relationship and continuity learning mechanisms related to patient-centeredness were triggered. The most important learning mechanisms found in this study were: reflecting, contextualizing disease with life stories, broadening perspective and engagement with patients.

Discussion and Conclusions: In an educational intervention which supports continuity and the development of meaningful relationships, learning mechanisms related to patient-centeredness were triggered. In former studies, meaningful relationships between students and patients were seen as an outcome for patient-centeredness. In addition, we suggest that valuable student-patient relationships provide a context which fosters learning, and therefore are an important enabler for the development of patient-centeredness in medical students.

Take-home Messages: Continuity and meaningful relationships between students and patients contribute to the development of students' patient-centeredness. Therefore, we advise faculty to design educational interventions which provide continuity and enables students and patients to build meaningful relationships.

Set and Setting in Ketamine Therapy: A Patient's Tips for Providers and Students

AUTHOR(S):

- Ronan Hallowell, Keck School of Medicine of the University of Southern California, USA
(Presenter)

ABSTRACT

Background: Ketamine was approved for use as an anesthetic in the USA in 1970. In the past 20 years it has been studied as a treatment for refractory pain and treatment-resistant depression. Over the past several years hundreds of off-label ketamine clinics have opened in the USA, including some university medical centers. Ketamine clinics also operate in Mexico, Canada, New Zealand, Spain, Switzerland, Germany, and the UK. Although controversy still surrounds the long-term efficacy and safety of ketamine therapy, its salutary effects for many patients who have not been able to find relief by other means justifies its availability in addition to demanding on-going research on both the pharmacological and extra-pharmacological considerations germane to its safe and effective use. At sub-anesthetic doses ketamine can have dissociative and psychedelic effects. For some, these are unwanted side-effects to be mitigated while for others they can be an essential part of effective treatment. Regardless, it is important for providers to be sensitive to the unique effects of ketamine and how to work with patients to provide a safe and caring environment. Drawing on the author's own experience of dozens of ketamine treatments for depression, his work as a medical educator & 20 years of research on indigenous cultures uses of psychedelics, he provides tips for providers and students on how to work with patients to develop an optimal set and setting for treatment.

Summary of Work: This work presents autoethnographic data collected by the author from ten IV infusions of ketamine for treatment-resistant depression over a six-week period in early 2019 at a hospital in California.

Summary of Results: Clear communication with the physician around the treatment plan and protocol is crucial for building trust and smooth functioning of sessions. Nurses should receive training related to dealing with patients experiencing non-ordinary states of consciousness. The setting should be as calm, private and aesthetically pleasing as possible.

Discussion and Conclusions: Caring communication and sensitivity to the patient's delicate state can make a significant positive impact on the patient's experience.

Take-home Messages: Clinicians understanding of the psychotherapeutic potential of psychedelic experiences can help patients leverage extra-pharmacological benefits of treatment, whereas a negative attitude can have deleterious effects.

Let's ask the patient - development of a questionnaire for patient's feedback in medical education

AUTHOR(S):

- Karin Björklund, Department of Neurobiology, Care Sciences and Society, NVS, Karolinska Institutet, Stockholm, Sweden (Presenter)
- Terese Stenfors, Department of Learning, Informatics, Management and Ethics (LIME), C7, Karolinska Institutet, Sweden
- Gunnar Nilsson, Department of Neurobiology, Care Sciences and Society, NVS, Karolinska Institutet, Sweden
- Charlotte Leanderson, Department of Neurobiology, Care Sciences and Society, NVS, Karolinska Institutet, Sweden

ABSTRACT

Background: Ability to apply patient-centeredness throughout a patient encounter, and to adequately communicate, are important skills for medical students to develop. Today, feedback regarding patient-centeredness is often provided by a clinical teacher. Patients are rarely asked to provide feedback to students. One way for patients to provide feedback to students is by a questionnaire. There is however a lack of validated questionnaire designed for written patient feedback in medical education. The aim of this study was to develop a feedback questionnaire for patient's feedback to medical students, adjacent to a clinical encounter.

Summary of Work: The development and validation process of the patient feedback questionnaire follows the CONSORT checklist using a social constructivist framework. The items were developed in alignment with learning outcomes for the medical programme at Karolinska Institutet, and validated through interviews with 65 patients, 22 students at various stages in medical education, eight clinical supervisors and clinical teachers. Further, 256 patients gave 86 students feedback, using the questionnaire. Data was analysed by thematic content analysis and psychometric methods to analyze the outcomes and construct of the questionnaire. Exploratory factor analysis in the framework of confirmatory factor analysis were used to assess internal validity. Cronbach alpha were used to test reliability of the items in construct of the final factor model.

Summary of Results: The internal consistency was high, constructing two domains and 19 items. The items experienced included relevant areas for feedback. The student's experiences indicates that the questionnaire provides feedback that facilitates the student's ability to identify learning gaps within the field of communication and patient-centeredness.

Discussion and Conclusions: Discussion: The result shows that the items are valid, reliable and internally consistent in the construct of the questionnaire. The questionnaire provides patient opportunities for concrete and direct feedback, and help students in clarifying their competency-level regarding ability to communicate and apply patient-centeredness. Conclusions: The questionnaire is a valid, reliable and internally consistent questionnaire for patient's feedback to students in medical education.

Take-home Messages: The questionnaire is a promising learning tool in order to facilitate medical student's development of communication skills and patient-centeredness.

A patient involvement programme toward interprofessional approach in fourth year medical students before clinical training

AUTHOR(S):

- **Mina Suematsu, Nagoya Graduate School of Medicine, Japan (Presenter)**
- Noriyuki Takahashi, Education for Community-Oriented Medicine, Nagoya University Graduate School of Medicine, Japan
- Kentaro Okazaki, Education for Community-Oriented Medicine, Nagoya University Graduate School of Medicine, Japan
- Keiko Abe, Critical Care Nursing, Aichi Medical University, Japan
- Masafumi Kuzuya, Department of Community Health and Geriatrics, Nagoya University Graduate School of Medicine, Japan

ABSTRACT

Background: Patient involvement in medical education has recognised as effective ways for understanding patients' perspectives globally. However, in Japan few programmes with real patients were reported before clinical training, especially patients as educators. Then, we implemented a new programme which was involved a patient with Parkinson disease (PD) and retired expert on communication. The aim of this study was to explore what medical students could learn from the programme.

Summary of Work: Subjects were 238 fourth year medical students participated in this programme in 2017 and 2018. They divided into small groups consisted of 7 or 8 students. The programme included two sessions. Firstly, they role-played as five healthcare professionals (medical doctor, pharmacist, nurse, care manager and physical therapist) to make their care plan for the patient with PD. Secondly, they explained their care plans to the patient and got the feedback immediately. After that, we asked them three basic questions, scoring on a five-point Likert scale, and their reflection from this programme.

Summary of Results: The response rate of questions was 61.8%. The mean score (\pm SD) of three questions were $4.6(\pm 0.7)$, $4.5(\pm 0.8)$ and $4.5(\pm 0.8)$ respectively. Their reflection was 'Happy to hear the story from both the perspectives of an educator dedicated to communication and a patient.' 'Surprised that medical doctor grasped little information and should discuss the other healthcare professionals.' 'First experience to see tremor.' and etc.

Discussion and Conclusions: Although this programme was a pilot, almost all medical students answered the programme was useful to know the patients perspective and the importance of cooperation with the other professionals. Additionally, the students were aware of their respect for the patient, and could understand easily how difficult the patient felt in his life, nevertheless the patient in this programme was also the expert on communication.

Take-home Messages: A successful patient involvement programme could lead medical students to respect patients and should be implemented repeatedly before clinical training.

Clinical Education in Outpatient Settings: The Patient as a Teacher

AUTHOR(S):

- Jose Knopfholz, PUC-PR, Brazil (Presenter)
- Odenir Nadalin Junior, PUC-PR, Brazil
- Leonardo Bach Margraf, PUC-PR, Brazil
- Maira de Mayo Oliveira Nogueira Loesch, PUC-PR, Brazil
- Lidia Ana Zytinski Moura, PUC-PR, Brazil
- Caroline Ehlke Gonzaga, PUC-PR, Brazil

ABSTRACT

Background: The clinical teaching at a university in Curitiba (Brazil) includes lectures, simulation, case discussions, bedside teaching and supervised internship in an outpatient care clinic. Unlike most schools, in which practical clinical education is taught in a hospital environment, this course has outpatient care clinics created especially for undergraduate teaching purposes. In small groups, students attend to patients from many medical specialties under a teacher supervision.

Summary of Work: A questionnaire (n=81) with 10 multiple quantitative (1 to 5 scale) and qualitative questions was applied among students who attended those clinical activities. The aim is to look upon to the impact of the outpatient care environment on medical training, evaluating the performed activities and the acquired skills.

Summary of Results: Questionnaire results showed that the main clinical ability positively impacted by the internship in the outpatient care facilities was the communication with the patients (4.87), followed by the ability to perform anamnesis (4.73), physical examination (4.67) and physiopathological reasoning (4.4). The students pointed out that autonomy and the skills development from the contact with real patients are the strongest features among teaching-learning strategies. The impact perception about feedback on learning was 4.18. However, the teacher supervision and the quality of the feedback made by them were indicated as the points that should be improved.

Discussion and Conclusions: The practical learning at academic outpatient care settings showed up being a good resource in teaching clinical abilities, consolidating the knowledge obtained in other scenarios like traditional classrooms and simulation center. Furthermore, it helps students to develop good medical care practices, through the outpatients' wealth of signs and symptoms - what makes the patient a kind of teacher. Good behavior, respect and empathy are encouraged since the beginning of the training, what contributes to humanized care learning.

Take-home Messages: Low-complexity levels of health care are a safe place for students to improve their clinical abilities by practicing an autonomous medical health care under supervision with real patients, whom turn out to be their teachers. Therefore, it is necessary to rethink clinical education in a general way, expanding the practical learning to extra-hospital care environments.

Understanding patient perspectives of resident roles in academic family medicine

AUTHOR(S):

- Charlie Guiang, St. Michael's, University of Toronto, Canada (Presenter)
- Damian Rzeznikewicz, St. Michael's, University of Toronto, Canada
- Morgan Slater, St. Michael's, University of Toronto, Canada

ABSTRACT

Background: Reports have shown that Family Medicine residents in Ontario provide approximately 625,000 hours of care to family medicine patients yearly. However, a UBC survey showed that more than half of the respondents (55%) did not understand the role and training of resident physicians involved in their care. This study strives to better understand the ideas and perceptions of the patients seen at an Academic Family Health Team with regards to the roles of resident physicians.

Summary of Work: - Conducted a prospective study of patients in the family practice centers affiliated to St. Michael's Hospital. - Administration of surveys to eligible participants over the age of 18 who are rostered to a physician at any of the sites. - Quantitative and qualitative assessment; October 1st 2016 to February 1st 2017. 205 respondents in total.

Summary of Results: Do you feel that you understand the difference between a medical student, a resident, and an attending physician? (n=201) Yes - 73.5%
When a doctor provides you care, is it important for you to understand their level of training? (n=192) Yes - 85.4% No/Unsure - 14.6%

Do you always know the level of training of the physician who is caring for you? (n=191) Yes - 32.5% No/Unsure - 67.5%

Would you be more willing to see a resident physician if you understood his/her level of training? (n=189) Yes - 78.3% No/Unsure - 21.7%

Is a resident a medical doctor? (n=198) No/Unsure - 34.8%

Does a resident physician have a license to prescribe medication? (n=189) No/Unsure - 50.3%

Discussion and Conclusions: Considerations: - We were able to distribute a large number of surveys in a short period of time - First study of its kind at the University of Toronto - Distribution of surveys between clinics was uneven - Largely female sample - difficulty generalizing results to male patients.

Take-home Messages: Patients want to understand the level of training of care providers in academic family medicine and are more likely to engage in care with resident physicians if they do. However, patient education is often omitted from clinical encounters, contrary to patient preferences.

Personal values as predictors of medical students' empathy

AUTHOR(S):

- Maria Grazia Strepparava, University of Milano - Bicocca, Italy (Presenter)
- Stefano Ardenghi, University of Milano - Bicocca, Italy
- Giulia Rampoldi, University of Milano - Bicocca, Italy

ABSTRACT

Background: The theory of values has been shown to influence a wide range of human behaviors. However, little is known about the specific relationship between personal values and the empathetic attitude in medical students.

Summary of Work: The aim of this study was to assess personal values in a sample of Italian medical students and to clarify its relationships with empathy variables.

Summary of Results: The impact of personal values (measured by the Portrait Value Questionnaire) on empathy dimensions (measured by the Interpersonal Reactivity Index) was investigated in a convenience sample of 398 second-year students (female=207; main age=19.93, SD=1.39) from an Italian Medical School. Analyses of variance and multiple hierarchical regression models were performed with the predictive analytics software SPSS 24 for Mac. ANOVA revealed that male students scored higher in Self-Enhancement scale ($F=36.503$; $p>0.001$), while female students had higher levels of Self-Transcendence dimension ($F=12.402$; $p>0.001$). Regression models showed that Self-Transcendence had a positive contribution to Empathic Concern ($B=3.973$; $p>0.001$), while Perspective Taking was predicted by Self-Transcendence ($B=3.567$; $p>0.001$) and Self-Enhancement ($B=-0.697$; $p<0.05$), even after controlling for gender and age.

Discussion and Conclusions: Gender differences in personal values were found. Male medical students scored higher in self-promotion dimension, while female students were more disposed to transcend selfish interests. Moreover, self-transcendence value was positively related to students' tendency to adopt the point of view of others and to feel sympathy and concern for unfortunate people. On the contrary, the self-enhancement value could be a barrier to see the world from others' viewpoints.

Take-home Messages: These findings have some educational implications. Medical education should develop assessment strategies and tailored educational interventions to improve students' awareness about their own personal values since they are early predictors of medical empathy.

Does postgraduate clinical training enhance empathy and empathic communication among trainee dentists?

AUTHOR(S):

- Toshiko Yoshida, Okayama University, Japan (Presenter)
- Sho Watanabe, Okayama University Hospital, Japan
- Takayuki Kono, Okayama University Hospital, Japan
- Hiroaki Taketa, Okayama University Hospital, Japan
- Hajime Shirai, Okayama University Hospital, Japan
- Yasuhiro Torii, Okayama University Hospital, Japan

ABSTRACT

Background: Empathy in the dentist-patient relationship has positive effects on patient outcomes, such as increasing cooperative behavior and patient satisfaction. Therefore, enhancing empathy in dental education is a critical issue for delivering better care to patients. The aim of this study was to determine whether postgraduate clinical training enhances empathy and empathic communication behavior in medical interviews among trainee dentists.

Summary of Work: The study involved 31 trainee dentists and 10 simulated patients (SPs). The trainee dentists conducted initial interviews with the SPs twice, at the beginning and the end of their clinical training. They completed the Japanese version of the Jefferson Scale of Physician Empathy (JSPE) before each interview. The characteristics of the trainee dentists' verbal interactions during the interviews were analyzed using the Roter Interaction Analysis System (RIAS). We added six categories to the task-focused exchange to analyze the dental content. We calculated the percentage rates of trainees' verbal interactions for each category and then concentrated all categories into 14 larger clusters. The data were analyzed using the Wilcoxon test.

Summary of Results: No significant differences were found in the JSPE scores between the beginning and the end of clinical training. Trainee dentists at the end of training used more positive responses, gathered more dental data, had less emotional expression, less facilitative behavior, and gathered less medical data and less psychosocial data than those at the beginning of training.

Discussion and Conclusions: The trainees' unchanged self-reported empathy scores indicate that the postgraduate clinical training may not be effective in increasing their empathy. The results also suggest that the post training tends to enhance history-taking skills but not empathic communication behavior in medical interviews. A dental postgraduate clinical training program that cultivates the trainees' humanistic attitude should be developed.

Take-home Messages: A more integrative approach that bridges scientific aspects with a humanistic attitude should be applied to the postgraduate clinical training program in dentistry.

To See is to Believe - the compulsory course “Medical services to the remote area” substantiates empathy education in the real-world practice

AUTHOR(S):

- **Ling-Lang Huang, Mackay Medical College, Taiwan (Presenter)**
- Yih-Jer Wu, Mackay Medical College / Mackay Memorial Hospital, Taiwan
- Chao-Hsiung Lee, Emergency Department / Mackay Memorial Hospital, Taiwan
- Shiu-Jau Chen, Mackay Medical College / Mackay Memorial Hospital, Taiwan
- Chun-Chih Peng, Mackay Medical College / Mackay Memorial Hospital, Taiwan
- Ming-Jong Bair, Department of Internal Medicine / Taitung Mackay Memorial Hospital, Taiwan

ABSTRACT

Background: Despite adequate medical students graduated each year, the number of physicians in remote areas remains far from sufficient in Taiwan. Commiserating local people about their different needs and values towards life is the first step to initiate the motivation for remote area services. To this end, we initiate a compulsory course “Medical services to the remote area” that enables students to participate real-world medical services in Taitung, a remote county in eastern Taiwan.

Summary of Work: Year-6 medics took the course by clinical rotation to Taitung Mackay Memorial Hospital for 2 weeks, during which they participated in medical services at the hospital and several health-care stations in Taitung county. The questionnaire at the end of the course and 3 reflection reports were collected for the analysis.

Summary of Results: Totally 20 medical students already finishing the course from June to December 2018 were enrolled. From the qualitative analysis of 60 reflection reports, 3 major conclusions were drawn. First, commiserations to the difficulties in accessing medical resources: limited medical facilities (80% of students), traffic limitation (45%), poor family support (45%); second, commiserations to the differences in values towards life: the values led to different medical decisions which were beyond evidence-based medicine (85% of students). The distinct values may result from limited medical resources (55%), low financial status (30%), patient-physician relationship (25%), low educational levels (15%); third, substantiation of empathy into a motivation: 65% of students expressed their willingness to be remote area physicians.

Discussion and Conclusions: Our questionnaire results, in line with the qualitative analysis, showed that as high as 100% of students agreed or extremely agreed that the course had strengthen their empathy about social and cultural difference in patients of remote areas, and that the course had ignited their passions towards services to patients in remote areas. In agreement with our findings, around 50% of residents without experiences of services in remote area during their student time refused to join the rotation to Taitung, in contrast to none of those with.

Take-home Messages: Real-world course in remote area enables students to “see” differences from their hearts, to genuinely “believe” the value, and finally to take an action for the services.

Influences on medical students' empathy in Walailak University

AUTHOR(S):

- **Patthira Sangthong, Vachira Phuket Hospital Medical Education Center, Thailand (Presenter)**
- Krittin Manokarn, Vachira Phuket Hospital Medical Education Center, Thailand
- Withita Jangiam, Vachira Phuket Hospital Medical Education Center, Thailand

ABSTRACT

Background: Being a good doctor not only requires clinical skill, but also emotional skill. Empathy is the ability to understand and share another person's feelings and emotions. It is considered one of the essential attributes of professionalism for medical students. Sometimes patients don't want only clinical problem to be treated but sometimes they want a doctor to understand them. Our study aims to study the differences in the scores of empathy between medical students in Walailak university.

Summary of Work: The Jefferson Scale of Physician Empathy (JSPE) was translated into Thai version and administered to 240 medical students in Walailak University (1st year to 5th year) using Google forms. Questionnaires were divided into two parts. The first part was a general information which include sex, age, years, grades and illness in family members. The second part consists of 20 questions to assess skill of empathy. 202 medical students were participated in our study. The study was analyzed by SPSS (Independent-samples T test and One-way ANOVA).

Summary of Results: Mean score of empathy for medical students was 102.16. The highest score is in 2nd year medical students with the score of 105.19. The lowest is in 4th year students with the score of 99.29. Preclinical students have higher score than clinical students but not statistically significant. The statistically significant in sex which females have higher score than males ($p=0.45$) and the medical students who have the illness person in their family have higher score than those who have not ($p=0.003$).

Discussion and Conclusions: Medical students in Walailak university had high empathic level. Female medical students have higher score of empathy than male. It might be the effect of cultural expectation about gender role. Another reason is that males are portrayed as less emotional and more cognitive. Illness in family members also promotes empathy in medical students. The development of empathy should be promoted in medical students especially in male by teaching the importance of empathy to improve doctor-patient relationship.

Take-home Messages: Empathy is essential to improve doctor-patient relationship. We can promote our empathy by taking care of patient like our family members.

Empathy Assessment in Thai Medical Students: The Acceptability of Thai Translation of Jefferson Scale of Physician Empathy-Student Version

AUTHOR(S):

- **Bhumin Chotiwatanadilok, Faculty of Medicine, Srinakharinwirot University, Thailand (Presenter)**
- Krittanont Wattanavaekin, Faculty of Medicine, Srinakharinwirot University, Thailand
- Tanyamon Poomontienchai, Faculty of Medicine, Srinakharinwirot University, Thailand
- Wasin Boonnitchasin, Faculty of Medicine, Srinakharinwirot University, Thailand
- Chaiyapruk Kusumaphanyo, Department of Anaesthesiology, Faculty of Medicine, Srinakharinwirot University, Thailand
- Amarin Narkwichean, Department of Obstetrics and Gynaecology, Faculty of Medicine, Srinakharinwirot University, Thailand

ABSTRACT

Background: In medical school, students were taught that empathy is the key success in doctor-patient relationship. Many researches studies have been shown to increase patients' satisfaction, comfort, self-efficacy, and trust which in turn allow better diagnosis, shared decision making, and compliance. Yet, clinical empathy is still poorly defined and ways for its assessment remain ambiguous. In this study, we examine the psychometric properties of a Thai translation of the Jefferson Scale of Empathy and its ability to assess empathy.

Summary of Work: This cross-sectional study used Jefferson Scale of Physician Empathy-Student Version (JSPE-S) to assess 28 sampled medical students at Srinakharinwirot University. They were asked to complete JSPE-S and then to suggest additional statement that can more precisely measure their empathy.

Summary of Results: All the selected students scored more than 126 from JSPE-S. The highest empathy score was found in the second-year students, while a decline was found as academic year progresses. 64% of the students stated that JSPE-S does not accurately measure their empathy. Many suggested that some statements did not effectively reflect their empathy. Additionally, common preferred statements were suggested, such as "I believe that empathy is a skill that can be taught and improve" and "I often feel that I could have been more empathetic".

Discussion and Conclusions: The study revealed that Thai medical students viewed JSPE-S as an inaccurate instrument to measure their empathy, even though its validity and reliability was confirmed. Many of its questions were commented as ineffective and some alternative questions were suggested as better substitutes. A direct translation from the English version may had missed the nuance of empathy meaning in Thai context. A revision of Thai translation of JSPE-S is recommended to accurately determine ones' empathy.

Take-home Messages: Jefferson Scale of Physician Empathy-Student Version (JSPE-S) may not be an accurate measurement of empathy in Thai medical student. Further questioning may be required to reflect a complete evaluation in ones' empathy.

Determining Factors Influencing Empathy in Preclinical and Clinical Year Medical Students

AUTHOR(S):

- **Tanyamon Poomontienchai, Faculty of Medicine, Srinakharinwirot University, Thailand (Presenter)**
- Bhumin Chotiwatanadilok, Faculty of Medicine, Srinakharinwirot University, Thailand
- Krittanont Wattanaevaekin, Faculty of Medicine, Srinakharinwirot University, Thailand
- Yanin Tangjaroenpaisan, Faculty of Medicine, Srinakharinwirot University, Thailand
- Amarin Narkwichean, Department of Obstetrics and Gynaecology, Faculty of Medicine, Srinakharinwirot University, Thailand
- Chaiyapruk Kusumaphanyo, Department of Anaesthesiology, Faculty of Medicine, Srinakharinwirot University, Thailand

ABSTRACT

Background: Empathy is a multifactorial personality trait which is key to effective patient-physician communication. Yet, clinical empathy is still poorly defined and ways for its enhancement remain unclear. A better understanding of empathy will allow a wider diversification on ways to improve it.

Summary of Work: Average-performing students were chosen by using snowball sampling method. They are then separated into four focus group discussion. Each focus group lasted for an hour and included 7 students. A sample of 14 preclinical year and 14 clinical year medical students were enrolled. They were asked to identify factors and strategies for enhancing empathy. Through a consensus thematic analysis, three researchers independently performed qualitative analysis on the audio records and field notes to identify themes. Comparison of each themes were then examined to identify any similarities and differences.

Summary of Results: Themes from preclinical year medical students' group suggested that empathy is built through personal factors such as "experience with receiving empathy" and "parenting style" and served as dominant factors determining the degree of one's empathy. In contrast, clinical year medical students' group propose "compatible relationship between individuals" and "current mood" as key factors affecting empathy.

Discussion and Conclusions: It is repeatedly observed that empathy is often diminished as medical students academically advance. To decrease this decline, individually-tailored curricular programs to promote empathy should be considered as different factors are being valued differently. Giving empathy-related experiences and emphasizing on the role of attentive advisors are favored more on preclinical year students while mood management skills may be more influential for clinical year medical students.

Take-home Messages: Dominant factors influencing cultivating empathy are observed to be different between preclinical year and clinical year medical students. Hence, an individually-tailored curricular programs must be considered to effectively promote empathy.

A phenomenological exploration of medical students' understanding, development and expression of clinical empathy

AUTHOR(S):

- Tan Ying Peh, National Cancer Centre Singapore, Singapore (Presenter)
- Victor Loh, National University Hospital, Singapore
- Gillian Phua, National Cancer Centre Singapore, Singapore
- Wee Shiong Lim, Tan Tock Seng Hospital, Singapore
- Janneke Frambach, Maastricht University, Netherlands

ABSTRACT

Background: Clinical empathy is a key component of medical education as it impacts on patient outcomes and physician well-being. Evidence shows that although medical education does not foster empathy, students' empathy development is influenced by their medical school experiences, in line with situativity theory. To inform educational strategies to cultivate empathy, this study aims to explore medical students' understanding, development and expression of empathy through their lived experiences.

Summary of Work: A qualitative research design using a phenomenological approach was adopted. Participants (n=11) were purposively sampled from the clinical years of two medical schools in Singapore. Semi-structured interviews were used to elicit how their lived experiences have shaped their understanding, development and practice of empathy. Interview transcripts were analysed using interpretive analysis with an inductive approach to look for emerging themes.

Summary of Results: Empathy was understood to be putting oneself in the patient's shoes and seeing things from his/her perspective, and communicating and acting upon this understanding back to the patient. Empathy development was largely influenced in the clinical years by students' own experiences, observations of others and reflection. Students felt empathy is expressed through verbal and non-verbal communication, allowing patients to share in order to better understand their needs, demonstrating care and concern, and treating the patient as a person. Although students recognised the positive impact of empathy, they identified several barriers to the practice of empathy, including time constraints and medicine's focus on medical aspects of care.

Discussion and Conclusions: Participants seemed to have a good understanding of the broad concept of empathy. Clinical years appear to be critical in empathy development, through students' experiences with patients and healthcare professionals. Emotional detachment appears to remain widespread in medicine. Although empathy training has largely focused on cognitive empathy, more effort should be made to incorporate affective empathy training into the medical school curriculum through activities such as reflection, especially in the clinical years.

Take-home Messages: Empathy is a multifaceted concept. Medical students' clinical experiences influence their development and expression of empathy. Hence, educational strategies such as reflection should be implemented in the clinical years to foster empathy.

Emotion regulation: A useful predictor of empathy in medical students

AUTHOR(S):

- Giulia Rampoldi, University of Milano - Bicocca, Italy (Presenter)
- Stefano Ardenghi, University of Milano - Bicocca, Italy
- Maria Grazia Strepparava, University of Milano - Bicocca, Italy

ABSTRACT

Background: Recent research has shown that emotion regulation (ER) is a predictive factor of academic performance and well-being in medical students. However, little is known about the specific relationship between difficulties in ER and empathy in the medical education context.

Summary of Work: This study was designed to determine whether difficulties in ER were associated with empathy in a sample of Italian second-year medical students. A negative correlation between difficulties in ER and empathy was expected.

Summary of Results: A convenience sample of 389 second-year medical students (female=207; main age=19.93, SD=1.39) completed the Jefferson Scale of Physician Empathy - Student Version (JSE-S), and the Difficulties in Emotion Regulation Scale (DERS) at the beginning of the academic year. To test the statistical association between ER difficulties and empathy levels, multiple linear regression was performed with the predictive analytics software SPSS 24 for Mac. Our research hypothesis was confirmed. DERS scores explained 8.4% variance in medical students' empathy. Controlling for the effect of gender and age, lack of emotional awareness ($B=0.726$; $p<0.001$) and lack of emotional clarity ($B=-0.496$; $p<0.05$) subscales showed a significant negative relationship with medical empathy scores.

Discussion and Conclusions: Difficulties in emotion regulation predicted empathy levels in medical students. Lack of emotional awareness and clarity negatively correlated with empathetic attitude.

Take-home Messages: For improving and maintaining students' empathy levels, medical educators should provide a set of ER strategies to their students during medical school. This would help them to be aware of their own and others' emotions during the emotionally demanding encounters with patients.

Barriers to Expressing Empathy in Healthcare - A Literature Review

AUTHOR(S):

- **Shien Ru Tan, NUS Yong Loo Lin School of Medicine, Singapore (Presenter)**
- Chester Tan Guan Hao, NUS Yong Loo Lin School of Medicine, Singapore
- Yi Cheng Zhou, NUS Yong Loo Lin School of Medicine, Singapore
- Ying Pin Toh, NUHS Department of Family Medicine, Singapore
- Lalit Kumar Radha Krishna, NUS Yong Loo Lin School of Medicine, NCCS Division of Palliative and Supportive Care, Singapore
- Eng Koon Ong, Duke-NUS Medical School, NCCS Division of Palliative and Supportive Care, Singapore

ABSTRACT

Background: Studies on interventions to increase empathy have typically focused on healthcare professionals' (HCP) or students' self-assessed empathy. However, studies have showed that there are variable correlations between self-perceived empathy and observed empathy by patients. This review aims to identify key reasons and possible barriers that could result in this gap.

Summary of Work: A scoping review of empathy in healthcare was conducted following Arksey and O'Malley's (2005) framework. A literature search of databases PubMed, Cochrane, CINAHL, Scopus, PsycINFO was carried out looking at articles published between 1st January 2000 to 19th September 2018 in the English language. Articles involving barriers to empathy expression and papers investigating differences in self-perceived and observed empathy were selected. Data from selected articles were entered into a data entry spreadsheet and open coding and thematic analysis was carried out.

Summary of Results: 38,113 abstracts were retrieved from the initial search and screened for eligibility based on the selection criteria. Final selection of articles was settled upon based on negotiated consensus between the authors. Themes identified were broadly categorized into work-environment (e.g. task-centeredness, duration of interaction), HCP/student-related (e.g. lack of confidence), patient-related (e.g. language, cultural differences) empathy factors and scales used to measure empathy.

Discussion and Conclusions: The various multi-level barriers and reasons raised highlight the complexity of the HCP/student-patient relationship that could affect empathic communication between both parties. Current measures of empathy could be further investigated to better assess the complexity of this relationship so that changes can be made to aid empathetic communication. Empathetic communication is a dynamic, multi-factorial issue that would benefit HCP, students and patients. Evaluating the perspectives and difficulties faced by both parties is important to help bridge the gap in communication to maximize the benefits of empathy, hence promoting more usage of empathy in the clinical setting.

Take-home Messages: • Empathy improves patient satisfaction, better patient engagement and job satisfaction. • Empathetic communication is complex, with various multi-factorial barriers. Organizations and individuals need to consider these challenges and carefully monitor the HCP-patient relationship. • Interventions to increase empathy and scales measuring empathy should consider both HCP or students' self-evaluation and patients' perspective.

A Literature Review of Empathy Theories

AUTHOR(S):

- **Tan Guan Hao Chester, NUS Yong Loo Lin School of Medicine, Singapore (Presenter)**
- Zhou Yi Cheng, NUS Yong Loo Lin School of Medicine, Singapore
- Tan Shien Ru, NUS Yong Loo Lin School of Medicine, Singapore
- Toh Ying Pin, NUHS Department of Family Medicine, Singapore
- Lalit Kumar Radha Krishna, NUS Yong Loo Lin School of Medicine, NCCS Division of Palliative and Supportive Care, Singapore
- Ong Eng Koon, Duke-NUS, NCCS Division of Palliative and Supportive Care, Singapore

ABSTRACT

Background: Empathy builds rapport between patients and doctors, while protecting against burnout. Yet many report that empathy levels drop throughout life in the medical sector. This review aims to provide a broad overview of various models of empathy, create deeper insight into the nature of empathy, and thus more effective methods of empathy training and practice.

Summary of Work: A literature search of databases (PubMed, Cochrane, CINAHL, Scopus, PsycINFO) was carried out looking at articles published between 1st January 2000 to 19th September 2018 in the English language. Articles relevant to empathy models and theories were selected for. Data from these articles were entered into a data collection spreadsheet and open coding and thematic analysis was carried out.

Summary of Results: In the initial search, 38113 articles were retrieved, using the agreed upon selection criteria to sieve, the final selection of articles was chosen. Models generally separate affective and cognitive empathy, with the former dealing with emotions and the latter dealing with thoughts, intentions, and beliefs. Different theories explain empathy from physiological or philosophical standpoints, though no consensus has yet been reached.

Discussion and Conclusions: Cognitive empathy generally falls into analytic and phenomenological stances, whereas affective empathy is understood less concretely, with greater discussion in this field. The self-other distinction that elevates emotional contagion to empathy is especially important in the prevention of emotional exhaustion and depersonalisation. Empathy is taken as an intrinsic good in a clinical setting, but a cohesive theoretical foundation for the inner workings of empathy is still currently underdeveloped. A better, more comprehensive understanding of empathy may be able to help develop personhood-targeted interventions to increase empathy levels but also prevent burnout.

Take-home Messages: • There are multiple theories about the ways in which we understand each other's emotions and thoughts. • Theories generally deal with either affective or cognitive empathy. • Personhood and the self-other distinction is important in protecting healthcare professionals against compassion fatigue and burnout.

Impact of serious illness communication skills training on medical students' empathic attitudes and self-efficacy in empathic communication

AUTHOR(S):

- Jacqueline Yuen, The University of Hong Kong, Hong Kong (Presenter)
- Christopher See, The University of Hong Kong
- Tse King Cheung, The Chinese University Of Hong Kong
- Chor Ming Lum, Shatin Hospital
- Wai Tat Wong, The Chinese University Of Hong Kong

ABSTRACT

Background: Handling emotions is a common challenge for physicians when communicating bad news regarding serious illness. Communication training programs often focus on skills training, yet it is also important to assess their impact on other key determinants of behavior including attitudes and self-efficacy. This study aims to examine whether a serious illness communication training program can impact on medical students' empathic attitudes and self-efficacy in empathic communication.

Summary of Work: A one-week blended learning communication training program is delivered to sixth-year medical students (N=214) in 2018-2019. It consists of small group skills practice via role-play, and online training involving lectures, video-based exercises and reflective writing. A mixed-methods approach for program evaluation is used. Participants completed surveys with the Jefferson Scale of Empathy - Medical Students version (JSE-S) to assess attitudes toward empathy in patient care and self-rated preparedness in using specific empathic communication skills at baseline (T1), six weeks (T2), and between three to six months post-training (T3). Changes in mean JSE-S scores and preparedness levels were compared using paired t-tests. Qualitative data from written course reflections on the key lessons related to empathy were coded using thematic analysis.

Summary of Results: Analysis to date indicates mean JSE-S scores at T2 were higher (110.41 vs 113.5, P = .055) and significantly higher at T3 (115.47, P = .017) compared to those at T1. Self-assessed preparedness in using empathic communication skills was significantly higher at T2 compared T1 (P < .01) and T3 compared to T2 (P < .02). Content analysis categorized the key lessons around empathy into three themes: the skills in understanding the feelings of others, the skills in communicating empathy, and positive attitudes regarding empathic behaviors in patient care.

Discussion and Conclusions: Triangulation of data through a mixed-methods approach supports the effect of the communication training program on improving learner empathic attitudes and self-efficacy in empathic communication. The increase in mean JSE-S scores and preparedness levels from six weeks to between three and six months post-training supports the notion that these effects can be sustained and even enhanced long-term.

Take-home Messages: A blended learning serious illness communication training program can foster learners' development of empathic attitudes and self-efficacy in empathic communication.

Creation and evaluation of a Massive Open Online Course (MOOC) on 'Developing Clinical Empathy'

AUTHOR(S):

- Elaine Mealey, St George's, University of London, UK (Presenter)
- Katherine Joekes, St George's, University of London, UK
- Angela Kubacki, St George's, University of London, UK
- Amy Spatz, St George's, University of London, UK
- Karen Lobb-Rossini, St George's, University of London, UK
- Sheetal Kavia, St George's, University of London, UK

ABSTRACT

Background: 'Online learning' is increasingly used within medical education and continued professional development. The authors created a free Massive Open Online Course (MOOC) on "Developing Clinical Empathy: Making a Difference in Patient Care". MOOCs are free-to-enroll, globally accessible online courses, allowing access to education in low income countries. There is an emphasis on online social learning, which offers the potential for rich engagement and discussion with diverse learner groups of a global and inter-professional nature. This presentation addresses development and evaluation of the MOOC.

Summary of Work: Creating a MOOC to support 'clinical communication' development for healthcare professionals (HCPs) runs counter to the principles of 'experiential learning' which forms the cornerstone of most clinical communication teaching. The course (4 learning hours over 2 weeks) provides a relevant knowledge base and is intended as a 'flipped classroom' learning resource for HCPs, to be used in conjunction with applied skill acquisition in the clinical workplace. Emphasis was placed on: introducing and defining 'clinical empathy'; recognising and responding to empathic opportunities; considering the challenges and benefits of developing an empathic practice; and attending to self-care. Learning objectives and teaching modalities within the MOOC were carefully aligned.

Summary of Results: Steps to complete the MOOC successfully will be addressed, including lessons learned for improving the planning, creation, delivery, evaluation and maintenance phases. Data on global participation showed that 1,374 learners from 113 countries embarked on the MOOC, with 416 (30%) learners completing ≥90% of the course. Analysis of the free text discussion fora and evaluation will provide further insight into the efficacy of the course.

Discussion and Conclusions: When creating a MOOC, attention needs to be paid to planning, evaluation and maintenance. The open access and social learning aspects of the course create a global learning environment, with active learners demonstrating a richer understanding of the concepts of clinical empathy and an opportunity to exchange ideas about why, when and how empathy can be demonstrated effectively within a consultation.

Take-home Messages: Creating a MOOC on 'Developing Clinical Empathy' is feasible and can have a place in education for HCPs globally.

The effects of curriculum for improving empathy and reducing burnout in medical school

AUTHOR(S):

- Hyoung Seok Shin, Korea University Department of Medical Education, South Korea (Presenter)
- Young-Mee Lee, Korea University College of Medicine, South Korea
- Kangmoon Kim, Korea University Department of Medical Education, South Korea

ABSTRACT

Background: Physicians' empathy plays a crucial role to keep a positive relationship between physicians and patients and helps to improve patients' satisfaction and produce an effective performance for the patients. Medical educators have applied various empathy education programs to improve medical students' empathy level. However, studies have shown that burnout of medical students negatively can affect their empathy level. Therefore, in this study, we want to verify the correlation between the empathy of medical students and examine the effectiveness of empathy education programs for medical students.

Summary of Work: To measure medical students' empathy level, translated versions in Korean of the student version of Jefferson Scale of Physician Empathy (JSPE-S) and Interpersonal Reactivity Index (IRI) were used. To examine their burnout level, Maslach Burnout Inventory - Student Survey (MBI-SS) was used. 1293 medical students from 15 medical schools in South Korea participated in this study, and out of 1293, 313, 486, and 494 students were first-year, third-year, and fifth-year students, respectively. The authors examined the relationship between students' empathy level and burnout level and if there was a significant difference on JSPE-S, IRI, and MBI-SS scores among three different grade groups.

Summary of Results: In line with findings of previous research, it is verified that there was a negative correlation between medical students' empathy level and burnout level. Also, there was no significant difference in JSPE-S scores between three different grade groups. However, the results showed that first-year students' IRI scores are statistically higher than fifth-year students' scores. Also, first-year students' MBI-SS scores are significantly lower than third-year and fifth-year students.

Discussion and Conclusions: According to the results, senior students have a lower empathy level and a higher burnout level than junior students. For further analysis, the authors examined curriculum of each medical school to see if particular programs for medical students, including early clinical exposure, simulated patient program, are implemented and those are effective depending on when the programs are offered. Details will be discussed.

Take-home Messages: Providing various education programs for improving empathy level are important, however, the timing of delivery of education programs is more important.

Enneagram for medical students to nourish empathy

AUTHOR(S):

- Harutaya Kasyanan, Buddhachinaraj Hospital Medical Education Center, Thailand (Presenter)
- Sukanya Rakkhajeekul, Buddhachinaraj Hospital Medical Education Center, Thailand

ABSTRACT

Background: Empathy is one of the core values of medical professionalism. Studying medicine amidst stress, hard work, and competition can cause medical students to have less empathy and be more self-centered. We organized activities that help nourish empathy throughout clinical years by teaching “Enneagram”, a system of nine personality types to better understand ourselves and others, through the process of self-awareness.

Summary of Work: We organized 2 days of enneagram classes for 4th-year medical students, 5 groups of 9-12 people, totaling 52 students. We did many self-reflections sessions and panel discussion to help each student examine which of the 9 personality types they are associated with. Key determinants include the pattern of feelings, thoughts, actions, potentials and limitations. After the activity, students voluntarily joined the in-depth interview on what they gain from this activity.

Summary of Results: From the answers of 24 students, everyone achieved better self-understanding, where 79% got more understanding and empathy for others and 58% better realized their strengths and weaknesses. 33% can accept people from different background more and hence perform better as a team member. 12.5% would be more able to understand psychological root cause of illness and empathize more with patients.

Discussion and Conclusions: All students understood themselves more and most of them understand others better. More than half could extend this knowledge for self-development and relationships. Some of them expressed that, when they accepted their own weaknesses as well as others more, they became more tolerant and compassionate towards each other. As for applying the experience to understanding and helping patients, only a few could see the connection because of the limitation of the 4th-year student as real-life doctors and the rather short 2-day period for this activity. But by observation, we found that when students realized their own defensive reactions and blind spots, they were likely to be more resilient, which will also promote both empathy and their mental health.

Take-home Messages: Enneagram, as a tool for self-awareness, can lead to personal growth, thereby enhancing medical professionalism and patient centered care teamwork.

In what ways do tutors intervene in simulated consultations to encourage empathetic communication in medical students?

AUTHOR(S):

- Luke Riceman, Barts and The London School of Medicine and Dentistry, UK (Presenter)
- Harvey Wells, Queen Mary, University of London, UK

ABSTRACT

Background: Empathy is recognised as an important characteristic of a good doctor, and medical schools are encouraged to facilitate their students in their empathetic development. However, whether empathy can truly be taught, and how best to do so, is still open to debate. While there are large amounts of research into empathy measurement instruments and the decline in empathy through medical school, there is less literature focusing on the views of communication tutors with regards to teaching empathy.

Summary of Work: 8 communication tutors of varying experience participated in semi-structured interviews. The aims of the interviews were to explore what empathy means to tutors, how they attempt to encourage empathy, and whether they think certain individuals are more susceptible to empathetic education. The interviews were transcribed and analysed for similarities and differences.

Summary of Results: The results may show that communication tutors share a view of what empathy means, and this may subsequently affect how they approach their teaching sessions. The tutors may all also have specific tactics they employ in order to get their students thinking more empathetically, in which case this information could be used to guide the development of medical school curricula in the future.

Discussion and Conclusions: It is hoped we will find a clear ideology shared by communication tutors with regards to empathy and can begin to form a clear outline of how best to educate our medical students. In 'Generic Professional Capabilities Framework' the term empathy is mentioned twice; once regarding its importance in maintaining the trust of patients, and again in regard to its use in establishing good doctor-patient communication. Empathetic doctors offer better care to their patients, and we should be striving to make our medical students more and more empathetic.

Take-home Messages: Empathy is a hugely important characteristic for a doctor to have, as having a genuine consideration and understanding of a patient's background leads to them providing a deeper, more holistic and personal standard of care. With an understanding of the thought processes of communication tutors delivering education on empathy, we hope to produce ever more empathetic doctors.

Item Response Theory Analysis of the Jefferson Scale of Empathy (Student Version)

AUTHOR(S):

- Giovanni Piumatti, University of Geneva, Switzerland (Presenter)
- Milena Abbiati, University of Geneva, Switzerland
- Anne Baroffio, University of Geneva, Switzerland
- Margaret W. Gerbase, University of Geneva, Switzerland

ABSTRACT

Background: The Jefferson Scale of Empathy (JSE) is the most adopted self-reported tool in medical education research to assess empathy. Since empathy during medical studies is an important correlate of career choice, clinical competence and professionalism, this instrument has been adapted for medical students (JSE-S). Researches have psychometrically tested the JSE-S, but applications of Item Response Theory analyses (IRT) are missing. The current study tested the JSE-S using IRT to expand our knowledge on the psychometric characteristics of this instrument.

Summary of Work: At the Geneva medical school, 575 students (Mage=20.80 years, 64% females) enrolled to a preselection academic year filled in the JSE-S. Graded response modeling within IRT assessed JSE-S' total scale reliability and tested single items' performances in measuring students' empathy levels. This technique estimates the discriminative power of each item representing how well an item can be used to differentiate between different empathy scores, either high or low. It also assesses the threshold parameters of each item scoring point, namely the empathy score needed to have a 50% chance of scoring on a particular point or higher.

Summary of Results: JSE-S's set of items exhibited low standard error levels and high-test performance results to cover especially low levels of the empathy spectrum. The discriminative power of this instrument diminishes when aiming to differentiate between students at high empathy levels. Items' discrimination indexes ranged between -0.07 (i.e., "Physicians should not allow themselves to be influenced by strong personal bonds between their patients and their family members"), and 2.15 (i.e., "Asking patients about what is happening in their personal lives is not helpful in understanding their physical complaints") indicating that certain items may provide redundant information (lower values indicate poorer discrimination).

Discussion and Conclusions: Based on the overall standard error levels indicating how well an instrument measures the entire spectrum of a psychological self-reported trait, the JSE-S is confirmed a reliable tool to assess medical students' empathy. However, it better differentiates between students at low rather than at high empathy levels.

Take-home Messages: Certain JSE-S' items are particularly suited for tapping into high levels of the empathy spectrum.

Using sociodrama techniques to enhance nursing students' emotional skills of ethical sensitivity

AUTHOR(S):

- Miao-Ju Chwo, Fu Jen Catholic University, Taiwan (Presenter)
- Gin-Hong Lee, Fu Jen Catholic University, Taiwan
- Ming-Teh Lin, Fu Jen Catholic University, Taiwan
- Ting-Chun Chen, Fu Jen Catholic University, Taiwan

ABSTRACT

Background: When nursing students participate in service-learning, they usually meet the people different from themselves. It is critical for them to have sensitivity and empathy toward service target.

Summary of Work: The study subjects were 132 students in the first-grade of the nursing department. The effect evaluation comes from the students' after-school qualitative feedback. The session included warm-up games based on communication and interaction, sharing a real story happened to them with peers in small groups, role-playing a volunteer student's story, using "double" to voice the roles empathetically in the story, reflection after role-playing and doubling.

Summary of Results: Coding of 132 students' feedback resulted in identification of three thematic categories: (1) Feeling as the protagonist When students played the protagonist in the story, they experienced a three-stage transition. At first, they felt nothing big deal. Then the negative emotions and feelings came and influenced them. At the end, they reconsidered their original thoughts and behaviors. (2) Thinking as an observer When students told "their" story and watched the classmates role-playing the roles of their story, they had the opportunity to review the context, thoughts, emotions and needs of the "self" and "the other party" in the story as a more objective observer. They discovered more context of the problem, non-verbal messages, and possible strategies. (3) "Reflection" on the service-learning: Students applied the learning experience to the service-learning, including they wanted to try to aware their prejudice in the progress of service, to consider the other's needs in others' context, to use non-verbal messages to better interact with the people they serve.

Discussion and Conclusions: These study findings are important for: (1) recognition of the importance of the course session prior to service-learning in helping students understand other people different from them; (2) encouraging research to focus on applying sociodrama techniques to develop emotional skills of ethical sensitivity.

Take-home Messages: It is difficult and challenging to understand others different from yourself. Role-playing and doubling the characters from students' own story helped them increase sensitivity and empathy toward people different from them by immersing them subjectively in the protagonist' emotions and rethinking the situation objectively in the position of observer.

Scenario based, group discussions in teaching Ethics and Professionalism

AUTHOR(S):

- Li Nien Michelle Tan, National University Hospital, Singapore (Presenter)
- Yee Cheun Chan, National University Hospital, Singapore
- Roy Joseph, National University Hospital, Singapore

ABSTRACT

Background: There are limited studies on methods of teaching medical ethics and professionalism. We share our experience in the conduct of ethics and professionalism workshops for Year 2 Residents using a format of scenario based, small group discussions and simulations guided by senior clinicians and ethicists. The workshop's objective is to increase their knowledge, skills and attitudes to responding to ethical and professional issues in the work environment. This format offers the theoretical advantage of contextual and collaborative learning. Group discussions provide diverse perspectives that prompt reflective learning. Simulations allow safe development of practical skills and build confidence and expertise.

Summary of Work: Eight full day workshops have been conducted using this format since November 2016 in the National University Hospital in Singapore. The workshop focuses learning in 5 core topics; consent and shared decision making, confidentiality, care at the end of life, relating to colleagues and managing adverse outcomes. Residents are given a condensed pre-session reading material. During the session, a short introduction of each topic is given and this is followed by small group discussion and role-playing the resolution of cases relevant to the topics.

Summary of Results: The perception of learning across the 5 domains were ascertained through an evaluation form offered to each participant at the end of the workshop. The domains were the inter-activeness of the session, stimulation of self-directed learning, relevance, advancing of clinical decision-making skills and the increase in confidence in managing ethical and professional issues. There were 193 participants in all and the response rate was 86%. The mean ratings for each of the domains on the 5-point Likert scale were 4.6,4.5,4.5,4.4 and 4.4 respectively and the overall was 4.46. A consistent non-structured feedback was the usefulness of the realistic clinical vignettes and the group discussions.

Discussion and Conclusions: Small group discussions and simulated resolutions of relevant case scenarios involving ethical and professional issues were reported to be useful by junior residents.

Take-home Messages: Case-based and guided small group activities are useful in the teaching of medical ethics and professionalism to residents.

Dialogues in the Group for Fundamental Nursing Practicum

AUTHOR(S):

- Jen-Juan Liaw, School of Nursing, National Defense Medical Center, Taiwan (Presenter)
- Luke Yang, Department of Social Welfare and Social Work, Hsuan Chuang University, Taiwan,
- Hsien-Hsien Chiang, School of Nursing, National Yang-Ming University, Taiwan
- Yu-Lun Tsai, School of Nursing, National Defence Medical Centre, Taipei, Taiwan

ABSTRACT

Background: The value of education does not only achieve instrumental learning, but learning of life meaning. As educators in nursing, we do not just teach our students technical knowledge and skills, but also help them build personal and ethical knowledge. The study purpose was to use focus groups as a teaching method to help students experience meaning of life and care after fundamental nursing practicum (FNP).

Summary of Work: We used purposeful sampling to conduct four sessions of focus group with free association discussion after FNP. Each session lasted 50 minutes, and included 14-15 sophomore nursing students who voluntarily attended inner and outside circles of group (fish bowl). The teacher was a facilitator to hold and contain this group. Students freely talked their feelings here and now, and experiences during practicum. Dialogues in groups were recorded, transcribed word by word, and analyzed by using content analysis.

Summary of Results: Three themes were developed as the following: (1) Over judgement vs. self-kindness: "I am not good at skills, my patient cough severely while suction. After practicum, I cry and lose my temper. I need to well prepare myself next time". (2) Technique oriented vs. meaningful oriented learning: "At the beginning, I expect to have more opportunities to perform nursing skills. Later I found that this is not so important. The important is that I can well prepare myself and learn nursing". (3) Then & there vs. here and now: "We are considered as barriers without any functions. However, group dialogues help me perceive the importance of my existence"

Discussion and Conclusions: The results suggest that empathy is not intellectual learning, and may not learn through teaching. Empathy need experiential and embodied learning. The role of teaching needs to provide the embodied learning environment. The groups respect students, and let them generate their creativity and spontaneity. Dialogues of focus group help students reflecting their learning experience, and meaning of life, the importance of their existence, and enhancing empathy on others.

Take-home Messages: Focus group with free association discussion is one of the teaching methods to build personal and ethical knowledge for nursing students.

Analysis of the attitude towards concordance in the future students' work environment

AUTHOR(S):

- **Agata Stalmach-Przygoda, Department of Medical Education Jagiellonian University Medical College, Poland (Presenter)**
- Łukasz Małeckki, Department of Medical Education Jagiellonian University Medical College, Poland
- Michał Pers, Department of Medical Education Jagiellonian University Medical College, Poland
- Magdalena Szopa, Department of Medical Education Jagiellonian University Medical College, Poland
- Jolanta Świerszcz, Department of Medical Education Jagiellonian University Medical College, Poland
- Grzegorz Cebula, Department of Medical Education Jagiellonian University Medical College, Poland

ABSTRACT

Background: The principles of doctor-patient relations have been changing over last decades. In the past, it seemed to be sufficient if the patient followed the recommendations of the doctor (compliance). Currently, the patients have taken on more decision-making and take more responsibility for the treatment (concordance). While constructing a curriculum at Jagiellonian University Medical College, we wish to adapt our courses to the needs of patients. Therefore, the goal of this study was to assess Polish doctors' and patients' attitudes to concordance.

Summary of Work: An anonymous questionnaire was conducted among doctors and patients. The Leeds Attitude Towards Concordance (LATCon II) scale was the core of the questionnaire. Respondents also answered the question of the reasons why (in their opinion) patients do not follow medical recommendations.

Summary of Results: The survey was completed by 126 doctors and 46 patients. The average LATConII score for doctors was 40.2 and for patients 35.7. The difference between these averages is statistically significant. Polish patients attitudes toward concordance are less positive than those of doctors. As to the primary reasons for non-compliance, doctors indicate the responsibility lies mainly on the patients side (64%), doctor's side (20%), or caused by the system (16%). As to the primary reasons for non-compliance, patients report reasons lying mainly on the patient's side (68%), doctor's side (25%), by the inconvenience of therapy (4%), and caused by the system (2%).

Discussion and Conclusions: A preliminary analysis of the attitudes of doctors in Poland indicates a relatively positive attitude to concordance. At the same time, it reflects their perception that the patient is responsible for not following the medical recommendation and that there is ineffective cooperation between a physician and a patient. Widespread beliefs in the medical community can influence and shape student attitudes. It seems that the optimal method of teaching concordance consists of attitudes that do not overly blame either doctors or patients.

Take-home Messages: While integrating shared decision making and concordance elements into education, it is useful to know the types of attitudes that students may encounter in their future work place in order to adapt the teaching methods to the needs of this community.

Assessment of clinical performance of internal medicine residents utilizing a structured evaluation form that focuses on the six domains of ACGME core competencies: Experience at a medical center

AUTHOR(S):

- Cheng-Han Wu, National Taiwan University Hospital, Taiwan (Presenter)
- Po-Yuan Chang, National Taiwan University Hospital, Taiwan
- Ming-Shiang Wu, National Taiwan University Hospital, Taiwan

ABSTRACT

Background: Assessment of clinical performance of resident trainees is essential during the training course. Analysis of these data could offer valuable insights and opportunities of implementing changes in medical education.

Summary of Work: Internal medicine residents were evaluated on a monthly basis utilizing a structured evaluation form by faculty members who supervised them. The form included 3-5 items under each of the six Accreditation Council for Graduate Medical Education (ACGME) core competencies and a global assessment scale. Scoring values were as follows: Excellent = A (score 90-100), Good = B (75-90), Fair = C (60-75), Poor = D (45-60), very poor = E (<45). A global score (range 1-100) and a comment column were also included.

Summary of Results: From August 2013 to July 2018, faculty members returned 9334 evaluations on 187 internal medicine residents during their residency years 1-3. The average domain score in each of the six ACGME core competencies for the participants in each year of residency were calculated. The average domain scores were as follows: Patient Care (PC): 85.38, Medical Knowledge (MK): 84.02, Practice-Based Learning and Improvement (PBLI): 85.12, Interpersonal and Communication Skills (ICS): 86.15, Professionalism: 86.01, and Systems-Based Practice (SBP): 84.49. Pairwise correlation analyses showed high positive correlation between these six clinical domains ($p < 0.0001$ for each comparison with Bonferroni adjustment). The correlation coefficients ranged from 0.7845 to 0.9144 and the lowest correlation was noted between the domain of MK with that of ICS (0.7845) and between the domain of MK with that of Professionalism (0.7962). Moreover, significant improvement of clinical performance between residency Years 1 and 2 and between years 1 and 3 were noted in the six ACGME core competency except for the ICS domain ($p < 0.05$). There was no difference of performance in the ICS domain across years of training.

Discussion and Conclusions: This study revealed clinical performance in MK domain is less correlated with that in either ICS or professionalism domain. Improvement in performance were demonstrated across years of training in the six ACGME core competency except for the ICS domain.

Take-home Messages: This structured evaluation form is a useful tool for the assessment of clinical performance of residents.

Flipped Evaluation Form - A Simple Solution For Better Evaluation Results?

AUTHOR(S):

- Wee Khoon Ng, National Healthcare Group, Singapore (Presenter)
- Selvia Kosim, National Healthcare Group, Singapore
- Lijing Melody Kuan, National Healthcare Group, Singapore
- Choon Kiat, Nigel Tan, National Neuroscience Institute, Singapore
- Chia Li Ann, Faith Chia, National Healthcare Group, Singapore

ABSTRACT

Background: The National Healthcare Group Internal Medicine residency programme uses Monthly Performance Evaluation (MPE) form to evaluate residents' performance in six ACGME-I competencies, which consists of five parts (in sequence): competency evaluation (using 9-point Likert scale), work output assessment, overall clinical competency (using R.I.M.E. framework), global assessment and qualitative feedback. A review of the residents' MPE results discovered discrepancies between residents' competency evaluation scores and the overall clinical competency, with limited qualitative feedback from the assessor.

Summary of Work: We introduced a new flipped MPE form, with the overall assessment questions at the start: overall clinical competency as the first question, followed by global assessment, written feedback, competency evaluation, work output assessment and lastly competency evaluation. The assessors must decide on residents' overall competency first, which aids to frame their minds to answer the subsequent questions to justify their decision. We aim to improve the quality of the completed evaluation forms and encourage more qualitative feedback.

Summary of Results: The results from "flipped form" for January to March 2018 were compared against the results from original form for October to December 2017 and the qualitative comments were analysed. 231 MPEs were received for the former and 215 MPEs for the latter period. Average word count for qualitative comments for original MPE form is 20.22, and 20.78 for "flipped form". However, sub-analysis revealed slight reduction (6.67%) in the number of words written for 'strengths and areas resident has performed well', but significantly increased number of words written for 'areas in need of attention' and 'actions agreed upon', 9.26% and 29.77% respectively, with the new form.

Discussion and Conclusions: The "flipped form" is a simple method that helps assessors frame their mindset and answer the subsequent questions to justify their global assessment. It likely reduces assessor fatigue and encourages assessors to provide more qualitative comments and recommend actionable goals, which will be useful for resident improvement.

Take-home Messages: Sequencing global assessment questions and qualitative feedback before detailed assessment of residents' competencies, is a simple but useful method to gather better evaluation results.

Embedding authentic and diverse assessments into postgraduate medical curriculum - Getting students to perform real life tasks in the classroom setting

AUTHOR(S):

- Latha Ramakrishnan, Imperial College London, UK (Presenter)
- Anna Maria Jones, Imperial College London, UK
- Jeffrey Vernon, Imperial College London, UK
- Sophie Rutschmann, Imperial College London, UK

ABSTRACT

Background: Imperial College London is implementing an ambitious Learning and Teaching Strategy that aims to prepare students “for an increasingly diverse and complex future work environment”. This necessitates curriculum review and redesign of all undergraduate and postgraduate courses across the college. The Faculty of Medicine offers 28 Masters programmes in diverse biomedical fields, 16 of which are healthcare related.

Summary of Work: Traditionally most of our academic programmes have assessed using closed book exams. Higher order cognitive skills like creativity, evaluation and critiquing are expected of postgraduates (level 7 QAA UK), which the stereotypic essays are often unable to meaningfully test. More importantly, essays and MCQs are NOT authentic tasks that our graduates will perform in their day-to-day jobs. Finally, diverse assessments need to be incorporated into the curriculum to encourage inclusivity. We, the Faculty education team, have been working closely with all the programme teams to redesign their assessment strategies.

Summary of Results: We have: replaced several traditional essays with problem-solving exams that require integration of advanced concepts; moved away from closed booked exams to course-work/open-book exams; diversified the nature/type of assessments; incorporated formative assessments as feed-forward to develop/practise skills at individual/team settings; introduced more authentic tasks as assessments. Examples: hospital newsletter; patient leaflet; poster/oral presentations; debates; grant proposal; lay summaries; public engagement; critical appraisal; reflective report; conference proceedings etc. Specific examples and alignments with learning outcomes will be discussed in the presentation.

Discussion and Conclusions: It has been challenging to convince some academics to move away from closed book essays. Staff confidence plays an important role in this. While some programmes have incorporated authenticity directly into their summative assessments, others will pilot them as formatives. Task-based assessments can help cut down marking times and subjectivity. This in-turn should improve the quality and turn-around time for feedback. Curriculum Review also aims to improve staff work-load and student feedback scores. We will be evaluating the impact of changes in the coming years.

Take-home Messages: In preparation for jobs that don't exist yet, our graduates should be able to provide creative solutions to open-ended problems. Careful embedding of diverse and authentic assessments into the curricula is the first step towards achieving this goal.

Influence of context on novice versus expert rater judgments of competence

AUTHOR(S):

- Anita Acai, McMaster University, Canada (Presenter)
- Ranil Sonnadara, McMaster University, Canada

ABSTRACT

Background: Competence committees (CCs) make decisions about residents' readiness for promotion to the next stage of training and responsibility; however, little is known about how this occurs in practice. In this study, we investigated CC decision making using a set of simulated resident files administered to both novice and expert raters.

Summary of Work: Sixty undergraduate psychology students (51 females; 9 males) and 20 competence committee members (12 females; 8 males) completed the study. Undergraduate students did not have any prior experience in making promotion decisions. Competence committee members were primarily physicians with nearly half reporting over 5 years of experience with resident promotion processes. Individually, each participant was administered 42 simulated resident files containing either performance data only (control) or performance data in combination with contextual information (e.g., information about the raters, the resident's professionalism, the resident's personal circumstances, or the participant's prior experiences with the resident). For each case, participants determined whether or not they would promote the resident in question.

Summary of Results: Contextual information that was inconsistent with resident performance led expert raters to become significantly more stringent in their decision making while novice raters could become either more stringent or more lenient, depending on the information provided. For example, learning that a resident had been unprofessional despite meeting or exceeding the formal requirements for promotion resulted in promotion 35% of the time for novices and 54% for experts, compared with 88% and 96% of the time in the control conditions, respectively. However, being told about a prior positive experience with a resident who did not meet the formal requirements for a promotion resulted in promotion 13% of the time for novices but 0% of the time for experts, compared with 2% of the time and 0% of the time in the control conditions, respectively.

Discussion and Conclusions: Contextual information about a resident or rater appears to influence decision making among both novice and expert raters in a simulated CC environment, albeit in a slightly different manner. These findings set the stage for continued work on how CCs make decisions in practice and reinforce the value of the group decision making in this context.

Take-home Messages: As above.

The implantation of an electronic assessment system improves the quality of clinical competency committee (CCC)

AUTHOR(S):

- Chih-Cheng Chien, Cathay General Hospital, Taipei, Taiwan & School of Medicine, Fu-Jen Catholic Univ, Taiwan (Presenter)

ABSTRACT

Background: When running CCC, there are three common problems hinder its efficacy in improving the competency of trainees. First, information offered by current hard-copy based assessment forms is not detail enough, especially the qualitative description. Second, some faculties are unable to assess trainees effectively and not providing useful information to CCC. Third, some trainees who have subtle problems which won't be picked up in any single assessment but are obvious when all the assessment are examined together in CCC, are unable to achieve better since current assessment system can't identify them earlier. To improve the quality of CCC systemically, our education management system started this project.

Summary of Work: Through effective faculty development, we urged our faculties work with IT department to develop an electronic assessment system which can be easily assessed using personal cellular phones. When logged in using ID and passwords, faculties can assess trainees whenever and wherever suitable. As for qualitative description, faculties can literally "talk" to CCC since the speech input function offered by any cellular phones can record their observations completely without the frustration of typing. The system can also monitor the quantitative data input by every faculties and alarm as designed. If a certain faculty rates trainees with no discrimination or if certain trainee is rated to be relatively poor consistently through serial assessments, the chair of CCC will be alarmed and proper actions can be triggered whenever needed. The institution education management system can also monitor all these events effectively.

Summary of Results: We have applied this system for months. Some actions have been reported by CCC which they consider to be not possible without the help of this system. More data are coming in and will be presented in the conference.

Discussion and Conclusions: We also apply this system for medical education other than physicians, such as pharmacists and nurses. Although certain medication is needed, the system works as well. The implantation of such an electronic assessment system improves the efficacy of assessment, and therefore the quality of CCC.

Take-home Messages: Technology can enhance not only learning, but also the quality of CCC.

Group assessment of junior doctor's skills in internal medicine fosters learning for all the attending doctors in the department

AUTHOR(S):

- Hanne Storm, Diagnostic Centre Silkeborg, and Centre for Health Science Education, Aarhus University, Denmark (Presenter)
- Birgit Larsen, Diagnostic Center, Denmark
- Rene Nielsen, Corporate Quality, Denmark
- Bente Malling, Centre for Health Sciences Education, Aarhus University, Denmark

ABSTRACT

Background: Assessment using Case based Discussion traditionally includes a one-to-one discussion with a supervisor. This entails a subjective and maybe unequal assessment of the trainees, which can only be overcome with the use of many assessors. The purpose of this study was to explore trainees' and supervisors' perception of a group-assessment concept.

Summary of Work: All 10-15 junior doctors in the department met 4 times for 5 hours over 1 year. Each junior doctor presented a case in internal medicine and discussed it with peers and supervisors (diagnosis, differential diagnosis, ethical considerations etc). Four supervisors (specialists in internal medicine) participated in the discussion and together assessed the junior doctor. An external consultant observed the group-assessment several times and conducted semi-structured interviews with the junior doctors as well as the senior doctors. Notes from the observations and the transcribed interviews were analysed using an inductive approach looking for participants' perceptions of the concept.

Summary of Results: Both junior doctors and supervisors preferred the group assessment to the individual assessment. The level of discussion was higher in the group compared to one-to-one discussion. All junior doctors gained new knowledge during their assessment but also reported to have learned from listening to the assessment of their peers. Supervisors reported to have gained new knowledge as well.

Discussion and Conclusions: Group assessment of junior doctors' professional skills in internal medicine fosters learning for all participating doctors in the department. It is a good way to structure assessment of professional skills, compared to individual assessment. The quality of assessment probably is increased and more objective.

Take-home Messages: Group-assessment is feasible and acceptable, and preferred by both junior doctors and supervisors.

Perceptions of assessment and feedback: hawks, doves and impact on learning

AUTHOR(S):

- Kaif Pardhan, Sunnybrook Health Sciences Centre & McMaster Children's Hospital, Canada (Presenter)
- Linda Jones, University of Dundee, UK
- Christopher Watling, Western University, Canada

ABSTRACT

Background: Residency training takes place in a work-place learning environment. Residents may work with several supervisors over the course of their training and each will provide feedback and assessments to them. Each supervisor may have a different approach to the delivery of their feedback and may deliver different assessments for the same quality of performance. Research question: among residents who receive regular feedback how do different styles of feedback by supervisors impact the residents' learning?

Summary of Work: A qualitative methodology was used. Participants were residents from residency programs that have routine one-on-one feedback and assessment. In depth, semi-structured one-on-one interviews were conducted by the primary investigator (PI). These were then transcribed, reviewed and coded. The participants were University of Toronto and McMaster University residents. Sample size will be determined by thematic saturation and data collection is ongoing. The interview guide was updated in an iterative fashion to further explore themes generated in the initial interviews. Interview transcripts will be reviewed and coded by the PI with assistance from collaborators with qualitative methodological expertise.

Summary of Results: Analysis of the first six participants revealed five themes. Residents described remembering feedback that generated a strong emotional response, both positive and negative; reflection on feedback as a component of using feedback for learning was consistent; reconciling feedback received that was in conflict with previously received feedback; relationship with the individual providing the feedback impacted feedback interpretation; feedback was parsed by residents to determine the rationale of the assessor and whether to incorporate feedback into learning process.

Discussion and Conclusions: How residents use feedback to further their learning is variable. This study identifies that styles of feedback, emotional response and relationship with the provider are all contributors to the learning that occurs after a feedback encounter. It also identifies that residents reflect on feedback differently and make decisions about how to incorporate feedback into their learning and practice.

Take-home Messages: The individuality of these responses to feedback are important for trainee self-reflection in furthering their learning as well as important in faculty development as they develop skills in assessment and feedback. It is also important for training programs that facilitate the trainee supervisor interactions.

Residents' View of Performance Feedback during Training in a Nigerian Teaching Hospital

AUTHOR(S):

- Fadekemi Oginni, Dept of Medical Education, University of Illinois, Chicago, USA (Presenter)
- Ara Tekian, Dept of Medical Education, University of Illinois, Chicago, USA
- Yoon Soo Park, Dept. of Medical Education, University of Illinois, Chicago, USA

ABSTRACT

Background: Feedback in Health Professions Education (HPE) is the cornerstone of effective clinical teaching and an important driver of learner improvement. There is a marked paucity of feedback culture and literature on types of feedback practices in Nigeria and from the African continent more broadly. This study seeks to understand resident doctors' perception of feedback in their training experiences. Findings will be compared with subsequent real life observations.

Summary of Work: A survey questionnaire inquiring about resident doctors' feedback experiences (type and frequency) and expectations was administered to all resident doctors in Obafemi Awolowo University Teaching Hospital (OAUTH). Descriptive statistics was used to examine trends in data and to interpret findings.

Summary of Results: Among 248 questionnaires distributed, 126 were available for review at the time of generating this report. Respondents were mostly Senior Registrars (Pre-part 2; 57.1%) and rarely Senior registrars at Post part 2 level (10.3%). 78% had completed over 75% of their rotations. The best feedback experiences were reported mostly in residents' primary specialty (62.2%). The experiences were characterized by specific content, clear indication of what was done correctly, and trainers discussion of what can be improved upon. Verbal feedback with face-to-face discussion was the residents' most common experience (53.6%); however, majority (60.5%) preferred multisource and written feedback. Feedback occurred mostly within 24 hours of the activity (91%) and was focused on medical Knowledge and procedural skills, but rarely on global performance, multiple competencies, reflection or self-assessment. Trainees identified rooms for improvement in the trainers' knowledge of educational methods, effective communication skills, availability and feedback structure.

Discussion and Conclusions: Residents in OAUTH are conscious of ongoing timely performance feedback delivery from their trainers, but not in their most desired form. Trainers may benefit from education on feedback methods and institution of a structure for performance feedback delivery in OAUTH. The proposed observational study would further enlighten developments to enhance effective feedback. Providing actionable and timely feedback to residents in OAUTH will benefit from a clear structure.

Take-home Messages: There is a need to introduce a clear structure into performance feedback methods employed in the training of resident doctors in OAUTH.

The 360-Degree Performance Assessment Implementation on Cardiology and Internal Medicine Residency Programs

AUTHOR(S):

- Rosiane Diniz, UFRN, Brazil (Presenter)
- Julio Cesar Sousa, UFRN, Brazil
- Cesimar Nascimento, UFRN, Brazil
- Cristiane Pita, UFRN, Brazil

ABSTRACT

Background: Performance assessment for medical residents is mainly focused on cognitive and clinical performance rather than behavior assessment. The 360-degree assessment allows to assess individual competency. The objective of this study was to report challenges in the of 360-degree assessment implementation on a Brazilian Cardiology (CRP) and Internal Medicine Residency Program (IMRP)

Summary of Work: The Cardiology and Internal Medicine Residency Programs were reviewed to identify the methods of resident's assessment. A course to train preceptors and professors in the 360-degree assessment was conducted

Summary of Results: The initial diagnosis identified that both programs almost exclusively assess cognitive performance of residents. Most of clinical staff was not comfortable with different formats of resident's assessment. Residents also were not used to perform self (SA) and peer review assessment (PRA). The training course was focused on the use of Mini CEx as a tool to assess the resident's performance. 70% of CRP preceptors team were trained and began to assess residents using Mini CEx. Only 11 from 20 residents performed self and peer review assessment. X residents were assessed by patients.

Discussion and Conclusions: There is a lack of staff training on competency assessment. Residents are not used to SA or PRA, which are the key point to be faced to implement 360-degree assessment in residency programs. It occurs because most physicians has never experienced this kind of assessment during their medical education. The clarification on 360-degree assessment purpose, the involvement of hospital/academy staff and assessment guidelines are essentials to implement multi sources assessments.

Take-home Messages: The 360-degree assessment in medical residency is complex and requires staff and resident training.

Development of a structure debriefing assessment tool for health care event: The Pearl of Wisdom tool (POW tool)

AUTHOR(S):

- Yi-Chun Chen, Taipei Medical University Hospital, Taiwan (Presenter)
- Jen-Chieh Wu, Taipei Medical University Hospital
- John O'Donnell, Pittsburgh University, USA
- Paul Phrampus, UPMC, USA

ABSTRACT

Background: Faculty-lead debriefing is a core element of experiential learning. The pearl of debriefing is to facilitate the learners on reflecting their action, figuring out “What, How and When” it happened, understanding “Why” it happened, and developing effective management for the patient care. The objective is to develop a structural debriefing assessment tool for health care professionals.

Summary of Work: A framework built for the debriefing assessment instrument, constructed based on a comprehensive search of contemporary literature and the debriefing experiences of expert group. Then, we developed the instrument using the modified Delphi process. 10 experts with specialty in debriefing and medical education from America, Singapore, Taiwan and China were invited to our external expert panel. A total four rounds of Delphi process were conducted in 18 months with more than 90% response rate and reached 8.61 consensus-score out of 9 points.

Summary of Results: The final debriefing assessment tool includes four categories with 14-item questions. The first part: Setting-up/Initiate section with 4 items: 1. Asks students if they are comfortable and ready to begin debriefing, 2. States ground-rules for the session to establish a positive learning environment 3. Asks questions to gather information on what participants believe occurred in the session 4. Acknowledges participant statements of performance. The second part: Analyze/Cover objectives with 4 items: 5. Maintains debriefing focus on scenario objectives or key actions/behaviors 6. Promotes participant reflection through use of questions and guided conversation 7. Facilitates the process of understanding performance. 8. Helps students to close knowledge, attitude or skill (KAS) GAPS. The third part: Summary/Take-home with 3 items: 9. Reviews key simulation events 10. Identifies actions which were effective and need improvement 11. Clarifies which events during the simulation were most important. The last part: Skills crossing all phases including 3 items: 12. Organizes the debriefing conversation 13. Utilizes effective verbal techniques during facilitation 14. Uses effective non-verbal techniques during facilitation.

Discussion and Conclusions: The Pearl-of-Wisdom tool provided a means for the evaluators and debriefers to discuss the observed performance which could be used as a powerful faculty development tool. The inter-rater reliability is tested now.

Take-home Messages: Pearl-of-Wisdom tool could be a powerful tool for faculty development.

Improving Feedback for Students: Encouraging Student Agency and Self-advocacy

AUTHOR(S):

- **Hannah McGinness, University of Sydney, Australia (Presenter)**
- Patrina Caldwell, University of Sydney, Australia
- Hasantha Gunasekera, University of Sydney, Australia
- Karen Scott, University of Sydney, Australia

ABSTRACT

Background: Student dissatisfaction with feedback on clinical placements is common despite feedback training for teachers. Brief placements are particularly challenging, due to limited time for skill observation and development of learning relationships. We aimed to determine whether a feedback workshop for medical students improves their seeking of and satisfaction with feedback.

Summary of Work: Following exploratory student focus groups, we developed a feedback workshop for University of Sydney medical students undertaking their Paediatric placements (3 x 2 week clinical attachments). It encouraged student agency and self-advocacy in obtaining feedback and provided specific tools to aid feedback seeking, recognition and utilisation. The workshop was piloted with an initial group of 10 students, and implemented for all students in 2 subsequent cohorts. Training was evaluated with focus groups and pre/post surveys in the initial cohort (pilot and control groups) and 2 subsequent cohorts. Likert-scale quantitative data was analysed with descriptive statistics. Bandura's social learning theory informed thematic analysis of qualitative data on student feedback behaviour.

Summary of Results: Pre- and post-survey data analysis of the first full cohort implementation showed the percentage of students satisfied with overall feedback, quality of feedback and quantity of feedback, and the percentage of students seeking feedback at least weekly improved (p values <0.05). Pilot group results were statistically significant only for satisfaction with overall and quality of feedback. None of the control group results were significant. Final cohort analysis is pending. Thematic analysis found students who attended the feedback workshop reported increased confidence in seeking feedback. For some this resulted in behaviour change, with students requesting feedback in situations where they previously would not have. The specific feedback tools did not result in improved student feedback behaviour.

Discussion and Conclusions: After the first full cohort workshop, students sought and received feedback more often with greater confidence and were more satisfied with the feedback received. Similar trends were seen in the pilot group but were only significant for some outcomes.

Take-home Messages: As an adjunct to teacher feedback training, student workshops may improve self-advocacy in obtaining feedback and feedback satisfaction. This may be particularly important for brief attachments where feedback challenges are amplified.

Feedback Culture in Medical School: An Observational Study of Non-verbal Cues in Simulated Communication Skills

AUTHOR(S):

- Kudzai Sibanda, Queen Mary University of London, UK (Presenter)

ABSTRACT

Background: Certain aspects of medical culture, such as the power dynamic between tutor and student, are barriers to students receiving constructive feedback. A large amount of communication is non-verbal, so I aimed to observe the student-tutor behaviour surrounding feedback. I was curious how tutors balance giving critical feedback with building confidence and how students experience this feedback on an emotional level. To what extent does feedback culture in medical school influence behaviour in simulated communication skills practice?

Summary of Work: This is an observational qualitative study focused on the feedback interactions between 6 medical students and 3 tutors in 3rd year simulated communication skills sessions. Data was collected via narrative non-participant observation using extensive field notes and continuous recording. I then conducted semi-structured interviews with the participants. The observational field notes helped shape the interview questions, to explore whether my observations reflected the experience of the participants. Using observation and interviews facilitated triangulation of the data increasing the validity and depth of the study.

Summary of Results: I used thematic analysis to identify congruent themes found in the interview transcripts and observational field notes. Themes were focused on anxiety, embarrassment, anger, reassurance and pride when receiving feedback. Tutors did not mention whether they adapted their techniques when students begin to exhibit non-verbal cues of discomfort, due to them being unsure how to. The balance between giving constructive feedback and building confidence was mentioned by tutors to be challenging. Modulation in voice and body language of the tutor affected students view of their own performance.

Discussion and Conclusions: Students react differently when receiving feedback and it may be beneficial for tutors to be trained to adapt to students showing a range of emotional responses. Often how the feedback is given and not necessarily the feedback content itself including but not limited to the body language, tone of voice, and environment can have a big influence on the effect of the feedback.

Take-home Messages: It is important that tutors are able to understand the emotional impact of receiving feedback. I have made suggestions as to why and how information about non verbal cues should be given to tutors as part of their tutor training.

The role of video-assisted feedback sessions in resident teaching: A pre-post intervention

AUTHOR(S):

- **Jaclyn Vertes, Dalhousie University, Canada (Presenter)**
- Allen Tran, Division of General Internal Medicine, Department of Medicine, Canada
- Tasha Kulai, Division of Digestive Care & Endoscopy, Department of Medicine, Canada
- Lori Connors, Division of General Internal Medicine, Department of Medicine, Canada

ABSTRACT

Background: Despite providing a large component of teaching to trainees, internal medicine residents receive little feedback on their teaching ability.

Summary of Work: This was a single center study of senior internal medicine residents in Halifax, Nova Scotia, Canada. Participants had a classroom-based teaching session video recorded. The recording was then watched by the participant and by two feedback facilitators, who then all met for face-to-face feedback. Participants completed a self-reflective exercise after this intervention. Audience members of the recorded session and a post-feedback teaching session completed an evaluation form. Scores from the evaluation forms from each phase were analyzed with the Wilcoxon Signed-Rank Test. Inductive coding was performed for qualitative data from the feedback sessions and reflective exercises.

Summary of Results: A total of 19 residents participated. There was no statistical difference in the evaluation form scores between the pre-intervention and post-intervention teaching sessions. Mean scores varied from 4.6 to 5.0 out of 5.0 on combined pre- and post-intervention evaluations. The majority (88.9%) of participants found viewing their recorded session useful, and 94.4% stated the intervention was worth continuing. Common themes of feedback and self-evaluation included “time-management,” “organization,” “communication,” and “environment.”

Discussion and Conclusions: There was no difference in the evaluation form scores after the intervention, but baseline scores were high. The majority of residents found the intervention and viewing a video recording of their teaching useful for development.

Take-home Messages: The addition of video recording teaching sessions, followed by formal feedback, could improve resident teaching ability.

Students' experience of 'Firecracker' as a formative assessment tool in the Cardiovascular Course of MBBS programme in the University of the West Indies

AUTHOR(S):

- Anwarul Azim Majumder, Faculty of Medical Sciences, The University of the West Indies, Cave Hill Campus, Barbados (Presenter)
- Subir Gupta, Faculty of Medical Sciences, The University of the West Indies, Cave Hill Campus, Barbados
- Oswald Peter Adams, Faculty of Medical Sciences, The University of the West Indies, Cave Hill Campus, Barbados
- Bidyadhar Sa, Faculty of Medical Sciences, The University of the West Indies, St. Augustine, Trinidad & Tobago
- Keerti Singh, Faculty of Medical Sciences, The University of the West Indies, Cave Hill Campus, Barbados

ABSTRACT

Background: Students should be assessed frequently and consistently throughout their medical training to track progress and determine whether they achieve required competencies. Formative assessments can enhance cognitive and motivational support for learning and achievement. Firecracker, an online educational software (<https://med.firecracker.me/>), provides an objective and accurate assessment of student performance and determines progress relative to peers. It was introduced in 2017 at the Cave Hill Campus of the University of the West Indies for the Year-2 cardiovascular system course in the MBBS degree. The objectives of this study were to determine: (i) satisfaction of students with Firecracker and (ii) their use of Firecracker.

Summary of Work: Questions and quizzes were uploaded weekly for 9 weeks by the Firecracker Administration. They were of a mixed type: analytical, problem solving, and knowledge-based and covered major areas of the cardiovascular system. The access, usage and grades from the Firecracker website were analysed. A paper-based questionnaire was used to seek the views of students (n=93) enrolled in the cardiovascular course.

Summary of Results: Of 91 students enrolled in Firecracker, 60 students completed the questionnaire (response rate 67%). During the 9-week period, 77% of all Firecracker quizzes were completed. The mean score achieved on the quizzes was 57% (range 0 to 100%). Three students were identified as being 'at risk' with an average quiz performance of <35%. Students who used Firecracker consistently achieved better cardiovascular system course grades compared to those using it occasionally or never. Most students reported being happy using Firecracker (70%), they found Firecracker helpful in complementing coursework (78.3%), and preparing for exams (58.4%). Most students (68.3%) found that the weekly Firecracker quizzes were well aligned with the course lectures.

Discussion and Conclusions: Firecracker was welcomed by the students, perceived to be helpful and use of this software was associated with better academic performance. Firecracker is likely to be useful in other courses for continuous monitoring of the progress of the students.

Take-home Messages: Firecracker identified students at risk of failing course examinations. Students were satisfied with its use as a formative assessment tool and it was found to be associated with better examination performance.

Feedback and Feedforward

AUTHOR(S):

- Linda Waggoner-Fountain, University of Virginia School of Medicine, USA (Presenter)
- Meg Keeley, University of Virginia School of Medicine, USA
- Maryellen Gusic, University of Virginia School of Medicine, USA

ABSTRACT

Background: The University of Virginia School of Medicine's Entrustable Professional Activities program promotes learning through provision of real-time feedback and integration of student support systems in order to foster learners' continued development. Master Assessors (MAs), faculty selected to engage in assessment across disciplines and clinical environments, identify learners who need assistance from either their faculty Coach and/or their Advisory Dean.

Summary of Work: MAs are uniquely qualified to identify learners in need of focused attention to address issues related to their clinical performance. MAs communicate directly with a student's Coach if a student is not meeting clinical performance expectations. Coaches partner with students to analyze and interpret all performance data to create an individualized learning plan. MAs contact a student's Dean if they believe that other academic or non-academic issues may be impacting a student's performance. Coaches work closely with the Deans to form a team of student support. The MAs also comprise the Entrustment Committee and are charged with summative decision-making about learners' readiness for graduated autonomy at key transition points in the curriculum. Decision-making discussions are summarized with feedback to the student and their Coach to further inform learning plan development.

Summary of Results: Since February 2018, 5 MAs completed 1481 assessments in 8 core clinical clerkships. 38% assessed students' abilities to gather a history and perform a physical exam; 22% assessed oral presentation skills and 20% assessed documenting an encounter in a clinical record. 304 learning plans have been completed by student-Coach pairs since July 2018.

Discussion and Conclusions: MAs engage learners in a reflective dialogue in the context of assessment and are empowered to communicate with Coaches and Deans. MAs provide both real-time and summative feedback to learners. Coaches guide students in creating a plan for clinical performance development and Advisory Deans address broader academic and non-academic issues.

Take-home Messages: Faculty with expertise in assessment can be integrated into multifaceted student support frameworks. By identifying students needing assistance, they ensure that this information can be used to help the learner get to the next stage of competence.

A feedback initiative, changing the culture of learning

AUTHOR(S):

- Kristian Krogh, Aarhus University Hospital, Denmark (**Presenter**)
- Anders Stochholm Nielsen, Herning Regional Hospital, Denmark
- Rikke Mossin, Randers Regional Hospital, Denmark
- Carsten Søndergaard Poulsen, Viborg Regional Hospital, Denmark
- Mads Skipper, Central Denmark Region, Denmark

ABSTRACT

Background: Workplace based learning is commonly used in medical education. But there is not a conceptual model or framework to guide organisations expanding the workplace based learning from postgraduate medical education to intercollegial postgraduate health education. One way to promote intercollegial learning, is promoting feedback in the daily work - focusing the organisation on continuous workplace-based learning. The scope of this study is thus to help organisations within hospitals and departments, to better interweave the focus on patient care with an educational focus by exploring enablers and barriers to intercollegial verbal feedback, and exploring ways to promote enablers and diminish barriers through an action research approach.

Summary of Work: Informed by Engeström's activity theory in the process of expansive learning, our aim was to foster an expansive learning environment in the department and exploring the complexity of the phenomena of feedback practice and culture, while breaking down barriers and supporting enablers. At the department of anaesthesiology at Randers Regional Hospital. We establish a voluntary frontrunner group of 12-15 people. As accustomed in action research process, this group helped designing and planning, and thereby tailor the process meeting the particular needs of the department. At baseline and at 18-month follow-up, an inductive thematic analysis of semi-structured interviews with the frontrunner group, and a control group, randomly selected among the staff.

Summary of Results: For both groups there were a shift in their approach to feedback. Often the barriers that were dominant at baseline were reduced or diminished. Some of the primary results from the analysis include enablers, such as: Having a forum for the frontrunners to meet, share ideas, and support each other. Ask for feedback to establish a norm and an expectation of giving and receiving feedback. Practise in peace by giving feedback on harmless topics. When giving feedback, do it with curiosity and interest.

Discussion and Conclusions: Overall, the feedback culture in which verbal feedback is actively embedded in intercollegial cooperative relation seems to have changed to be more constructive as barriers are being diminished.

Take-home Messages: Don't be afraid to ask for feedback, it will change the culture of learning.

“Is it me or is it the student?”: Clinical supervisors’ experience of giving feedback to physiotherapy students in clinical integrated learning

AUTHOR(S):

- Malin Sellberg, Karolinska Institute, Sweden (Presenter)
- Kirsti Skavberg Roaldsen, Karolinska Institute, Sweden
- Malin Nygren Bonnier, Karolinska Institute, Sweden
- Riitta Möller, Karolinska Institute, Sweden
- Alexandra Halvarsson, Karolinska Institute, Sweden

ABSTRACT

Background: Within health care education, clinical integrated learning has an important role in developing students abilities in clinical reasoning and combining theory and practice. Feedback is a cornerstone in effective clinical teaching and widely embedded in training professional activities. It facilitates learning for the student who will be aware of their strengths and areas of improvement. However, receiving and giving feedback is quite challenging task both for the students and their supervisors. The aim of this study was to explore clinical supervisors’ experience of giving feedback to physiotherapy students during clinical integrated learning.

Summary of Work: Informants, who were clinical supervisors for physiotherapy students were recruited in 2016 from the Department of Physiotherapy, Karolinska University Hospital, Sweden. Of all thirteen eligible clinical supervisors, one declined and 12 accepted participation. Data were collected with two focus group interviews. The informants’ experiences of giving feedback to students constituted the unit of analysis. The transcripts were systematically analysed by inductive qualitative content analysis. A purposeful and maximum variation sampling strategy was used to obtain breadth in data.

Summary of Results: Based on our preliminary results three categories emerged: constructive dialogue, Professional honour and action plan. Constructive dialogue is composed of the subcategories Promotes, Aggravates and Responses to feedback and incorporates the supervisors’ expectations to creating a constructive dialog with the student. Professional honour comprised subcategories Supervisors credibility, Emotional impact and Professional approach and describes how keen the supervisors were to have a professional attitude when giving feedback. Action plan comprising the subcategories Educational tools, Competence development and Support, describes how strategies were used to get support in giving feedback.

Discussion and Conclusions: Clinical supervisors manage different feedback situations by using educational tools and by reflecting together with a colleague. In difficult situations, clinical supervisors seek guidance and support from an experience colleague or the clinical teachers.

Take-home Messages: A professional attitude, educational tools and collegial support eases difficult feedback situations for clinical supervisor.

How do medical students value a multi-source feedback in developing their clinical skills?

AUTHOR(S):

- Ayad Al-Moslîh, Qatar University, Qatar (Presenter)
- Suvarna Prakash, Qatar University, Qatar
- Maha Desouki, Qatar University, Qatar
- Farhat Fatima, Qatar University, Qatar
- Alison Carr, Qatar University, Qatar
- Sheeba Sarafudheen, Qatar University, Qatar

ABSTRACT

Background: Feedback is a key element of formative assessment. Students and educators agree on the positive value of feedback after an observed clinical performance. Receptivity of feedback is influenced by the assessment culture. Promoting students' agency and active involvement in the process has been emphasized in the literature.

Summary of Work: 46 pre-clerkship medical students had multiple formative objective structured clinical examinations (OSCE) over two academic years. Some OSCEs targeted students individually and others involved groups of four students: with each rotating through being assessed and providing peer feedback. Five minutes per station was allowed for feedback following a ten-minutes performance time. After every formative OSCE, feedback was sought via a seven-item questionnaire, with opportunity for free comments.

Summary of Results: Total responses were from 39/46 students in the first formative OSCE, 13/46 in the second, and 14/46 in the third. All students preferred a formative OSCE over a didactic clinical skills revision session. The vast majority (97%) agreed that the feedback they received was useful. However, they requested longer time for feedback. 100% indicated that they benefited from listening to peer feedback. 87% preferred having the formative OSCE in small groups. 13% prefer to be assessed individually and receive feedback only from their examiner.

Discussion and Conclusions: Formative OSCE in small groups enabled students to be actively involved in reinforcing good practices and sharing misconceptions in clinical skills. The dominating students' preference for small group OSCEs encouraged the planners to organise further similar formats. The feedback time is planned to be increased. Students' preference to listening to colleagues feedback makes group OSCEs more advantageous. Planners believe more clinical skills can be formatively assessed through group OSCE with increased number of station for better exposure, less number of examiners and a similar or shorter overall time.

Take-home Messages: Group formative OSCE is liked by the majority of students. The added benefit of self, peer and examiner feedback facilitates bridging gaps in clinical skills performance. It also is more time-efficient and human resource- sparing from organizers perspective.

A Comparison on Attitude to Cadaveric Dissection between Thai and Ethiopian Medical Students

AUTHOR(S):

- **Natthiya Sakulsak, Faculty of Medical Science, Naresuan University, Thailand (Presenter)**
- Rachanee Chanasong, Faculty of Medical Science, Naresuan University, Thailand
- Abay Mulu, Department of Human Anatomy, College of Medicine and Health Sciences, Addis Ababa University, Ethiopia

ABSTRACT

Background: Cadaver-based instruction has been used as the main instructional tool in anatomical education. Naresuan University, Thailand and Addis Ababa University, Ethiopia encourage medical students to perform human dissection. This study investigates how the medical students' attitudes toward dissection vary with nationality and religion.

Summary of Work: The attitudes of 168 second-year medical students in Naresuan University, Thailand and 147 students in Addis Ababa University, Ethiopia toward cadaveric dissection were assessed by the same questionnaire. The questionnaires were distributed in 1 week before the initial dissection and after practicing dissection for 8 weeks. The data was analyzed by t-test at $P < 0.05$.

Summary of Results: 61.9% of Thai students were female and 94.65% Buddhist whereas 85.7% of Ethiopian students were male 87.8% Christians and no Buddhist. After 8 weeks exposure to dissection, most students of both universities displayed significantly increasing interest and excitement ($P < 0.05$). Thai and Ethiopian students considered that the factors of dissection room stress were the chemical odour (38.1% and 59.2%, respectively) and irritation of their eyes (41.07% and 20.4%, respectively). Over than 90% of the both students considered that human cadaver dissection was important for anatomy learning.

Discussion and Conclusions: The students of both universities had a similar opinion that chemical odour and irritation of their eyes were factors of dissecting room stressful. However, they preferred to continue dissection method in anatomy learning. **Conclusions:** This present study reported that most of the Thai and Ethiopian medical students showed interest in human cadaveric dissection although the nationality and religion were different. The environment of the dissection room could induce the student stressful.

Take-home Messages: Thai and Ethiopian medical students found that dissection is useful but the dissecting room environment should be concerned.

Musculoskeletal anatomy of the upper limb: Evaluation and comparison of common teaching & learning modalities

AUTHOR(S):

- **Vasileios Mitrousias, University of Thessaly, Department of Anatomy, Greece (Presenter)**
- Sokratis Varitimidis, University of Thessaly, Department of Orthopaedic Surgery, Greece
- Dimitrios Arvanitis, University of Thessaly, Department of Anatomy, Greece
- Aristeidis Zibis, University of Thessaly, Department of Anatomy, Greece

ABSTRACT

Background: Anatomy teaching and learning has traditionally been based on dissection. However, alternative teaching modalities such as prosections or plastic models, and newer ones such as three-dimensional anatomy software, are more and more used during the educational process. The goal of the present study is a. to investigate students' perceptions on each learning modality and b. compare the efficacy of the above teaching modalities in knowledge acquisition.

Summary of Work: In total, 349 first-year, volunteer, medical students without previous knowledge of anatomy, were taught gross anatomy of the upper limb, using four different learning modalities: dissection, prosections, plastic models and a 3D human-anatomy software. Each group was taught with four hours of lectures and four hours of laboratory work. Students' knowledge was examined by 100 questions. Half of them were tag questions of cadaveric specimens and anatomy atlas' images. The other half were multiple-choice questions (McQ), level-1 or 2 in Blooms taxonomy. An evaluation questionnaire was also given to students. The duration of the study was 4 years.

Summary of Results: Student-based analysis revealed that students of the dissection and the 3D group performed statistically significantly better in total questions and in McQ, compared to those of the prosection and the plastic-models group ($p < 0.001$). In tag questions, students of the 3D group performed significantly better, compared to the other three groups ($p < 0.001$). Regarding students' perceptions, dissection received higher ratings in questions assessing students' satisfaction, expectations but also fear/stress before the laboratory ($p < 0.001$). There was no difference between the four modalities regarding educational value ($p = 0.12$), but dissection and 3D software were considered more useful in preparing for clinical activities ($p < 0.001$).

Discussion and Conclusions: Dissection of fresh-frozen cadavers remains first in students' preferences and achieves higher knowledge acquisition. Contemporary, 3D anatomy software is considered equally important when preparing for clinical activities and mainly favor spatial knowledge acquisition. Prosections could be a valuable alternative when dissection is unavailable due to limited time or shortage of cadavers. Plastic models are less effective in knowledge acquisition but could be valuable when preparing for cadaveric laboratories

Take-home Messages: In conclusion, technological advances provide new, useful learning modalities, which could be successfully combined with dissection in a modern medical curriculum.

Challenges faced by Anatomy Honors students during weekly structured journal club activities

AUTHOR(S):

- Sanet Kotzé, Stellenbosch University, South Africa (Presenter)
- Elsje-Marie Geldenhuys, Stellenbosch University, South Africa

ABSTRACT

Background: Scientific writing is a skill that needs nurturing in a postgraduate program. To this end, anatomy honors students at Stellenbosch University participate in compulsory weekly journal club meetings. Students take turns in choosing and presenting a paper which is circulated to all students for critical evaluation prior to the meeting. All students are required to write an abstract of the weekly article, which is peer-marked. In addition, the facilitator marks, corrects and documents mistakes and misconceptions, which are discussed during the meeting. Previous research indicated that these students have a positive perception of the journal club activities particularly regarding their writing, presenting and scientific communication skills.

Summary of Work: The aim was to determine, from the point of view of the facilitator, what the common mistakes and misconceptions made by the students were, and if there were any noticeable improvements during the course of the year. Materials and Methods During 2015 (n=6) and 2016 (n=7), the same facilitator kept detailed notes on abstract writing, peer marking, presentation abilities and general performance of each student during the journal club meetings throughout the year. Notes were subjectively evaluated while particular attention was given to comparing notes early in the year with those taken later.

Summary of Results: Facilitator notes revealed the following: initial mistakes included confusing aims, objectives and epidemiological terms, general syntactic errors and longwinded writing. Initially, students often chose journal articles from low impact factor journals. After a few months, understanding the implications of journal impact factors, being able to recognize a well-written article and having the ability to evaluate an article without being over critical, improved. Writing became more concise and peer marking became more meaningful and less critical of small mistakes towards later months. Student presentation skills and their ability to successfully articulate their contributions during meetings, improved towards the end of the year.

Discussion and Conclusions: It was clear that students fared better with abstract writing in articles that were in their research field.

Take-home Messages: This qualitative study shows that the activities are beneficial to the development of students as future academics and will continue in the future.

illuminating the impact of a seven-day challenge drawing the celiac trunk on medical students' anatomical knowledge retention skills

AUTHOR(S):

- Piyachat Chansela, Phramongkutklao College of Medicine, Thailand (Presenter)
- Manop Chaimati, Phramongkutklao College of Medicine, Thailand
- Malee Chanpoo, Phramongkutklao College of Medicine, Thailand

ABSTRACT

Background: Knowledge of human topographical anatomy is the key foundations indispensable in performing clinical and intervention procedures and diagnoses. This core foundation needs to be retained; however, the nature of human anatomy makes it difficult for students to retain the myriad of information. Therefore, the new approach for anatomy teaching to help and improve their conceptual knowledge and make anatomy learning enjoyable is needed.

Summary of Work: This study demonstrated that students felt about this specific drawing was fun and so challenging and also made them paid attention to their work and reinforce them to read more books comprehensively.

Summary of Results: After the class finished, only 2.2% among them could memorize the structure of the celiac trunk and their associated branches. 31.5% of students could memorize the detailed contents approximately 50% and less than 50%. Interestingly, after the assignment, students expressed significantly gain knowledge retention. 10.9% of students felt confident that they could memorize all the structures. Nearly 62% of students could memorize more than 80% of the contents after challenge drawing. Furthermore, students' reflection showed that 91.3% of students were impressed this challenge and wanted it to be continued regularly. Of note, 7.6% of students thought that this challenge was benefit to improve their knowledge retention, but it occupied much of their time.

Discussion and Conclusions: In this study, we developed new challenging approach in teaching anatomy particular in the region of celiac trunk and evaluated the outcome of this strategy. Our study demonstrates that a seven-day challenge drawing the celiac trunk has a strong positive impact on not only improving knowledge retention skills in human topographical anatomy for medical students, but also making it more pleasurable to medical students.

Take-home Messages: A seven-day challenge drawing is a promising teaching approach in promoting knowledge retention skills.

A Study on the Effectiveness of Virtual Reality Models in Anatomy Education

AUTHOR(S):

- **Sristi Acharya, Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore (Presenter)**
- Eric P H Yap, Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore
- Sreenivasulu Reddy Mogali, Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore

ABSTRACT

Background: Cadaveric specimens are frequently used in teaching and learning of human anatomy but are becoming harder to procure due to various constraints. In addition, each student only gets a limited hands-on time with the specimens owing to the decreased curriculum time for anatomy education. With limited time and resources, students might not be able to consolidate their knowledge effectively. Virtual reality (VR) is a possible low-cost alternative for anatomy education. VR can potentially bring education outside the classroom and revolutionise digital learning by reducing specimen and facility costs and allowing students to employ independent learning with access to relevant resources at all times. The aim of this study is to develop low-cost photorealistic three-dimensional (3D) VR models and explore its effectiveness as a learning tool.

Summary of Work: Plastinated specimens were scanned using stereoscopic photogrammetry to create photorealistic VR models. They were subsequently integrated with anatomy notes in a website. Year 1 and 2 medical students were recruited. Two sub-studies were conducted; the first simulating a practical where VR was compared against a live instructor, and the second simulating independent learning where VR was compared to plastinated specimens. Students' learning was measured using pre-trial and post-trial quizzes for each method of education. A survey on students' perceptions of the different learning methods was also conducted.

Summary of Results: The VR website is shown to be an excellent resource for independent learning. There is no statistically significant difference in student performance ($p > 0.05$) when VR is compared to other teaching methods. Students perceived the VR website to be useful due to its easily accessible, intuitive and interactive models.

Discussion and Conclusions: This study shows that photorealistic 3D anatomical models integrated into a VR website are effective learning tools for practical or lesson preparation and revision. These models not only serve as a valuable adjunct to the cadaveric specimens but also complement traditional teaching methods.

Take-home Messages: These outcomes show great potential for the VR website in enhancing anatomy education. It also encourages further work into creating a database of photorealistic VR models and exploring its use in anatomy education and research.

Utilization of Virtual-Reality Technology for Learning Medical Anatomy

AUTHOR(S):

- **Seu-Hwa Chen, Department of Anatomy and Cell Biology, School of Medicine, Taipei Medical University, Taiwan (Presenter)**
- Kung-Pei Tang, Department of Education and Humanities in Medicine, School of Medicine, Taipei Medical University, Taiwan
- Tsan-Hon Liou, School of Medicine, College of Medicine, Taipei Medical University, Taiwan

ABSTRACT

Background: The virtual reality (VR) technology has received increasing attention in terms of medical education. Eight sets of virtual reality equipment are since 2018 available to the instructors and students at Taipei Medical University for teaching and learning medical anatomy in addition to cadavers. This study aims at investigating the correlation between students' utilization of VR technology in medical anatomy and their learning performances.

Summary of Work: 56 nursing school students who participated in medical anatomy course in 2018 were recruited for this study. The first half anatomy sessions were taught by cadavers. Students used VR program in addition to lectures in the other sessions. Data of their learning achievements prior to (midterm) and after using VR equipment (final), the usage count and flow state by using VR equipment were collected for investigating their Spearman's rank correlation coefficient. The 36-items LONG Flow State Scale (FSS-2-General) was employed to investigate students' perception. FSS-2-General comprises 9 domains: 1. Challenge-Skill Balance; 2. Merging of Action and Awareness; 3. Clear Goals; 4. Unambiguous Feedback; 5. Concentration on the Task at Hand; 6. Sense of Control; 7. Loss of Self-Consciousness; 8. Transformation of Time; 9. Autotelic Experience.

Summary of Results: According to Spearman's rank correlation coefficient, participants' learning performance after using VR equipment are significantly correlated to their midterm test scores ($\rho = .445$, $p = .001$), to the VR usage ($\rho = .295$, $p = .027$), and also to their flow state responses to "sense of control" ($\rho = .289$, $p = .031$).

Discussion and Conclusions: Although students who performed better in final examination had also more VR equipment usage, they had higher academic achievement in medical anatomy even without using VR equipment. Using the VR equipment was not required for the course participants. Students who perform better in final examination could be profiting from VR usage, but also could be highly motivated in learning anatomy. In addition, respondents' "Sense of control" in VR is the only factor that significantly correlated to their final exam scores.

Take-home Messages: Regarding the high cost of VR equipment, further study on this technology enhanced learning outcomes would be much needed.

Students' self-reflection on their real experiences during early exposure to conducting clinical research in their first-year clinical clerkship

AUTHOR(S):

- Wachiraporn Arunothong, Lampang Regional Hospital, Thailand (Presenter)

ABSTRACT

Background: Clinical research skills are crucial for medical students. Students still lack these skills after graduation. Reasons may be that the students curricula contain only clinical clerkships, and research methodology, while research experience for students is optional as an elective or a summer opportunity. Lampang Medical Education Center has initiated a mandatory 4-weeks rotation for first-year medical clerkship students to provide an opportunity for them to conduct research, themselves.

Summary of Work: Students were divided into groups of 3-4, according to their interest. Each rotation had 3 groups. Mentors from medical specialties including internal medicine, surgery, pediatrics, Ob&Gyn etc. initiated research topics. Students chose a topic and worked with their mentors on the following: 1)research question development, 2)literature review, 3)methodology, 4)proposal, 5)IRB submission, 6)data collection, 7)data analysis, 8) summary writing, 9)presentation preparation, and 10)final report. Students had 1 month before the new semester started to complete steps 1-5. Steps 6-10 were done during the rotation. Students' performances and knowledge were evaluated. Students reflected about what they learned and their attitude in the online evaluation.

Summary of Results: All of the students' performances were satisfactory. Students passed the knowledge test. Out of 41 students, 40 completed the reflections and attitude questions. A positive attitude was expressed by 95% of the students. They felt confident, challenged, and proud. They had a chance to use a search engine to do a systematic search, use statistical software, and learn the research process. On their first research presentation, 75% of them felt nervous but they gained more confidence in the process. About 83% thought research skills would be useful for their future study, 10% felt exhausted and 4% of them did not enjoy it.

Discussion and Conclusions: Through careful topic selection, students completed the research in a block. Students said they experienced benefits, had a good attitude, and enjoyed it. The topics being initiated by mentors, the proper duration, and the early inclusion of this rotation in the first-year clinical clerkship curriculum were debated among the students.

Take-home Messages: Its time to include a mandatory research rotation in a clinical clerkship curriculum.

“Health System Research” teaching in 5th year medical students by multidisciplinary staff in Medical Teaching Center, Sunprasitthiprasong Hospital, Thailand: 10-year experience

AUTHOR(S):

- Siritip Sanguanwongwan, Sanpasitthiprasong Hospital, Thailand (Presenter)
- Wisit Sanguanwongwan, Sanpasitthiprasong Hospital, Thailand
- Prapaporn Suwaratchai, Sanpasitthiprasong Hospital, Thailand
- Parinya Chamnan, Sanpasitthiprasong Hospital, Thailand
- Supot Saithong, Sanpasitthiprasong Hospital, Thailand

ABSTRACT

Background: Health system research is part of core medical curriculum, which has been taught in 5th year students at Sanpasitthiprasong Regional Hospital since 2007. The objective of this study was to describe 10-year experience in teaching health system research using a multidisciplinary team approach at this teaching hospital.

Summary of Work: Since 2007, ‘health system research’ teaching in the 5th year of medical curriculum has been run by a multidisciplinary team of instructors comprised of 3 medical doctors, 1 dentist, 2 nurses, 1 pharmacist, 1 lab technician, 1 radiology officer and 1 medical statistician. Most of these instructors had a certificate of “The International Short Course In Epidemiology and Biostatistics” from KhonKaen University, Thailand. Over a 4-week period, the 5th year medical students learned about health system research through a series of lectures on research methodology, group discussion and statistical analysis workshop. Simultaneously, the students were divided into groups of 4-7 persons, with each group required to complete and submit a research project at the end of the rotation. The students worked on their research projects under supervision of multiple supervisors. They could freely seek advice from any advisors regardless of the subjects/topics they taught. The students were allowed to make decision in each and every step of their research by themselves. Multiple evaluation methods were used including proposal presentation, poster and oral presentation of their research, multiple choice questions, practical tests on data management and statistical analyses, oral examination and manuscript writing.

Summary of Results: Over 11 years, all of 397 students passed the summative examination. Most of the students (57.68%) received grade ‘A’. A total of 82 researches (44 cross-sectional survey, 36 Cross-sectional analytical and 2 case-control studies) were conducted. The size of group of students for best cooperative working was a group of 4 persons. Student feedback suggested high satisfaction: 94.5% for personality of teachers, 91.0% for teaching skill, 89.9% for evaluation process and 94.5% for classroom conditions.

Discussion and Conclusions: A multidisciplinary team of instructors played a crucial role in fostering research skills in medical students and may represent an effective alternative of ‘Health System Research’ teaching

Take-home Messages: Medical students could respect and learn from multidisciplinary.

Research of medical students of Sunpasit Hospital Ubonratchathani, Thailand: A 5-year audit

AUTHOR(S):

- Prapaporn Suwaratchai, Sunpasitthiprasong Hospital, Thailand (Presenter)

ABSTRACT

Background: Research training is essential in a medical student curriculum. Sunpasitthiprasong hospital Ubonratchathani, Thailand has medical student course since 2009. The Objective of this study was to examine the quality of medical student research in Ubonratchathani province Thailand by auditing the results of manuscripts.

Summary of Work: From 2013 to 2017, all manuscripts were evaluated. The study instrument was an evaluation forms that have 5 research skill areas. Manuscripts quality is rated on a numerical (1-5), criteria based scale. Variables such as study designs, subject, sampling method, research instruments, and statistics methods were collected. Descriptive statistics were used to describe data.

Summary of Results: In total, 42 manuscripts were included in a 5-year period. The most common areas were social science ,medical education, prevention and screening and health services research. Cross section study designs was 100 %. The subjects were used in medical student 26.13% and patients 23.81%. Probability sampling was used 21.43% . Almost of the research instruments formulated by researcher 95.24 % and the questionnaire were constructed 95.24%. Statistics methods were 100% Estimation, 80.95% and hypothesis testing and 47.62% . Most of the research were good quality 85.71%. Analysis of manuscripts in five main research skill areas were good - Average score were (1) research methods 3.96 (2) information gathering 3.72 (3) critical analysis and review 3.85 (4) conclusion and suggestion 3.85; (5) discussion. 3.85.

Discussion and Conclusions: Quality of medical student was good and the medical student have good five research skill areas.

Take-home Messages: Research is essential part for medical students. The quality of research could evaluated by manuscript audit.

Factors facilitating the success of fourth-year medical students conducting clinical research according to a new curriculum: Lessons learned

AUTHOR(S):

- Rongtiva Muenpa, Lampang Medical Center, Lampang Hospital, Thailand (Presenter)
- Win Techakehakij, Lampang Medical Center, Lampang Hospital
- Ravin Sony, Lampang Medical Center, Lampang Hospital

ABSTRACT

Background: To enhance research skills for doctors, the Medical Faculty of Chiang Mai University (CMU) added a research skills topic to the new curriculum. Lampang Medical Education Center is affiliated with the Medical Faculty of CMU and so prepared a four-week rotation to teach research skills to the fourth-year class, starting in 2018. A question was raised of “what factors helped the fourth-year medical students to conduct clinical research within a four-week rotation?”

Summary of Work: A review and analysis of the research skills class was undertaken during November and December 2018. The manual and research reports were reviewed and the success of conducting each of the clinical research projects was evaluated. Data were analyzed using descriptive statistics.

Summary of Results: There were 47 fourth-year medical students conducting 12 clinical research projects during May to October 2018. The students were divided into four rotations. Each four-week rotation included 12 students with four students per project. Before starting the class, a four-day workshop was held on writing research proposals and to assign advisers for each project. The advisers came from 8 specialties including internal medicine, pediatrics, gynecology, family medicine, surgery, forensic medicine, emergency medicine and radiology. One of the projects was innovation, 9 were retrospective studies retrieving data from the electronic database and the remaining 2 were randomized control trials (RCT). Most of the time was spent collecting data (75%). At the end of each rotation, the retrospective and innovation projects were presented with completed results whereas the RCT projects were presented with incomplete samples.

Discussion and Conclusions: Most of the projects could be completed within four weeks if the students worked closely with their advisers and completed data collection within 2-3 weeks. The most appropriate study design was a retrospective study. An RCT could possibly be done if they had enough patients to study or had more study time.

Take-home Messages: Factors facilitating the success of fourth-year medical students conducting clinical research within four weeks were (1) well prepared study class, (2) close monitoring by project advisers, (3) retrospective study design and (4) availability of electronic patient database.

Implementation of Guideline Watch for knowledge translation in clinical students: a pilot study

AUTHOR(S):

- Chun-chao Chang, Taipei Medical University Hospital, Taiwan (Presenter)
- M.A i-No Kang, Taipei Medical University Hospital, Taiwan

ABSTRACT

Background: This study aimed to investigate the effects of interactive course with Guideline Watch for knowledge translation in clinical students.

Summary of Work: We (Taipei Medical University Hospital) designed an interactive course for knowledge translation using Interactive Response System in internal medicine training program. The contents were selected two topics about hypertension and sepsis management from the NEJM Guideline Watch 2017. According to the NEJM Guideline Watch, we designed scenarios with questions. Instructors asked questions and explained the evidences that were cited in the NEJM Guideline Watch. Then, the instructors also demonstrated how they appraise and apply the evidences and the guideline in local situation. After the course, students were asked for 10 multiple choice questions. There were 54 students took the course and completed the test. The other 42 volunteers (clinical students) received test also.

Summary of Results: The results showed that the students participating in interactive course with Guideline Watch for knowledge translation ($M \pm SD = 7.11 \pm 2.26$) had higher score in overall test than those in traditional internal medicine training program ($M \pm SD = 4.88 \pm 1.73$). The mean difference was 2.23 ($t = 5.48$; 95% CI, 1.42 to 3.04; $p < .001$). Moreover, the significant differences were observed in both topics of hypertension ($MD = 1.08$; $t = 4.08$; 95% CI, 0.55 to 1.61; $p < .001$) and sepsis management ($MD = 1.15$; $t = 4.12$; 95% CI, 0.60 to 1.71; $p < .001$). We did not observe any significant difference between male and female.

Discussion and Conclusions: The interactive course with Guideline Watch gave clinical students not only specific knowledge about hypertension and sepsis management, but also the process of knowledge translation. Clinical students not only memorized the knowledge that the course taught, but also understood how they evaluate and use evidences. Moreover, the effect of this course was not significantly affected by sex. However, our study cannot prove how the course affect the clinical performance after the knowledge translation. Thus, we suggest that further study should design performance evaluation for outcome assessment.

Take-home Messages: The interactive course with Guideline Watch is a promising strategy for teaching clinical students to learn knowledge translation.

The teaching of evidence-based medicine (skills) for medical students in real life practice

AUTHOR(S):

- Johannes Blom, Karolinska Institutet, Sweden (Presenter)
- Riitta Möller, Karolinska Institutet, Sweden

ABSTRACT

Background: Evidence-based medicine (EBM) means integration of the best research evidence with clinical expertise and patient values. Teaching EBM is now a core content of the curricula at several medical schools, but the methods of teaching often differ between the schools and clinics.

Summary of Work: To create equivalent teaching and examination in EBM at all main teaching hospitals in Stockholm, Sweden, we arranged separate meetings with course leaders and a common workshop on EBM and created a common structure of what the core of EBM consist of.

Summary of Results: The workshops topics were: formulate a question that can be answered; literature search; critical appraisal of scientific information; and application of results to everyday clinical practice. After the workshops the teachers agreed on an EBM examination including a common template for EBM poster as a part of a final examination.

Discussion and Conclusions: Modern medical curricula must include the introduction in EBM and develop students' skills in critical appraisal. What should be included in EBM seems to differ between clinicians and, therefore, an agreement on the contents and examinations are recommended. A model of EBM examination will be presented. To transfer EBM into teaching practice is not simple and teachers should get support and facilitation in examination of the EBM skills.

Take-home Messages: Our teachers and students have to learn that some evidence is better than other evidence.

Medical students' access to research and research education worldwide

AUTHOR(S):

- **Natasha Bouran, International Federation of Medical Students' Associations (Presenter)**
- Erwin Barboza-Molinas, International Federation of Medical Students' Associations
- Javier Asfura, International Federation of Medical Students' Associations
- Mindaugas Galvosas, International Federation of Medical Students' Associations
- Catarina Pais Rodrigues, International Federation of Medical Students' Associations
- Aikaterini Dima, International Federation of Medical Students' Associations

ABSTRACT

Background: Research is undeniably one of the key components of medical practice, enabling great advancements in global health and allowing doctors to provide better healthcare to their communities. Nonetheless, one of the major limitations that medical students face is the lack of exposure to undergraduate research, as well as access to research projects.

Summary of Work: The International Federation of Medical Students Associations (IFMSA), through its Research Exchange and Medical Education Standing Committees, developed a survey to understand the current situation worldwide regarding medical students' access to research and research education in the medical curriculum.

Summary of Results: We received 619 responses from 206 countries, having representation from the 5 regions in which IFMSA is divided: Africa, Americas, Asia-Pacific, Eastern-Mediterranean and Europe. Regarding the results, even though the large majority (97,4%) of the participants agreed that research education should be approached in a medical curriculum, only 19,7% considered research education to be sufficiently addressed. From the current curriculum structure, it was observed that 36% had specific mandatory courses in their university and 21,2% had participated in optional courses, workshops or conferences on research because of a lack of training from their university. Regarding the research opportunities, 18,3% did not receive any research opportunity from their university, and 39,3% had never been involved in any research project.

Discussion and Conclusions: Research education is a vital component of medical education and medical students seem to consider its inclusion as essential for their formation. However, not enough emphasis is being placed across the globe, with most medical students seeking opportunities to train themselves in research outside the formal curriculum.

Take-home Messages: There is a clear interest of medical students of having more research addressed in the medical curriculum, but more opportunities for training in the curriculum and for development of research should be promoted.

Developing Objectives to Improve Leadership Competence for Graduate Students in Taiwan

AUTHOR(S):

- Miaofen Yen, National Cheng Kung University, Taiwan (Presenter)
- Li-Wei Hsieh, Tainan Hospital, Ministry of Health and Welfare, Taiwan

ABSTRACT

Background: Developing leadership competence is one of the major goals in graduate studies among health care professionals. Health professionals with leadership competence will influence the health care system and improve the wellbeing of clinical care.

Summary of Work: The core elements of leadership competence were articulated. The objectives of leadership competence for graduate students studying master programs in nursing were generated. The research design was a descriptive study with Delphi technique. The research team delineated a theoretical framework of leadership competence. A panel of experts both from academic and clinical settings was invited to review the objectives generated by the research team according to the key elements derived from the theoretical framework. Delphi technique was applied to examine the objectives. The criteria used for consensus were a threshold of 75% experts rating above 4 on a 5-point Likert's scale, and quartile deviation less than .6 for each item.

Summary of Results: The overall goal of leadership competence was leading teams to demonstrate advance clinical practices as well as promote quality of nursing care. Ten objectives were depicted to reflect the overall objective including self-directing, leading people, resource management and vision building. Delphi panelists, seven from clinical and seven from academia reviewed the overall goal and 10 objectives. After two rounds of evaluating the objectives, all item reached the criteria for consensus. The Delphi panelists also reviewed teaching strategies in accordance with each objective, including flipped teaching method, group presentation, role model learning, and class activity. The objectives of leadership competence will be threaded into course at a graduate nursing program curriculum.

Discussion and Conclusions: Leadership competence encompasses personal characteristics articulation, leading people, resources management and vision building. The overall objective for leadership competence for graduate students was to lead health care team in clinical practice, thus to improve clinical care. The consensus was reached among experts from academia and clinical settings.

Take-home Messages: Leadership education must be provided to enhance care quality in clinical. Objectives of leadership competence may derive from personal characteristics articulation, leading people, resources management and vision building. Teaching strategies to improve leadership competence may include flipped teaching method, group presentation, role model learning, and class activity.

Learning leadership for practice - student and graduate perspectives on how to prepare

AUTHOR(S):

- **Sophie Munday, Collaborative Partnerships Office, Imperial College London, UK (Presenter)**
- Senita Mountjoy, Collaborative Partnerships Office, Imperial College London, UK
- Elizabeth Muir, School of Public Health, Imperial College London, UK

ABSTRACT

Background: Doctors are expected to demonstrate leadership and management skills throughout careers (GMC, 2012). Emphasis on leadership in the GMC Outcomes for Graduates (2018) and FMLM indicative undergraduate curriculum (2018) underscore the importance of developing leadership skills longitudinally preparing graduates for leadership in practice. In crowded curricula, recognition of leadership learning varies. There is a need for signposting making leadership learning opportunities explicit (Stringfellow et al, 2015, Quince et al, 2014). Leadership opportunities differ at undergraduate and postgraduate level (Spurgeon et al, 2010). Leadership self-assessment tools like the Medical Leadership Competency Framework tool (MLCF, 2012) may not be appropriate for medical students. We aim to explore leadership learning needs and preparedness for leadership in practice at different stages of training in undergraduates and recent graduates. We will consider the MLCF self assessment tool at different stages of study and whether it could play a role in making implicit leadership learning more explicit (Eraut, 2004).

Summary of Work: We will purposively sample three cohorts; second and fifth year medical undergraduates and foundation trainees. Participants will complete the MLCF self assessment tool. Data will be paired with focus group data exploring perceptions of leadership skills necessary for undergraduates, how their leadership skills have been developed and where their perceived development needs lie. We will explore views on the MLCF tool and how participants perceive it could be used. Appropriate ethical approvals have been sought.

Summary of Results: Results will be presented at conference.

Discussion and Conclusions: This work is particularly timely in light of recent GMC and FMLM publications. We hope that this will inform developments nationally and locally whilst our institution is in the midst of a curriculum review. Additionally, we intend that this may inform future work with one of our international partners, exploring generalisable and transferable learning tools for leadership.

Take-home Messages: Leadership learning opportunities are variable and often implicit across the medical education continuum. Tools developed for postgraduate leadership self assessment could be utilised or adapted for undergraduates. Implementation of such tools, could assist in student recognition of and reflection on leadership learning and could contribute to a leadership portfolio.

Early Empowerment of Undergraduate Students to Become Independent Leaders in Academic Medicine

AUTHOR(S):

- Rachel Wing Chuen Lai, Faculty of Medicine, The Chinese University of Hong Kong, Hong Kong (Presenter)
- Ka Hou Christien Li, Faculty of Medicine, Newcastle University, UK
- Keith Sai Kit Leung, Aston Medical School, Aston University, Birmingham, UK
- Ishan Lakhani, Faculty of Medicine, The Chinese University of Hong Kong, Hong Kong
- Tong Liu, Department of Cardiology, Tianjin Institute of Cardiology, China
- Gary Tse, Faculty of Medicine, The Chinese University of Hong Kong, Hong Kong

ABSTRACT

Background: Modern medicine is trending towards ultra-specialization. Yet, emphasis in leadership remains an essential skill for becoming successful, independent and well-rounded biomedical researchers. The aim of this pilot study is to elucidate the feasibility of nurturing medical undergraduate leaders in academic medicine.

Summary of Work: Undergraduates with interests in academic medicine and with less than 3 months of previous research experience were recruited to join the Laboratory for Cardiovascular Physiology at the Li Ka Shing Institute of Health Sciences, the Chinese University of Hong Kong. Personalised training through the adapted 'Learn one, do one, teach one' model were provided to potential students in becoming independent researchers with the aim of leading less experienced students in scientific studies as senior authors. Beside publication skills, they were encouraged to develop their communication and networking skills through experiential learning at academic conferences, establish student-led societies and platforms while seeking out intramural and extramural research funding.

Summary of Results: In this pilot model, four medical students were recruited into our leadership development programme. Students were taught the principles of research from start to publication and presentation over a mean period of 12.6 months. In total, the students published 31 international peer-reviewed articles and attended 14 conferences to present 17 oral or poster presentations. Two student produced abstracts that were selected for best oral presentations on three separate occasions. They also successfully mentored 41 junior students, serving as senior authors in 8 publications. One student served as the founding president of the Student Cardiovascular Society at his medical school, obtained an intramural funding for a 3D printing for anatomy education and was awarded two prizes for academic research. The second student obtained extramural donation (€45,000EUR) to establish a health promotion initiative coupled with public health research for ethnic minorities.

Discussion and Conclusions: The pilot model equipped students with foundational peer leadership skills, social intelligence and sense of responsibility in academic medicine with personal mentorship, practical field experience and international research exposure.

Take-home Messages: Medical students can demonstrate leadership skills early in academic medicine through an adapted 'Learn one, do one, teach one' model.

Investigation on medical students' leadership and its influencing factors: A study from Shantou University Medical College, China

AUTHOR(S):

- Zhanqin Huang, Shantou University Medical College, China (Presenter)
- Dongqing Zhang, The First Affiliated Hospital of Shantou University Medical College, China
- Guanhua Fan, Shantou University Medical College, China
- Junhui Bian, Shantou University Medical College, China

ABSTRACT

Background: Leadership development is an important part of university education. The emphasis on leadership education in medical school has been just started in China and gradually be taken seriously. The aim of this study is to investigate the degree of leadership and its influencing factors of medical students at Shantou university medical college.

Summary of Work: We used the literature analysis, questionnaire survey, statistical analysis in this research. The modified "college students' leadership assessment scales" was used to measure the undergraduates leadership. We investigated the potential influencing factors by using self-made "college students' family background, social participation and school activity questionnaires". There were 838 medical students involved in this investigation. 812 copies of valid questionnaires were collected. The reliability and validity of the questionnaires were examined.

Summary of Results: The scores of undergraduates' leadership is measured by the typical five-level Likert scale. The medical students have good performances on decision making, activity planning, communication and management in organization. However, they have low scores of personal responsibility and motivation to be a leader. The students from city or comparatively developed areas have higher scores than the students from rural areas or economically underdeveloped areas. The students who have been the leaders of student organization have higher scores than others who have no experience. The family background had impact on the degrees of student leadership. The family social capital, financial situation and cultural background have positive correlation to the levels of student leadership. There was a significant correlation between the level of social participation and the undergraduates' leadership. The activities of the school, such as organizational participation is significantly related to the undergraduates' leadership.

Discussion and Conclusions: The findings showed that the family background, social participation and school activities could influence the degrees of undergraduates' leadership. It suggested that we need to optimize the curriculum system to improve the leadership of undergraduates. We should educate the students to enhance the awareness and ability of social participation, enhance the school activities' atmosphere, improve the function of community's leadership training.

Take-home Messages: Leadership education should be emphasized and improved in Chinese university.

#3JJ Poster - Management and Leadership

Cross-cultural understanding contributes to leadership competency development among health professionals during their global health experience

AUTHOR(S):

- Mikio Hayashi, The University of Tokyo, Japan (Presenter)
- Daisuke Son, The University of Tokyo, Japan
- Masato Eto, The University of Tokyo, Japan

ABSTRACT

Background: Globalization has increased the opportunities available to healthcare professionals working in developed countries for providing clinical and educational support in other countries. However, it is unclear how the experience contributes to the leadership competency of healthcare professionals. Therefore, we explored this contribution with the objective of analyzing the process of individual leadership competency development. The study focused on the members of a multinational team of physicians, dentists, and nurses.

Summary of Work: In this study, qualitative descriptive data were collected in face-to-face, semi-structured interviews. The thematic analysis method used in this study involved generative coding and theorization. Japanese health professionals who participated in an international medical cooperation project as part of a multinational medical team were interviewed between July 2017 and March 2018, and data were analyzed and interpreted using a social constructivism paradigm.

Summary of Results: In total, 20 research participants, including 5 nurses, 5 dentists, and 10 doctors, with an average clinical experience of 15.3 years were interviewed. Through data analysis, 58 emergent themes were categorized into the following seven leadership competency areas: leadership concepts, teambuilding, direction setting, communication, business skills, working with others, and self-development. The relationships among the leadership competency areas were identified. Individual leadership competency development associated with leading a medical care team was related to “understanding the environment of other cultures.” Additionally, the concept of “developing and empowering others” was associated with the actual delivery of medical care. Experience in “conflict management” during actual global health clinical practice led the participants to reflect on their communication and business skills. There were differences in leadership competency areas among professions: nurses particularly reflected on communication skills toward patients, dentists reflected on business skills, and physicians reflected on leadership concepts and teambuilding.

Discussion and Conclusions: This study clarified the process of individual leadership competency development through global health experience. The findings provide information on expected learning competency for those considering medical practice in other countries in the future.

Take-home Messages: Leadership competency development among health professionals is based on the idea of cross-cultural understanding during their global health experiences.

Piloting a formative assessment tool on leadership and communication skills in Emergency Medicine residents at Pontificia Universidad Católica de Chile

AUTHOR(S):

- **Sofía Basauri Savelli, Pontificia Universidad Católica de Chile, UK (Presenter)**
- Mandy Moffat, Centre for Medical Education, University of Dundee, UK
- Oscar Navea Carrasco, Pontificia Universidad Católica de Chile, Chile
- Hans Clausdorff Fiedler, Pontificia Universidad Católica de Chile, Chile
- Felipe Maluenda Barrientos, Pontificia Universidad Católica de Chile, Chile

ABSTRACT

Background: Developing leadership and communication skills is a fundamental aspect of healthcare professional's training and should be considered within the curriculum. This study aimed to pilot a formative assessment, observing senior Emergency Medicine (EM) residents as team leaders. The formative aimed to encourage reflective practice, self-awareness and allow residents to identify their future learning needs.

Summary of Work: The assessment tool was developed using educational frameworks, institutional policies and stakeholders' opinions. A list of competencies to be measured was identified and constructed into a checklist. Three residents were observed during three shifts each by senior staff members. All participants were asked to watch an explanatory video of the project before the implementation phase and to reflect upon their experience during the process, providing guidance questions. At the end of each shift, staff members provided feedback and discussed with the resident an action plan for improvement. Upon completion of three observations, both staff and residents provided a written reflection of their experiences.

Summary of Results: Reflections from residents and staff showed that they found this activity useful, suggesting that it becomes part of the curriculum. Residents describe how it gave them more clarity on what their responsibilities were and how to manage themselves, increasing their confidence. They found the checklist and immediate feedback useful for identifying strengths and weaknesses. Staff members found the assessment tool useful, however timely feedback was a challenge. The activity did not negatively impact on the normal running of the clinical area. Residents described how their view of leadership changed and requested further training on EM leadership and administration skills.

Discussion and Conclusions: Reflections from this pilot study confirm the need for including assessment of abstract skills such as leadership and communication in our EM training programme. Formative assessment led to residents feeling better prepared to perform as team leaders and plan for further development. A similar formative assessment could be used in other contexts to assess and develop these skills.

Take-home Messages: This formative tool allowed assessment of leadership and communication skills in the workplace. Residents describe increased confidence and understanding of their responsibility as leaders. This experience encouraged reflection and identification of learning needs.

Collaborating for a unified curriculum in Developmental Paediatrics: Process and Outcomes

AUTHOR(S):

- **Katharine Gardiner, University of Notre Dame Australia, Australia (Presenter)**
- Bradley Jongeling, University of Western Australia, Australia
- Joanne Somerville, University of Western Australia, Australia
- Ellen McKinnon, University of Western Australia, Australia
- Robin Guttinger, University of Notre Dame Australia, Australia

ABSTRACT

Background: With the establishment of a third medical school in Western Australia, the resultant need for clinical placements and collaboration in curriculum development and delivery in a small subspecialty has been highlighted. Developmental paediatrics service provision is coordinated centrally, with paediatricians working in multi-disciplinary teams in community child health centres. Most teaching and supervision on clinical placements will thus be delivered by the same clinicians, regardless of a student's university affiliation. We are aiming to produce a teaching curriculum that includes core concepts in the specialty as well as meeting each university's learning objectives. It also needs to fit with delivery of clinical services.

Summary of Work: Developmental paediatricians, the service manager and academic leads from each university have a series of meetings to review core specialty concepts, current methods of curricula delivery, preferred teaching strategies and other affiliated learning foci. The integral role of inter-professional collaboration in the specialty, the appropriate nature of clinical experience for students and the logistics of arranging clinical placements in geographically diverse centres are identified from preliminary scoping work.

Summary of Results: This presentation will focus on the methods for developing agreement on core content and concepts, the nature and collation of common curriculum resources and how these will be made available for students in their institution, either on clinical placements or through the learning management system of each university. We are also adapting resources for use within each university to meet their institutional needs and teaching methods. A common approach for clinical placements for individual students also needs to balance the needs of the service, the limited time of supervising clinicians and the benefit to the student for their learning and clinical practice.

Discussion and Conclusions: There is goodwill and common ground among all members but the competing pressures of clinical and academic roles, the need to work within frameworks of three universities and the centralised health service make this project challenging. The ultimate aim for a common curriculum that does meet the objectives for all stakeholders is worth pursuing.

Take-home Messages: Inter-university curriculum collaboration is achievable but is more manageable in small subspecialties where clinical placements are managed by a cohesive group of clinicians.

Lay representatives: what difference do they make?

AUTHOR(S):

- Kim Walker, University of Aberdeen, UK (Presenter)
- Judy Wakeling, NHS Education for Scotland, UK
- Julie Ferguson, NHS Education for Scotland, UK

ABSTRACT

Background: In recent decades, many healthcare organisations have begun to use ‘lay’ representatives - the representation of members of the public on decision-making committees and throughout the hierarches of medical institutions. NHS Education for Scotland (NES) is an education and training body and a special health board within NHS Scotland, with responsibility for developing and delivering education and training for the healthcare workforce in Scotland. In 2009, it introduced lay representatives onto local and national committees and panels relating to the management of postgraduate medical education and training. Between 2016 and 2018 NES undertook a research project to gather in-depth data on the role of lay representatives within the organisation.

Summary of Work: Lay representatives who had recently relinquished their role together were purposively sampled and invited to participate in telephone interviews using a semi structured questionnaire to provide detailed feedback on their perception of the role, their impact and any difficulties they had encountered. NES panel Leads/Chairs were also interviewed to gain perspectives from the ‘other side.’ The data were analysed in NVivo 9 (qualitative data coding software) using template analysis.

Summary of Results: A total of 25 lay representatives and six NES Leads were interviewed. Almost all of them came from a professional background. The key themes identified were: Making a difference; Difficulties with the role; Diversity in the role; and Maintaining an outsider perspective. Nobody considered that the role was “tokenism”.

Discussion and Conclusions: Lay representatives have now become well integrated into NES. However, there can be difficulties with the role and since most had a professional background some lay representatives felt their talents are being under-utilised, a case of differing expectations which can be a sensitive area to manage. Different roles for the lay representatives almost meant their involvement varied. Diversity both in terms of profession and ethnicity in this group to more fully represent the population they serve would require positive recruitment.

Take-home Messages: Whilst lay representatives can bring important life skills to their role, there will always be limits to the extent to which their presence in a healthcare organisation ensures transparency and full external scrutiny.

Design and validation of a real and perceived academic workload measurement instrument for students of health-related undergraduate programs

AUTHOR(S):

- José Peralta Camposano, Universidad De Chile, Chile (Presenter)
- Natalia Harden Díaz, Universidad De Chile, Chile
- Constanza Pino León, Universidad De Chile, Chile
- Shenda Orrego Molina, Universidad De Chile, Chile
- Sandra Flores Alvarado, Universidad De Chile, Chile
- Javiera Esturillo Pinet, Universidad De Chile, Chile

ABSTRACT

Background: Literature on academic workload shows us how this concept can be separated into three dimensions: declared, real and perceived workload. The first of those corresponds to studying time as declared by academic schedules; the second, to real working hours from students; and the third, to a subjective measure of the workload. Along with that, there exists a series of factors that explain the students perception on their workload.

Summary of Work: The present work's objective is to design and validate an instrument that allows us to measure both real and perceived academic workload for higher education students from the health area. The questionnaire was built based on a bibliographic revision and the conduction of two focus groups conformed by various undergraduate programs' students from the Medicine Faculty of the Universidad de Chile. It was, afterwards, submitted to three qualitative pre-tests. To evaluate the survey content's validity, we recurred to a 14 national and international expert panel. The analysis was performed according to the Content Validity Ratio and the Content Validity Index, proposed by Tristán-López.

Summary of Results: The final instrument consists of a self-applied questionnaire with both a characterization section (10 questions) and one concerning academic workload by subject and semester (5 and 2 questions, respectively). The complete instrument was validated with an 84% consensus between the judges. Both tests, when applied by sections, were approved with a 77% and a 94% agreement, respectively. Each question, after being individually analyzed by the judges, was validated. Nevertheless, it was decided to collect the expert panel's commentaries to improve the sentences clarity.

Discussion and Conclusions: It is possible to assure, considering these results, that the proposed instrument constitutes a contribution for the measurement of real and perceived academic workload by the students. Therefore, its results can constitute a valuable input to the scholar and/or student support organisms in health education contexts.

Take-home Messages: The development of this study shows us the importance of considering multiple approaches when deciding how to study academic workload, as it is a complex and multidimensional problem which has to be issued under an interdisciplinary approach.

OT role-emerging placements in primary care

AUTHOR(S):

- Emily Chamberlain, GP Education Unit, Southampton, UK (Presenter)
- Juliette Truman, University of Southampton, UK
- Samantha Scallan, GP Education Unit, Southampton, UK
- Amanda Pike, Health Education England, UK
- Johnny Lyon-Maris, GP Education Unit, Southampton, UK

ABSTRACT

Background: GPs in the UK are under significant pressure in delivering primary care and this has highlighted the need for workforce development. Occupational Therapists (OTs) are highly skilled practitioners working across health and social care sectors. Educated at pre-registration level to work with physical and mental health issues, OTs can potentially provide valuable support to GPs. To date OTs are not routinely utilised within Primary Care. For over ten years the University of Southampton OT Department has developed placements in a range of settings for students, but never previously in primary care.

Summary of Work: Four role-emerging placements were developed across four different primary care settings in Hampshire, UK. Three challenging clinical areas were identified in which OT students could gain experience and complement their undergraduate studies: frailty, mental health and learning disabilities. The focus of this study was to determine whether role-emerging placements in primary care enhanced the learning of OT students. A case study approach was used to evaluate the project. Methods of data collection for this study included: observation of small group teaching sessions and end of placement interviews with students, educators and members of the primary care teams involved in the placements.

Summary of Results: Role-emerging placements allowed for a deeper understanding of the breadth of skills Occupational Therapists could offer primary care. OT students were able to develop generalist skills as independent practitioners, consolidate their learning from previous placements and develop a deeper sense of professional identity.

Discussion and Conclusions: Placements in primary care settings provided exposure to mixed caseloads across frailty, mental health and learning disability. OT students developed a deeper understanding of working within primary care and it's potential as a career option whilst offering insights to the primary care team of the added value of Occupational Therapy.

Take-home Messages: OTs are an under-utilised profession in frontline primary care. The role of OT has not been well researched as a first point of contact healthcare professional in primary care. OTs broad training in mental health, physical frailty and learning disabilities are potentially valuable to service delivery in General Practice.

House System Inspired by Hogwarts House from the “Harry Potter” Movie

AUTHOR(S):

- Hataitip Tangngam, Nakoreping Medical Education Center, Thailand (Presenter)
- Worachet Techarak, Nakoreping Medical Education Center, Thailand
- Pornsuda Krittigamas, Nakoreping Medical Education Center, Thailand

ABSTRACT

Background: 4th - 6th year medical students are divided into four houses including Ruby, Amethyst, Sapphire and Emerald. Each house is under the authority of a group of Nakoreping staff members. The Heads of the houses are in charge of giving their students important information, improving medical school performance, increasing social support, encouraging student-mentor relationships, improving self-esteem, dealing with stress, and responding to emergencies in their houses. Throughout the academic year, the houses compete for the house cup, gaining points based on extracurricular activities such as performance in a Welcoming ceremony, at a New Year party and during a Teacher’s Day.

Summary of Work: In this qualitative study, a total of 60 clinical year medical students were asked to complete an open-ended questionnaire about their attitudes and feelings about the House system. The data was analyzed by using coding and thematic analysis.

Summary of Results: All of the medical students were satisfied, gave positive responses and expressed enjoyment in participating in this House system. Their reasons can be summarized as followed: 1) It will encourage participation in extracurricular activities. 2) It will simplify bonding between junior and senior students, so they can help each other in their House 3) It will provide an opportunity to meet their mentors frequently and develop positive relationships between students and teachers 4) Create activities which provide some challenge with the aim of reducing stress. For the next year, it is suggested that we provide some outdoor activity such as a Sports Day between Houses and invite interns to join the Houses.

Discussion and Conclusions: The House system is intended to help students learn the value of competition, how to build respect and learn teamwork, develop group responsibility and relieve stress.

Take-home Messages: This House system, as in the Harry Potter movie, could not only be a part of extracurricular activities, but also emphasize the importance of a mentoring system.

How to implement Team Resource Management in the clinical settings for head nurses

AUTHOR(S):

- Tzu Sang Chen, Tungs' Taichung Metro Harbor Hospital, Taichung, Taiwan (Presenter)
- Ching-Shiang Chi, Tungs' Taichung Metro Harbor Hospital, Taichung, Taiwan
- Chien-Chien Tung, Tungs' Taichung Metro Harbor Hospital, Taichung, Taiwan

ABSTRACT

Background: Team resource management (TRM) training has been introduced in the clinical settings for years; However, how to effectively implement the concept to the clinical setting is difficult after 1 hour in-class course for most head nurses by report. The aim of this work is to enhance the use of knowledge of nursing supervisors through a multidisciplinary TRM training model.

Summary of Work: The head nurses of different specialties participated in this study. Leadership, Situation Monitoring, Mutual Support, Communication were the major modules of the course. The training workshop was held for 12 hours, divided into 3 stages. It first focused on the implementation strategy that was delivered by expert speech and video appreciation. The second stage was scenario simulation and group discussion. In the third stage, the TRM theory was applied to the clinic in the actual exercise model. Learners also used the line group to exchange feedback.

Summary of Results: A total of 16 head nurses participated in this workshop, with 20.2 average working years. The females accounted for 100%. The average satisfaction score of the students was 100 points. In January 2019, a total of 5 supervisors (31.3%) have been used in morning meetings, hand off and rounds. After sharing experience with one another, they gradually increased their willingness to display the training schedules, which can improve the knowledge of nursing supervisors. Line group experience sharing can stimulate the will of practice.

Discussion and Conclusions: Clinical nursing teaching has always retained the concept of traditional classroom teaching. This course focuses on effective reflection and designing courses in a graded manner. Joining the Line group to share experiences can stimulate the willingness to use. The use of the TRM training model can improve the clinical application of nursing supervisors. The author tries to use the sub-teaching method and establish the Line sharing group, which is more effective than the traditional "classroom" method.

Take-home Messages: Multiple teaching methods and line group establishment can promote head nurses' utilization in TRM in the clinical settings.

Adapting to Challenges in Promoting an Inter-Institutional Research Collaboration Model in Bahrain

AUTHOR(S):

- Davinder Sandhu, Royal College of Surgeons In Ireland, Medical University Bahrain, Bahrain (Presenter)
- Randah Hamadeh, College of Medicine and Medical Sciences, Arabian Gulf University, Bahrain
- Durjoy Shome, College of Medicine and Medical Sciences, Arabian Gulf University, Bahrain

ABSTRACT

Background: Bahrain an archipelago in the Arabian Gulf has a population of 1.2m people and two medical schools at Royal College of Surgeons in Ireland, Bahrain (RCSI Bahrain) and the College of Medicine and Medical Sciences, Arabian Gulf University (AGU). There is increasing recognition by UNESCO and Universities that research collaboration has many advantages with greater access to faculty and learner's critical mass, savings on capital and equipment cost, building relationships to utilise the expertise as well as wider dissemination of outcomes. With the objectives of the above through optimum utilization of available resources, a key priority of both Universities vision was to create mechanisms to fulfil these aspirations.

Summary of Work: How was the joint research collaboration established? • Since 2014 created a common research fund exceeding \$250,000 over 5 years. • Sharing capability and facilities such as the animal house, cell culture techniques. • Each project has at least two investigators from each University, thus a convergence of expertise. • Opportunities for students to engage. • Co-authorship of publications and conference presentations.

Summary of Results: Research collaboration outcomes: • Since 2014 a joint senior steering group oversaw this initiative. • Seven projects funded and another 2 will be supported in 2019. • Complementary facilities and techniques used - animal house, tissue culture lab, specialized equipment. • Co-author publications (2) and around 10 conference paper-presentations to date. • Organization of the first AGU/RCSI joint research conference 2019 • Increasing collaboration with student placements, teaching and examination of thesis.

Discussion and Conclusions: Research collaboration is defined as working together to jointly produce new knowledge with wide applications in a cost effective manner. This includes advice and insights as well as practical working. Additional spin off is the professionalism affecting attitudes and behaviours. This model has been achieved in Bahrain by increasing the visibility, cross fertilization of ideas and productivity of research to mutual benefit. There has been good uptake by basic scientists, and future development will be to increase the involvement of clinical faculty.

Take-home Messages: Higher education institutions in developing nations must collaborate to ensure that research, teaching and learning are directed in a cost effective manner to achieve regional benefit.

Perception of High Value, Cost-Conscious Care Amongst Undergraduates: Attitudes, Barriers, Environment and Clinical Role Model - A Longitudinal Cohort Study

AUTHOR(S):

- Joo Wei Chua, National University Health System, Singapore (Presenter)
- Desmond Teo, National University Health System, Singapore
- Reshma Merchant, National University Health System, Singapore

ABSTRACT

Background: Providing high value, cost-conscious care (HVCC) is a critical 7th general competency for physicians yet it is often not included in undergraduate medical school curriculum. There is general agreement that countries with fast-ageing population and increasing medical complexities will lead to increased healthcare cost. Role models during clinical years committed to delivering HVCC was often mentioned as an important factor in many studies.

Summary of Work: We conducted a longitudinal cohort study using mixed methods for medical students from Yong Loo Lin School of Medicine, Singapore. A survey was conducted among graduating medical students (Y5) to understand their changes in attitudes, barriers and role-modelling towards HVCC compared to their time in Year 3 (Y3). Focused group discussions were also conducted to explore the impact of their training on HVCC.

Summary of Results: Among 167 respondents (response rate 55.3%), slightly more Y5 had heard of HVCC (51% versus 46% Y3) with similar numbers agreeing to it being taught in medical school. More than 2/3 agreed that physicians are key drivers of high healthcare cost. Slightly more Y5 (35%) compared to Y3 (29%) agreed that it is unfair to ask physicians to be cost-conscious and still keep the welfare of their patients foremost. More than half of Y5 (59% versus 44% Y3) agreed that it is easier to order a test than to explain to the patient on its necessity. Similar numbers agree that organizational culture matters. More than 2/3 of Y5 agreed that ordering fewer tests increases risk of malpractice litigation compared to half of Y3. Y5 are also exposed to more negative role-modelling behavior than in Y3. The focused group results will be available by August.

Discussion and Conclusions: To ensure a sustainable healthcare system, future doctors need training in providing HVCC through the creation of a supportive environment involving positive role models for delivering HVCC care and integration of HVCC in the longitudinal curriculum.

Take-home Messages: A multi-pronged approach in a supportive environment to promote HVCC practice would be essential to equip the doctors of tomorrow to practice good medicine in the era of rising healthcare costs.

Capacity building for nurses and allied health professionals to enable research evidence-based practice - a novel, proof-of-concept programme

AUTHOR(S):

- **Silvie Cooper, University College London, UK (Presenter)**
- Julie Sanders, St Bartholomews Hospital, Barts Health NHS Trust/Queen Mary University London, UK
- Nora Pashayan, University College London, UK

ABSTRACT

Background: Building research capacity for nurses and allied health professionals could enable successful translation of research into clinical practice, and improve patient care and outcomes. We report on the development of a proof-of-concept coordinated multi-strategy programme to build research capacity among nurses and healthcare professionals that surmounts many of the usual barriers to engagement.

Summary of Work: Our programme was informed by research evidence and developed in partnership our host National Health Service (NHS) Trust, and delivered to nursing and allied health professional (AHP) staff at the Trust. Programme activities included: a. Active dissemination of easily accessible research messages, relevant to clinical practice b. Increasing research literacy and interpretive skills through interactive masterclasses c. Mentoring point-of-care staff to enable translation of research evidence into practice.

Summary of Results: Engagement with the programme and initial feedback show that it is feasible to use this programme to deliver training to NHS point-of-care staff in their workplace. The impact of this programme on clinical practice and patient care is under evaluation.

Discussion and Conclusions: By delivering the programme in the workplace, and providing mentoring, this novel programme overcomes many of the traditional barriers to participating in continuous professional development. We built productive relationships between programme leaders and participants to understand the specific contextual and organisational needs of the group. We collaboratively developed the materials for research awareness activities, engaged a broad cohort through our masterclasses, and encouraged champions to be agents of change for implementing research evidence into practice.

Take-home Messages: 1. We surmounted many of the usual barriers to engagement with training by locating the programme in the workplace 2. It is feasible to deliver tailored training opportunities that reach a broad range of healthcare professionals by being responsive to contextual, organizational and learning needs and working collaboratively.

Quality Improvement for the Undergraduate curriculum

AUTHOR(S):

- Ashish Ladva, King's College London (GKT), UK (Presenter)
- Sonal Srivastava, Kings College London (GKT), UK
- Jasmine Patel, Kings College London (GKT), UK
- Anistta Maheswaran, Kings College London (GKT), UK
- Ayantika Dhara, NHS, UK
- Bandipalyam Prathibha, NHS, UK

ABSTRACT

Background: Almost a decade ago, Paul Batalden and Frank Davidoff, argued that if healthcare was to achieve its full potential, 'change making' had to become an 'intrinsic part of everyone's job, every day, in all parts of the system'. The Academy of Medical Royal Colleges produced a report in 2016 highlighting the need for Quality Improvement (QI) to be part of the curriculum from the undergraduate years. Despite this, few medical school curricula have QI as an integral part. As one of the early groups of medical students to be part of this new curriculum at Kings College London (KCL), we describe our experience and argue that this should be a mandatory part of every undergraduate curriculum.

Summary of Work: QI project is part of the 4th year and includes an introductory session about the Model for Improvement. A group of students (usually 4) work together with a supervisor to undertake a project in the hospital where they undertake their clinical placement. One day a week is allocated for the QI project and two or more PDSA cycles are expected during the project. This is then assessed by oral and written work.

Summary of Results: Using the Model for Improvement, we studied and identified solutions to tackle poor compliance with National recommendations for the proper documentation of Non-Invasive Ventilation (NIV) at QEQM Hospital in Margate. As a result, we implemented a standardised NIV prescription and assessed its effectiveness. To undertake this project we needed to work with professionals from various disciplines. We received first hand experience of the challenges that are faced in implementing sustainable change in healthcare, and learnt ways of overcoming them. The importance of team work and time management was exceptionally clear.

Discussion and Conclusions: Undertaking the QI project, has provided us insight into the continuous nature of change-in-practice to provide effective patient-centred care. Having gained acumen that will change our practice for the better, as doctors we will be better equipped for the future. We argue that QI should be a mandatory part of the undergraduate curriculum in all medical schools.

Take-home Messages: QI should be considered an essential learning experience, as part of the undergraduate curriculum.

The Perceptions of Workplace Bully in the Nursing staff - Group role-playing in a one-day workshop

AUTHOR(S):

- Yi-Fei Chung, Taiwan (Presenter)
- Tzu-Sang Chen, Taiwan

ABSTRACT

Background: Workplace violence is an issue that recognizes no national boundaries. Nurses face a higher than average level of violence in the healthcare institutions in which they work. If the workplace violence of nurses not properly managed and disposed of, is not only harmful to the personal and physical health of the nursing staff, but also may affect the morale of the work and the operation of the team, and endanger the quality of patient care, or even lead to the loss of nursing staff, causing serious harm to medical institutions and nursing professions. Besides, the hospital and nursing administrators should pay attention and grasp the degree of working stress to nurses.

Summary of Work: The purpose of this study was to explore the experiences and perceptions among nurses facing violence in their workplaces. The study was the one-day workshop that have 53 participants that have qualifications be a preceptor in from a regional hospital in the middle of Taiwan. The group project designed in the form of a one-day workshop, from warm-up activities, workplace bullying awareness, case analysis discussion, situation simulation, role-playing in group, experience of bullying and being bullied.

Summary of Results: The demographic characteristics of participants presented 53(100%) women and have qualifications be a preceptor with the average age was 33years old (S.D=5.7 years); the most common educational level was 4-year college (87%); 26.4% worked in the intensive care unit, 20% in the medical department, and 69.8% were the nurse staffs in the clinical, non-administrative. Results showed significant between the Pretest-posttest that use the Paired-Samples t test. After this one-day workshop, we also followed up nurses of bully, we got positive feedback form their supervisors and the introspection.

Discussion and Conclusions: Results provide specific data and insights into the prevalence of workplace violence faced by nurses in Taiwan. These findings may help nursing administrators, educators and healthcare managers prevent, reduce, and control such incidents in the future.

Take-home Messages: Old thinking lead to bad workplace in nursing, they always full of themself. The role-playing in group of one-day workshop can effectively improve the understanding of nursing staff on workplace bullying. The project should be list in the routine education.

A theoretical and conceptual framework for the investigation of Self-Regulated Learning by trainee clinical scientists on the UK Scientist Training Programme

AUTHOR(S):

- **Megan Smith, University of Birmingham, UK (Presenter)**
- Sharon Buckley, University of Birmingham, UK
- Sandie Gay, National School of Healthcare Science, UK
- Ian Davison, University of Birmingham, UK

ABSTRACT

Background: Self-regulated learning (SRL) describes how individuals control the cognitive, motivational, behavioural and affective aspects of their learning and how they achieve their goals. The need for health professional trainees to engage in SRL is well recognised, with SRL having benefits to both lifelong and workplace-based learning. The UK Scientist Training Programme (STP) is a pre-registration training programme for clinical scientists that combines workplace-based learning with a Masters in Clinical Science. Whilst STP trainees are expected to control their own learning, exercising autonomy and active participation, the nature of their workplace-based learning is not well-documented. An understanding of trainee clinical scientists' workplace-based learning, particularly the role of SRL, is needed to inform development of effective strategies to support trainees, trainers and other healthcare professionals involved in their learning.

Summary of Work: Theoretical perspectives were combined to help understand the learning strategies used by STP trainees; these were assessed through semi-structured interviews.

Summary of Results: Zimmerman's Cyclical Phases Model (Zimmerman and Moylan, 2009) was selected as a theoretical framework due to its grounding in social cognitive theory and articulation of SRL sub-processes. It was used alongside situated learning theory and four learning behaviours, synthesised by Milligan et al. (2014). Thematic analysis of interview responses suggests that STP trainees learn tactically and opportunistically in the clinical setting. Whilst e-portfolio requirements encourage SRL, some trainees set goals outside of the formalised curriculum, recognising their role as lifelong learners. Trainees' social connections influence their goals, learning strategies, self-reflection, and personal beliefs. Some trainees recognise how aspects of self interfere with their learning.

Discussion and Conclusions: Although the findings stress the unique workplace opportunities, the theoretical perspectives used in combination have advanced our understanding of the impact of intrinsic factors and social context on trainees' SRL. Potential implications for STP development are discussed.

Take-home Messages: The use of Zimmerman's model in combination with other theoretical standpoints provides an appropriate theoretical lens for investigation of this phenomenon.

The impact of ability to self-evaluate knowledge on readiness for self-directed learning

AUTHOR(S):

- **Matej Žnidarič, Faculty of Medicine University of Maribor, Slovenia (Presenter)**
- Monika Sobočan, Clinic for Gynecology and Perinatology, University Medical Centre Maribor, Slovenia
- Sebastjan Bevc, Clinic for Internal Medicine, University Medical Centre Maribor, Slovenia
- Radovan Hojs, Clinic for Internal Medicine, University Medical Centre Maribor, Slovenia

ABSTRACT

Background: Self-directed learning (SDL) relates to an individuals ability to recognize appropriate study material and acquire the necessary knowledge on own initiative. SDL competent students frequently evaluate personal study progress and choose appropriate sources of information to learn new concepts. The purpose of our research is to evaluate the impact of students SDL ability on self-evaluation during longitudinal formative assessment.

Summary of Work: Medical students (n = 29) voluntarily participated in this study during an annual knowledge progress test (PT). The PT covered main clinical and preclinical topics with the use of MCQ type questions and an DKO option (“do not know option”). There were no penalties for incorrect answers during the PT. Prior to starting the exam, students were asked to complete the SRSSDL (“self-rating scale for self-directed learning”) questionnaire. SRSSDL measures the ability of SDL on four dimensions of self-learning: “awareness”, “learning strategies”, “learning activities” and “evaluation”. Our study analysed the correlations of SDL scores and the DKO score, used to evaluate insights of knowledge, on the PT. Data was analysed using the descriptive statistics and the Pearsons correlation.

Summary of Results: Our study shows, that higher scores in SDL components “learning strategies” (p=0.031; r=0.401) and “learning activities” (p=0.038; r=0.388) translated in this small group of medical students are linked to better alignment of expected and achieved levels of DKO. There was no statistically significant correlation among the SDL components “awareness” (p=0.636; r=0.092) and “evaluation” (p=0.115; r=0.299).

Discussion and Conclusions: Our study indicates that students SDL scores were closely related to the ability of self-evaluation during the PT exam, especially for learning strategies and learning activities. Previous studies showed, that awareness and learning activities developed during years of medical study, however, no significant difference was seen in the development of learning strategies and evaluation. To enable students to more accurately self-evaluate knowledge during medical school activities, schools should offer more training in learning strategies and activities.

Take-home Messages: This small pilot study shows, that there was a correlation of SDL subcomponents and DKO score accuracy. In order to train and improve students in their knowledge self-assessment accuracy, activities towards learning ability and strategy should be designed.

Self-directed Learning Readiness Scale in 4th - 6th Year Medical Student at Chonburi Hospital - a Community Hospital

AUTHOR(S):

- Yuthana Khongthip, Chonburi Hospital, Thailand (Presenter)

ABSTRACT

Background: Self-directed learning (SDL) is considered an important skill in medical learning. Our curriculum, like many others, was constructed to promote SDL skill in the students. Readiness for SDL in our students has never been evaluated before. We sought to show readiness for SDL and identify significant characteristics that associated with high readiness for SDL in our students.

Summary of Work: A cross-sectional study was conducted. Students in the current clinical year (4th - 6th) were asked to participate. The SDL readiness scale (SDLRS) questionnaire which included a 5-point Likert scale of 40 items was answered by consented students. Characteristics collected were a medical school year, gender, the most preferred type of curricular activity (lecture, problem-based discussion, patient-based discussion) and grade point average (GPAX). The mean score (\pm SD) will be presented. The SDLRS of > 150 was considered as high readiness and the proportion of students who have high readiness was compared in each factor.

Summary of Results: Of all 119 students, 92 responses were returned. Overall mean SDLRS was 145.7 (\pm 19.4). The mean SDLRS in 4th, 5th and 6th year student was 140.7 (\pm 15.3), 147.1 (\pm 25.7) and 150.9 (\pm 12.2), respectively, and was not significant different ($p=0.117$). Thirty-eight percent of students (35/92) were highly ready for SDL (29%, 39% and 50% in 4th, 5th and 6th year, respectively). Gender (male) was the only significant factor associated with high SDL readiness, while other factors were not.

Discussion and Conclusions: Although there was a trend toward progression of SDL readiness in each higher medical year, it was not significant. The proportion of students who have high readiness for SDL was only 38%. Male students have higher proportion of readiness than female students.

Take-home Messages: Each institution should assess the SDL readiness of their students for the benefit of promoting this important skill.

Better Choice for Your Career - Pre-doctor experience camps create opportunities to realize the future for senior high school students

AUTHOR(S):

- Wen-Cheng Huang, Center for Education in Medical Simulation, Taipei Medical University, Taiwan (Presenter)
- Lin Yun Ching, Center for Education in Medical Simulation, Taipei Medical University, Taiwan
- Chiao-Li Chan, Center for Education in Medical Simulation, Taipei Medical University, Taiwan
- Che-Wei Lin, Center for Education in Medical Simulation, Taipei Medical University, Taiwan

ABSTRACT

Background: In the past, the career of Doctor is enviable worldwide. Actually, some medical students give up their learning because they don't like the "real life" in medical training. Therefore, we try to create an experience camp for senior high school students and help them to realize the Doctors job.

Summary of Work: A total 390 senior high school students participated in these camps during 4 years. The camps were held for 5 days. We arranged medical training as Interns/Residents. It includes history taking, physical examination, OSCE, duty on call, and clinical skills.

Summary of Results: During 5 day-curriculum, the results showed 390 students within 4 years have more Interests to be a doctor and their target becomes clearer or more definite by Pre-camp and Post-Camp questionnaires.

Discussion and Conclusions: We use 4 dimensions for evaluation of the influence after this experience Camp. It included Comprehension of a Doctors Routine/ Realization of the Skills a Doctor Needs/ The Challenges and Difficulties of Physicans Work/ Self Expectations. The results all showed they can more clearly understand the life of a doctor. If we want to choose suitable medical students, we could offer some opportunities to help them realize their job in the future. This Pre-doctor experience camp tried to create a simulated environment to let students make their best decision before they become doctors.

Take-home Messages: If we want to choose suitable medical students, we could offer some opportunities to help them realize their job in the future. This Pre-doctor experience camp tried to create a simulated environment to let students make their best decision before they become doctors.

Becoming a doctor: Students' perspectives in Germany

AUTHOR(S):

- Peter Jan Chabiera, German Medical Students' Association, Germany (Presenter)
- Johannes Kopp, Trier University, Germany
- Bernhard Gibis, National Association of Statutory Health Insurance Physicians, Germany
- Sylvia Hartmann, German Medical Students Association, Germany
- Jana Aulenkamp, German Medical Students Association, Germany
- Rüdiger Jacob, Trier University, Germany

ABSTRACT

Background: Among medical students in Germany the expectations on future working conditions in healthcare are partly quite different from the status quo in health care. Work-life balance, for instance, is a strongly discussed topic in the younger generation as well as where they want to work. To assess the preferences of doctors-to-be and identify trends for Germany's healthcare system in the future three surveys (2010, 2014, 2018) were performed.

Summary of Work: A link to an online questionnaire was sent by the medical faculties as a personalized e-mail to all medical students enrolled in Germany's faculties. Topics were expectations towards workplace, preferred disciplines, pros and cons concerning the work in hospitals and residency, working in multiprofessional teams and interprofessionalism, digitalization and work-life-balance. As the 2018-survey is the third 'visit' within 8 years, we have established a longitudinal-like-study and thus can present the course of developments over time.

Summary of Results: In 2018; 13915 (14,8% of all medical students) medical students in Germany took part in the survey. The most important expectation towards the workplace is the compatibility of family and work (named by 94.4%). Over 80% prefer to work part-time, especially women - and almost 70% of the medical students in Germany are women. General medicine has become more attractive over the last years (38.0% in 2010 to 42.5% in 2018). Surgery has lost attractiveness (29.3% in 2010 to 24.3% in 2018). Both trends are in particular of significance to more advanced clinical students. Furthermore, the countryside is not in demand as a place to work.

Discussion and Conclusions: We face significant changes in the expectations and demands of doctors-to-be concerning working hours, employers or self-employment, medical specializations and multiprofessional teams. Therefore, we face a unprecedented structural change in the Germany's system of medical care.

Take-home Messages: In coordination with the relevant stakeholders, national surveys can be established as a longitudinal study to investigate expectations and perspectives of medical students on their future career paths and working conditions. Strong differences between expectations and the status quo highlight the necessity of changes in health care's working culture in Germany.

Supporting Preparation for Practice in Radiotherapy Programmes

AUTHOR(S):

- Beverley Ball, University of Liverpool, UK (Presenter)
- Pauline Pilkington, University of Liverpool, UK

ABSTRACT

Background: As part of the pre-registration programmes in Radiotherapy, final year learners undertake a preparation for practice module, including completion of an application for a first post destination and interviews. Previously, mock interviews were undertaken as a face-to-face activity, but to reflect how recruitment is changing in the sector, e-interviews were introduced. The employability theme is embedded in modules to make Liverpool graduates able to compete in the changing climate of Health Care. The presentation will discuss the evolution and the preparatory workshops undertaken to support the learner with the final interview processes.

Summary of Work: The e-interviews compliment another aspect of speed dating style interviews whereby the learners (in small groups) move around stations answering a specific question aimed at an individual but with peer input and feedback from the interviewer. Learners fully participate in this experience, preparing themselves as if they were real interviews. It is an authentic learning activity: they have an opportunity to think about what they might be asked and prepare in advance, but during the interview have limited time to consider and present their answer. The activities prompt learners to read around the subject, and helps them learn how to deal with questions they are unable to answer deepening their understanding of their profession.

Summary of Results: The activities are placed in the curriculum before learners apply for jobs in their final year. The recording and answering of interview questions in small groups was evaluated as a major advantage over the traditional interview. Experiences of answering e-interview questions was a relatively pressured environment but allowed learners to see exactly how they appear at interview. In reviewing their own performance and considering their feedback, they had an opportunity to learn and improve.

Discussion and Conclusions: The small group work sessions allow for a variety of questions to be asked and answered individually, then with peer input and interviewer feedback (both written and verbal). Learner evaluation of the process is positive with a chance to review and reflect on feedback as a group and individually.

Take-home Messages: These methods of interview with supportive structured guidance workshops can be adapted and questions tailored to support any career area.

Occupation choices and career success of medical technology undergraduates

AUTHOR(S):

- Yu-Chih Liang, Taipei Medical University, Taiwan (Presenter)
- Blossom Yen-Ju Lin, Chang Gung University, Taiwan

ABSTRACT

Background: Students studied in the field of medical technology are expected to work in the clinical medicine, biotechnology, or medical research sectors to enhance the quality of healthcare and people's health. This study explored the determinants of occupation choices and career success among medical technology undergraduates.

Summary of Work: Among all undergraduate students enrolled from 1991 to 2013 in the Department of Medical Technology and Biotechnology of a medical university, 1412 graduated. Four occupation types, namely clinical medical laboratory, biomedical science and technology, medical research, and nonmedical industries, were recorded. Career success indicators comprised occupational commitment, perceived job performance, income satisfaction, job satisfaction, quitting intentions, and life satisfaction. Academic performance, gender, age, school enrollment methods were measured as potential determinants. A (e)-mail survey was conducted combined with the institutional data. Descriptive analyses, logistic regressions, and multiple regressions were performed.

Summary of Results: Our study was composed of 799 respondents with 24% of the respondents with occupations in the clinical medical laboratory, 33% in the biomedical science and technology, 23% in the medical research, and 20% in the nonmedical industries. Our study revealed that academic performance, admission selection methods, and age generation were related to one's occupation. In addition, age generation, academic performance, job characteristics, family, and unusual work or life events were related to one's career success in different ways depending on how the success was defined.

Discussion and Conclusions: Academic performance is related to postgraduation occupation choices and career success. This is consistent with occupational self-efficacy theory. In addition, the age generation of undergraduates showed different patterns for their occupational preferences. Career success could be considered from a holistic perspective, through professional activity and personal life and undergraduates showed the different patterns for varieties of career success indicators.

Take-home Messages: Medical educators should be aware of the value of curriculum designs, namely content and context based on occupational self-efficacy theory verified in this study. The age generation of undergraduates showed different patterns for their occupational preferences should be noticed. Career success could be considered from a holistic perspective and undergraduates showed the different ways for varieties of career success indicators.

The Research INvolvement, Determinants, Experiences, and Personality Traits of Health-care workers (Research IN-DEPTH) survey: Pilot results from New Zealand medical students

AUTHOR(S):

- Yassar Alamri, Canterbury District Health Board, New Zealand (Presenter)
- Diane Eley, University of Queensland, Australia
- C Robert Cloninger, Washington University, St. Louis, USA
- Erik Monasterio, Canterbury District Health Board, New Zealand

ABSTRACT

Background: The purpose of the study is to identify differences in personality traits of medical students, and to determine whether this impacts on specialty choice, research involvement and career satisfaction. With recent reports of high burn-out rates, as well as workplace bullying, a study such as this one is particularly timely.

Summary of Work: Medical students at our institution were invited to complete an online survey. We utilised the Temperament and Character Inventory (TCI), which is a well-validated personality test, and a demographic questionnaire. Data on chosen/prospective careers, and attitudes towards vocation and research were sought. The data presented are from a pilot for an ongoing longitudinal study.

Summary of Results: A total of 240 students (response rate 32%) completed the study survey. Male respondents constituted 32% of the study sample, and the median age was 22 years (range, 18-42). Data on career choices and personality characteristics are currently being analysed.

Discussion and Conclusions: Data on career choices and personality characteristics are currently being analysed.

Take-home Messages: We hope that the findings will provide understanding into what motivates medical students in their career choices and satisfaction.

What is the role of near-peer mentoring for medical students in better informing them about a career in general practice?

AUTHOR(S):

- Anjali Gondhalekar, UCL (University College London), UK (Presenter)
- Manisha Gossain, UCL Medical School, UK
- Anne Fitzgibbon-Cadiou, UCL Medical School, UK

ABSTRACT

Background: It is essential that medical students can make informed choices about a career in general practice. A report released by Health Education England (Wass et al) titled 'By Choice-not by chance, supporting medical students towards a future career in general practice' outlined a number of recommendations on increasing recruitment into general practice. The report illustrated the need for strong general practice role models and a contribution from near-peers to better inform medical students about a career in general practice.

Summary of Work: Ethical approval was sought prior to the project being initiated. A qualitative study was carried out looking at perceptions of medical students before and after the introduction of a near-peer mentoring scheme between UCL medical school students and UCL affiliated GP trainees. Questionnaires and focus groups were undertaken before and after the near-peer mentoring project to consider changes in the perception of general practice as a result of near-peer mentoring and this was considered in the context of the theory of change. Responses were transcribed and thematic analysis carried out using Nvivo software.

Summary of Results: Near-peer mentoring was found to be extremely effective overall. Key themes elicited from thematic analysis included the fact that the major factor impacting students perception of general practice as a career was their experiences of general practice during their clinical placements prior to the introduction of the near-peer mentoring scheme. The scheme was found to enhance perception of the GP role model and provided students with a more holistic outlook on general practice as a career.

Discussion and Conclusions: This project highlights one of the approaches that can be utilised to enhance the image of general practice as a specialty for aspiring young doctors to be and may help to provide them with role models that they may aspire to become more like.

Take-home Messages: Whilst further research is necessary, this project clearly suggests that there is scope for a wider reaching near-peer mentoring scheme, which could provide vital information and inspiration into a career in general practice in a more formal way. Moreover the scheme could also be adapted for mentoring between different trainee levels as well as for different specialities.

Engaging in the world of psychiatry

AUTHOR(S):

- Roshni Khatri, Brighton and Sussex Medical School, UK (Presenter)

ABSTRACT

Background: Under the current mental health curriculum, many medical students develop distorted assumptions about psychiatry; that mental health patients are difficult or impossible to treat, that the basis of treatments is unscientific, and that psychiatry is vastly different from other areas of medicine. Threshold concepts and capabilities are those which have the potential to transform students' understanding of psychiatry, yet are often troublesome to cross cognitively.

Summary of Work: From semi-structured interviews with psychiatry educators and free-text questionnaires with medical students we identify three threshold concepts in the curriculum: therapeutic risk-taking, biopsychosocial model, and understanding diagnosis in psychiatry. Additionally, we identify two threshold capabilities: patient centred adaptability and caring for patients.

Summary of Results: These concepts by their nature are often hard for the learner to understand, such as the rationale behind the discharging of a patient with emotionally unstable personality disorder who continues to self-harm on a ward. Here the learner may be stuck in a liminal space, trying to understand something that at face value does not make sense, while the teacher must find a way to make this transition to understanding as smooth as possible. These concepts offer the opportunity to allow students to experience transformational moments in their understanding and demystify areas of uncertainty.

Discussion and Conclusions: Researching threshold concepts provided the framework for the task of improving the psychiatry training via clinical placements for medical students. By identifying troublesome and transformative aspects of learning, this allowed a focus on the challenges and struggles that students experience when grasping concepts in psychiatry. Involving both students and educators in the discussion of curriculum design allowed a dynamic and inclusive consideration of all stakeholders involved in the learning process.

Take-home Messages: These concepts and capabilities challenge students' distorted assumptions, hence we propose focused teaching activities that can help students cross these thresholds: engaging in explicit diagnostic reasoning, learning about the role of a psychiatrist, and psychotherapy skills. These activities can be integrated into the undergraduate curriculum to help medical students develop a better understanding and appreciation of psychiatry.

When do medical students aim to be a doctor in Japan?

AUTHOR(S):

- Tomoko Miyoshi, Okayama University Hospital, Japan (Presenter)
- Mayu Uka, Okayama University Hospital, Japan
- Shuya Yano, Okayama University Hospital, Japan
- Sato Asuka, Okayama University Hospital, Japan
- Ogawa Hiroko, Okayama University Hospital, Japan
- Fumio Otsuka, Okayama University Hospital, Japan

ABSTRACT

Background: Medical students need to graduate from 6-year elementary school, 3-year junior high school, and 3-year high school in Japan. Universities give such chances as an open hospital for understanding medical school. High school and junior high school also have work experiences in their curriculum. In contrast, expectation of their parents, families and teachers are also influenced to students. Okayama University started the program of future career for students in third year medical school in 2015. The purposes of the program are “Thinking about social needs to medical students” and “Various working after graduation from medical school”. The program was settled between basic sciences and clinical sciences, and included a small group discussion about “What do you need doctors in the future in Japan?” and dialogues with doctors who selected various professions. Students answered to a questionnaire about their career after this program.

Summary of Work: 337 students participated this program. Average age was 22.1 year-old. Female students are 27.6 %. Most of students decided to be a doctor in high school days. Interestingly 21.7 % of medical students decided to be a doctor in their elementary school days. As the reasons, internal motivation was 32% and external motivation was 15%. 27% students were influenced by their parents and 15% students were by doctors. 40% students changed the images of their ideal doctor in their university life. Regional medical practice and medical research program were most influenced programs in the medical school. This Career program was also effected to students.

Summary of Results: Medical students are willing to a medical doctor when they are high school students. Internal motivation is the strongest reason to be a medical doctor. Parents and medical doctors also mostly influence high school students. Moreover, curriculum of medical school effects to medical students.

Discussion and Conclusions: It was reported that University students consulted about their career to families and friends more than faculties in Japan. Career education is important to medical school especially to lower year program.

Take-home Messages: Medical school students be ambitious!

Can the supportive culture for career development affect turnover intention among nurses in Japan?

AUTHOR(S):

- Miho Satoh, Yokohama City University, Japan (Presenter)
- Ikue Watanabe, Tohoku Fukushi University, Japan
- Kyoko Asakura, Tohoku University School of Medicine, Japan

ABSTRACT

Background: The constant turnover rate among nurses in Japan has been a serious problem over the past decades as invaluable nursing human resources with adequate experience have departed. The crucial factors influencing this include lack of career development opportunities and not being able to develop commitment to nursing or a sense of professionalism. This study aimed to explore the associations among the supportive culture for career development, commitment to nursing, and turnover intention.

Summary of Work: A cross-sectional questionnaire survey was conducted at 12 hospitals in Japan. The questionnaires were distributed to 1,034 nurses employed in these hospitals; of these, the data of 596 nurses (17.73 ± 10.01 years of clinical experience, 96.5% female) (valid response rate: 57.6%) were analyzed. The participants responded to questions related to the supportive culture for career development (four items), occupational commitment (affective commitment, continuance commitment, and normative commitment), turnover intention, and individual attribution.

Summary of Results: Supportive culture for career development showed significant correlations with affective commitment, continuance commitment, and normative commitment. The hierarchical regression analysis indicated that the “feeling of professionalism and autonomy in nursing” and “organizations’ adequate support system for skill development” had a significant direct relationship with turnover intention (Model 1: $\beta = -.200$, $p = .000$; $\beta = 0.150$, $p = .001$; Model 2: $\beta = -.131$, $p = .003$, $\beta = -.131$, $p = .004$, respectively). Affective commitment was associated with turnover intention in terms of “feeling of professionalism and autonomy in nursing” and “organizations’ adequate support system for skill development” (Model 2: $\beta = -.152$, $p = .001$).

Discussion and Conclusions: A workplace culture that fosters the feeling of professionalism and autonomy in nursing or support for skill development could increase the affective occupational commitment, thereby decreasing turnover intention among nurses. In hospitals, a supportive system and an education program for career development are required for the retention of highly skilled nurses.

Take-home Messages: Nursing administrators should develop education programs that would improve the nursing knowledge and skills of nursing staff. Such programs could strengthen their affective commitment to nursing or autonomy in nursing. Nursing staff are more likely to continue working within a supportive working environment that fosters career development and enhances their self-importance.

Development of Interprofessional Teaching OSCE: Experience From an Single Tertiary Teaching Hospital in Central Taiwan

AUTHOR(S):

- Tsu-Yi Hsieh, Taichung Veterans General Hospital, Taiwan (Presenter)
- Wei-Ting Hung, Taichung Veterans General Hospital, Taiwan
- Yu- Hsueh Chen, Taichung Veterans General Hospital, Taiwan

ABSTRACT

Background: The intended educational goals of patient-centered care for early year residents in our hospital were evidence-based practice, interprofessional collaborative practice, and shared decision making. However, due to diversity of clinical situation, trainees may not have enough exposures, effective reflections or timely feedbacks upon above domains. Therefore, we implanted an interprofessional OSCE station in routine teaching OSCE section since 2017.

Summary of Work: Interprofessional OSCE course content was developed through focus group discussion which included more than two different health professions. Each trainee was assessed by two observers from different health professions with two different assessment rubric in the same time. 10 out of 15 criteria of assessment rubrics were the same. Observers needed to lead reflective feedback discussion from different aspects by course content instructions immediately after trainee and standard patient encountered. Extended learning material was provided to trainee according to assessment results.

Summary of Results: 15 PGY1 and 11 residents from internal medicine attended interprofessional OSCE in 2017. Trainee satisfaction to course content was 90.4%, satisfaction to observers' feedback was 93%. Out of 10 core criteria, agreement level differences between observers was noticed in 3 patient education related criteria.

Discussion and Conclusions: Interprofessional OSCE station could be one of teaching modalities for interprofessional education. Observers from different health professions could provide more holistic feedback for trainee.

Take-home Messages: Interprofessional teaching OSCE with two observers from different health professions could provide more holistic assessment and feedback for trainee in early years.

Implementation of an OSCE at Medical Faculty of the Akaki Tsereteli State University

AUTHOR(S):

- Tamara Valishvili, Akaki Tsereteli State University, Georgia (Presenter)
- Irine Pkhakadze, Akaki Tsereteli State University, Georgia
- Tamar Pertaiia, Akaki Tsereteli State University, Georgia

ABSTRACT

Background: New Medical Education Benchmarks and preparation for international accreditation demands modernization of the Medical Education Program in different directions. The new, almost totally integrated curriculum causes to use new methods of student assessment, especially to test clinical skills, therefore thus, the implementation of the OSCE has become a significant challenge for team of faculty of Medicine of ATSU, especially in the background of the zero experience.

Summary of Work: The OSCE has been used to assess primary clinical skills for MD students. The examination, as Basic Clinical Skills course is conducted at the National Benchmarks simulation center of the Faculty of Medicine with full-equipped requirements. The students assessment was planned in 4 special stations to evaluate different skills. For example, the assessment of communicative skills was done in the first station, the technical performance of practical skills of primary care and resuscitation in urgent medical conditions in the second and in the third stations, and the assessment of the clinical thinking in the fourth station. For this purposes, precise instructions and multi-component check-lists have been elaborated, which would exclude subjective approaches and ensure credibility. The graduate and residents of the program were actively involved in the exam as trainers-instructors.

Summary of Results: Students and instructors surveys were conducted at the next stage. The discussion was held on the importance of assessing clinical practical skills and oral assessment, which will improve the quality of obtaining course learning outcomes.

Discussion and Conclusions: The implementation and widely use of OSCE at the ATSU Medical Faculty, will improve the quality of higher medical education and achievements of the Learning Outcomes.

Take-home Messages: Surveys revealed advantages and disadvantages from the first experience of OSCE: time management flaws, lack of number of trial stations, insufficient preparation of staff, the need to take the experience from European medical schools! Besides, the advantages of using the OSCE method were revealed: - measuring the correct use of the knowledge acquired by the student at the clinical situation. - assessing the student clinical skills objectively and accurately.

Utilizing Dynamic Assessment to Adjust OSCE Training Program for enhancing Individual Learning

AUTHOR(S):

- **Chin-Wei Chang, Center for Education in Medical Simulation, Taipei Medical University, Taiwan (Presenter)**
- Wen-Cheng Huang, Center for Education in Medical Simulation, Taipei Medical University, Taiwan
- Chao-Chun Kuo, Center for Education in Medical Simulation, Taipei Medical University, Taiwan
- Chin-Wang Hsu, Emergency Department, Wan-Fang Hospital, Taipei Medical University, Taiwan

ABSTRACT

Background: The OSCE test is one of the national examinations offered to nurses in Taiwan as registered Nurse Practitioners. Former training methods which based on traditional classroom training could not achieve satisfactory results. The most major reason is that students have different levels of knowledge and background, which leads to a gap in learning outcomes. Through the dynamic learning assessment to provide different levels of learning needs, we can redesign the curriculum to achieve the purpose of training.

Summary of Work: We provide a Dynamic Assessment in a OSCE workshop to adjust the learning strategy based on the students learning outcomes. Prior to class, structured telephone interviews can assess individual learners mastery of OSCE content and thereby become the basis for grouping. Within the course, we provide an OSCE test and regroup the students two to three times through scores to give different learning strategies. At the end of the study, we again provide individual tutoring based on the final simulation test.

Summary of Results: There was a very high evaluation of the workshop. All participants have almost significant growth in every OSCE exam content structure except for differential diagnosis. The pass rate of the students in the course is higher than National average.

Discussion and Conclusions: The results of the differential diagnosis were ordinary, the possible reasons are the difficulty of the exam or the ability to integrate information. Case discussions should be increased to enhance differential diagnosis. In order to use dynamic learning to assess and adjust individual strategies, the course must be split into multiple days or blocks. It may increase manpower and cost expenditures, but it may be good investment.

Take-home Messages: We normally have examination after the end of the study. However, for students of different backgrounds, we try to change the assessment training to course activities or implanting before courts. Through dynamic learning assessment, we can understand the current situation of students learning and adjustment strategies, thus effectively improve learning efficiency.

Developing and understanding the use of video in objective structured clinical examinations

AUTHOR(S):

- Alice Moulton, Keele University, UK (Presenter)
- Peter Yeates, Keele University, UK
- Jacquelyn Walsh-house, Keele University, UK
- Lorraine Clews, Keele University, UK
- Richard Fuller, Keele University, UK
- Robert McKinley, Keele University, UK

ABSTRACT

Background: Video is used in several roles to enhance assessment in Medical Education: to increase standardisation, improve feedback and to train and benchmark examiners. Whilst helpfully targeting assessor variability, these uses presume that assessors interpret video performances the same way they interpret live performances. Video could influence judgements in several ways: by reducing availability of sensory information, reducing volitional control or decreasing interpersonal interaction. Despite the potential for these influences to affect judgements, little research has compared how observing by video (versus live performances) influences examiners' judgements. Such differences are critical to the valid interpretation of video-based assessment scores. We therefore chose to study implications of examining by video whilst optimising methods for its use.

Summary of Work: This study blended action research and constructivist grounded theory. Thirty participants were recruited across 10 iterations of planning, acting, observing and reflecting upon simulated OSCE stations which were filmed using different camera modalities. In each iteration examiners judged both live and videoed performances. After scoring each performance (live or video), think aloud methods were used to explore examiners' perceptions of the salient features in the performance. Semi-structured interviews understood participants' perceptions of acceptability and information adequacy of different filming methods. Data was analysed using Grounded Theory.

Summary of Results: Examiners felt distanced from performances whilst judging videos. Tensions arose between a/.Camera obtrusiveness and adequacy of video views; and b/.Students' acceptance of cameras and the educational purpose of filming. These tensions were mediated by the interaction of OSCE station content with camera type and position, and sound and lighting quality. Examiners comfortably managed limitations of visual information and reduced volitional control through various strategies: focusing on salient behaviours, using inference, "thin-slice" judgements and proxy information, to usually reach equivalent judgements.

Discussion and Conclusions: Whilst video incompletely replicates assessors' live experiences, carefully employed video-based judgements achieve an "imperfect sufficiency" capable of achieving their purpose of enhancing standardisation or feedback in assessment. Assessors' information management suggests further implications for understanding assessor cognition.

Take-home Messages: Video can benefit assessment but only if institutions carefully balance the tensions between information adequacy, acceptability and purpose.

Designing OSCE-stations on organ donation to test challenging ethical and medical communication skills - A student initiative of the IMPPuls-Group

AUTHOR(S):

- **Jeremy Schmidt, German Medical Students' Association (bvmd e.V.), Germany (Presenter)**
- Aurica Ritter, German Medical Students Association (bvmd e.V.), Germany
- Richard Lux, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Germany
- Jana Jünger, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Germany

ABSTRACT

Background: Due to its high medical, ethical and judicial complexity in various cross-disciplines settings, organ donation represents a prominent example of the need for case-based training of communication skills within medical education. "Education about organ donation", a project of the German medical students' association (bvmd), aims at neutrally educating about the topic. All future physicians shall be aware of this and gain communication skills to give patients and relatives the best possible support and advice. Is it possible by students to develop OSCE-stations dealing with such challenging ethical subjects?

Summary of Work: Therefore, the bvmd cooperates with the German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy (IMPP) to develop stations of Objective structured clinical examination (OSCE). Three stations are developed, with the following topics: - General Practitioner: Consultation about the question of becoming an organ donor - Neurologist: Consultation with relatives about a brain-dead patient and the possibility of an organ donation - Nephrologist: Consultation with patient and close relative about a potential living donor donation Learning goals for students being assessed were formulated and the bvmd-taskforce was trained in developing OSCE-Stations. All stations are tested concerning feasibility, and networking to the nationwide implementation has started. The pilot period will begin at the end of 2019. It should be discussed that there might be problems due to students having different levels of knowledge and competence.

Summary of Results: In view of these OSCE-stations medical students train both their knowledge about organ donation and communication skills, which induce an opinion formation in patient or relative.

Discussion and Conclusions: With this cooperation within the IMPPULS-Group, involved students are enabled to transform their engagement of strengthening the topic of communication on organ donation in medical curricula into developing specific assessment settings. The three topics require lots of general knowledge on organ donation, while focusing not on specific medical detail knowledge, but on the patient needs for an empathic and shared-decision communication.

Take-home Messages: We believe an inclusion of OSCE stations and their required skillset into medical curricula will lead to a substantial improvement in knowledge about organ donation and the handling of complex doctor-patient communication settings.

Mobile Scoring Systems with Extended Online Feedback Augmented Teaching and Learning in Formative OSCE

AUTHOR(S):

- Te-Chuan Chen, Division of Nephrology, Department of Internal Medicine, Kaohsiung Chang Gung Memorial Hospital, Taiwan (Presenter)
- Chia-Chen Wang, Department of Pharmacy, Kaohsiung Chang Gung Memorial Hospital, Taiwan
- Haw-Chyan Lee, Department of Pharmacy, Kaohsiung Chang Gung Memorial Hospital, Taiwan
- Yu-Chan Kang, Department of Pharmacy, Kaohsiung Chang Gung Memorial Hospital, Taiwan
- Ching-Ling Tai, Department of Pharmacy, Kaohsiung Chang Gung Memorial Hospital, Taiwan
- Lily Wang, Department of Pharmacy, Kaohsiung Chang Gung Memorial Hospital, Taiwan

ABSTRACT

Background: Objective structured clinical examinations (OSCEs) are common for formative teaching and summative assessment. However, item scores are easily lost when using paper-based formats.

Furthermore, common mistakes are difficult to debrief across students immediately post-exam. Finally, students report being left with unanswered questions after feedback, despite it being provided swiftly.

Summary of Work: To avoid missing scoring items, we developed an App to automatically calculate scores enabling real-time statistical calculations, plotting and debriefing. An interactive forum extended feedback online; for participants to ask post-exam questions, and raters to provide additional feedback. We analyzed raters' (experienced, qualified, pharmacy teachers) perceptions and students feedback.

Summary of Results: Forty pharmacy postgraduate students and twenty-one raters participated during 2016-2017. The G coefficient was 0.82. It showed significant improvement for raters using mobile scoring systems and extended online interactive feedback forum. Learners' self-assessment improved significantly before and after the program. "Feel free to ask questions online" comprised students' most important factor.

Discussion and Conclusions: Our systems may help raters score students, providing automatic calculation, avoiding missing scores and promote debrief in groups. The interactive online forum may provide and extend the interactive learning and teaching between learners and raters. Furthermore, it may decrease the manpower of calculating scores, provide extended online feedback and is environmentally friendly.

Take-home Messages: We demonstrated that integrated high technology that can help and augment the learning and teaching for health professional students. It may overcome some problems in traditional formative OSCE to help teachers and students especially they come from different sites at a distance.

Music therapy may not help Thai medical students to reduce their stress before the formative-OSCE test

AUTHOR(S):

- Wannaphorn Rotchanapanya, Medical Education Center Chiangrai Prachanukroh Hospital, Thailand (Presenter)
- Vich Thampanya, Medical Education Center Chiangrai Prachanukroh Hospital, Thailand

ABSTRACT

Background: There is already some research regarding the effects of listening to classical music before an taking an exam. Previous study found that 70% of students who listened to music and received encouragement from instructors before an exam performed better than those who did not. Therefore; we applied this to medical students in Thailand to see if the results were similar or different.

Summary of Work: Forty-two fourth and fifth year students in the August 2016 to January 2017 period were enrolled in the study. The parameters measured were vital signs and ST-5. GPA and other data were reviewed. A non-music listening group and a music listening group were created. Measurements were taken at 2 different time intervals.

Summary of Results: In total 14 males and 28 females were included. The group included 10 and 32 of 4th and 5th year students respectively. There were no significant differences in age, gender, or GPA in the groups. Recordings of PR, BP, RR, and OSCE scores showed no significant statistical difference. Stress scores were not lower in the music listening group prior to taking examinations. Stress scores of those groups listening to music and those non-listening to music prior to entering the examination were 5.76 (+/-)2.46, and 4.14 (+/-) 2.43 respectively. (p=0.038)

Discussion and Conclusions: Listening to classical music before entering the examination room is not effective for Thai medical students. They strongly agreed that music can reduce stress (92.3%), but do not favor the rhythms as in this research. (50%). The difference in the matter of encouragement may influence the result of this study. Just only listening to music before entering the formative-OSCE test during a stressful situation is not suggested to reduce stress in Thai medical students.

Take-home Messages: For Thai medical students entering the test, there should be nothing to disturb them in order to better reduce their stress.

Electronic Marking Application for OSCE Examination

AUTHOR(S):

- Shekhar Kumta, The Chinese University of Hong Kong, Hong Kong (Presenter)
- Ho Keung Ng, The Chinese University of Hong Kong, Hong Kong
- Paul B. S. Lai, The Chinese University of Hong Kong, Hong Kong
- Yan Jin, The Chinese University of Hong Kong, Hong Kong
- Alex L. K. Yung, The Chinese University of Hong Kong, Hong Kong

ABSTRACT

Background: Objective Structured Clinical Examination (OSCE) is widely used for testing clinical skill performance and competence in medical education. The scoring procedures are standardized for examiners and the score is usually marked on paper. This requires tedious administrative manual work totally and sort out marks and to set pass or fail standards.

Summary of Work: An iPad application was developed by Faculty of Medicine, The Chinese University of Hong Kong (CUHK) in 2013 and was used as a marking tool to facilitate examiners in School of Public Health and Primary Care for department module examination. The marking scheme of OSCE within the application was preinstalled onto iPads prior to the examination. Examiners selected the scores from the checklist and typed in any feedback in a comment section. All the examination results were stored in iPads and sent to administrator via email after the examination. Tabulation of results was immediately possible.

Summary of Results: This paperless marking method has been used by School of Public Health and Primary Care department (SPHPC) in the past five years since 2013. Not only has it reduced the workload of administrators dramatically, but has avoided marking errors when compared with manual marking, prior to 2013. From 2013 to 2018, 5 to 10 stations were used in Year 4 OSCE examinations every module by SPHPC. 40 to 55 students participated in OSCE every module and there are four modules every year. The electronic marking application by iPad has been used in these OSCE examinations.

Discussion and Conclusions: Electronic forms of the marking scheme for any OSCE can be easily created and stored via this iPad application. This dramatically decreases administrative work and reduces human errors, as the final scores are calculated automatically. The user-friendly digital interface and simple operation flow have been well received by our examiners.

Take-home Messages: With the ever-increasing number of students (n=200+) in the Faculty of Medicine, CUHK, this OSCE marking scheme has unburdened administrative staff and eliminated inaccuracies in the scoring of High Stakes Exams. However the IT backbone needs to be robust and scalable, perhaps requiring enterprise based on-line database services to make such an application scalable for use across the faculty.

Factors affecting the OSCE effectiveness in training new nurses on cardiopulmonary resuscitation (CPR)

AUTHOR(S):

- Yi-Hung Lai, Department of Nurse, Taichung Veterans General Hospital, Taichung, Taiwan (Presenter)
- Lin-Zin Hong, Department of Nurse, Taichung Veterans General Hospital, Taichung Taiwan
- Pi-Chu Wu, Department of Nurse, Taichung Veterans General Hospital, Taichung, Taiwan

ABSTRACT

Background: To explore factors related to the effectiveness of new nurses in objective structured clinical examination (OSCE) training on unintended cardiopulmonary resuscitation (CPR).

Summary of Work: Research design: A pre- and post- study was conducted at a medical center on a single group of new nursing staffs (n=66). The study was conducted over a period from three months to one year using Unexpected Cardiopulmonary Resuscitation OSCE, based on structural questions and answers collected from individual nurses. In total, three times self-evaluation were performed: before training, right after training, and 6 months after training. Evaluation tools included the unintended CPR professional knowledge scale, and undesired CPR confidence index. We also analyzed the following individual data in relation to their learning performances: gender, age, education level, working years, CPR experience, certificate of advanced cardiac life support (ACLS) and the number of clinical CPR performed.

Summary of Results: Research results: The population average score of the unintended CPR professional knowledge scale was 73.8 points before training, 74.8 points right after training, and 74 points after 6-months training. The population average score of the unanticipated CPR index was 28.5 points before training, 29.8 points right after training, and 30 points after 6-months training. However, in association with unintended CPR professional knowledge, statistically significant differences were found between those with and those without ACLS licenses: either before (p=.005) or right after training (p=.045). In association with the unanticipated CPR confidence index, statistically significant differences were found between those with and those without ACLS certificates (p=.025). The confidence index of the unintended CPR gradually increased with the duration of training, and finally reaching significant improvement levels (p=.010). Significant differences were also found between gender (p=.008), specialist education (p=.021), and ACLS license (p=.021).

Discussion and Conclusions: A number of factors of individual nursing staffs were found to associate with their differences in performance on unintended CPR learned through OSCE. Our findings could help medical units improve CPR training for new nurses.

Using the objective structured clinical examination as an assessment strategy for Novice Nursing Practitioners

AUTHOR(S):

- Sue-Hsien Chen, Chang Gung Medical Foundation Administration Center, Taiwan (Presenter)
- Kun-Yun Yeh, Division of Hemato-oncology, Department of Internal Medicine, Taiwan
- Shu-Ching Chen, Department of Medical Research, National Taiwan University Hospital, Taiwan
- Yo-Ping Lai, Department of Internal Medicine National Taiwan University Hospital, Taiwan

ABSTRACT

Background: The Objective Structured Clinical Exam (OSCE) is a valid method of assessing competence in medical and nursing specialties. We sought to develop an OSCE to evaluate novice nursing practitioners' (NNPs') clinical competency, work stress, professional confidence, and satisfaction.

Summary of Work: An experimental study (pre-post). Fifty-five NNPs received the OSCE three-months following graduation, comprising four stations: history taking, physical examination, problem-directed management, interpersonal communication, required procedure techniques. Examiners completed an assessment checklist, participants completed a pre-post questionnaire (modified from a Nursing Competency Questionnaire, a Stress scale, and Satisfaction with Learning scale).

Summary of Results: Pass rate=74.5%: significantly higher among nurses from medical-surgical wards (85.7%) and intensive care unit-emergency departments (77.8%). Lowest scores were reached on the fever patients' station. OSCE performance was associated with educational attainment, work unit, but not gender. Significant increases in: competency, confidence, clinical practice satisfaction. Significant decrease observed in work-stress

Discussion and Conclusions: NNPs improved across a range of key domains following the OSCE intervention. However, their inability to perform well in history taking and symptom assessment may be attributed to them having few opportunities to encounter febrile patients during early working experience, especially for NNPs from the baby room, and operation rooms. We found that the OSCE process had a positive educational influence, at providing a meaningful and accurate assessment of the competence of NNPs. Although the implementation of an OSCE remains costly, the benefits for NNPs, educators, and administrators regarding increased competence and workforce stability following OSCE training outweigh its costs.

Take-home Messages: The OSCE offers an objective and standard tool to assess multifaceted clinical ability of NNPs in a close-to-clinic situation.

Development and Testing of the Objective Structured Clinical Examination Grief Counseling Training Program for Nursing Staff

AUTHOR(S):

- Hsueh-Hsing Pan, National Defense Medical Center, Taiwan (Presenter)
- Chi-Kang Lin, Tri-Service General Hospital, Taiwan

ABSTRACT

Background: Following a disaster, manpower deployment, immediate and effective resource investment, and grief counseling are the important tasks of disaster nursing. However, the crisis management of nursing staff and the grief counseling after a disaster occurred are still an important and challenging issue. The aims of this study were to develop and test an objective structured clinical examination (OSCE) for grief counseling in disaster nursing. We also wanted to understand the satisfaction for grief counseling as well as to explore the predictors of outcome in the OSCE.

Summary of Work: The OSCE content of grief counseling was to examine the content validity, and then to discuss with 11 experts using Angoff scoring. Finally, we set out the criteria for passing the OSCE. Military nurses were recruited to the OSCE. Data were collected including demographics, satisfaction, and the OSCE score of grief counseling. Teacher critique the OSCE occurred following testing.

Summary of Results: The content validity index of this study was 0.9 and the average score in the third Angoff scoring was 15. A total of 162 nursing staffs received OSCE test for grief counseling. Among these nursing staffs, 73(45.1%) passed and 89(54.9%) failed the test. Logistic regression analysis was used to adjust the confounding factors. The results showed that age ($p = 0.031$), perceived OSCE performance ($p < 0.05$) was the most important factors in predicting the pass of OSCE test.

Discussion and Conclusions: In this study, we developed and test the OSCE of grief counseling among nursing staffs. In addition to understanding the ability of nursing staffs in grief counseling, this OSCE test also helped to improve the practical skills of grief counseling.

Take-home Messages: This OSCE of grief counseling can be applied in disaster nursing as well as in clinical patients care. Therefore, it is worth developing and promoting in disaster nursing and patient care.

OSCE as final evaluation of performances in residents of Orthopedics and Traumatology

AUTHOR(S):

- **Natasha Kunakov, Universidad de Chile, Facultad de Medicina, Chile (Presenter)**
- Juan Manuel Salas, Universidad de Chile, Facultad de Medicina, Chile

ABSTRACT

Background: In 2007, Orthopedics and Traumatology Department, Faculty of Medicine of the Universidad de Chile, decided to conduct an Objective Structured Clinical Examination (OSCE) as a final practical examination of their residence. Good examinations have several characteristics, including validity, reliable scores, educational impact, practicability, acceptability and good cost-benefit ratio. OSCE has the characteristics of a good examination. This examination has come to be considered the gold standard for the assessment of a student's clinical competence and to certify competencies. In Chile exists OSCE experience in evaluating undergraduate and medical degree certification, but there are limited experiences in postgraduate training programs.

Summary of Work: Each year the department must evaluate 20 - 24 residents. A OSCE blueprint is defined with 10 stations. Teachers participate in a B-learning course of Simulation and OSCE, the final product is the station for the examination. The station creator trains the simulated patients (when necessary), leads the pilot and acts as an examiner. The stations are evaluated with a checklist. The standard setting is defined at 70% . Residents answer a satisfaction survey when finished. A report is created from each resident, with the scores obtained in each station.

Summary of Results:

Year:	2013	2014	2015	2016	2017	2018
Average:	7,5	8,4	8,2	8,6	8,2	8,5

Discussion and Conclusions: The clinical teachers were satisfied with the performance shown by the students, which coincides with their subjective evaluation during the training. The clinical teachers were able to recognize problems in the students training plan and it had been corrected year after year. This program is multi-center, OSCE allowed to show problems in the programs of each center and correct towards a single training program. The standard setting that was defined is being surpassed every year by residents. The survey answered by the residents at the end of the OSCE revealed that they felt satisfied with the exam, believed that they had been well evaluated and that the clinical problems presented at the stations were perceived as real and frequent in the practice of traumatology.

Take-home Messages: OSCE is a clinical examination that provides information about the performance of individual residents. But, most importantly, OSCE provides valuable information about the quality of postgraduate training programs.

On-site simulation improves the quality of high-stakes OSCE

AUTHOR(S):

- **Marcos Borges, Ribeirao Preto Medical School, University of Sao Paulo, Brazil (Presenter)**
- Regina Pose, Escola da Saúde, Universidade Municipal de Sao Caetano do Sul, Brazil
- Larissa Fernandes, Ho Consultoria
- Luciane Loures dos Santos, Ribeirão Preto Medical School, University of Sao Paulo, Brazil
- Cristina Del-Ben, Ribeirão Preto Medical School, University of Sao Paulo, Brazil
- Valdes Bollela, Ribeirão Preto Medical School, University of Sao Paulo, Brazil

ABSTRACT

Background: Objective structured clinical examination (OSCE) is widely used to assess clinical competencies during medical studies. In Brazil, high-stake OSCE is also used to select the best candidates for medical residency. Examiner training for OSCE is still challenging.

Summary of Work: A six-station OSCE with 11 simultaneous rooms (replica) for each station and 92 examiners selects residents, in a program with 850 applicants in the second phase exam. In 2017, examiners and SPs were trained based on oral explanations showing the checklist. In 2018, we developed three on-site simulations for each station before the exam and everybody (SPs and examiners) had the opportunity to see and discuss doubts related to the performance and checklist. Examiners perception (52 examiners answered a questionnaire) and inter-examiner reliability were assessed with interclass correlation coefficient (ICC).

Summary of Results: Compared to 2017, the majority of examiners said they used to have difficulty to interpret checklist tasks and that there was not a good inter-examiner calibration (54.95 and 70.6%, respectively). In 2018, most of them considered that simulations had good quality and improved inter-examiner calibration (88.2 and 86.4%, respectively). Additionally, ICC improved after training and simulations.

Discussion and Conclusions: On-site simulations just before a high-stake OSCE improved inter-examiner variability and, consequently, exam quality. Moreover, the training was well acceptable for examiners and improved their perception related to OSCE quality. Additionally, they felt more comfortable being as examiners. Therefore, on-site training with simulations for OSCE contributes to the exam quality and participant perception.

Take-home Messages: The implementation of on-site simulations for OSCE led to better inter-examiner variability, participant perception and resulted in more reliable exams. Moreover, the training did not have a negative impact on the OSCE organization.

Can the Standardized-Patient Substitute the Faculty-Physician in OSCE

AUTHOR(S):

- Panomkorn Lhakum, Medical Education Center Chiangrai Prachanukroh Hospital, Thailand (Presenter)
- Piyaporn Sirijanchune, Medical Education Center Chiangrai Prachanukroh Hospital, Thailand

ABSTRACT

Background: Currently the objective structured clinical examination (OSCE) was directed observed by faculty-physician (FP). Standardized-patient (SP) also played an important role in this field. The aim of this study was to compare FP and SP assessments of medical students in OSCE.

Summary of Work: To evaluate the assessment in OSCE of SP compare to FP scoring to medical students. The OSCE designed to assess in professionalism, communication skill, history taking and physical examination. The OSCE consists of 5 minute station. The fourth-year medical students were evaluated by both SP and FP.

Summary of Results: The 22 fourth-year medical students were evaluated the OSCE by both SP and FP. The OSCE mean score assessment were 76.59+9.39 by SP and 54.68+9.53 by FP. There was a significant difference of scoring between SP and FP with P value <0.001. The interrater reliability between SP and FP was 4.55%, Kappa 0.025. Mean scores of professionalism domain were 92.27+5.28 by SP and 91.25+5.12 by FP. There was no significant difference of scoring between SP and FP with P value=0.07. The interrater reliability between SP and FP was 46.36%, Kappa 0.443.

Discussion and Conclusions: The assessment of medical student OSCE by SP could not substitute FP. But there was similar agreement in professionalism domain. Well trained SP should be warranted.

Take-home Messages: SP was able to assess medical student professionalism equally as well as FP.

Does the non-native English accent influence the examiners' markings in an Objective Structured Clinical Examination (OSCE)?

AUTHOR(S):

- An Kozato, Queen Mary University of London, UK (Presenter)
- Nimesh Patel, Queen Mary University of London, UK

ABSTRACT

Background: OSCE assessment is an important aspect in medical education. There are anecdotal evidences that students with non-native English accents and speak English as second language (ESL) perform less well in the OSCE due to subconscious bias. Historically, the issue of accent related bias has its routes on ethnocentrism, which stated one's own group is perceived as superior to the external group. Tajfel discussed prototypical categorization is activated when an individual is perceived as the member of a typical group. It is possible that the degree of in/out-group identity creates stereotyping. Stereotypes were activated when making judgements, leading to a bias in how information is accessed when marking medical students in an OSCE. Other research explored the disparity in OSCE marks according to the difference in ethnicity. Studies demonstrated students with ESL performed less well in OSCEs. However, score differences due to the presence of accents have not been investigated. This study aims to fill this gap in the literature by evaluating the differences in the examiners' marking given to a student with a non-native English accent and a student with a native English accent.

Summary of Work: OSCE examiners in the UK were recruited. Participants were randomly assigned to 2 groups and watched 2 pre-recorded online videos of simulated students with/without non-native English accents performing with varied degree of proficiencies. They marked the performances and the differences in the given marks due to the presence of non-native English accents was statistically analysed.

Summary of Results: The characteristics of participants such as gender, ethnicity and years of training are summarised. The result discusses the differences in the collected scores due to the presence of accents.

Discussion and Conclusions: The discussion describes the validity and reliability of the study including the potential bias in the study. The participants' characteristics are investigated to identify links between the characteristics and the markings. Possible causes of the results are discussed. Conclusion presents possible ways to improve the current OSCE assessor trainings.

Take-home Messages: The possibility of judgement bias in examiners due to non-native English accents presents an issue in ensuring the quality and fairness of OSCE as an assessment.

Assessing Stress and Resilience of Veterinary Medical Students undergoing the Objective Structured Clinical Examination (OSCE)

AUTHOR(S):

- Saundra Sample, Ross University School of Veterinary Medicine, St Kitts & Nevis (Presenter)
- Elpida Artemiou, Ross University School of Veterinary Medicine, St Kitts & Nevis
- Darlene Donszelmann, University of Calgary Veterinary Medicine, Canada
- Cindy Adams, University of Calgary Veterinary Medicine, Canada

ABSTRACT

Background: Veterinary education is an intense and demanding program wherein students are expected to learn a high-volume of often conceptually challenging material and are regularly assessed on their progress. Likewise, veterinary students are prone to feeling stressed and overwhelmed. At high levels of stress, people have difficulty forming, consolidating, and retrieving memories. In our veterinary students, this can greatly interfere with their ability to learn and perform on assessment, as well as their ability to make clinical decisions. This study proposes to look at the veterinary student experience of stress and their ability to perform on assessments through the lens of the objective structured clinical examination (OSCE).

Summary of Work: Third year student volunteers from the University of Calgary Veterinary Medicine (UCVM) class of 2019 participated in a semi-structured interview that explored the student-experience surrounding stress and OSCEs, as well as investigated coping mechanisms, and the student perception and development of resilience. Interviews have been transcribed and analyzed using thematic analysis.

Summary of Results: Thematic analysis identified two primary sources of stress revolving around institutional culture and a fear of failure. Students who demonstrated resilience tended to have previous experience with stress and failure, a strong sense of self-worth, and have an appreciation of the enormity of life experiences including crisis and disasters.

Discussion and Conclusions: Many of the veterinary students entering graduate programs have not previously experienced the intensity of a rigorous academic program, nor developed the art of resilience and stress management, and are susceptible to fear of failure, as well as emotional and medical problems. Further attention, must be given in student selection, as well as development of wellness programs.

Take-home Messages: No student can be untouched by the challenges they encounter in academia. We must explore creating a curriculum that is attentive to both psychological as well as academic development.

Station-Based Blended Learning for Undergraduate Medical Students in the Obstetrics and Neonatology Modules

AUTHOR(S):

- **Ausrele Kudreviciene, Lithuanian University of Health Sciences, Lithuania (Presenter)**
- Laura Malakauskiene, Lithuanian University of Health Sciences, Lithuania
- Ieva Andriejaite, Lithuanian University of Health Sciences, Lithuania
- Jolanta Sulinskiene, Lithuanian University of Health Sciences, Lithuania
- Rasa Tameliene, Lithuanian University of Health Sciences, Lithuania
- Ruta Jolanta Nadisauskiene, Lithuanian University of Health Sciences, Lithuania

ABSTRACT

Background: Due to changes and development of technologies, the traditional teaching techniques based mainly on a teacher explaining a topic and students taking notes become ineffective and not motivating for present-day students. The aim of the study was to evaluate the influence of the station-based blended learning on OSCE results.

Summary of Work: Retrospectively we analyzed OSCE results among medical students who underwent training with the use of traditional learning methods (lectures and seminars) (45.5% (n=106)) and the station-based blended learning technique (54.5% (n=127)). The study included 233 randomly selected undergraduate fifth-year students of the Lithuanian University of Health Sciences (LSMU) Medical Academy who during 2014 - 2018 were studying the Obstetrics and Gynecology modules.

Summary of Results: In the traditional learning group, the final median of the OSCE total score of the neonatology module was 9 points (the minimal score being 2, and the maximal score - 10 points), and that of obstetrics - 8.3 points (the minimal score was 3.8 points, and the maximal score - 10 points). In the group where station-based blended learning was applied, the medians of the students' OSCE total score in obstetrics and neonatology were statistically significantly higher: in neonatology, 10 points (the minimal score was 7 points, and the maximal score - 10 points), and in obstetrics, 9.6 points (the minimal score was 4.2 points, and the maximal score - 10 points), $p < 0.001$. The results of the logistic regression analysis suggest that in undergraduate medical students, the application of station-based blended learning may increase the frequency of the final results reaching 9.0 points or more by twofold (OR 2.41, 95% CI 1.057-5.498; $p = 0.03$), compared to the use of traditional learning techniques.

Discussion and Conclusions: Station-based blended learning is still rarely used when teaching of medical students, and thus more studies are required to evaluate the influence of this technique on the students' final results and persistence of skills, as well as on the knowledge of the subject. The application of blended station-based learning significantly increased the OSCE evaluation scores.

Take-home Messages: Station-based blended learning used for undergraduate medical students can be a standardized motivating tool for achieving better learning results.

Mock national licensing examination can help identify clinical competencies needed to be improved in medical students trained domestically and overseas

AUTHOR(S):

- **Sudathip Nimkingratana, Nakornping Medical Education Center, Thailand (Presenter)**
- Hataitip Tangngam, Nakornping Medical Education Center, Thailand
- Worachet Teacharak, Nakornping Medical Education Center, Thailand
- Pornsuda Krittigamas, Nakornping Medical Education Center, Thailand

ABSTRACT

Background: All medical graduates both trained domestically and overseas, who are seeking to practice in Thailand healthcare system are subjected to take the Thai National Licensing Examination (NLE). To prepare its students for the NLE examination, Nakornping Medical Education Center organized a mock NLE OSCE examination for its final year medical students and overseas medical graduates. This study was aimed to compare clinical competencies as measured in the mock OSCE examination between students trained in Thailand's medical school and those trained overseas.

Summary of Work: Mock NLE consisting of 20 OSCE stations was held to assess a range of key clinical competencies, such as history taking, physical examination, communication, procedural, and interpretation skills. In this cross-sectional analytical study, we compared the total OSCE score in the mock examination and the number of OSCE stations successfully passed between 20 6th-year medical students of Nakornping Medical Education Center and 8 overseas medical graduates, mostly from China, who spent their internship year in the same training center using Mann-Whitney U test. We compared the proportion of students from the two training schemes who successfully passed the OSCE examination, considering passing a minimum of 12 OSCE stations as successfully passing the mock examination.

Summary of Results: Medical students trained domestically scored higher OSCE marks than students trained overseas (median score of 1254.5 and 840.5 respectively, $p < 0.05$). The median number of OSCE stations students successfully passed was higher in medical students trained domestically than those trained overseas (median 11.5 and 4.5 stations, $p < 0.05$). 50% of the students trained domestically passed the mock OSCE examination, while none of the students trained overseas passed it. The students from both schemes scored low in communication skill. Those trained overseas had the lowest scores in history taking and interpretation skills.

Discussion and Conclusions: Clinical competencies in students trained domestically and overseas clearly differed. History taking, interpretation and communication skills were key areas for improvement in medical students.

Take-home Messages: Mock OSCE examination can be used as a formative assessment and is likely to help identify areas for improvement in medical students' clinical competencies.

A novel OSCE case to assess medical students' responses to a request for an unnecessary test: A mixed methods analysis of communication challenges

AUTHOR(S):

- Felise Milan, Albert Einstein College of Medicine, USA (Presenter)
- Sandra Oza, Albert Einstein College of Medicine, USA
- Pablo Joo, Albert Einstein College of Medicine, USA

ABSTRACT

Background: Rising health care costs and risks of interventions have prompted efforts to decrease utilization of unnecessary interventions. The Choosing Wisely campaign encourages a national dialogue on avoiding unnecessary medical tests and treatments and advocates key communication skills for promoting patient understanding of recommendations. To develop effective curricula and assessments, educators must appreciate the barriers to having these conversations. We developed an OSCE case to assess medical students' communication skills and challenges during an encounter with a patient requesting an unnecessary test.

Summary of Work: Students enrolled at two US medical schools participated in this OSCE after their 3rd-year clerkships. An SP presents with low back pain requesting an MRI (clinically not indicated). SPs reported whether students referenced clinical practice guidelines or discussed risks of unnecessary testing. Students completed a post-encounter note about perceived challenges in responding to the patient's request. Borderline regression method was used to determine reliability of case scoring.

Summary of Results: 251 students completed the OSCE case. 76% reported not ordering an MRI, 44% referenced clinical practice guidelines, 34% discussed risks of unnecessary testing. The decision not to order MRI corresponded with referencing clinical practice guidelines ($p < 0.001, r = 0.42$) and discussing risks of unnecessary testing ($p < 0.001, r = 0.31$). All students provided responses to the prompt. Most commonly reported challenges included the cost of the intervention, perceived lack of time, knowledge, skills, confidence and communicating with a patient perceived to be persistent/demanding. Case scoring reliability was good ($R^2 = 0.65$).

Discussion and Conclusions: In this OSCE case assessing competency in communicating with patients about unnecessary medical testing, most students did not order an MRI. Patient education was significantly associated with avoiding unnecessary testing. While students reported awareness of the need to consider cost and indications for testing, students perceived many challenges centered on the student-patient interaction. Those challenges resulting from a student's lack of knowledge, skills or confidence comprise a needs assessment for educators developing curricula to educate learners to communicate about value with patients.

Take-home Messages: Qualitative research done on OSCE clinical encounters can provide an in-depth view of our learners experience and thereby inform our teaching.

Exploring the risks of disruption of specialist physician training

AUTHOR(S):

- Leila Niemi-Murola, University of Helsinki, Finland (Presenter)
- Asta Toivonen, University of Helsinki, Finland
- Taina Autti, University of Helsinki, Finland

ABSTRACT

Background: In Finland, we are in the process of reforming our specialist training. Newly graduated doctors will apply entry to the specialist education program instead of simple registration. We explored the data of physicians registered as residents during years 1999-2009 without receiving their specialist degree in order to find factors behind disruption of specialist education. During the study period the residents were able to register for more than one speciality.

Summary of Work: Demographic data of all 877 students registered in specialist training during years 1999-2009 was retrieved from the files of the University of Helsinki. They had registered for 1715 specialties. We investigated their professional status in 2018 from different official and unofficial registers. We used classification of specialties described in previous medical education research (procedure-oriented, surgical, hospital-oriented and primary care).

Summary of Results: Of the 877 students, 345 (39.3%) had truly disrupted their specialist training (121 male, 206 female, $p < 0.01$), 49 of those were immigrants (14 %). Twenty-four percent (210/877 residents) received other specialty than their primary choice during the period. We found 249/877 (28.4%) residents who had graduated after the year 2009 (99 male, 146 female), 22 already had one specialty. No information was found of 32 residents.

Discussion and Conclusions: Female residents had a greater risk for delayed specialist training than male. Of the residents who had truly disrupted their specialist training, 184/354 (54 %) had chosen people-oriented specialties associated with an open personality (family medicine, geriatrics, general internal medicine). Half of the immigrants having disrupted their training had also chosen these specialties. Of those who continued their specialist training, 31.7 % had chosen people-oriented specialties.

Take-home Messages: Surprisingly many residents who had chosen people-oriented specialties disrupt their specialist training. The results indicate that some of them choose other specialty after temporary pause. Those who continued their training were younger than those who were classified as disrupted. The residents who had chosen procedure-oriented, surgical and non-primary care medical specialties are either more engaged with their studies or they receive more support during their specialist training.

What makes the difference in patient satisfaction? The perspective of specialty characteristics in residency

AUTHOR(S):

- I-Ting Liu, E-DA Hospital, Taiwan (Presenter)
- Chi-Wei Lin, Department of Family Medicine, Department of Medical Education, E-Da Hospital, Taiwan
- Ru-Yi Huang, Department of Family Medicine, Department of Medical Education E-Da Hospital, Taiwan
- San-Nan Yang, Department of Family Medicine, Department of Medical Education, E-Da Hospital, Taiwan

ABSTRACT

Background: Assessments of postgraduate medical training in clinical setting can be performed by mini-CEX, DOPS for single performance and MSF including patient satisfaction survey for routine performance. This study is to evaluate the specialty difference in patient satisfaction of residents, which may provide formative feedback during specialty training.

Summary of Work: Our material was extracted from the 2015-2017 work-base assessments database of medical education department of a teaching hospital in Taiwan. Modified chinese short form of SHEFFPAT was used as Patient Satisfaction Questionnaire (PSQ) including questions regarding altitude, clinical checking, listening, explanation, privacy/confidentiality, and overall satisfaction (scored 1 to 5). Inter-group comparisons were conducted by independent t test and one way ANOVA .

Summary of Results: 653 PSQ were collected from 45 trainees including 10 internal medicine, 19 surgical, 3 pediatric, 2 psychiatric, 5 emergency and 6 Family medicine residents. Independent t test showed female patients gave a higher PSQ score and female residents got higher patient satisfaction (Mean \pm SD=4.62 \pm 0.49, $p < 0.001$). One way ANOVA revealed significant intergroup difference in PSQ scores related to altitude, clinical examination, listening and share decision making, explanation, privacy/confidentiality, and overall satisfaction. Post hoc ScheffÉ analysis suggested that family medicine residents had significantly higher scores in all questions (Mean \pm SD=4.85 \pm 0.36, $F=9.73$, $P < 0.001$); psychiatric residents got higher score in privacy and confidentiality (Mean \pm SD=4.81 \pm 0.49, $F=12.06$, $p < 0.001$); pediatric residents got a relative lower score in question related to explanation (Mean \pm SD=4.25 \pm 0.44, $F=11.61$, $p < 0.001$) compared to internal medicine and surgical residents.

Discussion and Conclusions: Our results showed female residents gained higher patient satisfaction. As to inter-specialty difference, family medicine residents got higher patient satisfaction in explanation and listening compared to internal medicine and surgical residents. And psychiatric residents obtained higher patient satisfaction in questions concerned privacy/confidentiality. The patient-centered characteristics of Family medicine provided qualified patient-doctor relationship. Psychiatric patients maybe more concerned about privacy and confidentiality. The PSQ in Pediatric patients are mostly made by families to which information was provided indirectly.

Take-home Messages: Our study revealed gender difference and inter-specialty difference of patient satisfaction. Residents in specialty which put more emphasis on psycho-social skills during training process got higher patient satisfaction.

- Wan-Chun Liao, Kaohsiung Medical University Chung-Ho Memorial Hospital, Taiwan
- Yu-Yin Wang, Kaohsiung Medical University Chung-Ho Memorial Hospital, Taiwan

ABSTRACT

Background: According to WHO statistics, there were 18.1 million new cases of cancer in 2018. Cancer has continuously been the top cause of death in Taiwan. Scholars have pointed out that malnourished patients have a lower chance of surviving cancer (Sun, Chen, Xu, Le, & He, 2014), hence the introduction of HPN. Yet according to statistics, there is only a 63% success rate for PGY students administrating HPN. Currently there isn't much emphasis on HPN training for PGY students, not to mention the inadequacy of traditional training methods towards the instruction of HPN. This article uses a hybrid learning design to increase technical skills of PGY students and as a result increase the quality of nutritional care for patients.

Summary of Work: Learning Analysis: Survey of Student Cognition: 90%, Percentage of Proper Operational Skills: 63% State Objective: Able to understand HPN related concepts in the first month, able to administer HPN in the second month, and able to instruct caretakers on how to administer HPN in the third month. Selected and Utilized Materials and Media: Produced media for students to review online, and produced a HPN common clinical questions pamphlet. Required Learner Participation: Answering student questions through classroom discussions with the addition of patent modules and situational simulation teaching.

Summary of Results: Cognition: 90% to 100%. Affection: Satisfaction 100%. Percentage of Proper Operational Skills: 63% to 100%.

Discussion and Conclusions: During the application of HPN, it has been noted that caretakers often have many questions. It is recommended that students actively discover the needs of caretakers, and customize individual needs according to the manual to increase the percentage of proper operational skills. This article uses a hybrid teaching method (patent modules, situational simulations, and media) to intervene in a three-month learning program for HPN administration. This not only effectively helps students correctly administer HPN, but also provides a safer caretaking environment for patients.

Academic coherence of the systems of evaluation of residence programs of anesthesiology in Colombia

AUTHOR(S):

- Sandra Jaramillo Rincón, Universidad de los Andes, Colombia (Presenter)
- Eduardo Durante, Instituto Universitario Hospital italiano de Buenos Aires, Argentina
- Roberta Ladenheim, Instituto Universitario Hospital italiano de Buenos Aires, Argentina
- Juan Carlos Díaz Cortes, Clínica de Marly Jorge Cavellier Gaviria, Bogotá, Colombia

ABSTRACT

Background: One characteristic that evaluation needs to be considered as a learning tool is academic coherence, which is understood as the existence of a common thread that links all the arguments or ideas that make up the curriculum. However, in practice, there is not always a correlation within these elements.

Summary of Work: Through a National survey conducted in Colombia, whose purpose was to explore the perception that residents, teachers, and program managers had about the evaluation systems used in training programs in anesthesiology, academic coherence was investigated. The 71% of accredited anesthesia residency programs participated in the study. A total of 58% of responses were obtained from residents and 42% are teachers. A Likert scale of 5 points was used (1: totally disagree and 5: totally agree). The sub-domains evaluated were Congruence, Prioritization, and coherence between the instruments and the learning objectives. The statistical tests used were Student's T, Mann Whitney's U and Levene test.

Summary of Results: All the domains are present (Score 3,65 to 3,97), no significant differences were found in any of the domains of the variables in both groups. The scores of congruence and prioritization are higher in teachers, while those of coherence between the evaluation and relevance of instruments are higher in the residents. There was no correlation between the evaluation tools declared by the program managers, teachers, and residents.

Discussion and Conclusions: In Colombia, there is no standardization of evaluation systems, similar to the literature report. Although the study does not inquire about the explicit knowledge of the learning objectives of both teachers and residents, it does not mean that they do not have expectations about the learning process. It is clear that the residents have different learning goals than teachers, and this would be a problem. The results would not necessarily demonstrate the satisfaction of both teachers and residents.

Take-home Messages: It is valuable to inquire about the perspective of belonging and congruence that teachers and residents have on the image from which it should be evaluated to ask a specific question about the explicit knowledge of the learning objectives, in which case, even if it would give more epidemiological weight.

Improving Fiberoptic Skills in Anaesthetic Training

AUTHOR(S):

- **Christine Daniels, Charing Cross Hospital, UK (Presenter)**
- Joseph Manjaly, Charing Cross Hospital, UK
- Colleen Woo, Imperial NHS Trust, UK
- Patrick Ward, Chelsea and Westminster trust, UK
- Sonia Shah, Chelsea and Westminster NHS Trust, UK
- Savita Marathe, Chelsea and Westminster Hospital, UK

ABSTRACT

Background: Fiberoptic intubation (FOI) is an essential anaesthetic competency, that is needed in low frequency but high risk situations. This means that exposure to this skill during training is low, leading to reduced levels of confidence amongst trainees. A preliminary study found that 39% of anaesthetic trainees felt they lacked exposure here and wanted to improve this skill. The aim of this educational project was to introduce a novel teaching method to teach this competency involving cross-specialty learning. Ear-Nose-Throat (ENT) specialists use very similar techniques during awake fine nasal endoscopy (FNE), which are often routinely performed in clinics.

Summary of Work: We proposed a weekly programme whereby anaesthetic trainees were allocated to an ENT clinic where FNEs are commonly performed to improve their experience in using a fiberoptic scope. Here they were able to use the fiberoptic scope in an awake patient. Data was collected from 27 trainees over a 14 month period. Confidence levels were assessed in 6 domains using a 5 point likert scale both pre and post intervention. Qualitative data on the impact of the intervention was also collected.

Summary of Results: 88% of trainees have said the education program has changed their practice and 100% would recommend it to anaesthetic trainees at some point in their training. There was a 31% increase in confidence levels with regards to setting up the equipment, a 16% increase in discussing and consenting the procedure, a 14% increase in performing an asleep FOI with supervision; a 24% increase in performing an asleep FOI without supervision; a 21% increase in performing an awake FOI with supervision and a 38% increase in performing an awake FOI without supervision.

Discussion and Conclusions: This was a valuable novel training opportunity and confidence levels increased across all domains following our educational program. Trainees valued the experience and left very positive qualitative feedback.

Take-home Messages: The multi-disciplinary nature of modern care means that many skills are cross covered by different specialties. We cannot underestimate the benefit of learning from one another. In an era of competency-based education, more advantage should be taken of cross-specialty training.

Will scenario simulation by anesthesia residents improve knowledge retention in simulation-based Anesthetists Non-Technical Skill?

AUTHOR(S):

- **Maliwan Oofuvong, Prince of Songkla University, Thailand (Presenter)**
- Ngamjit Pattaravit, Prince of Songkla University, Thailand
- Orarat Kanjanawanichkul, Prince of Songkla University, Thailand
- Sirikarn Siripruekpong, Prince of Songkla University, Thailand
- Kanjana Nuanjun, Prince of Songkla University, Thailand
- Boonthida Suwannarat, Prince of Songkla University, Thailand

ABSTRACT

Background: We aimed to determine whether scenario simulation teaching by anesthesia residents could improve their knowledge retention at 90 days compared to anesthesia residents who attending a simulation-based Anesthetists Non-Technical Skill (ANTS) workshop.

Summary of Work: This was a prospective interventional study in November 2017 during an ANTS simulation workshop for anesthesia residents in a university hospital in southern Thailand. Third-year residents assigned as scenario simulators had 6 weeks to prepare for a case scenario under supervision before the workshop. All anesthesia residents took the pre-test that consisted of 20 multiple-choice questions with four choices. The simulation workshop consisted of three case scenarios of three themes: team working; task management; and decision making. Post-tests were given 90 days after the workshop. A comparison of the post-test and pre-test results was performed by paired t-test. The potential predictors of differences in the post-test and pre-test were analyzed by multivariate linear regression analysis and presented as beta coefficient (β) and standard error (SE).

Summary of Results: The roles consisted of seven scenario simulators, seven participants, and 10 observers. The overall 90-day post-test scores increased significantly compared to the pre-test score (13.2 vs 11.7, $P=0.007$, respectively). The predictors of differences in the 90-day post-test and pre-test score were third-year residents (vs first-year resident) ($\beta \pm SE = 4.0 \pm 1.8$, $P=0.021$), the roles of participants and observers (vs scenario simulator) ($\beta \pm SE = 5.5 \pm 1.7$ and 6.7 ± 2.0 , $P=0.002$, respectively). However, second-year resident (vs first-year resident) ($\beta \pm SE = 2.6 \pm 1.1$, $P=0.0003$) and the role of scenario simulator (vs participants and observers) ($\beta \pm SE = -6.6 \pm 1.8$ and -6.5 ± 2.2 , $P=0.0005$, respectively) were the predictors of high pre-test score.

Discussion and Conclusions: The role of scenario simulator did not improve in 90-day knowledge retention in the ANTS workshop, but the roles of the participants and observers did. This may be because the pre-test score of this role was already high and it did not improve much after the workshop compared to the other roles.

Take-home Messages: To gain knowledge retention in an ANTS simulation workshop, the anesthesia residents should participate by attending or observing the workshop without the necessity of being scenario simulators.

Family Medicine Supervisors' perceptions of the development of a blended learning programme for registrar training

AUTHOR(S):

- **Ann George, University of The Witwatersrand, South Africa (Presenter)**
- Deidre Pretorius, University of the Witwatersrand, South Africa
- Neetha Erumeda, University of the Witwatersrand, South Africa
- Michele Torlutter, University of The Witwatersrand, South Africa
- Carien Lion-Cachet, University of The Witwatersrand, South Africa

ABSTRACT

Background: The potential for E-learning to improve access to medical education across distributed training platforms is especially relevant in low- and middle-income countries. Given staffing constraints for the Family Medicine degree at one South African university, a seminar-based training programme was replaced with a blended learning format, with the main aim of standardising the registrar training across seven districts in two South African provinces. This paper reports on the challenges experienced by the consultants who coordinate the training in their districts and who developed the blended training programme. The lessons learned could be valuable to others undertaking similar initiatives.

Summary of Work: The development of the blended programme began in October 2016, for implementation in January 2018. Semi-structured interviews were conducted with four coordinators in November 2017. The coordinators were asked about their experiences while developing the programme. The interviews were audio recorded and transcribed verbatim. The transcripts were analysed thematically, using MAXQDA 2018 to manage the analysis.

Summary of Results: The main challenge identified was the problem of deciding the breadth and depth of content to teach. Another problem was the coordinators' lack of technological proficiency, both with the university's learning management system and with computers in general, which hindered their ability to develop the online components. Other challenges included a lack of time, insufficient people involved in the project and the difficulties with recruiting more people to assist with developing the programme in time to be rolled out. There were also concerns around the format of the online components, the best resources to use and the need for quality assurance of the online content. Despite the many challenges encountered, the coordinators felt that the process had enhanced their knowledge of teaching, especially when integrating the online resources.

Discussion and Conclusions: The many challenges encountered meant that the programme was not completely ready by January 2018 and had to be rolled out as a work in progress, with a different format to the one initially envisaged. The lessons learned allow recommendations that could counter the time- and labour-intensive nature of the process.

Take-home Messages: Converting existing programmes to a blended learning format is time- and labour-intensive, requiring adequate planning and preparation.

UK General Practitioner trainers' views and concerns on supervising disabled GP trainees - a structured interview study to elicit these and identify relevant learning needs

AUTHOR(S):

- Susan Buck, NHS Education for Scotland, UK (Presenter)
- Meiling Denney, NHS Education for Scotland, UK

ABSTRACT

Background: The General Medical Council guidance document 'Welcome and Valued' revised in 2018 highlights the importance of equality for doctors with a disability, and support for trainees in practices must reflect this. Doctors who are disabled or have long term health conditions should be supported through their training and be able to contribute to much needed UK medical workforce. This study explored the views of General Practitioner educational supervisors towards disabled trainees, and identify any training needs of the supervisors themselves.

Summary of Work: Structured personal interviews with undertaken with 5 educational supervisors, recorded with written consent and assurance of confidentiality. Each supervisor was given 3 scenarios involving disabled trainees, asked how they would manage these, and what implications they thought this would have for the trainee regarding achieving the required competencies for GP, and for the practice. The recordings were subsequently analysed to identify themes within the responses, as well as any support that supervisors felt would be helpful to them.

Summary of Results: GP Supervisors had varying experiences of supporting disabled trainees. They were keen to support them, but were concerned that others in the practice may perceive them as a burden. Supervisors wanted advance notice about disabled trainees so they could plan necessary training adaptations such as longer induction, additional equipment, and organisation of workload. They valued clear advice about how trainees whose functioning is impaired would meet competences, further training for themselves, and easy access to advice when needed. They were concerned about funding for any necessary additional equipment, and felt that they needed to be supported themselves as supervisors.

Discussion and Conclusions: Educational Supervisors felt it would be rewarding to successfully support a disabled trainee, and identified their own learning needs in this as trainers. They wished to have more information and training on this.

Take-home Messages: GP trainers are positive about supervising disabled trainees but have concerns about their own knowledge and skills relating to this. There is scope for educational organisations to be proactive in providing this to enable disabled trainees to optimise their time spent in primary care and fulfil their potential.

Developing an enquiry-based learning programme: constructing a spiral curriculum

AUTHOR(S):

- Rachel Owers, Southampton GP Education Unit, UK (Presenter)
- Johnny Lyon-Maris, Southampton GP Education Unit, Wessex Deanery, UK
- Samantha Scallan, Wessex School of General Practice, Wessex Deanery, UK

ABSTRACT

Background: General Practice (GP) trainees in their first two years of postgraduate specialty training attend half-day educational sessions each month focused on their learning needs as a future GP. For seven years the Southampton GP Education Scheme has used an ‘enquiry-based learning’ (EBL) approach embedded in a ‘spiral curriculum’ structure (Bruner, 1960) to provide a framework for learning. This paper presents the outcomes of a longitudinal development and evaluation of this curriculum. It examines how this approach meets the learning needs of trainees across a range of training contexts and at different stages of learning, as well as remaining dynamic to syllabus change.

Summary of Work: An approach to curriculum development was adopted based upon andragogic learning principles, set within a spiral curriculum. The sessions are created and resourced by a case writer. Each is mapped to the Royal College of General Practitioners GP training curriculum, identifying the key topics of learning as well as vertical themes (e.g. consultation skills) which run throughout packs allowing them to be revisited, as advocated by Bruner. In practice learners prepare for a session using a workbook. In the session they analyse and discuss their understanding of the case material, they can research unknown aspects using given resources or seek out alternative ones, they develop their thinking using role play scenarios. After the session learning is consolidated using a follow up workbook.

Summary of Results: Over 7 years the trainees’ perceptions of the curriculum has been gathered after each session using a questionnaire. In addition, the educational perspectives of case writers and facilitators have been explored. The sessions are well received by the trainees. Themes from trainee comments highlighted the sessions’ relevance to learning for general practice, peer support and their interactive nature. In addition to the clinical topic of each session, trainees recognised curriculum themes embedded vertically over the two years.

Discussion and Conclusions: EBL provides a valuable, integrated framework to help GP trainees navigate their learning journey through hospital-based education and GP practice-based training.

Take-home Messages: Understanding the principles of curriculum development is key to designing a robust programme of education.

Inspiring quality improvement (QI) in cancer care through tutors and learners

AUTHOR(S):

- Sabia Dayala, University of Manchester, UK (Presenter)
- Natalie Williams, Cancer Research UK, UK

ABSTRACT

Background: Despite initiatives in England that can be traced back to the NHS Cancer Plan in 2000, The Health Foundation reported (November 2018) that current 5-year cancer survival rates in England lagged behind comparable nations. It is therefore essential that the NHS drives forward significant changes that supports primary care in improving the early diagnosis of cancer.

Summary of Work: The aim of our work was to increase the likelihood of GP tutors offering a quality improvement project in cancer care through use of a face to face training session, using a bespoke toolkit created for use of Manchester medical students. Vignettes of student scenarios related to project work in cancer care were discussed by tutors at 3 optional workshops (5-8 tutors per workshop) who attended an annual training event, run in conjunction with Cancer Research UK (CRUK). Tutors were facilitated in small groups in how to use the bespoke toolkit. Quantitative and qualitative evaluation of the workshop was completed through questionnaires in paper and online format using non-duplicate questions.

Summary of Results: 20 GP tutors attended. More tutors responded to the paper questionnaire compared to online (80% response rate versus 75% respectively). All respondents said the toolkit assisted them very well (11) or quite well (5) to plan their next steps in the theoretical workshop scenarios and reported either definitely (12) or probably (4) using the toolkit in future. Qualitative comments were highly favourable.

Discussion and Conclusions: This toolkit aims to encourage and support quality improvement work in relation to cancer care and represents the first University and CRUK collaboration in the UK in order to support medical student involvement in cancer care at a General Practice level. Further evaluation is being conducted to assess the uptake of projects in cancer care and resulting impact on individual practices.

Take-home Messages: Training in small group workshops in conjunction with CRUK, using the bespoke toolkit, has had a positive impact on tutor likelihood of offering quality improvement projects in cancer care. It is hoped that this innovative approach will help to medical students to deliver sustainable transformations in cancer care at a local level in primary care, thereby developing their leadership skills and professionalism.

Learning Needs Analysis Among Residents and Medical Officers from various postings in the Children Emergency department (ED)

AUTHOR(S):

- Su Ann Khoo, KK Women's and Children's Hospital, Singapore (Presenter)
- Sashikumar Ganapathy, KK Women's and Children's hospital, Singapore
- Zaw Lwin, KK Women's and Children's hospital, Singapore
- Arif Tyebally, KK Women's and Children's hospital, Singapore

ABSTRACT

Background: Learning needs analysis(LNA) is vital in designing core curriculum in postgraduate education. Paediatric emergency medicine is reliant on a group of well- trained providers. The Children emergency department (ED) in KKH receives trainees from 3 specialties, 3 healthcare systems, every 3-6 months. There is an increasing need to design an evidence-based comprehensive teaching programme to impart knowledge and skills required in the ED.

Summary of Work: We distributed questionnaires with Likert-scale type responses, to 90 trainees rotating through the department in the period of 1 January 2018 to 31 December 2018. The questionnaires focused on existing styles of teaching programmes, and topics covered. Focus group interviews were held thereafter to identify common themes brought up to deepen our understanding of the needs of trainees.

Summary of Results: 50-68% of the trainees felt that the mock code and simulation, morbidity and mortality meeting, as well as the team- based learning(TBL) junior doctor orientation programme were most beneficial. The 5 most useful topics were paediatric trauma, approach to specific complaints, respiratory and cardiac emergencies, neurological emergencies and x- rays grandround.

Discussion and Conclusions: The LNA is a systematic process to identify gaps between current and desired performance to make informed decisions. The trainees have variable backgrounds in paediatric and emergency training. LNA is essential as judicious planning can help determine feasibility, tailor curricular design, and optimize resource utilization. It also identifies benchmark measures for program effectiveness, which will be useful for tracking future effect and deficiencies. In conclusion, more than half of the junior doctors preferred a teaching curriculum which helps them relate most closely to day-to-day practice in the ED, and revealed a preference for mixed-methods training in reinforcing important knowledge and skills required in the ED. The alignment of stakeholder needs with the normative needs expressed by the greater community for higher quality of training that can lead to improved learning, and subsequently, patient care outcomes.

Take-home Messages: Learning needs analysis is a vital step in designing a comprehensive curriculum and training for the junior doctors in the emergency department with varying backgrounds. This is crucial for their continuing postgraduate training as well as simultaneously improving patient outcomes.

PED talks: Paediatricians Educating and Developing together

AUTHOR(S):

- **Kate Lydekker, St George's University Hospital NHS Foundation Trust, London, UK (Presenter)**
- Rosie Roots, St George's University Hospital NHS Foundation Trust, London, UK
- Katie Evans, St George's University Hospital NHS Foundation Trust, London, UK
- Nicholas Prince, St George's University Hospital NHS Foundation Trust, London, UK

ABSTRACT

Background: Working within a tertiary hospital in South London with multiple paediatric teams can make it difficult for paediatric trainees to attend teaching sessions during the day. The GMC has emphasised the importance of institutions' duty to foster an environment of learning. We therefore set out to create an innovative teaching programme that would bring these teams together in an informal educational setting with the opportunity to meet other members of the MDT.

Summary of Work: In September 2018, the paediatric team devised a plan to make paediatric themes accessible to the wider MDT. This was achieved through quarterly teaching sessions incorporating the Pecha Kucha™ style of presentation utilizing 'short sharp bursts' of up to date paediatric teaching involving an evening of 6-7-minute presentations plus one longer presentation (10-20 minutes) on a wide range of topics. The sessions run for 90 minutes after afternoon handover to ensure optimal attendance.

Summary of Results: Since the start of the programme two evenings have taken place and were well attended. Following the second session, using feedback via SurveyMonkey, we ascertained: • 79% rated it 'highly enjoyable' with 21% rating 'enjoyable' • 71% rated it 'highly educational' with 29% rating 'educational' • 100% felt pace of presentations were 'just right' • Other comments: enjoyed the short presentations and relevant topics. Most did not enjoy the inclusion of a longer talk, others commented they would like to see more involvement from the MDT.

Discussion and Conclusions: The evenings have been well received amongst attendees. Feedback so far shows the Pecha Kucha™ style of presentation fosters a sociable atmosphere and positive learning environment. More in depth contemporaneous feedback will be obtained over the coming sessions, with emphasis on ways to encourage not only MDT attendance but also MDT participation and presentation.

Take-home Messages: Members of MDT and paediatric trainees all enjoyed the teaching and particularly commented on its 'informal and enjoyable atmosphere'. There is a wide scope for improving the format and content with plans to improve on this further using feedback from earlier sessions.

Not so hard! Redefining Performance Standards for Pediatric Hip Dysplasia Examination Skills

AUTHOR(S):

- **Deborah Rooney, Dept. of Learning Health Sciences, USA (Presenter)**
- Chase Barlow, College of Engineering, University of Michigan, USA
- Trevor Alberts, College of Engineering, University of Michigan, USA
- Clifford Craig, Department Orthopaedic Surgery, C.S. Mott Children's Hospital, University of Michigan, USA

ABSTRACT

Background: Proper examination/diagnosis of developmental hip dysplasia (DDH) are required skills for all trainees who provide neonatal care. Our previous work demonstrated the value of the MichiganHip simulator as a training tool. In spite of this, anecdotal evidence has suggested that the amount of pressure applied during a DDH exam may be a strong secondary indicator of exam quality, and pressure values could be used to define pass-fail DDH performance standards. The goal of this proof-of-concept study is to collect and evaluate authentic pressure measures from a targeted sample of expert clinicians to define acceptable pressure range (APR) as a performance criterion, and (2) evaluate preliminary validity evidence relevant to internal structure to determine if this novel measurement process could be used as a performance standard for the DDH examination.

Summary of Work: Study. Three experienced clinicians (pediatric orthopedics, primary care, pediatrics) examined the clinical variations of the MichiganHip (left+, right+, bilateral+, and normal). Weights were captured three times on 2 platforms (iPhone/Android), for both left and right hips using a commercially-available baby scale (Hatch Baby, Inc. Grow). Weight were converted to force (Newtons). Analyses. Differences in mean force were analyzed across clinical specialties, platform, model variations, and hip side using one-way ANOVA. An acceptable Pressure Range (APR) as an initial performance competency criterion was identified.

Summary of Results: Although there were no statistical differences in mean force across specialty, platform, or model variations, $P=|.63, .95|$, there were differences across right ($M_{right}=29.89\text{ N (6.7 lbs)}$), and left hips ($M_{left}=24.40\text{ N (5.5 lb)}$), $F(1,58)=8.33$, $P=.005$. The estimated APR was calculated, $27.6\text{ N (6.1 +/- 1.3 lbs)}$.

Discussion and Conclusions: Although this work suggests force pressures may be used to assess DDH examination skills, more research should be done to evaluate the impact handedness may have on applied force during the DDH examination. Also more validity evidence should be examined to evaluate the ability applied force to discriminate novice and expert DDH exam abilities, and the relationship of force and correct diagnoses.

Take-home Messages: A commonly-available baby scale, may be used to assess DDH examination quality so we may provide feedback during simulation-based training AND ensure best quality of care for our infant patients.

Balint groups enable paediatric trainees to learn from challenging doctor patient interactions in the workplace

AUTHOR(S):

- Nicholas Schindler, Great Ormond Street Hospital, UK (Presenter)
- Laura Pountney, East and North Hertfordshire NHS Trust, UK

ABSTRACT

Background: As paediatricians we have the privilege to meet many young people with complex health needs and social backgrounds. Those interactions can require a significant degree of emotional resource from the doctor, yet medical training rarely involves formal mechanisms to cope with and learn from our thoughts and feelings. We explored how Balint groups might facilitate peer reflection and learning amongst paediatric trainees around challenging doctor patient relationships.

Summary of Work: Six small group sessions, facilitated by two paediatric registrars were conducted using the Balint methodology. A structured survey of seven questions was circulated to attendees through an online survey platform after each session. Thematic analysis was used to identify key areas of interest and semi structured interviews with some contributing trainees enabled further exploration of these themes.

Summary of Results: 76 paediatric trainees attended six Balint groups. Trainees commented that they have little or no allocated time within their clinical practice to reflect upon challenging doctor patient interactions, and their self-perceived ability to recognise challenging personal emotions was low. Participants felt the depersonalised Balint model facilitated exploration of difficult feelings, enhanced personal reflection and peer learning. Respondents valued reflection alongside peers; "Simple interventions like this can have a huge impact in helping trainees reflect and realising that you are not alone." Trainees also appreciated being able to reflect honestly; "the depersonalized model works well in this environment as it removes the extra emotional attachment to the patient/situation"

Discussion and Conclusions: There is limited opportunity for paediatric trainees to undertake personal reflection on difficult doctor patient interactions in their workplace. The structured nature of the Balint methodology can enable paediatric trainees to reflect on the doctor patient relationship in a contrastive manor, including sharing personal thoughts felt to be taboo in the workplace such as anger, dislike, and fear. Balint groups can be conducted within 45 minutes and might be beneficial as part of regular departmental education programme.

Take-home Messages: Our work suggests that the Balint methodology can be used to facilitate personal reflection and peer learning in UK paediatric trainees.

Pediatric Resident Preparedness for Neonatal Intensive Care Unit (NICU) Disasters: A Mixed Methods Design

AUTHOR(S):

- Lamia Soghier, Children's National Medical Center, USA (Presenter)
- Nitin Kuppanda, George Washington University School of Medicine and Health Sciences, USA
- Joelle Simpson, Children's National Medical Center, USA

ABSTRACT

Background: Neonatal intensive care unit (NICU) disaster preparedness is essential to safely care for neonates during a crisis. Pediatric residents are core personnel who play critical roles during disaster response. However, they are seldom considered in disaster protocols and preparedness research.

Summary of Work: Objective: To assess pediatric residents' preparedness, their potential roles during NICU disaster scenarios, and determine their training needs. Semi-structured interviews with 10 senior pediatric trainees were used to create response choices for a survey (mixed-methods). Questions addressed resident roles and responsibilities during crises, current preparedness, prior experience, and perceived training needs. Survey results were used to confirm themes from interviews.

Summary of Results: Central themes included: 1) lack of prior training, 2) unpreparedness for evacuation or surge, 3) importance of disaster training, 4) insufficient knowledge of NICU disaster protocols, and 5) primary role of residents as system facilitators. Of the 37 residents invited to participate in the survey, 30 responded (81%) (57% full completion). Surveys confirmed that all residents (100%) did not have prior NICU disaster training and most were not prepared for evacuation (88%) or surge (82%) due to unfamiliarity with content and location of disaster protocols (100%). Roles included: recruiting other residents (35%), clerical work (26%), and any role assigned by supervisors (21%). Residents agreed that education on NICU disaster protocols (100% evacuation, 91% surge) would make them more prepared and most wanted to receive training (90%). Residents believed that a multi-pronged approach during every NICU rotation (53%), including multidisciplinary simulations (89%), NICU disaster handbook (78%) and a visible description of residents' role (72%) should be used. Most were willing to respond to a hospital disaster (84%) but did not know their specific role (96%).

Discussion and Conclusions: Pediatric residents' views on NICU disaster preparedness are quite universal and not limited to residents who self-selected for interviews. Residents lacked experience but were enthusiastic to train and willing to respond. Education should include multidisciplinary simulations delivered every NICU rotation to allow them to contribute fully to any disaster response.

Take-home Messages: Trainees comprise a large proportion of the workforce during disasters yet are not adequately trained for these scenarios. This survey delineates steps to address these gaps.

#3NN Meet the Experts – Assessment Policy, Practice and Research Clinic

Date of Clinic: Monday, 26 August 2019

Time of Clinic: 1015-1200

Location of Clinic: Suite E, Level 0

Experts:

- Richard Fuller & John Cookson (ASPIRE Assessment Panel), UK
- Matthew Homer & Jennifer Hallam (University of Leeds), UK

Summary: This session presents an ideal opportunity to meet colleagues working in Assessment policy, practice and research and get advice on how to make your assessments even better! The group's expertise spans programmes of assessment (in new and existing programmes), standard setting, blueprinting, OSCE development and the use of innovative approaches such as sequential testing

If your institution is interested in exploring an application for the Aspire Assessment award, we are happy to share advice and signpost resources.

No appointment is necessary, but if you can't make the session, please get in touch with during AMEE!

#4A Symposia

Date of Presentation: Monday, 26 August 2019

Time of Presentation: 1400-1530

Location of Presentation: Hall A, Level 2

Every way of seeing is a way of not seeing: Critical insights into the blind spots of entrustment language

Presenters:

- Daniel Schumacher, Cincinnati Children's Hospital Medical Center, USA
- Lorelei Lingard, Western University, Canada
- Anneke van Enk, University of British Columbia, Canada
- Karen Hauer, University of California, San Francisco, USA
- Carol Carraccio, American Board of Pediatrics, USA
- Olle ten Cate, Utrecht University; The Netherlands

Summary of theme and why it is important: *"Every way of seeing is also a way of not seeing."* – Kenneth Burke

Over the last decade, the concept of "entrustment" has risen to enormous popularity and power in medical education. Underpinning the concept, however, is an elaborate yet fragile set of keywords and concepts which educators appear to conflate, interchange, and evolve to suit their purposes. This situation threatens to create a scholarly cacophony and to undermine robust entrustment decision-making in the clinical workplace. This symposium addresses this problem with three aims: to approach a more uniform lexicon of entrustment terms, to advocate the abolishment of problematic terms, and to illustrate the inherent complexity of entrustment language as a basis for high stakes decisions.

Five speakers will draw on empirical research to offer the audience specific examples across each of these areas and provide the basis for a rich discussion of how entrustment language shapes assessment decisions in the clinical workplace. "Independent practice" is often described as the goal for entrustment. When we focus on "independence," we can become blind to the interdependent nature of how care is delivered. We can also lose sight of the fundamental task of tailoring supervision to learners' abilities and progressively removing this until "unsupervised practice" can be entrusted. Does "independent practice" have a place in our vernacular? Is the goal for entrustment "unsupervised practice" or something else? Our first three speakers (Schumacher, Lingard, and van Enk) will explore these questions. We will next consider issues with the use of the word "entrustment," word contains the word "trust." What implications does that have for assessors? If you do not entrust someone does that mean that you do not trust them? Entrustment is not just about the individual to be entrusted. The bidirectional relationship between the person to be entrusted and person to entrust will be explored further in the third brief presentation during this symposium (Hauer). What is the role of the trustor's propensity to trust? Do terms like "entrustment" and "trust" shift our focus too far from what a trainee can do to what a supervisor will allow them to do based on their trust propensity? Do these terms turn the clear performance of learners into myopic decisions of supervisors? Finally, we will explore how the inconsistent use of terms might impact high stakes decisions and standard setting in the entrustment framework (Carraccio). If we do not agree on terms and definitions, how do we develop a shared mental model of what the performance of a graduating student or resident looks like? How do we set performance standards when expectations of performance by clinical competency committees (CCCs) differ from actual performance of residents? What is the role of unclear and conflated definitions in creating this gap? If expectations and performance of some EPAs are lower than others, but the community feels these EPAs are critical for practice, what impact should this have on standard setting? Our discussant (ten Cate), will reflect on the presentations, offering insights as well as provocative questions to enrich the interactive large group discussion to follow the presentations. The symposium will conclude with a discussion of potential action steps that all can take as we work through the implementation of competency-based education and specifically EPAs.

Who should participate in the symposium? This symposium will be of particular interest to assessment researchers, those leading assessment programs in medical education and training, members of competency committees, and administrators in the undergraduate and post-graduate medical education communities.

What will they gain from participating? Participants will leave the session with an understanding and appreciation for the importance of having a shared language for entrustment decision-making. We hope this understanding will be deep enough that participants will leave with not only clear definitions of terms but also a commitment to using terms that promote a common understanding and avoid possible confusion.

#4B Symposia

Date of Presentation: Monday, 26 August 2019

Time of Presentation: 1400-1530

Location of Presentation: Hall C, Level 2

How to train your dragon: Transforming faculty development in social and behavioural sciences

Presenters:

- Betsy White Williams, University of Kansas School of Medicine, Clinical Program Professional Renewal Center, USA
- Jeni Harden, University of Edinburgh, UK
- Fred Hafferty, College of Medicine, Division of General Internal Medicine, Program on Professionalism and Values
- Hiroshi Nishigori, Kyoto University, Japan
- Tracey Collett, Plymouth University, UK
- Kathy Kendall, University of Southampton, UK

Summary of theme and why it is important: The film *How to Train your Dragon* tells the story of a boy, Hiccup who aspires to follow his Viking tribe's tradition of becoming a dragon slayer. During one attack, Hiccup shoots down a Night Fury but finding he cannot bring himself to kill the dragon, sets it free. Later Hiccup returns to the forest to find the Night Fury unable to fly because of its crippled tail fin. Hiccup gradually befriends the dragon (naming it 'Toothless' due to its retractable teeth) and makes a harness and prosthetic fin that allows him to guide the dragon in flight. Toothless and Hiccup successfully fight together against a common enemy 'the Red Death' that threatens the village. This changes the mind of the villagers about dragons and vice versa, and they begin to accept each other, working together in harmony.

AMEE has, for at least few years, undertaken workshops and symposia at its annual conference on aspects of social and behavioural sciences medical education. Based on comments and questions at these symposia, it appears that the translation of behavioural and social sciences (SBS) principles and concepts into clinical courses and into medical practice remains challenging. This symposium will address a key and persistent aspect of this challenge; faculty development in SBS. In many ways, SBS and clinical faculty are the villagers and the dragons of this story; we know that there is often a lack of understanding and poor communication between these groups. It can appear that they have very different experiences, priorities and goals, and at times may even seem to speak different languages. Yet, as in the story, they share common enemy; a concern over the preparedness for students working in increasingly complex health care settings and the ability of medical schools to adapt to these demands. Faculty development opportunities are foundational to the cultural transformations needed to tackle these challenges.

Through presentation of case-based teaching examples, we will invite the audience to consider who they are – villagers or dragons – and to participate in a discussion of how we can be the Hiccup and Toothless of our own stories: addressing cultural inertia; tackling the hidden curriculum; developing understanding and partnerships between SBS and clinical faculty; and setting examples to motivate others. We will discuss opportunities and potential barriers to developing and implementing a faculty development curriculum across the educational continuum that promotes the enhancement of social and behavioral sciences principles and concepts into practice at the individual and system level. Although not final answers, we will provide guideposts for the field in this critical enterprise.

Who should participate in the symposium? Medical educators, Medical education faculty, physicians, medical students

What will they gain from participating?

- Greater understanding of how social science (knowledge, skills and competencies) can form part of faculty development
- Insight of the opportunities and barriers to faculty development in SBS from a range of national and educational contexts
- An awareness of the benefit of teaching social sciences to physicians across the career span

#4C Symposia

Date of Presentation: Monday, 26 August 2019

Time of Presentation: 1400-1530

Location of Presentation: Hall N, Level 2

From simulation to workplace: translating lessons for clinical event debriefings

Presenters:

- Walter Eppich, Northwestern University Feinberg School of Medicine, Chicago, USA
- Cristina Díaz-Navarro, University Hospital of Wales, Cardiff, UK
- Ross Scalese, University of Miami School of Medicine, Miami, USA
- Andrew Coggins, The University of Sydney, Western Clinical School, Sydney, Australia
- Rebecca Szabo, The University of Melbourne, Melbourne, Australia

Summary of theme and why it is important: Despite proven benefits, debriefing conversations that promote learning from clinical practice occur too infrequently. This impacts health care team functioning and, thus, patient care. Failures to implement debriefing programs are common in busy clinical environments where clinicians often think they do not have time or the skills to debrief, amidst other perceived barriers. This situation stands in stark contrast to other experiential learning domains such as health care simulation, which view structured feedback and debriefing as integral to their educational practices.

Clinicians and teams hone their clinical skills by talking about and reflecting on their performance in debriefings through regular participation in debriefings. In addition, they also hone their ability to talk about and reflect on their performance and patient care after real clinical episodes. Better translation of relevant lessons from health care simulation to clinical settings could enhance workplace learning and drive continuous performance improvements, benefitting both clinicians and patients. This symposium has three aims:

1. to provide a theoretical foundation for clinical debriefings as a driver for workplace learning
2. to translate principles from health care simulation to clinical debriefings, including the importance of psychological safety to promote honest reflective dialogue
3. to offer practical strategies to support clinical debriefings in a variety of settings

To achieve these aims, we have brought together representative experts in healthcare simulation and debriefing, each of whom will contribute a valuable perspective:

- What is debriefing and why it matters, (5 min, **Walter Eppich**)
- Real world applications of clinical event debriefings (10 min each):
 - Debriefings during general internal medicine inpatient rotation for undergraduate and graduate medical education (**Ross Scalese**)
 - Debriefing in the operating theatre (**Rebecca Szabo**)
 - Charge nurse led clinical event debriefings in the emergency department (**Andrew Coggins**)
 - TALK Debrief: a novel framework for structured team self-debriefing in clinical environments to promote learning and patient safety (**Cristina Díaz-Navarro**)

After brief presentations (45 min total), panellists will welcome questions from the audience as part of a moderated discussion to explore further applications and strategies for clinical event debriefings.

Who should participate in the symposium? Health professions educators across the educational spectrum, from undergraduate and graduate settings to continuing professional development

What will they gain from participating? After the session, attendees will be able to:

- Explain why clinical event debriefing are important and how they support workplace learning, team performance, and patient safety
- Describe a practical yet theoretically grounded approach to clinical event debriefing
- Outline practical strategies to implement clinical event debriefing in their own clinical environments

#4D Short Communications - Teaching and Learning - Team-Based Learning

Date of Presentation: Monday, 26 August 2019

Time of Presentation: 1400-1415

Location of Presentation: Room L3, Level 1

Team-based learning (TBL) replaces Problem based learning (PBL) in Years 1 and 2 of a large medical school

AUTHOR(S):

- Annette Burgess, The University of Sydney, Australia (Presenter)
- Jane Bleasel, The University of Sydney, Australia
- Chris Roberts, The University of Sydney, Australia
- John Hickson, The University of Sydney, Australia
- Ceren Guler, The University of Sydney, Australia
- Inam Haq, The University of Sydney, Australia

ABSTRACT

Background: With increased student numbers in the Sydney Medical Program (from 142 Year 1 students in 1997 to 332 in 2016), and a lack of standardisation across cohorts, student satisfaction of the problem-based learning (PBL) model had decreased in recent years. In 2017, Team-based learning (TBL) replaced PBL. This study sought to explore students' perceptions of TBL in Year 1 and Year 2 of the 2017 medical program.

Summary of Work: Year 1 (n=275) students completed 11 TBLs in the Foundations, Musculoskeletal and Respiratory blocks. Year 2 (n=350) completed 16 TBLs in Neurology, Endocrinology and Renal blocks. TBL classes were held once per week, with approximately sixty students per class, and 11 teams of five or six students. Prior to each class, students were given pre-work, and completed an online Individual Readiness Assessment (IRAT) test. During class (two hours), students completed the Team Readiness Assurance Test (TRAT), received feedback with clarification from facilitators, followed by clinical problem solving activities. Student feedback was collected by questionnaire, using closed and open ended items. Data were analysed using descriptive statistics and thematic analysis.

Summary of Results: In total, 232/275 (84%) Year 1 and 258/350 (74%) Year 2 students responded. Students found positive aspects of TBL included the small group dynamics; intra-team and inter-team discussions; interactions with facilitators; provision of clinical contexts by clinicians; the readiness assurance process. Suggested improvements included: better alignment of pre-reading tasks with the TBL case; shorter class time; increased opportunity for clinical reasoning; and additional feedback on the mechanistic flowchart.

Discussion and Conclusions: Although the use of TBL required an instructional approach, needing direction from the tutor, it remained student-centred, generating a range of positive outcomes, including students being prepared for class, small group size to encourage peer learning, and immediate feedback by facilitators who were content experts. Suggested improvements include better alignment of tasks and timing.

Take-home Messages: Changes in both curricula and pedagogy are needed to prepare students for demands of increasingly complex healthcare systems. TBL has provided a successful replacement for PBL. Additionally, the application of TBL principles meant the sessions were not reliant upon a high teacher to student ratio.

Effectiveness of Team Based Learning versus Lectures in Delivering Surgical Case Management Conferences among 4th year Medical students: A Randomized Controlled Trial

AUTHOR(S):

- **Cherrie Ann Angon, De La Salle Health and Medical Sciences Institute, Philippines (Presenter)**
- Michael Lawenko, De La Salle Health and Medical Sciences Institute, Philippines
- Rafael Alexis Resurreccion, De La Salle Health and Medical Sciences Institute, Philippines
- Warren Roraldo, De La Salle Health and Medical Sciences Institute, Philippines

ABSTRACT

Background: A lot of innovative teaching techniques are being established to increase the cognition of students. In the advent of outcomes based education, team based learning is an innovative teaching learning strategy that lets the students prepare for the activity hoping that they can retain more content. In the Philippines, most medical schools use traditional lecture, therefore, the aim of this study is to compare the effectiveness of team based learning to traditional lecture type in terms of the students test scores.

Summary of Work: Thirty six fourth year medical students were blinded and randomized either to traditional lecture group (TL) [n=19] and team based learning group (TBL) [n=17]. A flipped classroom approach was done for both groups wherein online content with an embedded pre quiz questions was given 1 week prior to the face to face meet. An online post quiz was also given to both groups after the face to face meet. For traditional lecture group the student in charge was tasked to give a lecture on the management of acute cholecystitis with a preceptor present. For the TBL group the student was tasked to perform a TBL session with a preceptor present. Student's pre-test and post test scores where compared.

Summary of Results: Paired T-test was used to compare effectiveness of TBL versus traditional learning method. Comparing the pretest and posttest of both groups, there was an increase in post test scores as compared to pre test scores ($p < 0.03$). Among these scores there was significant mean difference of -7. As to the level of satisfaction, TBL group stimulated their practical thinking which can be applied in clinical practice.

Discussion and Conclusions: Team-based learning method is significantly more effective in increasing test scores than traditional lecture in surgical case management conferences for fourth year medical students.

Take-home Messages: Team based learning is an innovative teaching learning strategy that can be an effective alternative to the traditional lecture based teaching for surgical case management conferences for medical students.

Team-based learning (TBL) to facilitate the shift towards 'health care as a team sport'

AUTHOR(S):

- Yolande Reitsma, North-West University, South Africa (Presenter)

ABSTRACT

Background: From 2010 the Faculty of Health Sciences at the North-West University in South Africa included a compulsory module 'Understanding the world of health' into all 2nd-year health curricula. This implies teaching ± 1100 students from 13 different health disciplines in a 100-minute contact session, over a period of 11 weeks, in an auditorium style lecture theatre. Achieving the module's aims to develop a critical mindset regarding the world of health by exposing students to diverse disciplinary views and to foster interprofessional collaboration and peer-learning within this context, pose unique challenges. Kayingo and McCoy Hass (2018) argue that the complexity of the rapidly evolving health care landscape and the shift towards 'health care as a team sport', requires educators to continuously and critically reflect on the way they prepare students as health professionals. Students' feedback (2017 and 2018) guided our critical reflection and pedagogical redesign. In this ongoing SoTL research, we aim to satisfy our curiosity to the question: To what extent will the pedagogical redesign enhance student engagement and optimise interprofessional peer learning to better prepare our students as health professionals?

Summary of Work: This research study is anchored in a constructivist-interpretivist paradigm with a mixed method approach as the strategy of inquiry. Data collection instruments include a student profile questionnaire, LMS tools, focus group interviews and a module reflection sheet.

Summary of Results: I will share selected preliminary findings as data-analysis and the dissemination of results is scheduled to commence after August 2019.

Discussion and Conclusions: Delegates interested in innovative teaching practices, active-learning, Team-Based Learning, module redesign, student engagement and peer-learning will find this session valuable as it provides both a scientific and practical perspective on a pedagogical redesign.

Take-home Messages: As health professions educators we have to be more responsive by acting as change agents, incorporate transformative educational strategies into our teaching, enhance our scholarship and continuously reflect on our role, responsibilities and practices within the field of health science education. We have to be inspired!... to inspire!

#4D Short Communications - Teaching and Learning - Team-Based Learning

Online Team-Based Learning Best Practice Development

AUTHOR(S):

- Brian O'Dwyer, CognaLearn and Embry-Riddle Aeronautical University, USA (Presenter)

ABSTRACT

Background: 1. The TBLC Online Community of Practice was formed in 2017 with 17 members from 10 institutions and has generated a whitepaper and four manuscripts pending publication. 2. Four sub-teams were formed to address preparation, readiness assurance, applications and peer evaluation. 3. Overall best practices include: a) Preparation: materials, educators and learners b) Communication: more frequent, scaffolded and modality relevant c) Technology: created or curated to support online TBL.

Summary of Work: The co-authors divided into teams and developed principles for online TBL across for four dimensions: preparation, readiness assurance, applications and peer evaluation. Teams then used a variety of methods including literature searches, appreciative inquiry, faculty surveys and reviews of existing online teaching frameworks in addition to drawing on the experience of the co-authors.

Summary of Results: Best practices for online TBL include: 1. Preparation: Providing learners with appropriate information, thoughtfully forming teams and scaffolding interactions and using introductions to create social presence. 2. Readiness assurance: Investing time for team building, flexibility in design, enhancing collaboration while maintaining course organization with efficient navigation and use of technology. 3. Applications: Considering the method of delivery (asynchronous or synchronous) and location (co-located or distributed) in the design of application exercises, employing technology to support the chosen design and using analytics to support and measure collaboration. 4. Peer evaluation: Providing rationale for peer-evaluation to ensure student buy-in, ensuring process transparency, providing multiple formative and summative evaluation cycles to promote learning and employing technology that supports data collection, analysis, and dissemination.

Discussion and Conclusions: Online TBL is an emerging area of practice. Best practices are in a nascent stage and will continue to evolve. This work doesn't represent an end, but rather a beginning for further refinement.

Take-home Messages: 1. The TBLC Online Community of Practice was formed in 2017. 2. Four sub-teams addressed preparation, readiness assurance, applications and peer evaluation. 3. Best practices include: a) Preparation: materials, educators and learners b) Communication: more frequent, scaffolded and modality relevant c) Technology: created or curated to support online TBL.

The use of team-based learning pedagogy to educate radiographers in axial skeletal image interpretation

AUTHOR(S):

- Celine Tan, Singapore General Hospital, Singapore (Presenter)

ABSTRACT

Background: No available study has evaluated the effectiveness of team-based learning (TBL) pedagogy among radiographers in learning radiographic image interpretation. The primary aim of the study was to evaluate the perception of the learning experiences in the learning method, teamwork and individual preparedness using TBL and online learning approach. The secondary aim was to compare the differences in assessment scores between radiographers using both pedagogies.

Summary of Work: The study was carried out in December 2017 to March 2018. Twenty-four radiographers were randomly divided into TBL (n=12) and online learning (n=12). Learners acquired the knowledge through structured teaching methodologies with respect to their assigned tutorial groups. All radiographers sat for a short answer question test at the end of the tutorials. Feedback on their learning experience was collected using a 4-point Likert scale. Independent T-test and Mann Whitney U test were used.

Summary of Results: The response rate was 100% (n=24). The difference between the perception of learning experiences among both pedagogies were significant ($p < 0.05$). Radiographer satisfaction was high with TBL. Knowledge retention was higher through tutorial discussions and collaboration with their peers during TBL. TBL group felt more prepared for the assessment. There was a significant difference in the final assessment scores for TBL as compared to the online learning group ($M=27.5 \pm 1.62$ and $M=23.92 \pm 2.71$, respectively, $p < 0.001$).

Discussion and Conclusions: TBL was able to achieve a balance between discussion and delivery of contents. TBL promoted self-evaluation and allowed learners to correct their misconception through collaborative discussions. Learning gaps were addressed. TBL allowed radiographers to identify gaps in their knowledge and promote critical thinking. On the contrary, online learning lacked the opportunity in active learning processes. There was minimal participation in the online forum as the feedback received was not instantaneous. For this reason, learners may lose momentum and motivation to participate. The lower impact of online learning as compared to TBL could be related to other factors such as distraction and environmental factors which are beyond control.

Take-home Messages: TBL group demonstrated higher knowledge retention and greater satisfaction in learning axial image interpretation skills. TBL is a potential pedagogy in educating image interpretation knowledge and skills among radiographers.

#4E Research Papers - Selection in Health Professions Education

4E1 (19)

Location of Presentation: Hall M, Level 1

Is Reliance on the USMLE for Residency Screening at Odds with Efforts to Enhance Diversity among the Surgical Workforce?

AUTHOR(S):

- Aimee Gardner, SurgWise Consulting, Baylor College of Medicine, Houston, Texas, USA (Presenter)
- Katelyn Cavanaugh, SurgWise Consulting, MD Anderson Cancer Center, Houston, Texas, USA
- Ross Willis, SurgWise Consulting, University of Texas Health Sciences Center San Antonio, San Antonio, Texas, USA
- Brian Dunkin, SurgWise Consulting, Houston, Texas, USA

ABSTRACT

Introduction: With little objective information in application packets, residency program directors in the United States rely heavily on the United States Medical Licensing Examination scores (USMLE) as an initial filter to reduce the large volumes of candidates to a more manageable number. However, use of USMLE for selection has been criticized for its lack of validity evidence to be used for selection purposes, inability to predict later clinical performance, and potential bias against underrepresented minorities (URMs). We explore the extent to which situational judgment tests – assessments with demonstrated ability to predict job performance while also reducing adverse impact – can help capture candidate competencies and provide more equitable opportunities for URMs.

Methods: Industrial-organizational psychologists conducted multi-method job analyses at seven different residency programs to gather validity evidence for developing selection assessments. Each program provided 12-15 subject matter experts (SMEs) to participate. SME inclusion criteria required that all interviewees be central to the education program or represent a high-performing incumbent trainee. Each SME participated in a one-hour semi-structured interview with industrial-organizational psychologists to discuss program culture and expectations, and rated the importance of 20 core competencies derived from the literature. These data served as the validity evidence to inform development of unique situational judgment tests (SJTs) and scoring algorithms to assess applicant competency and fit. All programs lowered traditional USMLE1 cutoffs and invited all otherwise eligible candidates to take their respective assessments. URM status (women, racial/ethnic minority) of candidates who would have been considered for interview using previously-used USMLE1 cutoffs were compared to the candidate pool considered as a result of SJT performance.

Results: A total of 2610 applicants were invited to complete an SJT for at least one of seven surgery residency programs participating. Almost all (97%) of invited applicants completed the assessments. Seventy-two percent of all applicants represented at least one URM group (45.6% women; 46.7% non-white). USMLE1 scores and URM status were directly related, with whites performing significantly better ($p < 0.001$). There was no significant relationship between URM status and SJT performance. Accordingly, reliance on SJT scores resulted in more URMs recommended for further consideration across all seven programs ($p < 0.05$) compared to reliance on USMLE1 scores alone.

Discussion: These data reveal that reliance on USMLE as a primary screening tool may prevent URMs from even being considered for surgery residency positions. Comparison of those who would be invited using traditional screening criteria (i.e., using USMLE1 cutoffs as a primary filter) to those who would be invited using an SJT developed for selection purposes revealed substantial differences in the number of URMs considered for further screening.

Conclusions: The surgical education community should explore alternative screening tools with appropriate validity evidence to be used for selection purposes that can also help create a more equitable surgery workforce.

Date of Presentation: Monday, 26 August 2019

Time of Presentation: 1420-1440

Location of Presentation: Hall M, Level 1

Undergraduate medical course applicants' perspectives on selection cost and value

AUTHOR(S):

- Jonathan Foo, Monash University, Melbourne, Australia (Presenter)
- George Rivers, Monash University, Melbourne, Australia
- Louise Allen, Monash University, Melbourne, Australia
- Dragan Ilic, Monash University, Melbourne, Australia
- Stephen Maloney, Monash University, Melbourne, Australia
- Margaret Hay, Monash University, Melbourne, Australia

ABSTRACT

Introduction: Students are selected for health professions courses using a range of measures, assessing academic ability, aptitude, and personal characteristics [1]. Selection can be a costly process for applicants and their families, including costs relating to preparation courses, examination fees, travel, and time. The extent of these costs is currently unknown. Our research aims were to calculate applicant costs arising from the selection process for the medical school at Monash University (Australia), and to explore relationships between spending, socioeconomic status, and perceived effectiveness of preparation.

Methods: The Monash University undergraduate medical selection process uses a combination of prior academic achievement (high school matriculation score) and aptitude test scores (Undergraduate Medical and Health Sciences Admission Test [UMAT]), generating a shortlist of candidates who are then offered a Multiple Mini Interview (MMI). Applicants who attended an MMI for 2018 intake were invited to participate in an online survey. Our focus was on explicit and implicit costs arising from the UMAT and MMI. Data was collected on socioeconomic status, perceived preparation effectiveness, and costs associated with preparation (e.g. coaching products, study time) and attendance (e.g. travel costs, accommodation). Costs are in 2018 Australian Dollars.

Results: The response rate of the survey was 99% with 381 responses received. The median respondent was in the 94th percentile for educational advantage (based on school), and 84th percentile for socioeconomic advantage (based on home location). The median cost to applicants was \$1446 (IQR 776-2283) for the UMAT and \$721 (IQR 341-1163) for the MMI. The most utilised form of preparation for the UMAT was commercial preparation courses (n=270; 71%), with a median cost of \$500 (IQR 338-800). A statistically significant small positive correlation was found between amount spent on commercial UMAT preparation courses and applicant perceptions of its effectiveness ($r=0.24$, $P<0.05$). Similar correlations were also found for other UMAT and MMI preparation resources. No statistically significant correlation was found between socioeconomic status and amount spent.

Discussion & Conclusion: The costs and perceptions of effectiveness explored in this study provide new insights into the experience of applicants applying to medical school. Although applicants found costlier preparation resources more effective, the actual return on investment is unclear, with existing (albeit limited) literature on commercial preparation programs indicating little, no, or negative effects on outcomes [1]. Despite the lack of efficacy evidence, perceptions of efficacy associated with commercial preparation courses pervades applicant thinking, and has implications on the perceived equity of selection processes. Our study population came from relatively high socioeconomic backgrounds. Therefore, it is unlikely that, for the most part, applicant preparation decisions were limited by financial ability. Rather, the under-representation of applicants from low socioeconomic backgrounds is better explained by socio-cognitive career theory, in which cost is just one element [2]. Even at the application stage of the selection process, lower socioeconomic demographics are under-represented, and are further disadvantaged by screening using measures of prior academic achievement and aptitude test scores, but not interviews [2]. Future investigations into selection costs should focus on its influence on applicants getting to the interview stage.

Bridging the cultural divide? Exploring UK school pupils' perceptions of medicine

AUTHOR(S):

- Kirsty Alexander, University of Aberdeen, Aberdeen, UK (Presenter)
- Jennifer Cleland, University of Aberdeen, Aberdeen, UK
- Sandra Nicholson, Barts and The London School of Medicine and Dentistry, London, UK

ABSTRACT

Introduction: Literature published more than 10 years ago reported that UK individuals from non-traditional (lower socioeconomic) groups may not consider, or aspire to, medicine because of sociocultural barriers. Instead they perceive medicine as 'not for the likes of me'.⁽¹⁾ Since this time the UK Higher Education landscape has undergone significant change, with an increased emphasis on student choice and widening access (WA) initiatives. Consequently, this study looks anew at the perceptions of medicine held by school pupils from non-traditional backgrounds to assess whether sociocultural factors remain a major barrier to the profession.

Methods: Ten focus groups were conducted with 71 high-achieving pupils in their penultimate or final year at stated-funded UK high schools (aged 16-18). Participants attended schools engaged with medical schools' WA initiatives: that is, schools from which fewer young people progress to Higher Education at a university or college than the norm. Focus groups were audio-recorded and transcripts were analysed thematically using template analysis - a largely data-driven approach. Themes were then interpreted through the conceptual lens of the 'reflexive habitus' – an adapted version of Bourdieu's classic concept.⁽²⁾ This viewpoint highlights how individuals are able to reflexively alter their dispositions (behaviours, beliefs and tastes) to inform their decisions about how to act and appear in various social contexts. The lens facilitated a comparison of how the pupils' perceptions and expectations of medicine were challenged, reinforced or altered if they developed contact to those within the profession.

Results: Participants did not perceive that sociocultural differences would deter them from aspiring to, or pursuing, the career of their choice. Some participants identified their 'different' backgrounds as a strength to bring to medicine. They reported that intrinsic motivators (personal interest and fulfilment) were most important in their own career choices. When asked what they believed might have motivated current medical students for the career, participants debated the role of extrinsic motivators (high status and income) versus intrinsic ones. 'Hot knowledge' (social contacts) from within medicine helped some participants reconcile any 'clash' in perceived values and better imagine themselves in the profession.

Discussion & Conclusion: These non-traditional school pupils, attending state schools engaged with WA initiatives, appear to have embraced the belief that medicine is for anyone with appropriate desire and ability, regardless of their background. This suggests that the sector's efforts to remove perceived sociocultural 'barriers' to the profession may have been successful. Furthermore, some pupils reported that some aspects of their 'difference' (diversity) could help enrich the workforce and patient care. This positive view of diversity perhaps heralds a further – if still tentative – change in attitudes about who 'belongs' in medicine and why.

How do entrants to courses designed for underrepresented students perform compared to peers on standard medical degree courses?

AUTHOR(S):

- Sally Curtis, University of Southampton, Southampton, UK (Presenter)
- Daniel Smith, General Medical Council, London UK

ABSTRACT

Introduction: Diversifying and enriching the medical profession by reducing social exclusivity is a key aim of the medical profession around the world. In the UK, Gateway courses are increasingly popular widening participation (WP) routes into medicine, designed to attract and retain students under-represented in medicine, especially those from low socioeconomic backgrounds. These courses provide a more accessible entry to medical school and aim to support students to successfully progress through their studies. There is little evidence on the performance of students on Gateway courses and if these courses support students to achieve their academic potential.

Methods: Data from the UK Medical Education Database² (UKMED) were obtained for the three longest running gateway courses and standard entry medicine (SEMED) courses at the same institutions, for students starting between 2007 and 2012. These data included A-levels and UK Clinical Aptitude Test (UKCAT) scores on entry to medical school and Educational Performance Measures (EPM), Situational Judgement Test (SJT) and Prescribing Safety Assessment (PSA) scores as outcomes measures. 4,471 students completed their entire medical degree at the same medical school on a SEMED or Gateway course. 3,638 had one or more of the three outcomes on graduation and were included in the analysis to determine performance and whether course type predicts EPM, SJT and PSA scores after controlling for attainment and aptitude on entry.

Results: Students on the SEMED courses had higher attainment (A-level points, Cohen's $d = 1.338$) and aptitude (UKCAT test scores, Cohen's $d = 1.078$) than those on Gateway courses on entry. On exit SEMED students had higher mean EPM scores (Cohen's $d = 0.616$) and PSA scores (Cohen's $d = 0.653$) compared with Gateway students.

Undergoing a SEMED course is associated with higher EPM scores (accounting for 6.5% of the variance) and higher PSA scores (accounting for 6.5% of the variance) with no control for entry measures. When accounting for measures of attainment and aptitude on entry, course type is still a significant predictor of EPM (but only accounts for 1.8% of the variance) and PSA (but accounts for less than 1% of the variance).

There is a smaller significant difference in SJT scores between SEMED and gateway students (Cohen's $d = 0.114$).

Higher SJT scores are associated with course type when performance on entry is not controlled for but when measures of performance on entry are included course type is no longer significant as the variance in SJT scores is explained by A-levels, which co-varies by course.

Discussion & Conclusions: Students on Gateway courses have lower scores on entry to medical school, which is congruent with the entry criteria. However, there is a smaller difference in performance on exit than at entry between the two courses. This could indicate that students on Gateway courses show improvement in performance at medical school. Students on SEMED courses demonstrate better performance in EPM and PSA assessments. However, there was a reduction in this effect after accounting for initial attainment and aptitude. Course type was no longer a significant predictor of SJT performance after accounting for attainment and aptitude indicating similar performance in non-academic assessments for students on both courses.

Students from underrepresented groups may demonstrate lower attainment but they also show improvement in performance at medical school narrowing the gap with SEMED students. This indicates gateway programmes do help students achieve their potential.

Strategies Used by Master Adaptive Learners when 'Planning' for Learning: A Qualitative Study in Graduate Medical Education

AUTHOR(S):

- Linda Regan, Johns Hopkins University School of Medicine, Baltimore, USA (Presenter)
- Michael Gisondi, Stanford University School of Medicine, Palo Alto, USA
- Laura Hopson, University of Michigan Medical School, Ann Arbor, USA
- Jeremy Branzetti, New York University School of Medicine, New York, USA

ABSTRACT

Introduction: The ability to adapt expertise to both routine and uncommon situations, termed adaptive expertise, has recently been suggested as a necessary skill for practicing physicians. The Master Adaptive Learner framework (Cutrer 2017) proposes four key phases of learning necessary for the development of adaptive expertise. The first phase, 'planning' for learning, includes three steps: identification of gaps, prioritization of gaps to be addressed, and identification of learning resources. The aim of this study is to identify key strategies used by master adaptive learners as they are 'planning' for learning.

Methods: Using a constructivist paradigm, we conducted a qualitative study using focus groups to identify themes among a cross-specialty learner group of post-graduate trainees. We employed purposeful sampling, asking program directors to identify learners in their training programs who exhibited characteristics of the Master Adaptive Learner framework. We recruited voluntary participants from those identified to participate in focus groups at four university-based teaching hospitals in the United States. Transcripts were coded by two independent coders using a constant comparison analysis until saturation of codes was achieved. These codes were grouped into themes and refined through an iterative process until no further themes were identified.

Results: A total of 204 codes were identified from the transcripts of seven focus groups with 38 total participants representing multiple specialties. From these we established six major themes that represented key strategies used in the 'planning' phase of learning. Master adaptive learners identify their knowledge gaps through two forms of self-assessment: Performance-driven gap analysis occurs when learners compare their performance against a standard, while Community-driven gap analysis is facilitated by interactions with others in the learning environment, including teachers, peers, and students. Learners described two schemas used to prioritize gaps, Triage and Adequacy. Triage is the process in which learners make decisions regarding the importance and order of their learning tasks, as they ration their limited time. Adequacy is the process of defining an end-point for learning that signals that it is acceptable to move on to another task. Finally, learners identified two methods to select learning resources. Intentional adaptation is the deliberate, and sometimes opportunistic, choice of resources to best address identified gaps in a specific learning environment. Weighted curation is the iterative process by which learners dynamically evaluate the characteristics of the learning resource, such as credibility, applicability, or ability to engage with the material.

Discussion: We identified six strategies used in the 'planning' for learning phase of the Master Adaptive Learner model. Through narrative examples, trainees articulated their approaches to identifying, prioritizing, and addressing learning gaps, as well as barriers to the implementation of these strategies. All of these techniques rely on informed self-assessment and the determination of personal learning needs. In addition, many of these schema are developed through trial-and-error rather than formal instruction, even among this cohort of master learners. These findings may have important implications for curricula designed to teach learners how to best learn.

Conclusions: Trainees identified as master adaptive learners utilize six specific strategies to plan for learning. Learners who are not adept at independent learning may benefit from knowledge of these strategies. Educators should develop specific interventions to target and facilitate learner development of these strategies.

Student feedback literacy: the development of a framework for practice

AUTHOR(S):

- Elizabeth Molloy, The University of Melbourne, Melbourne, Australia (Presenter)
- David Boud, Deakin University, Melbourne, Australia
- Michael Henderson, Monash University, Melbourne, Australia

ABSTRACT

Introduction: A recent focus within the feedback literature is the conception of 'feedback literacy', where students are viewed as active players rather than passive recipients of performance information (Carless and Boud 2018, Noble et al. 2018). These publications are either conceptual in nature, or have an empirical focus on educational interventions to actively engage learners within classroom or workplace feedback processes. To date, we know little about learners' perspectives on, and experiences of, the roles they play in seeking, sense-making, and using feedback information for their own benefit.

Methods: Our research question was: how can we identify that learners demonstrate feedback literate behaviours or approaches within their programs? Our aim of this paper is to further clarify what constitutes learner feedback literacy and establish directions for research and practice within health professions education. The study was conducted at two Australian universities to explore feedback perceptions and practices. Data were drawn from open-ended questions in a large-scale student survey across all faculties (n=4514) supplemented with 4 focus groups (n=28) and student interviews (n=20). A Thematic Analysis approach was used in which the three authors analysed the data, and through a series of iterations, arrived at codes representing occasions of learner feedback literacy (provisional student feedback literacy framework). The researchers used the provisional framework to analyse the interview and focus group transcripts and made final adjustments to produce the final student feedback literacy framework presented in this paper.

Results: The Student feedback literacy framework has 32 empirically-informed items across three categories: 1) Understands feedback processes and purposes (10 items). Example: Appreciates the role of standards and criteria in judging the work of oneself and others (item 2). 2) Initiates and participates in information sharing and processing (10 items). Example: Builds trust in facilitating honest and meaningful information exchanges with others (item 6). 3) Plans and acts (12 items). Example: Responds to feedback information from others through goal-setting and planning how it might be utilized in future work (item 3)

Discussion & Conclusions: Identifying characteristics of student feedback literacy can be subsequently used for program design in the health professions (incorporating activities to promote feedback literacy) and further research. Embedding activities in first year would be a high priority, as well as progressive development of these feedback literacy competencies over time (increasing opportunities and complexity of the demands as students gain more knowledge and skills). Building in associated summative assessment to help orientate learners to the importance of these 32 capabilities will also be key. A challenge within health professions education will be curriculum crowding. For this to work, the development of feedback literacy cannot be an add-on but rather needs an integrated strategy, starting year one so that learners do not become reliant on limited opportunities for 'feedback' input from teachers (further reinforcing a limited view of feedback as the responsibility of the teacher).

The framework challenges commonly held assumptions about students and what they are capable of when it comes to feedback. The uptake of educational practices arising from the framework could encourage students to shift from a place of making the most of hopefully useful information (feedback as telling) to a position as active seekers and translators of feedback information. One of the compelling rationales for the development of these feedback capabilities is that they have currency in the workplace, beyond university courses.

ABSTRACT

Context: A growing body of research analyses the poor implementation of direct observation (DO) in residency, pointing in the direction of longitudinal training relationships as a way forward^{1,2}. A common feature in this research is that DO itself tends to remain a black box, hardly explored as a phenomenon in itself. Different reasons for and practices of DO may possibly lead to different effects. With this study we explored what DO entails in longitudinal training relationships, according to residents, and if and how DO helps them learn: what are the possible manifestations, meanings and effects of DO, according to residents? A differentiated picture of DO can guide future interventions to make DO work better in residency.

Methods: We followed a constructivist grounded theory approach, conducting four focus group sessions with a total of 31 participants, all general practice residents in their first or last year of training. Focus group discussions were about residents' experiences with various manifestations of DO of technical skills. Through open coding of the transcripts, memo writing and constant comparison, a model describing the mechanisms that led to various effects of DO on residents was constructed and refined, iteratively collecting and analyzing data until theoretical sufficiency had been reached.

Results: We found that residents were ambivalent regarding DO. DO was challenging for residents, in terms of preserving their autonomy, authenticity and credibility. Experiencing some control over situations where DO was introduced was important to residents. In how different DO situations allowed for residents' control, we found some patterns: Planned DO moments tended to add to residents' sense of control, whereas ad hoc DO was perceived as more unpredictable. In these ad hoc DO situations, four typical scenarios were recognized, of which only one led to actual DO of the resident. In the other scenarios, when for instance supervisors took over a consultation while they were asked to directly observe a resident handle the situation, there could be detrimental effects to the training relationship and residents' learning. An open dialogue to negotiate control over DO situations, reportedly, was important but hard to conduct. A perceived good training relationship was helpful in this, and, reversely, benefited from regularly observing each-other in planned bi-directional DO sessions.

Discussion & Conclusions: Exploring DO experiences in longitudinal training relationships with general practice residents revealed the importance of predictability of DO-situations and negotiated control of both supervisors and residents. Discussing working arrangements, and planning DO, seemed crucial to make DO happen and use it to support learning. Our findings help us understand how mechanisms within longitudinal training relationships may influence the use of DO in post graduate medical education. Further research is needed to investigate if and how our findings apply to shorter training relationships.

Beyond self-regulated learning: How students develop self-regulation through co-regulated learning during clinical clerkships

AUTHOR(S):

- Derk Bransen, Maastricht University, Maastricht, The Netherlands (Presenter)
- Marjan Govaerts, Maastricht University, Maastricht, The Netherlands
- Dominique Sluijsmans, Zuyd University of Applied Sciences, Heerlen, The Netherlands
- Erik Driessen, Maastricht University, Maastricht, The Netherlands

ABSTRACT

Introduction: Although self-regulatory learning (SRL) is generally considered a key competence of graduating and practicing physicians, research findings suggest that students struggle to regulate their learning in clinical settings (Van de Wiel, Van den Bossche, Janssen, and Jossberger, 2011). Research into self-regulated learning (SRL) in clinical workplace settings increasingly focuses on social influences (e.g. interactions with peers, residents, clinical staff and others) on SRL-development. The impact of social interactions on students' SRL is embodied in the concept of co-regulated learning (CRL), which is defined as a "transitional process in the acquisition of SRL-skills through interactions with a more experienced other" (Allal, 2016 p. 263). In order to better monitor and support development of SRL skills, we need to gain a better understanding of how co-regulation facilitates students' SRL in clinical clerkships. In this study we explored undergraduate medical students' perspectives regarding CRL and perceived impact on the development of their SRL-skills.

Methods: We used individual semi-structured interviews with 11 undergraduate medical students enrolled in clinical clerkships in various hospitals in the Netherlands. Interviews were conducted between February and May in 2018 and lasted approximately 60 minutes. The interviews were audio-recorded and transcribed. We purposively sampled medical students to ensure a variety in gender, level of performance, and experience in clinical training. In line with the principles from constructivist grounded theory methodology, data collection and data analysis were conducted iteratively. In analyzing the transcripts, we made use of sensitizing concepts, acknowledging existing theoretical concepts in SRL and CRL.

Results: Results showed that co-regulated learning differed across students and was enacted differently when students gained clinical experience. Novice students relied heavily on peers and assignments offered by the university when formulating learning goals. With increasing experience, students were better able to specify and predefine realistic and feasible learning goals. Students developed their own unique professional identity and became more familiar with affordances and boundaries of the learning environment. Nurses often helped students in becoming familiar with the new environment and assisted students in seeking out learning opportunities. Mentors and workplace supervisors played important roles in co-regulating students' self-reflection. Whereas novice students were supported in reflecting on set learning goals, more experienced students were stimulated to reflect on general performance and experiences. Results furthermore showed that students who were already able to self-regulate their learning, engaged in interactions in co-regulated learning that developed their SRL-skills at a faster pace than students who struggled to self-regulate their learning.

Conclusion: Social interactions between students and others (e.g. peers, residents, nurses) in clinical clerkships are abundant and influence students' development of self-regulated learning skills. Therefore, focusing on how we can facilitate and optimize CRL in clinical workplace environments allows us to better facilitate students in their SRL-development and equipping them with tools to engage in life-long learning with each other. Furthermore, it would be interesting to examine how we can facilitate students who struggle to self-regulate their learning to engage in co-regulated learning.

Palliative care in undergraduate medical curricula

AUTHOR(S):

- Jolien Pieters, Maastricht University, The Netherlands (Presenter)
- Danielle Versteegen, Maastricht University, The Netherlands
- Franca Warmenhoven, Maastricht University, The Netherlands
- Judith Westen, Maastricht University, The Netherlands
- Jimmy Frerejean, Maastricht University, The Netherlands
- Diana Dolmans, Maastricht University, The Netherlands

ABSTRACT

The need for palliative care is increasing due to the aging population and the growing number of people with chronic diseases, such as cancer, heart failure, COPD, and dementia (Etkind et al, 2017). Physicians and junior doctors working in almost all specialties and in many care settings will regularly have to take care of palliative care patients. Providing palliative care can be challenging and calls for specific knowledge, skills, and attitudes that need to be trained in undergraduate medical curricula. Medical students are offered insufficient education and training in palliative care (Gibbins, 2011; De Bruin, 2018; Lloyd-Williams & MacLeod, 2004) and report lack of confidence and knowledge in this domain (WHO, 2014; Weber, 2011; Eyigor, 2013; Pieters, 2019).

Within this project, a toolbox consisting of new educational materials and adapted existing materials is developed which can be used in undergraduate medical curricula. Current instructional design theories focusing on professionally relevant tasks in palliative care are used to design or redesign the materials (Van Merriënboer & Kirschner, 2018). The tasks cover six main professional activities, such as being able to treat patients from four perspectives (physical, psychological, social and spiritual), and being able to collaborate with a multidisciplinary team of professionals and relatives. The toolbox offers medical universities materials that can be flexibly integrated into their own curriculum. The toolbox has been developed in close collaboration with various stakeholders, such as teachers, students, educationalists, and palliative care experts. Within this PechaKucha, I will explain how we developed the toolbox based on current instructional design guidelines and in close collaboration with various relevant stakeholders.

Teaching menstrual health - a journey towards better patient engagement as future doctors

AUTHOR(S):

- Rong Hui Teo, NTU Lee Kong Chian School of Medicine, Singapore (Presenter)
- Yuqing Michal Khoo, NTU Lee Kong Chian School of Medicine, Singapore

ABSTRACT

Background: Due to the mountainous terrain in Nepal, it is difficult for villagers to access basic healthcare or education when the nearest hospital or school could take them a day's hike. Project Aasha is a student-led Overseas Community Involvement Project with yearly services to Bung village in Nepal. In addition to bringing healthcare to the villagers via a health camp, we aim for sustainable development of the village through collaborating with local stakeholders in healthcare education and training, one of which being menstrual health education.

In Nepal, the topic of menstruation is taboo; menstrual blood is regarded as 'dirty', hence women undergoing menstruation are forbidden to touch water or stay with their families. These practices raise red flags concerning women's hygiene and accessibility to basic needs during menstruation, hence the need for education and a more positive perception towards menstruation.

As medical students, we taught the Nepalese students about menstruation and some feminine hygiene practices they could adopt. In one of two schools, we also conducted a focused group discussion (FGD) in addition to the regular teaching session. We will share our experiences teaching both schools, how we juggled different cultures and practices, and offer our insights on how FGDs improve audience engagement and outcomes. With the shift from medical paternalism to greater involvement of patients in the decision-making process, medical schools need to introduce to students a discussion-based approach in patient management. By having medical students helm a facilitator's role, such projects allow them to recognise differences, initiate discussions, and reach a common ground - skills doctors require when approaching patients with different health beliefs.

Conclusion: Conducting healthcare education encourages future doctors to make discussion and collaboration a stronghold of their doctor-patient relationships. It stimulates personal growth and enhances their abilities to engage patients.

What's on your Medical Education Story Playlist? Writing and Sharing Stories as a Medical Educator

AUTHOR(S):

- Meghan Treitz, University of Colorado, USA (Presenter)
- Janice Hanson, Washington University, USA

ABSTRACT

Once upon a time, long ago, in a land far, far away, teachers taught by telling stories. They packaged information into stories so that it could be easily remembered - and passed along. We frequently ask students to reflect and share what they have learned and experienced. Teachers can also share their own personal stories with learners. Telling stories can benefit teachers and add meaning for learners. For example, narratives have been shown to improve teaching about communication, diagnosing, and other critical aspects of medicine.

Storytelling is also inherent to medical practice. As healthcare providers, we routinely listen to stories of disease and of the people who experience disease. Medical professionals are often compelled to share their own stories of medical encounters. Stories need not be long. They just need to be personal and heartfelt. By telling stories, you will connect with each student. You may build frameworks for remembering, and aid them in assimilating new learning. You might inspire a student to listen deeply or gain confidence in sharing their own stories.

Some people say that we each have our own story 'playlist' - similar to a music playlist of your favorite songs, a story playlist is a collection of our own stories that we tell again and again. These stories may be an integral part of who we have become, or we may still be working through them.

This presentation will remind the viewers of the power and importance of stories in our lives as teachers and health professionals, share snippets of stories as examples, introduce the idea of a story playlist and provide an example, discuss a framework for creating a memorable story, and suggest ways for everyone to create their own story playlist, so their stories will be ready to share in-the-moment when teaching, providing care, or reflecting.

The evolving use of virtual patients in medical education

AUTHOR(S):

- James Thomas, Keio University School of Medicine, Japan (Presenter)
- Toshiaki Monkawa, Keio University School of Medicine, Japan
- Michito Hirakata, Keio University School of Medicine, Japan

ABSTRACT

Virtual patients (VPs) are technological tools that have continued to develop and evolve over the past fifty years. They take on a wide range of forms and may be used in the teaching, assessment, or evaluation of skills such as clinical reasoning, clinical communication, and medical history taking. Depending upon their design, they offer the potential to allow multiple learners to practise specific skills simultaneously, repeatedly, and with high fidelity, in a safe and interactive environment. Unfortunately, simulation in healthcare education still suffers from a lack of dedicated frameworks and taxonomy for instructional design and this is even more evident for simulation using virtual patients.

With recent advances in virtual reality, augmented reality, and artificial intelligence, educational institutions are starting to explore further ways to implement virtual patients in curricula worldwide. However, are they a worthwhile investment and how effective are they when compared to other educational resources and forms of simulation? What evidence exists to support their use, and what studies are still missing before they can be dismissed as a technology for technology's sake or firmly cemented in educational pedagogy as an indispensable tool?

In this talk, I will review the past and current uses of virtual patients in clinical education and highlight some of the obstacles that need to be overcome if their use is to be more widely accepted. I will introduce some of the exciting ways that virtual patients may be used over the next 5-10 years, including the integrated use of virtual reality, augmented reality, natural language processing, and artificial intelligence. I will draw upon examples from the current educational literature and explore some of the criticisms and limitations that are commonly encountered.

Shared mental models to support interprofessional team training: Getting everyone on the same page

AUTHOR(S):

- Wee Shiong Lim, Tan Tock Seng Hospital, Singapore (Presenter)
- Sok Ying Liaw, National University of Singapore, Singapore

ABSTRACT

Shared mental model (SMM) refers to the knowledge structures held by members of a team that enable them to form accurate explanations and expectations for the task and in turn coordinate their actions and adapt their behaviours to the demands of the task and other team members. SMMs can be broadly classified into task-related mental models that encompass task goals, procedures, and strategies, and team-related mental models that include role interdependence, communication patterns and shared attitudes and beliefs.

The importance of SMM for teamwork and team-performance has been recognized for almost two decades, particularly in high-risk industries such as aviation and the military. Studies in the healthcare setting echo similar findings, with SMMs described as outcomes of interventions as well as prerequisites for improved team performance. The growing necessity of team-based care underlines the increasing importance and relevance of strategies to impart SMMs in team-based learning to get 'everyone on the same page' to improve team-performance and, ultimately, patient safety.

In this PechaKucha presentation, we will illustrate the significant effect of SMM on interprofessional teamwork and team-performance in two common yet contrasting scenarios in the ward setting: acute deterioration on night call and inter-professional discharge planning conference. The former represents a short-lived action team where relatively well-structured tasks are carried out under time-pressure in a dynamic environment - team training should focus on task-related SMMs. In comparison, the latter typifies a more stable long-lived team in a lower-intensity environment with a larger team composition and more diverse task content - in this instance, greater emphasis should be placed during team training on team-related SMMs. Educational interventions designed to foster the development of SMMs such as team training, teamwork supportive tools, and group/individual reflection exercises will be discussed. We will also highlight challenges in the application of the SMM concept to interprofessional team-based training. The presentation will conclude with an exploration of the emerging role of virtual simulation to address logistical challenges in the use of simulation for collaborative learning of SMMs in interprofessional team care delivery.

PBL 360 - A story of innovation using 360-degree video to promote clinical reasoning in problem-based learning

AUTHOR(S):

- Jordan Tsigarides, Norwich Medical School, UK (Presenter)
- Jordan Curl-Roper, Norfolk and Norwich University Hospital, UK
- Josip Stosic, Norwich Medical School, UK

ABSTRACT

Problem-based learning (PBL) is implemented widely within medical curricula. Goals of the PBL session often include development of clinical reasoning skills. Paper-based trigger material lacks essential clinical information that can influence hypothesis generation. 360-degree video is a modern media format that allows students to experience content-rich clinical scenarios within PBL. Using 360-degree video to show realistic clinical scenarios can potentially improve students' clinical reasoning skills, increase learner motivation and stimulate meaningful discussion.

During this PechaKucha, we will showcase our enlightening experience of creating multiple 360-degree video scenarios for PBL. Our eighteen videos cover a nine-week PBL programme within our final-year emergency medicine curriculum. Two videos were created for each week. The first video acted as trigger material to stimulate discussion, clinical reasoning and generation of learning outcomes. The second provided a conclusion and was played during the following week. Videos were controlled with a desktop computer and viewed using an overhead projector. Students were able to pan around the scene, see/hear examination findings and interpret investigations. 'Stop & Think' moments were added to promote discussion and clinical reasoning. We evaluated students' subjective experience using a survey and gained observational feedback through independent peer review.

In comparison with paper-based cases, students felt that the 360-degree videos gave a better picture of disease, being more memorable and increasing motivation to learn. They agreed that the videos encouraged more useful discussion and consideration of human factors elements, teamwork and patient wellbeing. Qualitative data was also positive, demonstrating increased student engagement. Independent peer-review described effective hypothesis generation throughout the observed session. Full results will be available for presentation.

We filmed these 360-degree videos with limited prior experience and funding. This presentation intends to inspire other educators to produce 360-degree content, showcasing our innovative PBL scenarios and demonstrating their impact on our students.

From critical thinking to critical making: craft and everyday design in medical education

AUTHOR(S):

- Anna Harris, Maastricht University, the Netherlands (Presenter)

ABSTRACT

The intense effort in instructional design in medical education has the potential to overlook the more mundane and yet incredibly rich practices of everyday design. Everyday design in medical schools is tinkering work involving adaption or making in creative acts of re-purpose. Hardly a new practice in medicine - tinkerers and makers have often radically transformed the field with their inventions, take the stethoscope for example - these are skills however which can be lost as medical education strives for efficiency, standardisation, transparency and objectivity.

In this PechaKucha presentation I joyfully celebrate small acts of everyday design and the craftsmanship of training healthcare professionals. The presentation draws empirically from an ongoing anthropological and historical study of the role of technologies in training doctors' sensory skills of diagnosis. This study is one of the first collaborative and comparative social studies of medical training, with years of fieldwork already conducted by a team of anthropologists, science and technology studies scholars and historians in medical schools in Western Europe, Eastern Europe, West Africa and the Asia-Pacific.

In these medical schools we have found, and been inspired by, everyday acts of making. In the presentation I will share sensory images of, and stories about, teachers' materials and innovations. I will bring these examples into a broader narrative about design and critical making, areas of scholarship and practice I suggest offer fresh new perspectives on how to approach medical teaching. I argue that we should not only be observing more closely the existing practices of creativity and improvisation amongst teachers, but also allow more space for such making in medical schools, examples being makerspaces or skillshare workshops. Attending to everyday design is not only a creative and enlightening practice, but a necessary one, in order to train adaptive, creative healthcare professionals of the future.

Empathy in the Age of Technology?

AUTHOR(S):

- Margaret Brommelsiek, University of Missouri-Kansas City School of Medicine and School of Nursing and Health Studies, USA (Presenter)
- Gary Sutkin, University of Missouri Kansas City School of Medicine, USA

ABSTRACT

Humans have a complex relationship with technology, viewing it as both a tool toward enhanced performance and as a detriment that may result in our being redundant or even replaced. As technology becomes interwoven into every component of our lives, even the vessels we call 'bodies', what does our attachment to technology say about us as individuals and how is it shaping our humanness? Humanism is being open to others through engaged curiosity involving observation and active listening, reflection and deliberation. How we choose to negotiate technological advancements into our daily lives will ultimately inform our sense of place and our experiences of one another. In finding balance with technology, we must accept the fundamental human skills that cannot be replicated by machines, such as empathy, as empathy is realized through a shared experience of illness and health and through affirmation of the dignity and value of all people. Yet automation continues to infiltrate medicine. Advanced technologies are used in all aspects of medicine from electronic medical records to machinery used in diagnostics and robotic instruments used during surgery. This begs the question: what uniquely human traits will be required for making ethical decisions and an ability to cope with ambiguity?

This Pecha Kucha presentation will address fundamental questions concerning humanness in the face of technology through a visual explanation incorporating art and automation. It will explore the deeper meaning of our infatuation with technology, its impact on the social order, and preparing future generations to appreciate knowledge sharing, creativity, leadership, and interdisciplinary teamwork for ensuring an engaged and flexible society. Empathy cannot be automated. As the creators of advanced technologies we possess the power of how best to incorporate these tools into daily practice while maintaining our unique humanness.

The “\$10 Challenge”: Teaching Scalability in Medicine

AUTHOR(S):

- Shomit Ghose, UC Berkeley, USA (Presenter)

ABSTRACT

Background: Silicon Valley's innovation is not in technology, but in business models: re-imagining existing processes and making them cost-efficient. This focus on scalability and cost-efficiency has disrupted legacy business models worldwide. Healthcare faces a scalability challenge too. Demands increase, but resources do not. Is there merit in teaching medical students how to think about scalability within medicine? Doing so may help future physicians discover new ways of bringing care to broader populations. Existing entrepreneurship programs help physicians invent disruptive medical products; to date, there has not been a program to invent disruptive medical practitioners.

Summary of Work: Considering the need for scalable healthcare, we developed the “\$10 Challenge” program, to train medical students to think like scalability-minded Silicon Valley. The program engages students in the same process of disruptive thinking that fuels start-up innovation, thereby changing the way in which future physicians think about medical practice.

Within the \$10 Challenge, medical students work in heterogeneous teams with graduate students from other disciplines. Teams identify a single “challenge” with the aim of discovering a new solution where healthcare can be delivered for under \$10/patient, helping to achieve scalable healthcare. The focus on teaching the thinking process behind Silicon Valley innovation – scalability, low-cost – makes the \$10 Challenge a unique educational vehicle.

Summary of Results: \$10 Challenge participants consistently devise compelling solutions for medical problems in major areas of human need. More importantly, the program teaches students to think “outside the box”, beyond existing algorithmic approaches, in envisioning medical solutions that are effective and low cost.

Discussion and Conclusions: Based on participant feedback, the \$10 Challenge consistently achieves its goal of teaching disruptive thinking. Current measures of the success of the method are qualitative, with quantitative results known in the future. We believe the teaching method has value and should be considered for inclusion in other medical education programs.

Take-home Messages: The \$10 Challenge is simple, low-cost, and imparts the Silicon Valley philosophy of “Think Big, Think Small”: think of a big problem; think of its small solution. It presents a unique and needed complement to current medical education.

Innovating Virtual Reality Training: Decentralized Surgical Simulation Training

AUTHOR(S):

- **Martin Frendø, University of Copenhagen, Denmark (Presenter)**
- Ebbe Thinggaard, Department of Gynecology and Obstetrics, University Hospital Hvidovre, Denmark
- Lars Konge, Copenhagen Academy for Medical Education and Simulation (CAMES), University of Copenhagen, Denmark
- Mads Sølvsten Sørensen, Department of Otorhinolaryngology-Head & Neck Surgery and Audiology, University of Copenhagen, Denmark
- Steven A. W. Andersen, Copenhagen Academy for Medical Education and Simulation (CAMES), University of Copenhagen, Denmark

ABSTRACT

Background: Lack of access to simulation centers is a potential barrier to implementation of distributed virtual reality (VR) training. Decentralized training could be a useful solution but its feasibility and implementation is scarcely investigated. Here, we aim to evaluate the implementation and use of decentralized VR training using a freeware, high-fidelity simulator for temporal bone surgery.

Summary of Work: In a prospective, mixed-methods study, 20 otorhinolaryngology residents were provided three months of access to a VR simulator in their local department or at home. To facilitate self-regulated learning, participants were also given a range of learning supports for feedback and instruction. Focus group interviews were conducted and questionnaire data collected. Interviews were analyzed using thematic analysis.

Summary of Results: Qualitative analysis revealed five main themes: convenience, time for training, ease of use, evidence for training, and testing. Participants trained a median of 3.5 hours, primarily towards the end of the trial, and mainly used the simulator-embedded learning supports.

Discussion and Conclusions: Convenient access to VR training was a key feature to participants. This is important since most VR simulators are centralized at university hospitals and used in a 'boot camp' format that only allows for massed practice, which is inferior to distributed practice. Evidence demonstrating the effect of training on a VR simulator was considered imperative to participants and motivated them to train: in order for them to invest time in training, they wanted evidence that it is worthwhile. However, despite convenient access to and evidence for training, the training volume was modest, possibly due to lack of testing and mandatory requirements. In conclusion, decentralized VR training is feasible but requires a strong instructional design and curricular implementation.

Take-home Messages: Decentralized virtual reality training is feasible; A strong instructional design is required for implementation of decentralized virtual reality training; Scientific evidence for learning interventions motivates participants.

Design and implementation of a chatbot as a learning tool for medical students: a feasibility study

AUTHOR(S):

- Anand R, Christian Medical College, Vellore, India (Presenter)

ABSTRACT

Background: Chatbots are artificial intelligence (AI) agents that can respond to text responses to a user much like the conversational agents in market (Siri, Google Assistant or Alexa). While the question “is a chatbot really required in medical education?” is yet to be answered, in my perspective, chatbots also provide an opportunity for providing curated information for students, at the same time, providing an interactive and self-paced learning tool.

Summary of Work: I designed a chatbot on rule-based AI principle in which content is built into the bot. Specific triggers are also provided and linked to the content such that when a user prompts a query, the query is matched to the trigger and subsequently a response is returned to the user. I named the chatbot as ‘DiabEDeS Bot’; the content was basic information on diabetes mellitus suited for a first-year medical student. I developed this chatbot using an application called “Chatfuel” and deployed it on Facebook Messenger platform (<https://www.messenger.com/t/DiabEDeSBot>). Subsequently, I tested the chatbot for usability and acceptability in a small group of medical students (n=17).

Summary of Results: For the majority of students (83%), this was their first interaction with a chatbot. Students awarded a mean score (out of 10) for the chatbot on its intelligence (7.2), usefulness (7.5), relevance (7.6), trustworthiness (8.7) and enjoyment of interaction (8.7). Concise nature of information, accuracy and rapid response time were some of the features that the students liked in the chatbot. Limited responses and the inability of the chatbot to recognize some queries were features that students disliked in the chatbot.

Discussion and Conclusions: This study is a first to describe a model for design and implementation of a chatbot as a learning tool for medical students. This study also describes a simple methodology to develop chatbots without the requirement of knowledge on computer programming or expertise in artificial intelligence. Overall, the chatbot designed in this study was reasonably well received by medical students.

Take-home Messages: Chatbots are conversational agents with potential for use as learning tools in medical education.

Designing a 3-Dimensional Medical Curriculum Map

AUTHOR(S):

- Redante Delizo Mendoza, Ateneo School of Medicine and Public Health, Philippines (Presenter)
- Cenon Alfonso, Ateneo School of Medicine and Public Health, Philippines

ABSTRACT

Background: Numerous outcome based teaching and learning curricula use a tree structure where a set of general graduate outcomes branch into year level learning outcomes (LOs), into block/module LOs and to sessional LOs. While this provides a cascading view of learning outcomes, it shows limited linking across related LOs within disciplines. As the LOS become more specific, the relatedness between LOs become less obvious. Curricular trees go from general to specific, and thus is one-dimensional. To better show LO relationships, we proposed a 3-dimensional tagging system. In most medical curricula, this can be achieved by tagging the LOs to year levels, organ systems/related medical specialties (verticals) and the graduate or competencies as the 3 coordinates/dimensions.

Summary of Work: The Ateneo School of Medicine and Public Health (ASPMH) confers a combined MD/MBA degree. It decided to embark on curriculum re-structuring using the 3-D approach wherein more than 60 faculty mapped out their respective year module LOs against 11 ASPMH graduate competencies. Then the vertical coordinators wrote the vertical LOs and ensured alignment of the module LOs written by the module leads. They then tagged it to the ASPMH graduate competencies. A similar alignment activity was conducted across the year levels.

Summary of Results: Using the 3D process, large chunks of content overlaps became immediately apparent, while smaller gaps were recognized. Also, as the ASPMH graduate competencies include many soft skills such as leadership, communication and collaboration, the relevance of the combined MD/MBA programme was enhanced

Discussion and Conclusions: The method grouped allowed for recognition of related LOs, addressed the overlaps and gaps, and considered other LOs for further revision. Although this will still be further applied to the sessional LOs, the method has been proven largely effective at the year and disciplinary levels.

Take-home Messages: Current curriculum mapping techniques do not show relationships of LOs sufficiently well. If LOs are tagged to 3 dimensions, the alignment, gaps, overlaps and relationships become more easily recognizable and remedied.

Virtual Reality training for open surgical procedures - a new paradigm for simulation

AUTHOR(S):

- Kartik Logishetty, Imperial College London, UK (Presenter)
- Branavan Rudran, Imperial College, UK
- Justin Cobb, Imperial College, UK

ABSTRACT

Background: Virtual Reality (VR) uses headsets and motion-tracked controllers so surgeons can perform simulated open procedures in a fully-immersive operating theatre. We aimed to develop a VR platform which can be used for training surgeons for joint replacement surgery, and provide objective, automated feedback so that they can measure and track their progress.

Summary of Work: We used cognitive task analysis to interview 4 expert surgeons and distil their knowledge on key procedural steps, cognitive decision points, and strategies and solutions for managing complications in surgery. This information was story-boarded and then incorporated into virtual reality to create a fully-immersive 3D operating room with a patient prepared for surgery. On this virtual patient, surgeons could perform all steps of surgery in sequence, including assembling instruments and positioning implants. It was then validated by 4 expert surgeons, and a 36 trainees surgeons of differing experience.

Summary of Results: A Delphi consensus approach was used to assess content validity, and questionnaires were used to assess face validity. Performance of hip and knee replacement in virtual reality was assessed using in-VR metrics including operative time, number of times surgeons selected the incorrect instrument, number of times they positioned them incorrectly, and task-specific checklists. This confirmed construct validity, as related to their prior experience of performing real joint replacement surgery.

Discussion and Conclusions: We developed a virtual reality trainer which can place surgeons in operating rooms to safely practice surgery on virtual patients. This platform gave them objective feedback on their performance, and was validated for content, face and construct validity. As no senior supervision is required, there is no bias in the feedback.

Take-home Messages: This represents a new paradigm for surgical simulation, which was previously restricted to keyhole procedures. Fully-immersive VR can train and measure surgical performance, and may be an effective method to advance surgeons up a learning curve, prior to learning on real patients.

Recent Medical Graduates Working as Standardized Patients: Their Role as Educators to Student Doctors

AUTHOR(S):

- Toshiba Watson, Ross University School of Medicine Miramar Campus, USA (Presenter)
- Fiorella Melendez, Ross University School of Medicine Miramar Campus, USA
- Mariano Loo, Ross University School of Medicine Miramar Campus, USA
- Sean Gnecco, Ross University School of Medicine Miramar Campus, USA
- Melissa Smith, Ross University School of Medicine Miramar Campus, USA

ABSTRACT

Background: The concept of Standardized Patients (SPs) was introduced in 1963 at the University of Southern California by Howard Barrows, MD. Since then, the use of SPs has become common practice in most US medical institutions; Providing a safe learning environment without concern of patient mistreatment, inappropriate remarks and/or poor physical exam technique.

Summary of Work: At our medical school we've applied a non-traditional model. We utilize our recent postgraduate medical doctors, awaiting residency, as standardized patients (MD-SP) for students in their 3rd and 4th year of study.

OSCE and Clinical Skills Assessment video footage from a six-month period (>60 hours) was reviewed by Teaching Fellows. The clinical encounter, as well as feedback of Physical Exam and Communication Skills, were evaluated for both non-MD-SPs and MD-SPs. A checklist was used to compare deviations/drifts from script, presentation of pain, number of comments with supporting evidence, and strategies for improvement.

Summary of Results: Our findings indicate MD-SPs were more accurate in description of chief complaints with respect to quality and location of pain. Additionally, there was less variation in rating of Physical Exam skills, and the quality of feedback during debriefing was more detailed with opportunities for improvement using a formative assessment.

Discussion and Conclusions: We believe that MD-SPs, compared with non-MD-SP counterparts, can provide more specific and accurate feedback; not only improving communication/interpersonal skills but also a student's ability to take a detailed history and accurately perform physical exams. While it is not feasible to replace all non-MD-SPs, we believe MD-SPs play an important role in portraying clinical case scenarios and evaluating proper Physical Exam technique. MD-SPs can educate and provide constructive feedback in terms salient to the student. A limitation we encountered was inability of MD-SPs to recognize overuse of medical terminology when rating a student's communication proficiency with patients.

Take-home Messages: The use of a "near-peer" education model can be effective in OSCE/Simulated Clinical Scenario settings. Our non-traditional model can be applied in other medical schools as it provides an educational advantage to students while supporting unmatched recent postgraduates remaining medically relevant, a win-win model to all parties.

The Sequential Objective Structured Clinical Examination (OSCE) - A Review of Effectiveness and Feasibility

AUTHOR(S):

- Michelle Schlipalius, Monash University and Monash Health, Australia (Presenter)
- Neville Chiavaroli, The University of Melbourne, Australia

ABSTRACT

Background: The sequential OSCE has been postulated as a method of improving the validity of clinical assessment judgments and concentrating resources where they are most needed. This is achieved by reducing the number of stations for most candidates except those judged as borderline on initial 'screening' stations. Candidates judged as 'clear passes' or 'clear fails' are not examined further, while borderline candidates proceed to a second (sequential) OSCE to allow additional information to be obtained across wider content. Criteria for passing the examination are either a clear pass at the screening OSCE or a pass at the combined screening and sequential OSCE.

Summary of Work: A search of Medline, CINAHL and ERIC was performed using the terms 'OSCE' and 'sequential'. Twenty-one relevant articles were identified between 1991 and 2017.

Summary of Results: Screening OSCEs can be expected to have a lower reliability than a complete OSCE due to fewer stations, although several studies showed this difference might be marginal. Importantly, the reliability for the assessment of borderline candidates is generally unaffected as they attend the complete OSCE. The screening OSCE is commonly around half the length of the complete OSCE. The literature recommends that the screening OSCE stations be highly discriminating and the pass score for the screening OSCE be slightly higher than the empirically derived score from standard setting to minimise the rate of false positives. Candidates generally found the sequential OSCE design acceptable. Studies reported a significant reduction in costs ranging from 23% to 35%.

Discussion and Conclusions: The literature suggests the sequential OSCE design provides valid, feasible and cost-effective clinical assessment of borderline candidates. Several issues in the design and implementation of sequential OSCEs are highlighted including the timing of sequential OSCEs, the degree of support provided between OSCEs, blueprinting, standard setting and communication with candidates and examiners.

Take-home Messages: The sequential OSCE offers a practical and theoretically defensible approach to targeting high stakes assessment where it is most needed, on borderline students. More robust research is required to optimise its design and implementation.

Personalized OSCE Stations to Teach about Patient-based Bias and Racism

AUTHOR(S):

- Elizabeth Kachur, Medical Education Development, Global Consulting, USA (Presenter)
- Ingrid Walker-Descartes, Maimonides Medical Center, USA
- Lisa Altshuler, New York University School of Medicine, USA
- Omar Beckett, Maimonides Medical Center, USA
- Zachary Johnson, Cohen Childrens Hospital Northwell, USA

ABSTRACT

Background: Not infrequently, healthcare providers are subject to patient or family biases, even racism. As part of professionalism training they need to learn how to master their emotional impact and optimize effectiveness of such challenging clinical encounters. OSCEs provide unique opportunities to simulate difficult clinical situations and help learners develop effective strategies through skills practice, feedback and reflection.

Summary of Work: The Pediatrics Residency Program at Maimonides Medical Center (Brooklyn, NY) developed a new OSCE station which addresses the management of biases expressed by patients. Although the core of the case scenario is standardized, the simulated patient adjusted specifics based on personalized triggers which were predetermined for each learner. The triggers focused on race, ethnic background, religion, sexual orientation or professional degree. If not relevant for residents themselves, triggers were related to significant others. This strategy standardizes the station's emotional impact.

Summary of Results: To evaluate this atypical station format, feedback was collected from learners, observing faculty and simulated patients in a variety of debriefing sessions. By all accounts this was a very difficult station for residents due to its personalized nature. Nonetheless they were able to learn from it as evidenced by written and verbal ratings and comments. The station was also difficult for faculty in whom it triggered memories of some difficult patient encounters they experienced themselves. Similarly, the simulated patients found the personalized nature of the station challenging. It was very important for them to be able to stress subsequently that the values expressed during the case enactment were not their own.

Discussion and Conclusions: There are many reasons why people develop biases. Whether conscious or unconscious, they can greatly interfere with human interactions and, in a medical setting, with clinical work. It is essential for health profession educators to create programs that allow learners to develop effective strategies for managing such personally and clinically challenging situations.

Take-home Messages: Personalized OSCE stations are difficult for all involved due to their emotional impact. Yet, they can provide unique opportunities to assure that learners come to terms with their own feelings when being the recipient of patient biases.

SIMUportfolio: a platform for OSCE support

AUTHOR(S):

- **Martin Komenda, Masaryk University, Faculty of Medicine, Czech Republic (Presenter)**
- Matěj Karolyi, Masaryk University, Faculty of Medicine, Czech Republic
- Vojtěch Bulhart, Masaryk University, Faculty of Medicine, Czech Republic
- Petr Štourač, Masaryk University, Faculty of Medicine, Czech Republic

ABSTRACT

Background: Testing communication skills as well as the ability to react quickly and correctly to unpredictable patient behaviour is of key importance in the education of medical and healthcare study programmes. However, far from all forms of evaluation are suitable and effective for this very specific area. The Objective Structured Clinical Examination (OSCE) is nowadays the gold standard for the examination of clinical skills such as communication with the patient, history taking, physical examination, performing certain procedures, prescription, evaluation of X-ray images, reading ECG and many others. The complete process of OSCE implementation, however, is extremely demanding not only due to staffing, but also due to the administration of all necessary steps.

Summary of Work: SIMUportfolio is an entirely new and unique platform which, among others, provides a systematic support for OSCE in such a way that teachers involved can only concentrate on the fulfilment of requirements such as the selection of topics, preparation of stations, filling out the checklist, evaluation of examination etc. The process itself is completely arranged for by the SIMUportfolio, which in practice means that a deal of time is saved and that the management of OSCE is made easier overall.

Summary of Results: Over the years, the SIMUportfolio platform has been developed at the Faculty of Medicine of the Masaryk University in Brno (Czech Republic) as an all-in-one solution, which provides a comprehensive description of curriculum with links to guaranteed study materials (printed books as well as electronic multimedia tools, including virtual patients), interactive reporting of teaching contents and a special module dedicated to OSCE. The OSCE module itself covers the entire life cycle “ from the definition of OSCE stations to setting up the roles of involved teachers, planning and location of examinations, online implementation including checklist fill-in, final evaluation and passing the results to students and observers.

Discussion and Conclusions: Apart from the technical solution, methodical background is an integral part of the SIMUportfolio platform. This background has been developed continually at the Faculty of Medicine of the Masaryk University, in cooperation with leading experts in OSCE from across European academic institutions.

Take-home Messages: SIMUportfolio platform to achieve an effective OSCE.

Designing and implementing Objective Structured Clinical Examinations: a qualitative cross-national practice theory study

AUTHOR(S):

- Margaret Bearman, Deakin University, Australia (Presenter)
- Rola Ajjawi, Deakin University, Australia
- Sue Bennett, University of Wollongong, Australia
- David Boud, Deakin University, Australia

ABSTRACT

Background: The Objective Structured Clinical Examination (OSCE) holds a taken-for-granted place in the global medical education landscape. Despite extensive research, limited attention is paid to how OSCEs are implemented on-the-ground.

Summary of Work: Fifteen interviews were conducted with academics and administrators in three medical schools in the UK, Australia and Canada. The interviews focussed on their role in design and implementation of the OSCE. Analysis was framed by Schatzki's 'practice theory', which considers the people's activities as the foundation of society.

Summary of Results: The main practice of 'designing and implementing the OSCE overall' contained eight identified subpractices (eg 'designing an OSCE checklist' or 'grading the OSCE'). The most important roles were filled by academics and administrators, coordinating many other OSCE players (eg examiners, simulated patients, statisticians and so on). This design and implementation activity included many templates, spreadsheets, logistics lists and instructions. The interviewees were focussed on valid clinical assessment, using terms such as validity, evidence-informed, standards and standardised. At the same time, each local site adjusted to their particular medical school curriculum and healthcare systems. There was an immense amount of bureaucracy: committees, forms, procedures, employment procedures and double, sometimes triple, testing. However, actual practice was misaligned with ideal processes and 'work arounds' had to be employed to manage this.

Discussion and Conclusions: This study indicates that there are strong commonalities with OSCE design and implementation across the three nations. Local variations saw different design elements and processes, particularly in bureaucracies. The relationship with the healthcare system and the medical education community was stronger than an association with institutional processes.

Take-home Messages: There is a tension between the ideals of the OSCE and the local practices. The bureaucracies of the OSCE deserve further investigation.

ABSTRACT

Background: Objective Structured Clinical Examinations (OSCEs) in dentistry have been used as a key summative assessment within the School of Dentistry, University of Leeds, for undergraduate dental students since 1997. They sample a wide-range of clinical skills via a series of standardised stations and contemporaneously assess aspects of clinical competency against pre-defined criteria. Their use with small cohorts of postgraduates, rather than larger cohorts of undergraduates, has not been widely-reported.

Summary of Work: Ten active stations were developed for a cohort of five first-year postgraduate paediatric dental students who had no prior OSCE experience and with English as their second language. Station-design considered module learning outcomes for knowledge, clinical procedures, prevention and communication skills. Three professional simulated patients were used. Two circuits of five stations were run, with one rest-station in-between.

Summary of Results: The standard of the OSCE was established via Modified Angoff considering the borderline candidate with a final mean passing score of 56.9% which, with the addition of 1 SEM, gave an overall passing score of 60.6%. There was a wide-range of station difficulty (76.9%) and the variation in student scores was found to be due to station-level. Overall, reliability of the OSCE was very good (Cronbach Alpha = 0.83), with no single station detracting from the reliability.

Discussion and Conclusions: Examinee centred standard setting approaches (e.g., borderline regression) are generally viewed as inappropriate for small cohorts, but the application of test centred standard setting here has shown good reliability can be achieved with a small cohort. The OSCE promoted student engagement with assessment and they welcomed the controlled simulated environment. Feedback was exceptionally well-received and the results indicated communication skills and prevention were weak areas. This may reflect cultural differences and the challenge of communication with children.

Take-home Messages: The use of OSCE with small cohorts of students is a valuable summative assessment. Reliability was very good and the internal structure was aligned to module learning outcomes, contributing to validity of the OSCE. Constructive feedback on strengths and weaknesses enhanced the students' clinical skills for the long-term benefit of their patients.

OSCE global and domain scoring - is there really a difference?

AUTHOR(S):

- Deborah O'Mara, Univeristy of Sydney Medical School, Australia (Presenter)
- Edward Abadir, Univeristy of Sydney Medical School, Australia

ABSTRACT

Background: The passing standard for our Objective Structured Clinical Examinations (OSCE) was changed from borderline group to domain marking three years ago. Each station is scored on three domains; Checklist criteria, Structure and presentation and Communication and patient interaction. Each domain is scored on a 5 point Likert scale from Very poor performance to Much better than Expected Standard. Checklist criteria are converting to this scale based on an apriori allocation.

Summary of Work: To evaluate the validity of the domain passing standard, particularly the Checklist criteria domain, a 7 point global score was introduced. The Year 1 and Year 2 OSCEs were marked using both the domain and borderline regression methods. The Year 1 exam is based in two attempts at a 6 station OSCE and Year 2 have one attempt at a 12 station OSCE.

Summary of Results: Borderline regression provided similar estimates of passing rates to the re-classification of the checklist into a domain scoring model for Year 1 ($r=0.75$). The other two domains were also highly correlated with the global score; Year 1 $r=0.72$ for communication and patient interaction and 0.85 for structure and presentation. However, a borderline regression passing standard based on the checklist results and the global rating alone, would have resulted in a more lenient examination for Year 1, with a failure rate of only 1.2% compared to 7.3%. Furthermore, we found incongruent scoring between a specifically designed Communication OSCE and our Communication domain scores. Similar results were found for Year 2.

Discussion and Conclusions: This study found a large and significant correlation between two non-checklist domains and a global OSCE rating, suggesting that one is driving the other and questioning the degree to which the domains can be separated reliably. Furthermore, the incongruence between the checklist and communication domain result for a Communication OSCE raises concerns about the validity of domain scoring. Domain scoring and borderline regression provided complimentary information that should be used together to make high stakes decisions about passing standards.

Take-home Messages: Introducing a global score provided evidence for evaluating examiner behaviour as well as improving assessment accuracy.

The role of the clinical environment in shaping medical students' moral development

AUTHOR(S):

- Iman Hegazi, Western Sydney University, Australia (Presenter)
- Jenny McDonald, Western Sydney University, Australia
- Jane Graves, Western Sydney University, Australia
- Neeshaan Abrahams, Western Sydney University, Australia
- Ryan Thorneycroft, Western Sydney University, Australia

ABSTRACT

Background: It is generally accepted that most students start medical school idealistically, yet often walk out cold and aloof. Studies have shown that moral development does not occur during medical education and that it, in fact, may plateau or even regress. There is no empirical evidence as to the cause other than that the slowing or regression is coincident with medical students' exposure to the clinical setting. The investigation of medical students' moral judgement remains under-explored and driven largely by a handful of scholars. This, confounded by a recent spate of suicides by junior doctors in Australia and other parts of the world, raises the question: what happens to students during medical school?

Summary of Work: To explore factors contributing to the preservation, regression, and segmentation of moral development during the clinical years of medical training, the authors carried out a qualitative study of medical students' experiences and insights in the clinical setting. Students' experiences, relationships with staff and patients, their personal responses and systems of coping and their interpretations of moral regression or plateauing was analysed.

Summary of Results: Focus group discussions and interviews showed that many students were confused by what they witnessed, engaged in unethical conduct, felt powerless to challenge authority, and believed that their moral judgement had declined. Students attributed lapses in moral judgement to the clinical environment, where the hierarchical structure, bad role modelling, and fear of not fitting into a team were commonly cited.

Discussion and Conclusions: Understanding the factors that promote, impede or segment moral development in medical students will allow improved strategies for student education, orientation and support and will encourage evidence-based strategies for faculty development of hospital clinicians and staff to improve hospital culture and student experience.

Take-home Messages: More research is needed to understand how medical students reconcile and rationalise their lapses in moral judgement, and what kind of emotional impact this has on their personal and professional lives. Understanding this may provide some insight into how medical students can be better supported, and how medical schools and hospitals can be reformed to foster moral and ethical growth.

“I found myself a despicable being!”: medical students’ emotional responses to moral dilemmas

AUTHOR(S):

- **Diego Ribeiro, Campinas State University, Brazil (Presenter)**
- Marcos Costa, University of Groningen, The Netherlands
- Esther Helmich, University of Groningen, The Netherlands
- Marco Antonio Carvalho-Filho, University of Groningen, The Netherlands

ABSTRACT

Background: Medical students struggle to deal with moral dilemmas during clinical rotations. A moral dilemma consists of a situation in which two or more moral values conflict and the available choices support mutually inconsistent courses of action. Moral dilemmas trigger a moral reasoning process, resulting in different emotional reactions that may lead to moral distress. We sought to explore the nature of medical students’ moral dilemmas, their emotional reactions, and how those experiences influence their professional development.

Summary of Work: Thirteen final year medical students made a rich picture regarding a moral dilemma they faced during their clinical training. Rich Pictures are visual tools used in combination with interviews to enhance data collection by capturing the ‘hard-to-put-into-words.’ The authors analyzed the drawings and interviews through thematic analysis.

Summary of Results: Moral dilemmas arose in different clinical contexts and involved the need to deal with conflicting moral values from the patient, their families, the health professional team, the supervisor and themselves, often leading to a conflict of internal moral values, and challenges with understanding the best course of action. Students engaged in a moral reasoning process that evoked different emotional reactions. When students’ moralities were not aligned with the moral decision, students experienced moral distress accompanied by emotions like anger or frustration. When students’ moralities were aligned with the moral decision, students experienced positive emotions such as proud or courage. Although some experiences had happened more than one year before the interviews, students were still struggling to make sense of them and stated that those experiences were very influential in their process of becoming a doctor, particularly in helping them to understand that medicine demands for a professional and often personal commitment with a set of values and beliefs.

Discussion and Conclusions: Moral dilemmas trigger intense emotional reactions with significant impact on current and future professional behavior. Reflecting on the process of aligning personal and professional values around a real moral dilemma may be a powerful pedagogic strategy to scaffold professional identity development.

Take-home Messages: Clinical ethics training should address moral dilemmas faced by students when transitioning to clinical practice.

Just-in-time learning (JiTL) of bioethics: Experiences and lessons learnt

AUTHOR(S):

- **Kulsoom Ghias, Aga Khan University, Pakistan (Presenter)**
- Azra Naseem, Aga Khan University, Pakistan
- Sohail Bawani, Aga Khan University, Pakistan
- Sameer Nizamuddin, Aga Khan University, Pakistan
- Kausar S. Khan, Aga Khan University, Pakistan
- Tashfeen Ahmad, Aga Khan University, Pakistan

ABSTRACT

Background: We designed EthAKUL, a mobile JiTL environment for bioethics for medical/nursing students, trainees and practitioners at Aga Khan University Pakistan, as a three-phased R&D study using participatory design methods. EthAKUL includes modules on selected clinical ethics concepts and a discussion forum ('Let's Talk!') for participant-identified ethical dilemmas. The concept underlying EthAKUL and findings from the design/development phase were presented at AMEE 2017 and 2018, respectively. The initial findings from the second phase, i.e. facilitation of learning, are shared here.

Summary of Work: Sixteen facilitators were identified from a variety of medical/nursing specialities. Seventy-one students and trainees volunteered. Both groups were oriented to the learning environment and pedagogy in separate face-to-face workshops. An on-call schedule was created to ensure the availability of two facilitators on any given day for just-in-time discussion. Weekly reminders were sent to participants to post or respond to ethical dilemmas. A follow-up meeting was conducted with learners ~8-10 weeks after EthAKUL was launched to gauge their experiences. A WhatsApp group was used for discussion amongst facilitators.

Summary of Results: Between November 2018-January 2019, 22 ethical dilemmas were posted by learners (n=12) and facilitators (n=3) on 'Let's Talk!'. Response rates to individual posts ranged from 0-23. Of the 16 facilitators, 10 posted on 'Let's Talk!'. When facilitators could not respond during their 'call' period, other facilitators covered for them. The dilemmas varied from the clinical ethics modules.

Discussion and Conclusions: EthAKUL provided access to materials and a space for anonymous discussion of ethical dilemmas faced by students/trainees, yet a limited number of participants posted on 'Let's Talk!'. Majority of posts came during the work-week, likely as and when dilemmas were encountered. While facilitators encouraged open discussion, learners expected closure or concrete next steps.

Take-home Messages: EthAKUL has a potential for JiTL of bioethics and other subjects, but both facilitators and learners need to be more attuned and responsive to the pedagogy. Learners need support on identifying ethical dilemmas, and facilitators need training on facilitating text-based JiTL.

Do pharmacy and medical students share the same views on telling the truth?

AUTHOR(S):

- Lorraine Corfield, Keele University, UK (Presenter)
- Ian Smith, Keele University, UK
- Matthew Stibbs, Keele University, UK
- Maria Allinson, Keele University, UK

ABSTRACT

Background: The requirement for health-care professionals (HCPs) to tell the truth is articulated in the guidance of UK professional bodies. This study explores undergraduate healthcare students' views on truth telling.

Summary of Work: Fourth year medical and third year pharmacy students undertook an interprofessional on-line ethics exercise. They were faced with the dilemma of whether to tell the truth to parents about the distressing death of their daughter. After the exercise students were asked their views on truth-telling. Ethical approval for the study was obtained.

Summary of Results: 67 medical students and 90 pharmacy students completed the questionnaire (response rate 69%). Key results include: Should HCPs always tell truth to patients? Medical students yes 66 (98.5%) vs pharmacy students 64 (71%) Should HCPs always tell truth to relatives? Medics yes 49 (73%) vs pharmacists 40 (55%) Should HCPs always answer patients' questions honestly? Medics yes 65 (97%) vs pharmacists 76 (85%) There was a significant difference between all 3 pharmacy and medical student answers ($p < 0.05$). The medical students almost universally stated they would tell the truth to patients. 30% of pharmacy students felt that it is acceptable to withhold the truth in some situations. The medical students commonly gave the importance of maintaining trust as key, with professional duty being the next most commonly given reason for telling the truth. The pharmacists most frequently cited patient rights as a reason the tell the truth, with following professional standards being the next most common reason. Pharmacy students who would not always tell the truth usually gave concerns about doing more harm than good as their reason.

Discussion and Conclusions: Most pharmacy and medical students would tell the truth to patients. However, many more pharmacy students than medical students stated they would withhold the truth on occasion. The difference was seen despite discussing truth-telling in an on-line interprofessional exercise.

Take-home Messages: There is a difference between pharmacy and medical student approaches to truth-telling. This supports the importance of interprofessional learning as a method of challenging and sharing views.

A review of social accountability policy: Implications for health care training

AUTHOR(S):

- **Cassandra Barber, Maastricht University, Canada (Presenter)**
- Jimmie Leppink, University of York, UK
- Cees van der Vleuten, Maastricht University, The Netherlands
- Saad Chahine, Western University, Canada

ABSTRACT

Background: Accountability is central to medical education. While many schools strive to be responsive to the communities they serve, measuring social accountability (SA) remains a global struggle. Although various frameworks have been established to assist programs evaluate SA, their descriptions remain predominately conceptual in nature. No single document describes common and unique elements or identifies a set of indicators that extend across SA frameworks in medical education. Using context-inputs-process-products (CIPP) evaluation model as an organizational framework, this paper synthesized key elements in SA frameworks as an initial step to develop measurable indicators intended to facilitate the evaluation of SA in medical training.

Summary of Work: Thematic analysis was used to describe and compare common and unique elements across large-scale, public SA policy frameworks. These elements were then thematically coded using four dimensions of CIPP model. Sub-policies and/or program/institution specific documents were excluded from the analysis as they build upon previous frameworks and may lack generalizability.

Summary of Results: Of an initial sample of 25 documents, four key SA policy frameworks were included in the analyses. Emerging themes highlighted across frameworks and CIPP dimensions included core SA values (relevance quality; effectiveness and equity). These values were expected to be displayed across the training continuum in education, research and service activities. Sub-themes under each dimension included: context (public displays of institutional goals/mandates, collaborative partnerships with health systems); inputs (identification of community health needs, diversity); processes (curricular activities/reform/exposure); products (mix and distribution of graduates, quality assurance/program evaluation/accreditation) and impacts on public health (reduction of disease/mortality).

Discussion and Conclusions: This paper provides a thematic analysis and synthesis of key SA frameworks using CIPP to identify a set of performance indicators. Findings from our analysis revealed major themes consistent to the broader SA literature. The analysis and results of this paper provide tangible indicators that may be used as a guide for programs to evaluate SA, linking educational inputs and outputs.

Take-home Messages: SA is on the radar of all learning institutions. This paper provides a set of indicators to begin measuring the extent to which institutions are socially accountable. The indicators represented have the potential to support learning institutions interested in evaluating their practices for formative purposes.

Building a student-driven community-based educational program dedicated to social responsibility

AUTHOR(S):

- **Edouard Leayne, Lyon-Est School of Medicine, Claude Bernard Lyon I University, France (Presenter)**
- Violette Rey-Cadilhac, Lyon-Est School of Medicine, Claude Bernard Lyon I University, France
- Safwan Oufker, Lyon-Est School of Medicine, Claude Bernard Lyon I University, France
- Caroline Tilikete, Lyon-Est School of Medicine, Claude Bernard Lyon I University, France
- Yves Zerbib, Lyon-Est School of Medicine, Claude Bernard Lyon I University, France
- Gilles Rode, Lyon-Est School of Medicine, Claude Bernard Lyon I University, France

ABSTRACT

Background: Attitudes are an important part of medical students competencies. However, medical education has been shown to negatively influence student attitudes toward certain types of patient population, notably the underserved. Building educational programs dedicated to social responsibility during medical education is thus critical in order to improve the attitudes of medical students toward the underserved. Previous studies identified that translating medical school social missions to student experience needs innovative and original educational practices to be fully efficient.

Summary of Work: A new educational program dedicated to social responsibility has been created in September 2018 in the Lyon-Est School of Medicine, France. Based on community-based and experiential learning (35-hours training in charities dedicated to the underserved), this student-driven program aims to improve second-year medical students attitudes toward the underserved and to improve their awareness toward social issues in medicine and global health. The originality of the program is based on the concepts of experiential and narrative learning, with medical students participating in the program writing the narratives of meetings with men or women they will meet during their training in the community.

Summary of Results: A total of 65 medical students are freely participating in the program. We propose to present at the AMEE congress the process of the book redaction compiling the narratives. Some particularly remarkable narratives written by student will also be presented. The satisfaction and experiences of students will also be reported.

Discussion and Conclusions: Building innovative educational programs dedicated to social responsibility during medical education is critical in order to avoid negative attitudes toward the underserved in medical students. We propose to describe the building of a student-driven community-based program newly created in Lyon. Narrative and experiential learning are used to propose an innovative and original approach to teach social responsibility to medical students.

Take-home Messages: Medical education has been shown to negatively influence student attitudes toward the underserved Building innovative and original educational student-driven community-based program dedicated to social responsibility during medical education is critical Students participating in the program will write the narratives of meetings with men or women they will meet during their training in the community.

Professionalism to connect the student with the curriculum and healthcare society

AUTHOR(S):

- **Annelies van Ede, Radboud University Medical Center, the Netherlands (Presenter)**
- Wim Gorgels, Radboud University Medical Center, the Netherlands
- Rob Reuzel, Department for Health Evidence Radboud University, the Netherlands
- Merel van Gils, Radboudumc Health Academy, the Netherlands
- Suzanne Heemskerck, Department for Pharmacology-Toxicology Radboud University, the Netherlands
- Petra van Gurp, Radboud University Medical Center, the Netherlands

ABSTRACT

Background: In 2015 we started an extensively revised curriculum Medicine (MED) and Biomedical Sciences (BMS). The leading principles include an active, collaborating, self-directed role of students in a meaningful practice based and patient centred environment in which they develop to life-long learners. In this curriculum we started a generic longitudinal educational line 'professionalism' in all three MED and BMS bachelor years.

Summary of Work: All students are assigned to coaching groups (8-9 students each) and a personal coach. There are student group meetings and individual sessions at least 8 times a year each. The program gives attention to learning strategies, learning in collaboration, interpersonal skills, formulating learning goals, reflection on patient contacts, giving and receiving narrative feedback, discussions about current events, vocational orientation and individual, personal professional awareness and development. For assessment students show part of their E-portfolio, including written essays about their personal development supported by feedback from peers, patients and faculty.

Summary of Results: Yearly, students and coaches evaluate the elements of the educational line professionalism. The results show the appreciation of the small fixed groups for their open and safe environment (students 88%, coaches 95%); the program provides tools to get used to academic skills, peer assisted learning and collaboration; students explicitly perform personal strength and weakness analysis and reflections. Students feel stimulated to take responsibility for their own learning traject (students 70%, coaches 92%) and to formulate personal learning goals (students 65%, coaches 85%). During the bachelor students are willing and capable to take more initiative and responsibility for the programme. Students report the desire to discuss more about current events in health care and practical show cases related to professionalism. Patient contacts stimulate the learning process. The assessment of each students' personal development from the E-portfolio is time-consuming.

Discussion and Conclusions: Although the context differs, the educational line 'professionalism' is applicable for students MED and BMS to develop skills necessary to face the future challenges of the ever growing complexity of health care and become vigorous, innovative and life-long learners. It strongly facilitates embedding activities with the other learning activities, patient-contacts and actual health issues.

Take-home Messages: Educational line 'professionalism': essential part of every curriculum.

Social responsibility: Development of a blended learning community-based approach to health and social issues in the Hong Kong Community

AUTHOR(S):

- Carmen Wong, The Chinese University of Hong Kong, Hong Kong (Presenter)
- Paul Lai, College of Surgeons of Hong Kong, Hong Kong
- Samuel Wong, The Chinese University of Hong Kong, Hong Kong

ABSTRACT

Background: The World Health Organisation (1995) emphasise the role of medical schools to direct their education towards addressing the priority health concerns of the community, region, and nation they serve.' Hong Kong is an international city with similar and differing health and social issues. There was a need to educate and expose students to different issues in the community.

Summary of Work: The Social Responsibility (SR) curriculum consisted of two compulsory courses: Health Inequalities and Health Needs Analysis and 8 self- direct learning course which included poverty and deprivation, poverty and social exclusion ethnic minorities, foreign domestic workers, asylum seekers and refugees, health and stigma (HIV and mental illnesses), offenders health and cultural competence. Students were attached to community clinics and NGO facilities and included: homeless, sex workers, HIV clinic, private clinics etc. Students were required to complete the e-learning, attachments, attend debrief and complete a reflective essay

Summary of Results: The course was rolled out in a modular iterative approach. There were 4 modules of 56-57 students (Total: n= 228 MS) in Community and Family Medicine module with the last module in 1 March 2019. Results will include the process of course development, as well as the students' responses on debrief, interested topics, pre and post test quiz and evaluation.

Discussion and Conclusions: Initial analysis show that this was a feasible course and was well received. Post test quiz show that students gained knowledge. Most attempted course included: poverty and social exclusion and foreign domestic maids. Some students expressed attachments were not 'in depth' enough, whilst expressed 'helplessness'. Further support is needed for students to dissect and discuss the different issues

Take-home Messages: Social Responsibility is a vast topic and encompass empathy, professionalism, ethics and health care roles and needs. An e-learning blended approach with debrief is a good introduction to stimulate student's interest and learning. An interdisciplinary and guided approach is suggested.

Stepwise development of a new blueprint focused on the population's needs for good medical care

AUTHOR(S):

- Birgitta Kütting, The German National Institute for State examinations in Medicine, Pharmacy and Psychotherapy (IMPP), Germany (Presenter)
- Volker Schillings, The German National Institute for State examinations in Medicine, Pharmacy and Psychotherapy (IMPP), Germany
- Martin Hendelmeier, The German National Institute for State examinations in Medicine, Pharmacy and Psychotherapy (IMPP), Germany
- Maryna Gornostayeva Gornostayeva, The German National Institute for State examinations in Medicine, Pharmacy and Psychotherapy (IMPP), Germany
- Jana Jünger, The German National Institute for State examinations in Medicine, Pharmacy and Psychotherapy (IMPP), Germany

ABSTRACT

Background: The ongoing academic reform of the undergraduate medical program in Germany requires a reorientation of the curriculum and the corresponding steps of the medical licensing exam. Instead of assessing facts there will be a constant shift to assess competencies relevant for doctors' everyday clinical-practical work. Therefore, the 2nd part of the reformed medical licensing exam should be focused on population's needs for good medical care. The particular challenge will be to develop a blueprint that meets the current licensing regulations but at the same time meets all future requirements. The contribution is aimed at describing the steps needed for developing a competency-based blueprint increasing content validity and representativeness.

Summary of Work: In several workshops with health care professionals representing all disciplines and sectors of medical care in Germany a new structure for revising the IMPP-GK, a learning objective catalogue legally binding for German state examinations, was developed and accepted. The structure of the catalogue was integrated in a multidimensional blueprint, including the CanMED roles for physicians, organ systems, occasions for consultations, entrustable professional activities and a modified Bloom's taxonomy. A multidimensional classification system for items, developed two years ago, was used for analyzing the baseline situation. A total of 960 items of three recent exams was reclassified and the amount of items was evaluated for each dimension and category being similar to the integrated blueprint of the structure for the new catalogue of learning objectives

Summary of Results: The evaluation of past examinations according to the multidimensional blueprint indicated that the population's needs for good medical care is only partially considered. The amount of items addressing fact based knowledge, which is easily researchable or focusing on aspects being to specific was striking.

Discussion and Conclusions: Based on these findings the blueprint will be adapted and checked for plausibility by data from health service research.

Take-home Messages: Creating a feedback loop between the blueprint for medical licensing exams and data from health service research is a very helpful tool for the conception of medical licensing exam.

The development of social responsibility of medical postgraduate students

AUTHOR(S):

- Liudmila Kovalenko, Surgut State University, Russia (Presenter)
- Elena Kovalenko, Surgut State University, Russia
- Anton Vorobev, Surgut State University, Russia

ABSTRACT

Background: In modern society, there is an increase in expectations for a high level of professional training of the doctor and his social responsibility. The resident, communicating with patients, should solve not only clinical problems but also effectively interact with the patients relatives, colleagues, insurance and legal organizations.

Summary of Work: The subject of the research was the study of the conditions of social responsibility development in medical University residents, the definition of criteria and diagnostic methods. Social responsibility was assessed at cognitive, motivational and activity levels. 325 residents of different specialties took part in the work. During the empirical stage of the experiment the levels of social and moral-ethical responsibility, social intelligence, normative behavior, and self-control of residents were diagnosed. At the forming stage, the criteria of the efficiency of the new are defined.

Summary of Results: Development of social responsibility of residents in medical University provides the following pedagogical conditions: organization of the process of training of residents; development and implementation of a new curriculum, the model of relationships in the system doctor-patient, the social responsibility of the doctor, communication as a socio-psychological process, barriers to communication and management of conflict interaction; creating an educational environment through the inclusion of residents in social design, social and psychological diagnosis and the formation of a psychological portrait of the resident.

Discussion and Conclusions: The study reveals the essence of the concept of social responsibility, defines the structure of social responsibility, methodological approaches, presents the implementation of pedagogical conditions necessary for the development of social responsibility of residents, analysis of the results and dynamics of development of social responsibility of residents in the course of experimental work. During the implementation of pedagogical conditions the level of knowledge about social responsibility increased by 52.6%. At the same time, the level of social responsibility has increased also.

Take-home Messages: To solve this problem, special pedagogical conditions for the development of social responsibility of residents should be developed.

Career orientations of medical students: a Q-methodology study

AUTHOR(S):

- **Matthijs de Hoog, Erasmus MC-Sophia, the Netherlands (Presenter)**
- Karen Stegers-Jager, Erasmus MC, the Netherlands
- Job van Exel, Erasmus University, the Netherlands
- Lia Fluit, Radboud UMC, the Netherlands
- Jacqueline de Graaf, Radboud UMC, the Netherlands
- Lokke Gennissen, Erasmus MC, the Netherlands

ABSTRACT

Background: A balanced workforce is crucial in pursuing optimal health care. Yet, many countries are facing a misalignment of specialty preferences of their medical students and societal needs regarding future medical workforce. As a first step to bridge this gap a better understanding of the medical career choice processes is needed. In this study we explored the career orientations among Dutch medical students and their implications for future career choices.

Summary of Work: We explored career orientations of medical students using a Q-methodology, a hybrid qualitative-quantitative method. Medical students of two Dutch universities, varying in year of progression of medical school, ranked 62 statements with regard to importance for their future career choice. Afterwards, participants explained their ranking in an interview and completed a questionnaire regarding demographics. We used a by-person factor analysis to identify groups of individuals with similar orientations.

Summary of Results: Twenty-four students rankordered the statements. Three distinct orientations towards future careers could be identified. The first stresses lifelong self-development; the second has more emphasis on work-life balance, and the third that was more concerned with achievement and recognition of their work.

Discussion and Conclusions: The identified career orientations of Dutch medical students' differed in the importance of challenge, work-life balance, and need for recognition. These insights can help us to design interventions to shift career choices of medical students closer towards future needs in society.

Take-home Messages: Offering career coaching to students, using a tool that challenges them to explore and prioritize their values, needs and motivations, similar to Q-sort, and thereafter stimulating them to consider specialties accordingly, could be a promising strategy for guiding students to more long-term satisfying careers.

An early exposure to general practice for second year medical students: how does it change their perception on primary care?

AUTHOR(S):

- Juliette Macabrey, Faculty of Medicine Lyon Est, CUMG, France (Presenter)
- Lucile Wahl, Faculty of Medicine Lyon Est, CUMG, France
- Sofia Perrotin, Faculty of Medicine Lyon Est, CUMG, France
- Sophie Pelloux, Faculty of Medicine Lyon Est, CUMG, France
- Yves Zerbib, Faculty of Medicine Lyon Est, CUMG, France
- Gilles Rode, Faculty of Medicine Lyon Est, France

ABSTRACT

Background: General Practitioners (GPs) are a cornerstone of the French health care system. At any given time, 113 out of 1,000 patients will consult a GP when one patient out of 1,000 is admitted to a university hospital (White's square by Green). However, French medical students in their 2nd to 6th year complete only one rotation in general practice to familiarize themselves with primary care. Second year Lyon Est medical students who began medical school in 2017 attended a GP rotation consisting of 5 half-days. How does this early exposure to primary care change students' perception of this category of medical care?

Summary of Work: In 2018-2019, half of the second year students attended the September GP rotation, the other half will do so in May. A semantic differential questionnaire was developed for this study. Before and after the September rotation each student received this questionnaire online and was asked to anonymously respond to it to describe their own perception of GP medical care. The same questionnaire will be provided after May, and data from the three questionnaires will then be compared.

Summary of Results: 217 students attended the September rotation, and 185 will attend the May rotation. 284 of these students answered the pre-rotation questionnaire and 273 filled in the second questionnaire between October 5th and January 22nd. The final questionnaire will be sent out at the end of May. With this first insight into primary care, we expect changes in students' perception of GPs, resulting in a more accurate understanding of the GP's role.

Discussion and Conclusions: French students are asking for exposure to primary care to better understand its importance and contribution to medical care as a whole. An early rotation, at the very beginning of their medical studies may help them understand a crucial French public health issue: the role of GPs in the health care system. It may help them adapt and adjust their own learning while pursuing their studies and, later, in practicing medicine.

Take-home Messages: Early exposure to primary care through interaction with GPs can help medical students better understand primary care issues.

Medical students' expectations of the future

AUTHOR(S):

- **Marjo Wijnen-Meijer, TUM Medical Education Center, TUM School of Medicine, Technical University of Munich, Germany (Presenter)**
- Alison Ledger, University of Leeds, UK
- Constantina Constantinou, University of Nicosia Medical School, Cyprus
- Mini Ruiz, Karolinska University Hospital, Sweden
- Jacqueline Van Wijngaarden, University Medical Center Utrecht, the Netherlands

ABSTRACT

Background: All medical students have expectations of their future profession as a doctor. These expectations may be affected by various factors, such as labour market circumstances and experiences during medical school. The aim of this multi-site study is to gain insight into students' expectations and the contextual factors which shape them.

Summary of Work: Year 1 medical students from three medical schools (1. Leeds, UK, 2. Utrecht, Netherlands, and 3. Nicosia, Cyprus) are asked the following questions (via a questionnaire or reflective task): 1. Why do you want to be a doctor? 2. What are your expectations of your future profession as a doctor? 3. What do you look forward to in your future profession as a doctor? 4. What do you not look forward to? Each school is also logging internal and external contextual changes, to consider their influence on students' expectations. This paper will report findings from the initial round of data collection in 2017. Responses were coded line by line in an open coding process, followed by axial coding to identify main themes.

Summary of Results: Despite coming from different countries, the answers from the students are very similar. They are motivated to become doctors because they want to help people and are interested in the human body. They expect that it will be a tough but rewarding job, which will require lifelong learning. They look forward to interacting with patients and seeing patients leave the hospital healthier than before. They are worried about the work-life balance and having 'someone's life in your hands'. Death and breaking bad news are particular aspects of the job they anticipate will be challenging.

Discussion and Conclusions: This study offers exciting potential in comparing students' expectations in different countries, at different points in time and between cohorts. Findings regarding contextual influences can be used to improve curricula and student guidance, to ensure that expectations reflect the realities of current clinical practice.

Take-home Messages: Students expect medical work to be both rewarding and challenging. Medical educators need to understand students' expectations, so they can support their transition to practice.

Physician-Scientist or Physician Science? Research-Active Clinicians' Narratives of Research Success

AUTHOR(S):

- Anna Cianciolo, Southern Illinois University School of Medicine, USA (Presenter)
- Jordon Mitzelfelt, Southern Illinois University School of Medicine, USA
- Allen Ghareeb, Southern Illinois University School of Medicine, USA

ABSTRACT

Background: Worldwide, the number of physician-scientists, clinicians who devote the majority of their time to funded biomedical research, is declining. Barriers to research-service balance include training gaps, inadequate mentorship, clinical work demands, and increasing competition. Interventions focus on generative strategies, e.g., training pipelines, placing less emphasis on examining the personal and systemic factors that shape physicians' careers post-training. Exploring how faculty who remain engaged in research, despite barriers, conceptualize research success may enable more adaptive approaches to research-service balance.

Summary of Work: This appreciative inquiry was conducted with research-active clinicians at a teaching-intensive, community-based medical school. A medical education faculty member conducted one-on-one interviews with a convenience sample of 12 participants nominated by peers as active researchers. Interviews sought stories of how participants became involved in research, a time when they felt successful, a time when they felt unsuccessful, and their perceptions of others' expectations for their success. Audio-recordings were transcribed verbatim and analyzed thematically by the research team: the interviewer and two senior medical students engaged in medical education scholarship. Participants' curriculum vitae were examined to augment the thematic analysis.

Summary of Results: Participants' research engagement was diverse, including laboratory studies, clinical trials, and medical device development, and it evolved with changes in professional context. Participants' origin stories depicted strong intrinsic motivation and deepened participation in research stimulated by role models, collaborators, and institutional support. Success stories emphasized generating novel ideas, pursuing them to dissemination, and improving clinical practice. Stories of feeling unsuccessful emphasized failed grant proposals. Perceptions of others' expectations for success comprised scholarly productivity metrics typical of full-time researchers. Success stories did not reference these metrics, but stories of feeling unsuccessful did.

Discussion and Conclusions: The appeal of physician-scientists assumes that clinicians' direct involvement in medical care allows them to pursue high-yield research questions. However, participants' success narratives reflected a tension between meeting conventional scholarly productivity metrics and improving patient care. The physician-scientist concept, emphasizing metrics, may devalue the impact of research-active clinicians with divergent models of success.

Take-home Messages: Promoting 'physician science' - institutionally supported communities of research-active clinicians aimed at improving health outcomes - may better accommodate the research-service tradeoff and energize clinicians' special capacity to enhance healthcare.

Identifying the factors that influence foundation programme doctors' choice of career specialties, and where does paediatrics fit?

AUTHOR(S):

- Sarah Scales, Newcastle University, UK (Presenter)

ABSTRACT

Background: Modern medical training involves specialisation and early career choices. Concerns around fewer numbers of junior doctors applying for specialty posts, such as paediatrics, has implications for delivery of quality care. Social learning theory has previously been used to identify how people make important life decisions.

Summary of Work: A multimethod sequential design study was used. Initial interviews, using the repertory grid technique, were conducted to create a questionnaire which was distributed to all foundation year 2 (F2) doctors within the North East and Cumbria region. Finally, semi-structured interviews were conducted with F2s to determine the influences on their career choices.

Summary of Results: Repertory grid results highlighted the key categories where specialties differ, as well as ideal categories which were well represented in paediatrics. Less than half (47%) of F2 doctors intended to go straight into specialty training posts. Many planned locum/trust posts, travel or moving abroad as they did not feel ready to make a career choice. The most popular specialty choices were general practice and core medical training programmes; paediatrics was 6th in popularity. A model of career choice emerged from the interview data, demonstrating a longitudinal decision making process and four points of influence: pre-university; during medical school; during foundation training; and at the point of application to specialty training programmes. There was a general sense of pressure to make the right choice: worries about the working environment, an assumption of difficulty to change their careers and not having sufficient knowledge to make a decision were all significant influences on career choice.

Discussion and Conclusions: This data demonstrates that the early working careers of junior doctors provide the most useful information on specialty career options and the complexity of influences in the process of medical career choices. The literature² focuses on student experiences of different specialties, identifying that role models, perceived work-life balance and geographical location were important factors in career selection.

Take-home Messages: The process of specialty career choices are complex, but demonstrate a developmental timeline, which allows for consideration of tailored interventions appropriate to different stages. Through better understanding of the process of specialty career decisions, the imbalances in the specialty workforce may be potentially rectified.

Profile characterization of unsuccessful students

AUTHOR(S):

- **Ana Marreiros, Department of Biomedical Sciences and Medicine, University of Algarve, Portugal (Presenter)**
- Ricardo Afonso, Department of Biomedical Sciences and Medicine, University of Algarve, Portugal
- Isabel Palmeirim, Department of Biomedical Sciences and Medicine, University of Algarve/Algarve Biom, Portugal
- António Pêgas, Department of Biomedical Sciences and Medicine, University of Algarve, Portugal
- Sandra Silva, Department of Biomedical Sciences and Medicine, University of Algarve, Portugal
- Sofia Nunes, Department of Biomedical Sciences and Medicine, University of Algarve, Portugal

ABSTRACT

Background: The Integrated Master of Medicine of the University of Algarve (MIM-UAlg) is a 4-year course, open exclusively to persons who have already a Higher Education Degree (1st cycle) and it's a new medical curriculum based on PBL (Problem Based Learning). Students selection process for MIM-UAlg consists: 1st phase - a set of cognitive skills tests (to evaluate the following aptitudes: numerical reasoning, verbal reasoning and abstract reasoning) and a proof of English language knowledge (level B1 of the Common European Framework of Reference for Languages). The 2nd phase consist of a set of 10 mini-multiple interviews (MME) or stations of 8 minutes each.

Summary of Work: The main objective of this study was to understand if students with the greatest academic failure are susceptible of differentiation, taking into account the main intrinsic variables of the individual and the results of the selection process. Methodologically, a 2-step clusters analysis was applied with the Schwarz Bayesian clusters criteria selecting as quantitative variables: Age, MME, General Cognitive Abilities and as categorical variables: Training area, gender and Failed. A non-parametric analysis of Kruskal Wallis was later performed to attest the mean differences in academic results by cluster.

Summary of Results: The cohorts from 2009 to 2018 were analyzed, which represents a total of $n = 428$ (Female = 257 and Male = 171), whose multivariate analysis of the classification of individuals was able to differentiate 4 clusters of students, with the following distribution: Cluster₁ = 49, Cluster₂ = 120, Cluster₃ = 93 and Cluster₄ = 159. The variable failed was the one with the most discriminative power followed by: academic background, gender and age.

Discussion and Conclusions: The results showed that the knowledge-related (Personal Progress Index) and the skills lab (Objective Structured Clinical Examination) were the ones that presented the most statistically significant differences among the clusters of students. It has been verified that it is in the first years that these differences weigh more.

Take-home Messages: We believe that it might be possible to make an early failed student profile based, on a multivariate combinations composed with personal features (age and gender), selection results, academic background and the focus variable - Failed.

The Cross-cultural Experience of Academic Difficulty and Remediation

AUTHOR(S):

- **Simone Watkins, The University of Auckland, New Zealand (Presenter)**
- Jill Yelder, The University of Auckland, New Zealand
- Samir Selaq, The University of Auckland, New Zealand
- Karen Dorrian, The University of Auckland, New Zealand
- Elana Curtis, The University of Auckland, New Zealand
- Warwick Bagg, The University of Auckland, New Zealand

ABSTRACT

Background: Quality remediation is integral in reducing the costs of underperforming medical students. Research indicates that certain cultural groups enter remediation programmes more frequently than their counterparts and these students are likely to continue to underperform. We report on the lived experience of three cultural groups' experiences of remediation.

Summary of Work: A qualitative study utilising semi-structured, face-to-face, one-on-one interviews (n = 14) was employed. Interviews explored student perceptions of academic difficulty, including their experience with remediation within the medical programme at the University of Auckland, New Zealand. Participants included indigenous Māori, Pacific and international students with previous academic difficulty. Participation was voluntary via a global email invitation to all undergraduate levels and transcripts were offered for member-checking. Data was transcribed word-for-word and content coded with thematic analysis. Secondary analysis confirmed emerging themes.

Summary of Results: Student experiences of academic difficulty appear to be shaped by external, institutional and psychological factors. Sub-themes included the immediate learning environment along with acculturative, financial, health-related and social stress. Acculturative stress occurred due to the students entering an environment different to their cultural backgrounds. Psychological factors included both the negative emotional experience of failure and stigmatisation and the positive resultant coping mechanisms.

Discussion and Conclusions: The major themes identified are in keeping with the current literature, including the impact of the hidden curriculum such as, prejudice, teaching by humiliation, and hierarchies. There were complex situations surrounding causation of academic difficulty, although remediation appeared to be a 'one size fits all' approach. Of significance to this study was the demonstration of student resilience. Tailored remedial programmes with early identification of at risk students are required. Future work needs to focus on modifying medical programmes' intrinsic biases and hidden curriculum alongside fostering student resilience.

Take-home Messages: Future remediation practices need to identify and support at risk students by employing a personalised, culturally appropriate process. A positive learning environment is essential to foster deep learning and student trust. Medical programmes need to work on reducing the stigma of failure and promote student resilience to alleviate the cost of academic difficulty for both the students and institution involved.

Struggling with Strugglers: Using medical admission tests for improving educational practices

AUTHOR(S):

- Boaz Shulruf, UNSW, Sydney, Australia (Presenter)
- James Li, UNSW, Medicine, Australia
- Rachel Thompson, UNSW, Medicine, Australia

ABSTRACT

Background: Struggling medical students is an under-researched in medical education. It is known, however, that early identification is important for effective remediation. This work demonstrates how admission data can be used for identifying future struggling students leading to early intervention and minimising the risk of failure.

Summary of Work: Data comprise 700 students from the University of New South Wales undergraduate medical program. The main outcome of interest was whether these students struggled during this 6-year program; they were classified to be struggling if they had to repeat assessment. Discriminate Function Analysis (DFA) assessed whether their pre-admission academic achievement, Undergraduate Medicine Admission Test (UMAT) and interview scores had predictive effect regarding likelihood to struggle.

Summary of Results: A lower pre-admission academic achievement in the form of Australian Tertiary Admission Rank (ATAR) or Grade Point Average (GPA) were found to be the best positive predictors of whether a student was likely to struggle. Lower UMAT and poorer interview scores were found to have a comparatively much smaller predictive effect.

Discussion and Conclusions: These results indicate that pre-admission academic achievement can be used to predict which students are likely to struggle in an Australian undergraduate medicine program. More importantly, it was identified that not all selection tools have the same impact. Thus, it is important to consider the predictability of each selection tool independently when identifying the potential strugglers as early as upon the commencement of the medical study. Noteworthy that early intervention based on selection tools is preferable over early intervention based on ethnicity or social background which may be perceived as discrimination.

Take-home Messages: Selection tools should be used for identifying strugglers among the admitted students. Selection tools provide critical information for implementing early intervention for potentially future strugglers Using selection tools for early intervention may avoid tagging potential strugglers by any particular socio-cultural background thus may increase student motivation and minimise perception of discrimination.

Understanding Differential Attainment at Warwick Medical School (WMS), UK

AUTHOR(S):

- Olanrewaju Sorinola, University of Warwick, Warwick Medical School, UK (Presenter)
- Imogen Davies, University of Warwick, Warwick Medical School, UK
- Michelle Machado, University of Warwick, Warwick Medical School, UK
- Emily Reid, University of Warwick, Warwick Medical School, UK
- Nariell Morrison, University of Warwick, Warwick Medical School, UK

ABSTRACT

Background: Medical students from BME groups have poorer academic performance on average compared to their white peers. The BME attainment gap is widely thought to result from BME students' experiences of learning and there is evidence that interactions between students and teachers and between students and their peers critically affect learning outcomes. The GMC also emphasises the importance of equality and diversity. WMS is the largest graduate-entry medical school in the UK with students having already achieved 2nd class upper or 1st class in their undergraduate study. So why should BME students underperform?

Summary of Work: We collected quantitative data about admission, performance during the course and graduation across 5-8 year periods to have enough numbers for analysis according to each ethnic subgroups. We also collected qualitative data about BME student experience during the course from four focus groups and gathered data using semi-structured interviews in 2018. Thematic analysis of this data was done.

Summary of Results: Our data showed that white applicants 25% more likely than BME applicants to get an offer following the application and selection centre MMI process. BME students underperform during the course with less merit and distinctions awarded. Furthermore, no black students have graduated with honours over the last eight years. BME students in this study reported facing a range of difficulties throughout their graduate-entry medical training that they felt impeded their learning and performance: a. Relationships between staff and students and among students: including lack of representation and lack of understanding of cultural differences b. Institution and learning: including curricular, teaching and assessment practices c. Psychosocial and identity factors: including feelings of isolation, reduced self-confidence and low self-esteem that hindered their learning and performance.

Discussion and Conclusions: Despite recruiting students with proven achievement in their previous university degree(s), we still have an attainment gap at WMS. The data highlighted the areas to focus on and we have been working on these to remove the differential attainment and improve BME student experience.

Take-home Messages: As educators this is our gap not the students gap; we have a responsibility to prevent differential attainment in our students.

Near-Peer academic coaching in Undergraduate Medical Education

AUTHOR(S):

- Vijay Rajput, Ross University School of Medicine, USA (Presenter)
- Monica Garcia, Ross University School of Medicine, USA
- Robert Byard, Ross University School of Medicine, USA

ABSTRACT

Background: Near-peer advising studies have demonstrated effective results. Younger peers find the skills of near-peer advisors more achievable and easier to replicate. Similar studies conducted found that near-peer mentoring programs have been universally liked by both mentors and mentees. Near-peer academic coaching for at-risk students with the opportunity to be tutored by high performance recent graduates in not well studied.

Summary of Work: We identified and enrolled 26 at-risk students who passed USMLE Step 1 on the first attempt and scored a 210 or lower. We collaborated them with recent alumni (residents in internal medicine, Emergency and Family Medicine) who scored a 255 or higher on their USMLE Step 2 CK exams. The alumni mentors provided five one-hour academic advising sessions to the at-risk students. During the sessions, the alumni mentors reviewed cases; discussed resources, reviewed study time and habits, and assigned the mentees study objectives for the next session. USMLE Step 2 CK outcomes for mentored students were tracked and compared to non-mentored students within the same USMLE Step 1 score range and cohort.

Summary of Results: The mentored students who scored between a 201 and 210 on USMLE Step 1 scored an average of 222 and raised by 17 points on their USMLE Step 2 CK examination. Compared to non-mentored students who scored within the same range on USMLE Step 1, received an average of 217 and raised by 7 points on their USMLE Step 2 CK examination. Mentors and mentees were surveyed to rate their experience with the program. All mentored students indicated that they felt the program helped improve their readiness for the USMLE Step 2 CK examination and would recommend it to other medical students.

Discussion and Conclusions: Mentored students scored on average five points higher on their USMLE Step 2 CK examination compared to non-mentored students. All mentored students rated the program favorable and indicated that their assigned mentor interaction assisted them in preparing for their USMLE Step 2 CK examination.

Take-home Messages: Near-peer academic coaching can enhance student readiness and performance in high stake national examinations.

Identifying developmental trajectories of communication and interpersonal skills among medical students: Evidence from two longitudinal cohorts across four years

AUTHOR(S):

- Sunju Im, Pusan National University, South Korea (Presenter)
- Yoon Soo Park, University of Illinois at Chicago, USA

ABSTRACT

Background: Developmental trajectories are learning pathways through which students acquire certain competencies over time. They show the relationships between achievement and learning effort, providing information about progress to both students and instructors. Communication and interpersonal skills (CIS) are foundational competencies, which begin in undergraduate medical education (UME); however, it is unclear at what rate and what patterns students develop CIS during UME. We identified different patterns of CIS learning curves among medical students.

Summary of Work: We used data from two longitudinal cohorts of 2013-2016 (N=138) and 2014-2017 (N=140) students. Students were administered a six-station Objective Structured Clinical Examinations (OSCEs) every six months. A six-item CIS scale with five-point rating measures was used: good relationship, active listening, gathering information, empathy, sharing information, and physical exam explanation (G-coefficient=0.886). We used latent growth mixture models to investigate patterns of learning curves.

Summary of Results: Overall, students' CIS scores increased between second to fourth years. By item, 'good relationship' scores were the highest, 'physical exam explanation' scores were the lowest, and 'empathy' scores had the steepest increase (slope coefficient = 2.78; 95% CI:[2.49-3.06]; $p < 0.001$). The growth mixture models identified three distinct learning curves: 'continuous', 'slow', and 'stagnant' patterns. For students in the 'continuous' pattern, CIS scores improved continuously during the entire UME. The 'slow' pattern increased initially but the rate decreased in the latter period of training. The 'stagnant' pattern was a type in which CIS scores stagnates without further progress in the second half of training. Among 261 students, 65 (24.9%) showed a 'continuous' pattern, while 104 (39.8%) was in the 'slow' pattern and 92 (35.2%) was in the 'stagnant' pattern.

Discussion and Conclusions: Although CIS scores showed a tendency to increase, certain items continued to score lower without correction, and another item showed relatively rapid progress. In addition, not all students showed continuous improvement; some students may slow down or stop developing in their senior year.

Take-home Messages: Patterns of CIS developmental trajectories can inform better early tracking of learners and provide remediation opportunities for students who may not progress in a timely manner.

From good to excellent: improving learning climates in residency training

AUTHOR(S):

- **Milou Silkens, Amsterdam UMC, the Netherlands (Presenter)**
- Saad Chahine, Schulich School of Medicine & Dentistry, Canada
- Kiki Lombarts, Amsterdam UMC, the Netherlands
- Onyebuchi Arah, UCLA, USA

ABSTRACT

Background: Improving learning climates in residency training is challenging, yet necessary to benefit residents and patients. The complexity and multidimensionality of learning climates suggests that successful improvement activities should be tailored. To inform such tailoring, this study examined (1) types of learning climate and (2) contextual factors that explain learning climate variation.

Summary of Work: In Dutch residency training, we administered the validated Dutch Residency Educational Climate Test (D-RECT) through a web-based system in 2014-2015. Residents were invited to complete the D-RECT. We used latent profile analysis to identify types of learning climate and applied multilevel modelling to identify relevant contextual factors.

Summary of Results: A total of 1730 residents participated, representing 211 training programs. We identified four learning climate types: the substandard, adequate, good, and excellent type. The hospital type (academic/non-academic), quality of faculties' teaching performance, and faculties' time investment in educational activities were contextual factors that explained learning climate variation.

Discussion and Conclusions: Residents rated academic programs lowest, which might be due to this setting's complexity. Therefore, the academic learning climate should be managed carefully, e.g. by aligning residents' responsibilities with the intricacy of patient care provided in academic hospitals. Furthermore, our results stress the need for improvement of faculties' teaching performance. Residency programs should adopt a continuous improvement state of mind and strive for excellence. Improvement initiatives for learning climates should be context-specific and multi-faceted. Especially faculties' teaching performance should be targeted, as it proves to be strongly associated with learning climate performance in our study and literature so far.

Take-home Messages: We stimulate programs to not just be good, but to be excellent. Residency programs with high quality learning climates not only support residents' learning, but also safeguard patient care provided by their residents. To improve their learning climate, residency programs should embark on tailored improvement initiatives.

Equal opportunities for clinical learning: is there any dust under the rug?

AUTHOR(S):

- Juliana Sá, Faculty of Health Sciences, University of Beira Interior, Portugal (Presenter)
- Pia Strand, Lund University Faculty of Medicine, Centre for Teaching and Learning, Sweden
- Christina Gummesson, Lund University, Faculty of Medicine, Centre for Teaching and Learning, Sweden
- Ricardo Tjeng, Faculty of Health Sciences, University of Beira Interior, Portugal
- Miguel Castelo-Branco, Faculty of Health Sciences, University of Beira Interior, Portugal

ABSTRACT

Background: The power and influence of the hidden curriculum - culturally situated norms and values - on learning opportunities is a growing concern in medical education. However, while medical schools produce diversity and equal treatment policies, efforts towards surfacing and addressing equal opportunities in the clinical learning environment trail behind.

Summary of Work: To better understand how students perceive equal opportunities and inclusion in the clinical workplace we conducted a mixed method study. We distributed a learning climate questionnaire (the UCEEM) to medical students in clinical rotations in a Portuguese medical program and followed up results in a focus group interview with student representatives from all clinical years.

Summary of Results: Relatively high scores on the 'Equal treatment-scale' gave the impression that students perceived that people in general were treated with equal respect and dignity in the workplace. However, lower scores on the 'student inclusion- scale' and focus group data indicated that students not always felt welcome or included in teams and some less than others. Narratives revealed discrimination based on race, gender and weight influencing patient treatment and student learning opportunities.

Discussion and Conclusions: The investigation of how students perceived the learning climate in some clinical workplaces suggest that equal opportunities and inclusion may be a blind spot. Less problematic on the surface but a lot of dust under the rug. To broaden engagement and better understand where there truly are issues and how to respond to them, a first step could be to create spaces for reflection and dialogue among students and teachers.

Take-home Messages: Evaluations on learning climate should include questions on equal opportunities and inclusion. Mixed methods are necessary to make sense of the data. Addressing the hidden curriculum and power-structures in the clinical environment is complex and privilege is less visible to those who have it. Nevertheless, these issues must be surfaced and addressed in student curricula as well as in faculty development if policies are to be realized in practice.

Learning Environment, Stress and Coping in Psychiatry Residents: A Longitudinal Study

AUTHOR(S):

- Kang Sim, Institute of Mental Health, Singapore (Presenter)
- QH Chew, Institute of Mental Health, Singapore

ABSTRACT

Background: Few studies have explored learners' perceptions and its correlates within a postgraduate environment, especially within psychiatry training. This study examined longitudinal changes in perception of learning environment (LE), perceived stress and coping for psychiatry residents in junior and senior years of training. Based on extant social learning theories, the authors hypothesized that residents' perceptions of LE will improve with seniority, with accompanied lower stress levels and better coping.

Summary of Work: Eighty-two out of 101 psychiatry residents (81.2%) from the Accreditation Council of Graduate Medical Education-International (ACGME-I) accredited National Psychiatry Residency Program rated their perception of LE, perceived stress, and coping strategies from June 2016 to June 2018. Correlations between these variables, and changes across five time-points were examined.

Summary of Results: Senior-year residents reported better perception of LE over time, which was accompanied by increased use of problem-focused coping and lowered perceived stress level. Junior-year residents reported no changes in LE perception and coping strategies, despite rating greater perceived stress level over time. Perception of LE negatively correlated with perceived stress level and coping strategies, specifically less active-avoidant coping for junior-year residents, and less religious/denial coping for senior-year residents.

Discussion and Conclusions: Based on these findings, we have suggested specific strategies with emphasis on context, participation, and social interaction within a community of practice to better support our learners in their training.

Take-home Messages: - Junior psychiatry residents reported increased stress level, but no change in perception of LE and coping strategies over time. - Senior psychiatry residents reported a decrease in perceived stress level, better perception of LE and more use of problem-focussed coping over time. - Perception of LE negatively correlated with perceived stress level and specific coping strategies. - We suggest strategies with focus on context, participation, and social interaction to better support residents.

Assessment of Educational Environment in an Obstetrics and Gynaecology residency program in the UAE Using Postgraduate Hospital Educational Environment Measure (PHEEM)

AUTHOR(S):

- Neha Gami, Healthplus Clinic, United Arab Emirates (Presenter)
- Tasnim Abdelrahman, Corniche Hospital, United Arab Emirates

ABSTRACT

Background: PHEEM is an assessment tool used to evaluate the effectiveness of the educational environment. It evaluates three perceptions: role of autonomy, teaching and social support. In Abu Dhabi there are two residency programs of Obstetrics and Gynaecology (Corniche Hospital and Al-Ain Hospital). No prior studies were conducted to evaluate the educational environment of obstetric and Gynaecology programs in Abu Dhabi. Hence, the aim of this study was to evaluate the educational environment of the obstetric and gynaecology residency program in both Corniche and Al-Ain Hospitals using the PHEEM questionnaire and to compare the environment in the two hospitals.

Summary of Work: The 40 questions in the PHEEM questionnaire were used after few modifications for both groups. Data collected from the online response of 31 residents, was analysed with SPSS (version 24). PHEEM reliability was assessed using Cronbach's alpha co-efficient.

Summary of Results: The overall score of Corniche Hospital on the PHEEM questionnaire was 97.51 while that for Al-Ain Hospital was 120.86. Al-Ain scored higher with statistically significant differences in the total score as well as the subscale of each perception. Problem areas were identified in both groups and areas of further studies were highlighted.

Discussion and Conclusions: Among the Corniche residents there was a feeling that the training did not make them feel ready to be a specialist. They also felt that they did not have continuity of care. Another factor leading to low satisfaction was inadequate catering facilities while they were on call. On the other hand, the lowest scoring areas in Al-Ain were about the catering facilities when on call, a lack of no-blame culture in the program and conformation of hours to the residency contract. The results from this study support the use of PHEEM as a reliable instrument to identify issues related to the clinical educational environment. This study also brings out the strong and weak areas in the educational environment of the obstetrics and gynecology residency program in two hospitals in the UAE.

Take-home Messages: Perception of the educational environment using PHEEM is a useful tool to evaluate residency programs and can help identify areas that need improvement in order to improve training of residents.

Elements of an Optimal Interprofessional Clinical Learning Environment

AUTHOR(S):

- **Morgan Passiment, Accreditation Council for Graduate Medical Education, USA (Presenter)**
- Sheryl Cosme, American Nurses Credentialing Center, USA
- Janet Silvester, American Society of Health-System Pharmacists, USA
- Kevin Weiss, Accreditation Council for Graduate Medical Education, USA

ABSTRACT

Background: Patient care is becoming increasingly complex, compelling teamwork, problem solving, and innovative thinking by today's health care workforce. Addressing this complexity necessitates medical educators to purposefully design and plan educational experiences in collaboration with the leadership of the clinical learning environment. Optimizing these learning experiences for patient care involves interprofessional engagement and practice in the clinical learning environment. The National Collaborative to Improve the Clinical Learning Environment (NCICLE) held a symposium, with the intent to create a conversation that characterizes the optimal interprofessional clinical learning environment (IP-CLE).

Summary of Work: Over 100 participants representing a broad range of perspectives - both across health education professions (e.g., medicine, nursing, pharmacy, advanced practice providers) and across various levels of leadership (e.g., national stakeholders, educational leaders) participated in an iterative process to examine strategies that advance postgraduate education. The symposium generate a shared understanding across three areas: 1) the value of IP-CLEs, 2) characteristics of optimal IP-CLEs, and 3) the role of leadership in creating the optimal IP-CLE.

Summary of Results: Themes identifying the value of an optimal IP-CLE were organized into 4 groups: patients and families, learners, health care organizations and health systems, and academic medical centers. Key characteristics of an optimal IP-CLE identified 6 categories: patient centeredness, continuum of learning, reliable communications, team-based care, shared accountability, and evidence-based practice centered on interprofessional care. The role of leadership was defined from 3 different perspectives: macro (i.e., health systems consisting of multiple hospitals and clinic), meso (i.e., hospitals or multispecialty clinics), micro (i.e., clinical or service line units).

Discussion and Conclusions: These findings highlight the opportunity for leaders and educators to examine the settings in which clinicians are learning to purposefully plan how existing cultures, structures, and processes can support or hinder interprofessional learning and collaborative practice. Important next steps include defining a common language; refining the value for educators, learners, patients and organizations; building bridges between professions and external stakeholders; developing, testing and disseminating evidence-based models of learning; and advocating for optimal IP-CLEs.

Take-home Messages: The symposium framework can be used by educators to create conversations and actions toward developing an interprofessional clinical learning environment that meets the current and future needs of patient care.

Application of problem-based learning for operating room crisis management training

AUTHOR(S):

- Nobuyasu Komasaawa, Osaka Medical College, Japan (Presenter)
- Benjamin W.Berg, Hawaii University, USA
- Fumio Terasaki, Osaka Medical College, Japan
- Toshiaki Minami, Osaka Medical College, Japan

ABSTRACT

Background: Senior anesthesia residents must acquire competency in operating room (OR) emergency crisis management. Both technical and non-technical skills are necessary integral competencies for effective team-based OR emergency management. We conducted problem based learning discussion (PBLD) OR emergency scenarios for anesthesia residents, focused on 'Airway', 'Circulation', 'Central venous catheter', and 'Pain management complications'.

Summary of Work: Prior to integrated OR emergency clinical PBLD training, anesthesia residents completed two 5-point scale surveys regarding their emergency OR management experiences, and self-confidence in anesthesia-related crisis management. Repeat administration of the self-confidence survey was completed immediately following PBLD training.

Summary of Results: 35 anesthesia residents with mean clinical experience of 7.2 ± 3.5 years from 6 collaborating teaching hospitals. Post-PBLD resident clinical management self-confidence improved ($P < 0.05$) in all Circulation, Central venous catheter, and Pain management complications. Airway topics of impossible intubation, impossible oxygenation, and awake intubation did not show significant self-confidence differences following PBLD.

Discussion and Conclusions: The primary merit is the flexibility of PBLD to match learner needs. This approach permits on-the-fly facilitation and scenario modifications to flexibly match the professional needs and level of individual participants. Secondary merit is PBLD enables simultaneous participation of a larger number of learners, compared to traditional case management and debriefing of manikin-based scenario training. PBLD for OR emergency management and non-technical skill training can effectively improve resident self-confidence. PBLD can be used as an adjunct or alternative to more resource intensive simulation using standard high technology simulation-based resuscitation training for selected topics.

Take-home Messages: PBLD about OR crisis is effective for anesthesia resident education.

Does a targeted, online, interactive teaching module improve medical imaging knowledge acquisition and clinical application?

AUTHOR(S):

- Sue Garner, Deakin University, Australia (Presenter)
- Simon Ussher, Deakin University, Australia
- Anna Wong Shee, Deakin University, Ballarat Health Services, Australia
- Mark Yates, Deakin University, Australia
- Meg Murray, Deakin University, Australia
- Vincent Versace, Deakin University, Australia

ABSTRACT

Background: Current medical imaging curricula and methods of teaching, based on traditional classroom techniques, may not be providing medical students and interns with the skills required to be work ready and practice medical imaging at a basic level. Feedback from radiologists based in a teaching hospital, report a lack of acquired skills among junior doctors in regards to their knowledge of basic interpretation skills, appropriate history information gathering, and medical imaging vocabulary. As with many disciplines, medical education is increasingly incorporating e-learning into its curriculum, as it allows for an efficient and standardised education. An Australian University has developed a medical imaging curriculum using blended learning, with the e-learning module working alongside traditional classroom teaching.

Summary of Work: This research aimed to determine the impact of a targeted, online, interactive teaching module on students' medical imaging knowledge acquisition and clinical application (e-learning). A quasi-experimental, non-equivalent control group design was used, and involved a cohort of third-year medical students from four geographically disparate clinical schools. Control group students received traditional learning from their curriculum, whilst the intervention group included students from a single clinical school, who received the developed e-learning module in addition to traditional learning. Each group completed one pre-test multiple choice questionnaire (MCQ) and two post-tests (MCQ and Mock Objective Structured Clinical Examination: MOSCE), in order to compare medical imaging knowledge acquisition and clinical application.

Summary of Results: In this pilot study, the intervention group had significantly better performance than the control group in two of the themes 'knowledge' and 'combined comprehension and application' measured in MOSCE.

Discussion and Conclusions: The standardisation coupled with flexibility achievable with e-learning has previously been associated with high levels of student satisfaction, motivation, and engagement. Initial findings revealed that, compared to traditional teaching methods, the introduction of an online teaching module had a significant effect on students medical imaging knowledge, comprehension and application.

Take-home Messages: As the use of this online teaching module is new and being trialled at one rural clinical school, the results of this study will be replicated on a larger scale across a variety of clinical schools and sites.

Challenges and pitfalls of E-Learning System in Preclinical Medicine in Romania: Victor Babes University of Medicine and Pharmacy Experience

AUTHOR(S):

- Anca Maria Cimpean, Victor Babes University of Medicine and Pharmacy Timisoara Romania (Presenter)
- Romeo Minodoru Cosnita, Victor Babes University of Medicine and Pharmacy Timisoara, Romania, Romania
- Marius Raica, Victor Babes University of Medicine and Pharmacy Timisoara, Romania, Romania

ABSTRACT

Background: To change students' learning and evaluation for the first time in a 'frozen in time' medical education system represents a big challenge. To replace a microscope with a computer at histology seems to be like 'a fight against the wave' especially for countries where old learning and examination systems are similar with those implemented decades before. Such changes seems to have an unexpected impact on teachers, students and society being paved with challenges and pitfalls solvable by own 'step by step' experience overlapped on young generation actual needs.

Summary of Work: Present work started in 2017 at Department of Histology, by acquisition of E School System including a slide scanner, a Virtual Microscopy module for teaching and an Exam Module for students evaluation. Conventional microscopes were replaced by computers and classical glass slides with scanned images. Teachers and tutors were trained to use the system and to create MCQs for both practical and theoretical evaluations uploaded into Exam Module platform. We evaluated the E learning impact on students skills and performance and also on teachers and tutors work .

Summary of Results: 'Computer gaming' with histology was delightful for students. By contrast, teachers were afraid of loosing their jobs but slowly they understood that such system helps but not exclude them. Standardized informations given to students helped them to pass evaluations easier. Exams stress decreased while attendance to first examination increased. Graduation percentage and students' confidence in the accuracy of the exam results were improved. Time for evaluation was significantly reduced giving to teachers the opportunity to invest time in research or academic development. Teaching and exam module software was periodically updated, being adapted to our curriculum.

Discussion and Conclusions: Implemented for the first time in preclinical medical education in Romania, E learning and examination system had a quick positive impact on students and teachers despite of controversial issues which commonly come with any change. In the near future, one more discipline from our university and another romanian university decided to implement it as a confirmation of its usefulness.

Take-home Messages: Use the future for the present!

Lessons Learned - Virtual Graduation for Online Distance Students

AUTHOR(S):

- Jenny Crow, University of Glasgow, UK (Presenter)

ABSTRACT

Background: Many postgraduate students now undertake education online. Online learning brings flexibility, facilitating global access to courses and the ability to fit studying around a medical career. However, this mode of study can potentially result in students feeling disconnected from the University compared to on-campus students. To mitigate this, the University of Glasgow (UofG) has introduced a virtual graduation for the College of Medical, Veterinary and Life Science (MVLS). Graduation at UofG is a centuries-old, traditional occasion. Until this year, virtual graduation was not provided; thus, online distance students missed this unique experience, due to work commitments or geographical location.

Summary of Work: The first virtual graduation was held in November 2018. Before the event, separate test sessions were setup with students and senior management. A detailed plan was created and issued to all staff. A radio-controlled car was customised by the MVLS Bio Electronic Unit, an iPad attached, and graduation gown. Students were connect by Zoom to the ceremony in Bute Hall, which was facilitated by a member of learning technology staff.

Summary of Results: The ceremony went relatively smoothly. There were challenges; for example, one student joined the ceremony late and decided to change location during the ceremony, which was distracting for others. When interviewed, another student suggested that the audio could have been improved, but that they overall really enjoyed the experience.

Discussion and Conclusions: After the initial pilot, it was highlighted that greater clarity of audio especially the Principal's speech, would have improved the experience. Therefore, one of the next steps, is greater testing of different platforms and microphones. Student feedback also highlighted the need to provide a brochure, including the historical background to the ceremony, and expectations for virtual graduation.

Take-home Messages: For this project to be a success, it required support of the senior management; therefore they required a demonstration of the robust nature of the event. Testing was vital in this process. Virtual graduation was a great opportunity to connect students with the prestige of the University and celebrate in their success in graduating.

Patterns of online formative assessment usage and summative assessment performance in a clinical rotation

AUTHOR(S):

- Karen Scott, The University of Sydney, Australia (Presenter)
- Meenakshi Rattan, The University of Sydney, Australia
- Deborah O'Mara, The University of Sydney, Australia
- Hasantha Gunasekera, The University of Sydney, Australia

ABSTRACT

Background: Medical programs often integrate technology-enhanced learning (TEL) with face-to-face teaching. One TEL format, online formative assessment, promotes retention of knowledge, provides feedback for learning and enables active learning, which is beneficial according to Constructivist theory. There are scant data on how student use of TEL affects summative assessment results in clinical rotations. We investigated patterns of student TEL usage in Sydney Medical School's eight-week flipped-classroom Child and Adolescent Health block and examined associations with summative assessment and demographic characteristics.

Summary of Work: Data were extracted from the Learning Management System's access logs for 266 students who passed the block over four cohorts (July 2015-June 2016). Individual student access logs were downloaded and de-identified. Usage data included number of access clicks and duration of access overall and for five online formative assessments. We used K-means cluster analysis to investigate usage patterns in conjunction with academic performance and student characteristics. Most data were ordinal, and continuous measures were standardised prior to analysis. Multicollinearity was avoided through correlational analyses prior to final variable selection.

Summary of Results: The four cluster K-Means solution provided the best fit to the data, identifying four key usage patterns: 'Disengaged students' (16% students) - little TEL usage and lowest assessment scores (mean block mark=70%, SD=7%); 'Minimalist students' (27% students) - accessed some TEL but not all and had average assessment scores (mean=72%, SD=7%); 'Strategic students' (33% students) - selective TEL usage and good assessment scores (mean=75%, SD=6%); and 'Conscientious students' (24% students) - comprehensive TEL usage and good assessment scores (75% block, SD=7%). This trend was also evident with the separate end-of-year Barrier exam. Demographic differences between clusters were small.

Discussion and Conclusions: These TEL usage and assessment patterns could be applicable to other contexts. Analysing TEL usage may highlight students who could be encouraged to become more engaged with their learning if we demonstrated impact on summative assessment.

Take-home Messages: Patterns of students' TEL usage generally correspond with summative assessment results. We provide a framework for targeting students who have a minimalist or disengaged attitude to make better use of opportunities afforded in an expansive medical program.

E-learning readiness of medical students from the University of the Witwatersrand

AUTHOR(S):

- **Argentina Maria Ingratta, University of the Witwatersrand, South Africa (Presenter)**
- Ann George, University of the Witwatersrand, South Africa
- Lionel Green-Thompson, Sefako Makgatho Health Sciences University, South Africa

ABSTRACT

Background: Students are major stakeholders in the global trend towards eLearning in medical education. The current curriculum review at a South African university promises greater technology-based learning. This study investigated the usage of information and communication technologies (ICT) for eLearning amongst the 2017 medical student population at the University of the Witwatersrand (Wits). This information could inform the feasibility of moving towards more ICT-based learning and introducing a 'bring your own device' (BYOD) policy.

Summary of Work: A cross-sectional survey was circulated to a convenience sample of first (n=255), third (n=350) and final year (n=319) students drawn from the six-year medical programme (MBBCh). Students were asked about what devices they had access to, how they used them for learning, and about obstacles to using their devices for learning. The survey included both closed- and open-ended questions. Quantitative data were analysed using frequency tables, custom tables, and the Kruskal Wallis ANOVA test. Responses to the open-ended questions were analysed using content analysis.

Summary of Results: The survey response rate was 48.5% (448/924) with a completion rate of 81% (364/448). Most students (99%) owned internet-capable devices and regarded their laptop (91.5%), smartphone (87%) and tablets (64%) as important to their academic success. The majority of students (79.1%) were willing to use their own device(s) at the university. The respondents displayed predominantly positive attitudes and dispositions to ICT, with about half stating that they engaged more with courses that use ICT. More than 90% of respondents would prefer some degree of online teaching and learning. Perceived barriers to eLearning included poor internet connectivity; device features, especially battery life; concerns about safety and security; high data costs; and insufficient usage of eLearning by teaching staff to warrant students bringing their own devices.

Discussion and Conclusions: These medical students own, value, and are willing to use their ICT devices for learning. However, the University needs to address the unreliable internet connectivity, high data costs, and safety and security concerns when using devices on campuses before eLearning can be implemented more effectively.

Take-home Messages: Students are ready for BYOD provided the environment is adequate.

Measuring the Learning Outcomes of Healthcare Hackathons

AUTHOR(S):

- Mataroria Lyndon, Centre for Medical and Health Sciences Education, The University of Auckland, New Zealand (Presenter)
- Leo Anthony Celi, Massachusetts Institute of Technology, USA
- Felipe Piza, Hospital Israelita Albert Einstein, Brazil

ABSTRACT

Background: Healthcare hackathons are proposed as a model for teaching health information technology skills and analytics through interprofessional collaboration and teamwork. Few studies have measured their effectiveness with these objectives.

Summary of Work: A multicentre cross-sectional study of two healthcare hackathon events were conducted in Beijing, China (November 2017), and in Madrid, Spain (December 2017). Participants (n=183) were invited to complete an online survey at the end of the hackathons. The survey contained the Affective Learning Scale, Team-Review Questionnaire, measures of event satisfaction and perceived knowledge gain. The data collected was analysed using descriptive statistics, and one-way ANOVA to identify demographic differences in responses (by gender, professional group).

Summary of Results: The response rate was 54%. Participants were mostly male (53%); 38% were health professionals, 21% were engineers, and 20% were computer scientists. 97% of participants expressed satisfaction with the hackathon, and 95% are likely to recommend these events to others. Precipitants' affective learning scores (Likert-type scale scored 1-7) demonstrated positive perceptions of the learning process relating to content and subject matter (M = 5.90, SD = 1.21), suggested behaviours (M = 4.79, SD = 1.85), instruction (M = 6.16, SD = 1.23), engagement (M = 4.64, SD = 2.09), and future participation (M = 6.13, SD = 1.32). The greatest knowledge gain reported pertained to medical data analysis and application, cross disciplinary teamwork, and gaining knowledge of other disciplines. Teamwork experience was highly rated (Likert-type scale scored 1-7) including a positive team climate (M = 6.10, SD = 1.23); commitment (M = 6.02, SD = 1.14); creativity (M = 5.94, SD = 1.25), and overall team effectiveness (M = 5.82, SD = 1.21). The one-way ANOVA found no significant differences in scores by gender or professional group (p>0.05).

Discussion and Conclusions: Hackathons provide a satisfying learning experience for participants across professional and demographic groups, and promote affective learning, cross-disciplinary collaboration, and team-work. With the increasing influence of healthcare technology and analytics on clinical practice, hackathons may provide educational opportunities to prepare healthcare professionals for a digital healthcare future.

Take-home Messages: Healthcare hackathons provide a satisfying learning experience for participants across professional and demographic groups and promote affective learning, cross-disciplinary collaboration, and team-work.

Integrating diversity into Problem-based Learning for pre-clinical students to develop cross-cultural care competence: students' and teachers' perceptions

AUTHOR(S):

- Peih-ying Lu, College of Medicine, Kaohsiung Medical University, Taiwan (Presenter)
- Jer-chia Tsai, College of Medicine, Kaohsiung Medical University, Taiwan

ABSTRACT

Background: Increasing diversity has posted challenges on learning objectives and pedagogic strategies of medical education worldwide. Previous studies showed students self-perceived cross-cultural care (CCC) preparedness was inadequate in the preclinical stage. Our study investigated the effectiveness of introducing CCC issues into Problem Based Learning (PBL) in the preclinical basic and clinical sciences integrated course (Block) in a Taiwanese medical school by exploring teachers' and students' perceptions.

Summary of Work: We included those less-prepared diversity issues previously identified into PBL scenarios of Blocks involving new immigrants, LGBT patients, and CAM etc. A total of 239 student general survey responses to Pediatrics, Renal and Infectious Disease and a specific feedback survey to Infectious Disease section (student= 124; teacher=24) were collected and analyzed with SPSS. Two semi-structure student survey questions and focus groups interview on tutors were conducted, transcribed/coded and analyzed with content analysis.

Summary of Results: Quantitative analysis revealed students agreed that CCC integrated PBL gave them better understanding of diversity (63.9%) and preparedness for clinical learning (79.6%). Both students and teachers agreed that diversity issues should be included in curriculum. Qualitative analysis further revealed that although students identified CCC patient care issues such as decision-making pattern, bias, language, different generational health belief, social resources, and gender issue, tutors still believe there was a gap to bridge as most students still considered CCC equates to equality of treatment solely, which correspond the significant difference between student/teacher perspectives on students' preparation for LGBT patients ($p=0.018$). Overcrowded curriculum and time pressure for discussion remain challenging to both teachers and students.

Discussion and Conclusions: PBL embedded with CCC learning issues allows students in raising awareness of the impact of diversity on health care. Throughout the program, PBL tutors reflected the CCC issues and the gap in students learning experience. Much effort is needed in continuation of this design and constructing a guideline for integrating proper issues into different Blocks to help students obtain broader views of social-cultural aspects of medical care.

Take-home Messages: Strategically bringing CCC training into PBL courses in pre-clinical stage provides a milieu for students to understand diversity issues in health care and develop CCC, which better prepares students for clinical learning.

The Relationship between Racial Bias and Burnout Among Resident Physicians

AUTHOR(S):

- Lotte Dyrbye, Mayo Clinic, USA (Presenter)
- Jeph Herrin, Yale School of Medicine, USA
- Colin West, Mayo Clinic, USA
- Natalie Wittlin, Yale University, USA
- Sean Phelan, Mayo Clinic, USA
- Michelle van Ryn, Oregon Health & Science University, USA

ABSTRACT

Background: Given the importance of understanding physician bias and reducing racial disparities in care, we conducted a study to assess the relationship between burnout and explicit and implicit racial attitudes in a national sample of residents.

Summary of Work: In 2016, 3588 completed the second year of residency (R2) questionnaire and in 2017, 3058 completed the third year of residency (R3) questionnaire. Burnout symptoms were measured by 2 single-item measures from the Maslach Burnout Inventory. Respondents were classified as never having burnout (no burnout at either timepoint), recovered from burnout (burnout at R2 but not R3 timepoint), chronic burnout (burnout at both timepoints), and new burnout (burnout only at R3 timepoint). Explicit attitudes toward White and Black people were measured by a feeling thermometer (FT, both timepoints). The R2 questionnaire included an Implicit Association Test to measure implicit bias against Black relative to White people. We used multivariable models to examine the association between burnout status and bias; Black FT models were adjusted for R2 reported White FT score.

Summary of Results: In multivariable analyses, R2 reported burnout was associated with greater R2 reported explicit bias against Blacks (Coeff -2.34, 95% CI -3.40, -1.28) and implicit bias against Blacks (Coeff .05, 95% CI .02, .08). In the longitudinal cohort, explicit attitudes towards Blacks became more favorable overall between R2 and R3 (78.6 [20.8] vs 81.3 [19.9]). In multivariable analysis, the change in explicit bias against Blacks varied across different burnout change patterns from R2 to R3, with the most positive shift seen among residents experiencing recovery from burnout (referent never had burnout, delta Coeff [95%CI]: recovered from burnout, 2.49 [95% CI -0.67, 5.66], new burnout, -2.42, [95%CI -4.28, -0.57], chronic burnout, -0.58, [95%CI -2.38, 1.22]; overall p=.005).

Discussion and Conclusions: Burnout was associated with greater explicit and implicit racial bias. Explicit attitudes toward Black people became more positive over the course of one year. Specifically, recovery from burnout was associated with the greatest reduction in explicit bias against Black people.

Take-home Messages: Given the high prevalence of burnout among physicians and the negative impact bias has on medical care, symptoms of burnout may contribute to disparities in care.

Preaching to the choir? Medical students' evaluation of a module on care ethics and diversity

AUTHOR(S):

- Petra Verdonk, Amsterdam UMC, the Netherlands (Presenter)
- Nikki Bruin, Katholieke Universiteit Leuven, Belgium
- Maaïke Muntinga, Amsterdam UMC-VUmc, the Netherlands

ABSTRACT

Background: Addressing diversity issues in medical curricula is pivotal to increase physicians' cultural competency and critical consciousness. To reach all students with diversity education, insight is needed in the relationship between evaluation outcomes and students' sociodemographic backgrounds.

Summary of Work: In Amsterdam UMC-VUmc, we developed a 2nd year bachelor module on Care Ethics and Diversity which aimed to provide students e.g. with knowledge of concepts such as in- and exclusion in health care, discrimination and racism and skills to reflect on their own role in managing patients' diverse expectations in health care. After watching three art-based videos, students engaged in a dialogue about diversity, health care, and care ethics. In 2015 and 2016, a 12-item evaluation questionnaire based on learning outcomes were administered to medical students (N=287) immediately after the module. Module satisfaction was measured from 1=very poor to 10=excellent; learning objective-related items were measured using a 5-point Likert scale. Results were analyzed using multiple linear regression, Pearson's correlation and Chi-square tests.

Summary of Results: We found a strong positive correlation between overall satisfaction score (7.3) and students' level of interest in the issues addressed ($r=.70$). Male gender was negatively associated with increased awareness of own norms about good care. Students with migrant backgrounds reported higher satisfaction, perceived the module as more interesting and more personally relevant, and had higher scores on four of the six learning objective items.

Discussion and Conclusions: Minority students reported more overall satisfaction with diversity and care ethics education and more diversity learning than majority students. Engaging all students in diversity education is necessary, however, students' sociocultural backgrounds play a role in their learning. Privilege may influence students' (dis)satisfaction and level of (lack of) interest in diversity education. Further research is required to assess the impact of diversity education on diversity learning and processes related to building critical consciousness among all students.

Take-home Messages: 1. Openness to diversity education is associated with diversity aspects such as students' migrant background or gender; 2. Diversity education may reflect 'preaching to the choir'; 3. Research is needed about how to teach all students including more privileged majority students.

Gender bias in medical education: a level playing field?

AUTHOR(S):

- Gabrielle Finn, Hull York Medical School, UK (Presenter)
- George Hunt, Hull York Medical School, UK

ABSTRACT

Background: Gender bias is a well-documented phenomenon across many sectors including medicine and academia. Examples include females are likely to rise through the ranks and receive significantly lower salaries. Gender bias includes assumption of identities, gender roles, including heteronormativity and maternal wall bias, as well as the vocabulary associated with gender. This qualitative project explored experiences and awareness of gender bias and heteronormative assumptions within staff and students.

Summary of Work: Following ethical approval, all students and staff at a UK Medical School were all sent an email inviting them to participate in semi-structured interviews. 20 students and 9 faculty members were recruited. Once thematic saturation was reached, interviews were transcribed verbatim and thematically analysed.

Summary of Results: Five major themes emerged from the data. These were: culture, the absences of learning and exposure, compensation and positive discrimination, initiatives, and education. Associated themes and subthemes will be presented.

Discussion and Conclusions: Experiences of curriculum delivery were found to contain implicit heteronormative assumption and gender bias, with social issues (such as ethnicity and religion) not being comprehensively addressed. Teaching on gender and sexuality issues was thought valuable and desired to be encompassed in the formal curriculum. Student led, extra-curricular sessions on LGBTQ health were detailed by participants as having occurred in the past. A medical student desire has been recognised for more specific teaching on gender and sexuality. Participants discussed the impact of sociocultural beliefs and assumptions about normative gender and sexuality working into medical education and practice through the hidden curriculum. Participants readily attributed bias or norms experienced to wider societal influence. It was recognized that medical education is seeking to supersede this to enable the best rapport and care of patients.

Take-home Messages: Gender bias and heteronormative assumption continues to be experienced within medical education. These biases are reducing due to: societal change; active intervention; and education (about issues and health related factors). Interventions to reduce gender inequality are valuable and effective when engaged with appropriately. Students express a desire for increased education about gender issues and LGBT health in the formal curriculum (including epidemiology, disease and communication skills) to enable them to be better clinicians.

Teaching the transition: A simulation-based approach to address threshold concepts encountered in the transition to clinical placements

AUTHOR(S):

- Claire Spiller, IMBE, St George's University of London, UK (Presenter)
- Stella Ivaz, IMBE, St George's University of London, UK

ABSTRACT

Background: The transition from the preclinical to clinical years is an important liminal moment in the professional development of a medical student. Certain attitudes and behaviours have been observed as threshold concepts as part of this transformation. We proposed to address these threshold concepts using a simulation-based approach.

Summary of Work: Two simulation-based sessions were developed to prepare first year clinical students for a medical ward placement: a medical ward round and an 'on take' scenario seeing patients in A&E resus. These sessions were explicitly designed to incorporate the perceived threshold concepts of diagnostic clinical reasoning and of learning how to learn in the clinical environment. The sessions ran 6 times across the year to 328 medical students in their first clinical year and were evaluated by anonymous questionnaire.

Summary of Results: 52 responses were received. 86.6% of students agreed or strongly agreed the sessions helped prepare them for their Medicine placements. Amongst the reasons given for their usefulness, themes of practicality and elements of the 'hidden curriculum' were most frequently stated. 75% found the sessions helped them to negotiate the new learning environment. The 2 main themes reported by the students with respect to their performance in the clinical environment were increased familiarity and proactivity. 82.7% reported that the sessions improved their understanding of making a diagnosis. The most common articulation of this related to cognition in terms of process, structure and meaning.

Discussion and Conclusions: Improvements were reported in the understanding of clinical diagnostic thinking and in the ability to negotiate the clinical learning environment; the threshold concepts these sessions were designed to address. Of the aspects reported as most useful by students, it is the medium of simulation which permits these; the practical application of knowledge and skills, but also aspects of the 'hidden curriculum' which contribute to professional identity formation. Simulation can therefore provide a safe and ring-fenced space for developing aspects of professional attitudes and behaviours.

Take-home Messages: Simulation allows a means of addressing development of attitudes and behaviours contributing to professional identity formation.

Is Self-Regulated Learning a threshold concept? An audio-diary study of PBL in two UK Medical Schools

AUTHOR(S):

- Hilary Neve, University of Plymouth Peninsula Medical School, UK (Presenter)
- Sarah Meek, School of Medicine, University of Glasgow, UK

ABSTRACT

Background: An important aim of medical schools is to support students to become self-regulated, lifelong learners. Problem Based Learning (PBL) is well placed to foster self-regulated learning, although evidence as to whether this occurs is mixed (Loyens, 2008, Lucieer, 2014). The safe, facilitated and collaborative nature of PBL could also encourage the acquisition of Threshold Concepts by supporting learners through the unsettling liminal space. However, the different ways in which PBL is delivered in different settings can influence its success (Taylor & Mifflin 2008).

Summary of Work: The study took place in two UK medical schools with different approaches to PBL. Students and tutors recorded audio-diaries directly after PBL sessions. Participants were asked to describe shifts in understanding and aha moments, times where learning was troublesome, and perceived enablers and barriers to their learning. Reflections were uploaded to a secure dropbox, transcribed and analysed using the Threshold Concept Framework and NVivo software to identify key themes.

Summary of Results: 164 audio-reflections were recorded by 19 students and 13 tutors. Certain concepts were identified as troublesome and potentially threshold across both sites. Uncertainty in PBL, and the role of collaborative and visual learning in supporting students through liminality, were themes across both sites. An overarching theme related to self-regulated learning as a possible Threshold Concept, but differences emerged in relation to its development within the two PBL contexts. We will summarise these findings using illustrative quotes.

Discussion and Conclusions: While often troublesome at first, PBL can support students to cross thresholds in learning. Our findings suggest that the ability of PBL to foster self-regulated learning, including self-efficacy and metacognition, is influenced by the PBL approach and context, such as the balance between process and content and the use (or not) of explicit staff-defined ILOs.

Take-home Messages: Recognising self-regulated learning as a possible threshold concept highlights its importance in health professions education and as a PBL goal. Our findings provide insights into (i) why students and faculty often find PBL initially troublesome and (ii) how PBL curricula and tutors could facilitate students' development as self-regulated learners.

Development of Self Regulated Learning as a Threshold Concept: from the Learning Coaches' perspective

AUTHOR(S):

- Anna Vnuk, Prideaux Centre, Flinders University, Australia (Presenter)
- Johanna Jordaan, Prideaux Centre, Flinders University, Australia

ABSTRACT

Background: One of the central tenets of Programmatic Assessment for Learning (PAL) is the development of the student as a Self Regulated Learner (SRL). Last year, we presented a short communication at AMEE on 'Programmatic Assessment for Learning as a Threshold Concept' where we looked at how the students' reflections in the portfolio demonstrated their progress towards understanding PAL and becoming a SRL, when viewed through the lens of Meyer and Land's work on Threshold Concepts (TC). One of key resources within PAL is the Learning Coach (LC) whose role is to guide the student in their development as a SRL. The LCs read their allocated students reflections in their portfolios and then meet with them 2-3 times a year to discuss their progress. This current study continues from our work last year and looks at how the LCs perceive their students' progress in this journey and what they identify as enablers and barriers in this development.

Summary of Work: Flinders University has a 4 year Graduate Entry Medical Program. PAL was introduced for year 1 students at the beginning of 2017. LCs who started in either 2017 or 2018 were invited to join a focus group. A series of questions about their perceptions of the students' progress as SRLs and their perceptions of the barriers and enablers were asked and the responses were analysed through the framework of TC.

Summary of Results: The LCs were able to describe the students' development as SRLs with clear evidence of them passing through the stages of TC. They described great variability in when students crossed the threshold and highlighted several key factors as enablers including previous life and educational experience.

Discussion and Conclusions: SRL is a TC and the awareness of such can also be viewed as an enabler to its development.

Take-home Messages: Acknowledgement of SRL as a TC assists staff and LCs to support students in their development as SRLs. The goal is the development of the student as a practitioner who is a life long learner.

Broaching the Unbroachable: an evolutionary, inter-professional education simulation to safeguard children

AUTHOR(S):

- Rachel Carter, University of Plymouth, UK (Presenter)
- Andrew Kelly, Faculty of Medicine and Dentistry, University of Plymouth, UK
- Paul Fisher, Peninsula Medical School, UK
- Nicola Smith, School of Nursing and Midwifery, University of Plymouth, UK

ABSTRACT

Background: The majority of serious case reviews identify communication difficulties between professionals as being central to inadequate safeguarding of children. The importance of inter-professional learning (IPL) has been purported as a way forward in several key reports. Currently the University of Plymouths medical and nursing programmes deliver simulation based IPL. However, this is confined to critical emergency scenarios and to final year students. The important area of safeguarding has been developed with minimal inter-programme collaboration which has led to differences in student exposure to safeguarding education. This topic is recognised as being challenging to teach and is an important area in relation to threshold concepts and inter-professional skill acquisition.

Summary of Work: Three iterations of a role-play simulation were undertaken with 12 senior child health nursing and medical students based around a safeguarding intervention in an emergency department setting. Students were allocated roles as either a parent, nurse or doctor and given underpinning background information. The Six Steps IPL Debriefing Framework guided the simulation. The simulation and debrief were filmed for student reflection. A quantitative and qualitative evaluation was undertaken.

Summary of Results: Responses to the quantitative questions were very positive and 90% of participants strongly agreed or agreed that the simulation was beneficial to their learning and practice. There was a notable difference between the areas of perceived gain by the two disciplines. Interesting themes arose around difficult communication, parent perspectives, hierarchical issues and benefits of IPL.

Discussion and Conclusions: Students clearly valued the simulation and stated that it had improved their knowledge and skills in safeguarding. They found the IPL aspect of particular significance as it challenged views of professional roles in relation to safeguarding knowledge and practice. The importance of inter-professional collaboration was clearly identified and therefore this should be considered a threshold concept when developing safeguarding education.

Take-home Messages: Students value IPL activities. There is a need to increase safeguarding learning across both student groups. Findings highlighted that inter-professional collaboration in challenging areas should be developed as a threshold concept within our curricula.

An Escape Game as a Residency Orientation Experience

AUTHOR(S):

- Darius Beh, National University Health System, Singapore (Presenter)

ABSTRACT

Background: An escape game is a physical team-based adventure game in which players find hidden clues, solve puzzles and complete tasks to escape a room in a limited amount of time. Inspired by video games and fuelled by social media, escape rooms have experienced an exponential rise in popularity, and are now ubiquitous in most global cities. Escape games and simulation-based education have a number of similarities - both are problem-based, collaborative, and require interaction with physical aspects of the game “ and as such can be employed as an innovative tool to enhance post-graduate medical education. Prior to the start of Residency, first year Internal Medicine Residents at the National University Health System (NUHS), Singapore, undergo an orientation program in order to familiarise them with institutional practices, resources and prepare them for common on-call scenarios. The curriculum was previously delivered through a combination of didactic lectures and small group teachings.

Summary of Work: In April 2018, this was replaced by an immersive experience with a series of five interconnected escape games, designed to incorporate the learning objectives of the orientation curriculum. The premise was a 'viral outbreak' held in a colonial ex-military hospital. 30 new Internal Medicine Residents piloted the immersive experience and escape games. Residents were subsequently surveyed and asked to grade their learning experience using a 5-point Likert scale.

Summary of Results: Through the escape games, Residents were able to demonstrate critical thinking, time-management and teamwork. Residents found the experience to be engaging, enjoyable and fun. They felt less afraid to make mistakes and solve problems through trial and error. Overall, the experience was effective at teaching the learning objectives.

Discussion and Conclusions: Escape games are an innovative teaching method that can be both engaging and effective. They can be used to help junior Residents overcome the fear of making mistakes during educational activities and help initiate them in simulation-based medical education. Further research needs to be done to assess the use and effectiveness of such gamification in medical education.

Take-home Messages: Escape games are an innovative twist to simulation-based post-graduate medical education.

Residents juggling identity, emotions, and power in performing the collaborator role

AUTHOR(S):

- Charlotte Søjnæs, CAMES, Denmark (Presenter)
- Anne Mette Mørcke, CAMES, Denmark

ABSTRACT

Background: Residents identity processes and emotions have little room in the formal curriculum. Identity processes and emotion management are primarily learned informally in clinical communities of practice as a part of everyday routines and hidden curriculum. Professional identity is formed in tacit social processes or through the type of narratives told about not only ones own profession but also about the neighboring professions and is constantly being negotiated in social interactions. We, therefore, set out to explore residents' identity processes and emotions in collaborative interactions with nurses in postgraduate medical education.

Summary of Work: Eight residents participated in in-depth interviews that methodically highlighted identity processes. Their eight formal supervisors participated in shorter semi-structured interviews focusing on physician learning and supervision. Further, an observational study was performed using an ethnographic approach focusing on the residents at work in the clinical departments. Observation field notes and interview transcripts have been analyzed with qualitative methods for interpretation.

Summary of Results: Residents experienced collaboration with nurses as a vulnerable and sensitive interaction embedded in power relations. Challenges were related to three major themes: Authority/leadership, Gender/experience, Conflict management/power which all linked closely to residents' identity processes and emotions. Narratives told about ones own profession and about neighboring professions were used as a guiding point shaping the identity processes in the clinical departments. These narratives were informal and were not mediated or challenged by supervisors.

Discussion and Conclusions: The collaborator role contains essential learning opportunities connected to residents' identity processes and emotions, that are not being capitalized upon educationally. Supervisors paid little attention to the collaborator role and residents did not perceive collaboration as a part of the formal curriculum, but rather as something learned from role modeling, imitation and from observations of other residents trying to avoid repeating their mistakes. Focus on collaboration could benefit not only residents' identity processes and emotion management, but also the working conditions and patient care.

Take-home Messages: In work-based education, learning and collaboration are social activities embedded in different power relations. Hence, the ability to understand power relations and how to negotiate power will benefit future resident education.

Another layer of complexity: dealing with complexity in out-of-hospital residency training

AUTHOR(S):

- Nelleke Noeverman-Poel, Amsterdam UMC, Vrije Universiteit Amsterdam, the Netherlands (Presenter)
- Sayra M. Cristancho, Schulich School of Medicine and Dentistry, University of Western Ontario, Canada
- Nynke van Dijk, Amsterdam UMC, University of Amsterdam, the Netherlands
- Cees M.P.M. Hertogh, Amsterdam UMC, Vrije Universiteit Amsterdam, the Netherlands
- Esther Helmich, University Medical Center Groningen, University of Groningen, the Netherlands
- Martin Smalbrugge, Amsterdam UMC, Vrije Universiteit Amsterdam, the Netherlands

ABSTRACT

Background: Doctors in out-of-hospital settings are increasingly being confronted with complexity, among other things because of the rising number of patients with complex problems and the shift of complex care towards out-of-hospital settings. Therefore, it is important that residents in those settings are prepared for dealing with complexity. In this study we aimed to gain more insight into what complexity looks like in out-of-hospital settings and how residents learn to manage complex cases.

Summary of Work: We asked 17 residents and supervisors in two out-of-hospital residency programs in The Netherlands (General Practice and Elderly Care Medicine) to create a Rich Picture of a complex situation, followed by a semi-structured interview. The analytical process involved 1) open coding of the interview transcripts 2) analysis of the drawings 3) focused and theoretical coding of the transcripts, informed by the analysis of the drawings.

Summary of Results: Drawings were populated with buildings, vehicles, phones and arrows. These symbols represented collaboration between multiple care providers, transitions of patients between systems and the involvement of multiple institutions (e.g. hospital, nursing home, General Practice) or systems (e.g. mental health care, home care) for one single patient. These situations were highly challenging for residents: it was, for example, difficult for them to coordinate care when multiple professionals were involved. Residents had to learn to navigate different systems and to collaborate across institutions. Supervisors helped them by unraveling different aspects of complex cases, pointing at possible pitfalls and explaining how systems work and how to collaborate with other professionals.

Discussion and Conclusions: In the literature, complexity in medical training involves medical, social or systemic aspects. In this study, 'intersystem complexity' arose as new layer of complexity that residents face during their training. It is important to recognize this type of complexity in medical education, as it requires different supervision strategies; in particular making intersystem complexity explicit, and discussing different ways to coordinate care across systems. Further research should focus on teaching strategies to learn residents deal with intersystem complexity.

Take-home Messages: Intersystem complexity is an important feature of complexity in out-of-hospital residency training and requires specific supervision strategies.

Impact of Increased Preparation Time for Residents Before Ward Rounds: The MED2DAY Study

AUTHOR(S):

- **David Gachoud, Lausanne University Hospital, Switzerland (Presenter)**
- Matteo Monti, Department of Internal Medicine, Lausanne University Hospital, Switzerland
- Pedro Marques-Vidal, Department of Internal Medicine, Lausanne University Hospital, Switzerland
- Vanessa Kraege, Department of Internal Medicine, Lausanne University Hospital, Switzerland
- Oriane Aebischer, Department of Internal Medicine, Lausanne University Hospital, Switzerland
- Antoine Garnier, Department of Internal Medicine, Lausanne University Hospital, Switzerland

ABSTRACT

Background: In 2015, we conducted a time and motion study in our Department to describe residents time allocation during their shifts. We found that residents switched from one task to another up to 15 times per hour, highlighting the fragmented nature of residents work. To address this issue, we decided to reform the work schedule and asked residents for their input. One point of improvement concerned a lack of preparation time before ward rounds. This led us to postpone the start of rounds by one hour.

Summary of Work: We sought to assess the impact of an increased preparation time on (1) the rounds duration and (2) the allocation of residents time during rounds. Therefore, we repeated the same protocol as in 2015. Between May and July 2018, trained observers followed residents and recorded 22 predefined activities. Results were expressed as mean (95% confidence interval) or percentage. We adjusted results for number of patients cared for.

Summary of Results: We recorded a total of 49 day shifts in 2015 and 63 day shifts in 2018. On average, ward round duration was reduced by 25 minutes (95% CI 39 - 11; $p < 0.001$), from 118 minutes in 2015 to 93 minutes in 2018. Time allocated to patients decreased by 18 minutes, while the percentage of round time allocated to patients remained stable, corresponding to about half of the round. The most important evolution relates to computer use: the time spent with a computer was reduced by 25 minutes. A limitation of the study is that quality indicators of the rounds were not measured.

Discussion and Conclusions: We found a 25-minute reduction in both round total duration and time spent with a computer. This is certainly a gain in efficiency for residents and nurses, both of which are better prepared and less likely to look for information during rounds. However, we observed a reduction of the time spent with patients, an unintended consequence of our reform.

Take-home Messages: Residents need appropriate time to prepare before ward rounds. Measures targeting ward round should include both the preparation time and the round process itself.

Thinking beyond trainee feedback alone: High-stakes postgraduate medical training review using Activity Theory

AUTHOR(S):

- Jon Cooper, Medical Education Leeds, Leeds Teaching Hospitals NHS Trust, UK (Presenter)

ABSTRACT

Background: Postgraduate medical education quality is subject to regulation through the General Medical Council (GMC) and enforced through locality offices (e.g. Health Education England [HEE]). This focusses on trainee feedback from national surveys or review of local hospitals. If feedback serially falls below expected standards, serious sanctions can be imposed, including trainee withdrawal. Despite interventions, we experienced continual poor feedback from Foundation trainees (FTs) in Trauma and Orthopaedics (TO) at our hospital, with the threat of trainee removal. We looked at a whole socio-cultural system, including trainees, with the aim to improve training in TO.

Summary of Work: We used Activity Theory to observe the entire work in TO, beyond just the FTs (subject); TO trainers, other ward staff, department of medical education, HEE (community); GMC / HEE Quality standards; foundation curriculum (rules); formal teaching activities, supervision (tools); informal teaching / supervision, non-clinical tasks, clinical-educational engagement and leadership (division of effort). Through several days of direct trainee observation in practice, clinical-management engagement; findings and solutions were shared, and the subsequent impact of interventions reviewed - rapidly enabling improvement in FTs training (object) and the wider educational environment (outcome).

Summary of Results: FTs in TO were initially disengaged, unfulfilled in an unsupervised clinical environment with a high workload. Trainers and managers underappreciated the problems. Identification of system-wide barriers to training led to shared trainee-trainer-manager solutions (e.g. additional workforce, rota re-design, dedicated training time, augmented ward supervision). After implementation, trainees felt empowered, engaged and part of a team.

Discussion and Conclusions: Identifying an activity system to understand the dynamic interactions within Foundation Training in TO provided a deeper-understanding of the whole training system rather than information reported by FTs alone. Shared findings and awareness of roles within a system were key to developing manageable solutions. This methodology improved FTs satisfaction, creating a more supported and sustainable training environment.

Take-home Messages: Activity Theory provides a framework for observing a whole social-cultural training system rather than just one user (trainee) and should be considered when assessing any postgraduate training environment.

What does innovation mean and look like? A perspective from the Medical Education Innovation Network (MEIN)

AUTHOR(S):

- **Martina Johnson, Faculty of Medicine, University of Southampton, UK (Presenter)**
- Susie Rebelo Hopkins, Faculty of Medicine, University of Southampton, UK
- Scott Border, Faculty of Medicine, University of Southampton, UK
- Jacquie Kelly, Faculty of Medicine, University of Southampton, UK
- Judith Holloway, Faculty of Medicine, University of Southampton, UK
- Anna Ruff, Faculty of Medicine, University of Southampton, UK

ABSTRACT

Background: In recent years innovation has become a ubiquitous term in education circles. The drive and desire to innovate represents all that is new and exciting in teaching as well as suggesting a culture of flexibility that reflects the changing demands of the educational landscape. Educational innovators seek knowledge to support new ideas or instructional techniques that can reach students in more effective and exciting ways. However, these applications remain largely untested and should be underpinned by rigorous evaluation before being deployed on a larger scale. The Medical Education Innovation Network (MEIN) is a community of practice within the Faculty of Medicine at the University of Southampton. The aim is to engage colleagues with examples of innovative teaching which are informed by scholarship and research. Through our website and events, the network shares examples of innovative practice in medical education across the wider University and beyond, demonstrating transferability.

Summary of Work: This is an ongoing mixed methods study that collected data from the MEIN 2017 conference panel discussion and debate about risk and rewards of innovation and from interviews with participants in the teaching and scholarship podcast series in 2018/19. Qualitative inductive thematic analysis to identify what innovation means and looks like for teachers, clinicians and students will be performed alongside bespoke focus groups, evaluation of sessions delivered and analytics collected from the MEIN website.

Summary of Results: This study is currently ongoing and would benefit from a wider discussion at the AMEE conference. Results will be presented alongside the MEIN model for promoting and sustaining innovation in medical education.

Discussion and Conclusions: The inaugural MEIN conference brought together UK academics, clinicians and students to debate the risk and rewards of innovation. This spawned a seminar and podcast series with high profile educators who shared their experiences of innovating in the challenging political context of higher education. Over two years, MEIN has brought together scholars from different institutions to share the pitfalls, challenges and triumphs of educational innovation.

Take-home Messages: By creating a culture and environment of scholarship, where we can develop and evaluate our practices, we can establish a robust framework to inform colleagues in how innovation develops excellence in teaching.

Change management: promoting communication and stakeholder involvement

AUTHOR(S):

- Sabina Cerimagić, The University of Sydney, Australia (Presenter)
- Priya Khanna, The University of Sydney, Australia

ABSTRACT

Background: The aim of this research is to analyse organisational change management communication strategies used in curriculum reform. Drawing from our own experience within a large Australian medical school, the authors will drill down on the human factors that challenge communication and change management strategies, to share tips and pitfalls. This interactive workshop will demonstrate how staff empowerment and involvement can positively impact change management.

Summary of Work: A change sizing and readiness survey was used; the survey is based on the Awareness, Desire, Knowledge, Ability and Reinforcement (ADKAR) Model. The Survey participants were asked 17 multiple-choice questions and 3 open ended questions. For the multiple-choice questions, participants were given a Likert scale spectrum to choose from.

Summary of Results: Some of the most important factors in achieving curriculum change is clear communication and the involvement and empowerment of staff. There is no doubt that if we do not consult widely with our stakeholders, if we did not get them involved via the working parties and committees and if we did not let them have a say, make decisions and listen to their feedback, this curricular change would simply not be possible. The effort to initiate and sustain this new MD curriculum will be significant, despite the trials and tribulations that will undoubtedly occur. This change to the Sydney Medical School's curriculum will lead to developing compassionate, diverse and innovative lifelong learners who work in partnership with individuals and communities to improve health through clinical care, education and research.

Discussion and Conclusions: This research shines a light inside insight our 'lessons learned'; taking on board what worked well and why in our project and avoid the mistakes that we have made. This research will challenge the reader to consider, within the context of their own organisations, how stakeholders will be persuaded to 'buy into' a new educational initiative or program in time for 'go-live', so that they are ready, willing and able to adapt to the new environment.

Take-home Messages: The key factors in achieving curriculum change are: 1. Clear two-way communications with all relevant stakeholder; 2. Early stakeholder involvement in the change project; 3. Staff empowerment.

What are the support needs of healthcare innovators? An analysis of critical success factors and limiting factors

AUTHOR(S):

- Kathleen Leedham-Green, Imperial College London, UK (Presenter)
- Gabriel Reedy, Kings College London, UK
- Sian Kitchen, Health Education England, UK
- Josh Brewster, The Health Innovation Network, UK

ABSTRACT

Background: To create a culture of sustainable, agile learning within a healthcare organisation or network, it is necessary to provide targeted support to healthcare innovators. There is a maturing literature on the range of factors that are reported to support healthcare innovations in becoming embedded and spread. There is however less evidence on limiting factors, or the factors that are critical to their success, due to a gap in the literature on struggling or unsuccessful innovations, or research that compares both successful and unsuccessful projects in a consistent way.

Summary of Work: 56 discrete success factors across nine themes were identified from the literature and scoping interviews. A mixed methods survey was sent to 176 innovators from the Health Innovation Network of South London. Responses were received from 65 projects across six categories of success. Respondents rated the impact of each success factor in relation to their project and provided qualitative insights into each of the nine themes.

Summary of Results: Analysis of factor variance (Kruskal-Wallis 1-way ANOVA) across categories of success indicated eleven critical success factors with high certainty and a further six with moderate certainty. These were categorised into themes relating to expertise, leadership, organisational fit and structural support and a weaker theme relating to participation. There was an emergent theme amongst narratives of limiting factors relating to the difficulties navigating the boundaries and intersections between organisations, professions, sectors and cultures.

Discussion and Conclusions: Conclusions have been drawn via an analysis of the drivers to these factors, providing targeted suggestions for educators who wish to enhance the success of innovation within their organisational context.

Take-home Messages: Organisations should provide educational support to healthcare innovators that: 1) provides networking and showcasing opportunities; 2) targets expertise in leadership, implementation science and quality improvement; 3) creates a dialogue between management, patients and innovators so that projects have broad support. Structural change is also needed to: 1) align organisational rewards with patient-level impact and value creation; 2) address the interfaces between services and sectors.

A situated learning approach to delivering collective leadership in healthcare

AUTHOR(S):

- Yvonne Ng, National Healthcare Group, Singapore (Presenter)
- Winnie Teo, National Healthcare Group, Singapore
- Nicholas Chew, National Healthcare Group, Singapore

ABSTRACT

Background: Singapore's healthcare is undergoing extensive change from acute, institution-centric care towards community and team-based healthcare models. Healthcare professionals are concomitantly turning away from the traditional structure of physician leadership towards a model of collective leadership, where the process of influencing members of a unit towards a common goal is distributed among various members as the situation requires. The aims of this ongoing study were to elucidate key elements of collective leadership (CL) and incorporate them in a curriculum for all levels of staff across a large healthcare organization.

Summary of Work: A review of the literature on collective, shared or distributed leadership was carried out and a framework describing key CL attributes, patterns of interactions and behaviours was drawn up. The framework provided the foundation for conceptualizing CL at individual, team and organizational levels. However, instead of didactic, mechanistic means of learning, the curriculum was premised on constructivist principles of situated learning theory. As CL is primarily a relational process, this curricular approach would be appropriate to facilitate the cultural and social shifts required for CL development.

Summary of Results: Three levels of interaction and the corresponding critical elements required for CL were described; for example, at the individual level of interaction, self-awareness and interpersonal capabilities were key to CL, while at the team level, relationships, team culture as well as task-related and performance capabilities of the team were fundamental to enable CL. Rather than lessons on gaining competencies in these areas, the curriculum was designed to elicit participants sharing about their lived experiences, and use shared narratives to build mutual alignment and commitments.

Discussion and Conclusions: The curriculum was first implemented with upper management staff, as positional leaders are fundamental to shaping organizational culture. At the current time, nearly 100 senior leaders from various institutions have undergone CL, about 10% of the final number. Evaluation of the curriculum will involve collation of narratives of social change within the participants' work units.

Take-home Messages: A situated learning approach, emphasizing participants' reflections and sharing provides an authentic, motivated learning of CL in healthcare.

Location of Presentation: Room 0.51, Level 0

Models of Educational Leadership operationalised in an NHS Hospital: How effective are they?

AUTHOR(S):

- Suzanne Gawne, East Lancashire Hospitals NHS Trust, UK (Presenter)

ABSTRACT

Background: The delivery of care to patients in the NHS is under increasing financial pressure. The need to continuously improve service delivery and meet targets set by external regulating authorities whilst making financial savings is challenging. Alongside this, Trusts must provide a suitable educational environment that meets the needs of learners in the workplace.

Summary of Work: This case study examined the educational leadership models operationalised in a busy Hospital Trust to consider the factors and barriers that affect the quality of workplace based education. Qualitative data was collected through semi-structured interviews with lead educators in the area being studied. Themes from the data identified factors that contribute to the quality of education in the workplace and how leadership structures impact this.

Summary of Results: The data revealed Two Global Themes: The Delivery of Education in the Workplace and Leadership in Medical Education within which were further organising and basic themes exploring the challenges and barriers involved in delivering medical education in the workplace. The leadership model identified in this study is more fitting with a transactional model of leadership and the advantages and opportunities for moving to a collaborative approach for the delivery of medical education are discussed with suggestions of how to do this. The study highlights the pressures on front line staff to deliver safe, personal and effective care whilst maintaining the demands of external regulating authorities with a subsequent impact on the quality of training delivered.

Discussion and Conclusions: There is general sense of feeling undervalued, stressed due to tensions with delivering education whilst maintaining clinical commitments and a lack of a shared vision between educationalists, clinicians and management. There is evidence to show the value of a transformational and collaborative leadership approach to facilitate the changes needed in an evolving NHS and this requires a move away from the traditional transactional leadership approach that has previously dominated the NHS.

Take-home Messages: Trusts must harness and support individuals to help share a collaborative vision for education to be part of everything we do in order to create an educational environment that is supportive to all learners in the workplace and supports the transforming workforce.

#4S Short Communications - Management 1

4S6 (2213)

Date of Presentation: Monday, 26 August 2019

Time of Presentation: 1515-1530

Location of Presentation: Room 0.51, Level 0

Key Performance Indicators for Evaluating the Educational Effectiveness of Medical Schools

AUTHOR(S):

- **Claudio Violato, University of Minnesota Medical School, USA (Presenter)**
- Tanzeela Khalid, University Medical and Dental College, Pakistan
- Mussurat ul Hasnain, Rashid Latif Medical College, Pakistan
- Sumera Eshan, Faisalabad Medical University, Pakistan
- Manuelli Kavika, The Fiji National University, Fiji

ABSTRACT

Background: Key performance indicators (KPIs) are the vital signs of a medical school that signal its health in real time. They enable us to examine the workings of a medical school, as well as the strength of governance and management. To be effective, a set of KPIs must account for the major aspects of medical school's performance and assess the components critical for success as well as for social accountability and continuous quality improvement (CQI).

Summary of Work: The following KPIs were employed to evaluate the educational effectiveness of medical schools: 1) student selection processes data, 2) standardized student performance data (internationally standardized licensing exams), 3) locally constructed assessments (course exams, OSCEs, etc.), 4) student satisfaction data, 5) teacher effectiveness and faculty sufficiency, 6) institutional effectiveness (student, well-being, learning environment, instructional methods, etc.), 7) financial health (financial data, student debt, tuition, etc.), and 8) value added analyses. Extensive data were employed in a variety of multivariate analyses (e.g., repeated measures, regression analyses, value added analyses, generalizability analyses, analysis of variance) from example schools in the USA, Canada, Pakistan, Sudan, Italy, Saudi Arabia and France.

Summary of Results: Several themes emerged from the KPI analysis: teaching and instruction (e.g., faculty development on instructional methods in the classroom and clinical environment), assessment (e.g., direct observation in the clinical environment), curriculum improvement (enhance clinical integration in scientific foundations and basic science integration during clinical education), and enhance student well-being (reduce burnout, improve quality-of-life responses, improve the learning environment).

Discussion and Conclusions: The purpose of CQI - closely aligned with program evaluation - is to enhance educational programs, improve the effectiveness of teaching, learning and assessment, foster an optimal learning environment, and generally achieve excellence in medical education programs. KPIs are useful for program evaluation; they depict program activities and outputs needed to achieve the intended outcomes of a program. Value-added also contributes to the students' progress towards stated or prescribed education objectives over time to assess student growth.

Take-home Messages: KPIs help to clarify the success of a medical school and what its program is trying to achieve and what it does to get results.

#4T Round Table – Patient Engagement

4T1 (3262)

Date of Session: Monday, 26 August 2019

Time of Session: 1400-1530

Location of Presentation: Room L5, Level 1

Accessibility of Patient Education

AUTHOR(S):

- Giordia Solda, IFMSA (Presenter)
- Heber Olivia, IFMSA
- Tatiana Zebrova, IFMSA

ABSTRACT

Introduction: Education accessibility involves creating health-related materials that are designed and presented so that they can be understood by audiences of diverse literacy levels. Certain instructional design principles, along with strategies to enhance readability, help facilitate patient understanding, bridge gaps in health literacy, improve health outcomes, and reduce readmission rates. Medical leaders have identified patient engagement as one of the most critical concerns of health systems during the digital transformation of the healthcare industry.

The presenters will suggest how patients can truly be engaged in the management of their condition.

#4T Round Table – Patient Engagement

4T2 (3425)

Date of Session: Monday, 26 August 2019

Time of Session: 1400-1530

Location of Presentation: Room L5, Level 1

Learning from young patients: two stories

AUTHOR(S):

- Susan Kennedy, East Kent Hospitals University NHS Foundation Trust, UK (Presenter)

ABSTRACT

“What lessons do you think you have for doctors?”

“Believing that the patient really is the expert in their health? The amount of times doctors haven’t believed what I’ve said until they’ve seen it in notes from other doctors. Like ‘I think you must have got that wrong, you’re too young to have that.’”

“It’s your body. And you’re scared. And that needs to be respected.”

“What’s so amazing when you meet it, when it’s done right is the care and attention. You know, when a doctor is really listening. Really looking. When I was in x hospital – I could feel them looking!”

“I felt I had a truly good consultant when she addressed my age – being so young – and being a woman. Nobody had ever talked to me about these things before – I was just a person with DDD.”

“The whole GP thing, I know it’s not their fault, but it’s rubbish knowing you’ve got 10 minutes sitting opposite someone like a job interview. Rarely do I give as much detail as I go in wanting to and there is a dreadful power imbalance. It feels more like an interview than a conversation.”

“In hospital, it’s like you have to sit up and be ok and perform somehow. I’m always thinking, am I doing this wrong? Am I being ill ‘wrong’?”

“The best doctors are the ones that listen, that ask you questions about you. Not just medical questions. They have a proper conversation with you. They have respect for you. I am a human, I have a brain – please allow me to use it in this process!”

#4T Round Table – Patient Engagement

4T3 (1408)

The Senior Citizen Partnership Program (SCPP): a win-win for both medical students and the elderly generation

AUTHOR(S):

- Ute Hauck, Curtin University, Australia (Presenter)

ABSTRACT

Doctors require exemplary communication skills and the right attitude to care for the growing number of elderly patients. Early exposure to the elderly in medical courses has been shown to help change student attitudes and challenge thinking in stereotypes. The SCPP runs for the duration of the MBBS course and aims to introduce students to ‘healthy ageing’. Two students are partnered with a senior citizen residing in a retirement facility. The students meet their senior partner a prescribed number of times, forming a partnership rather than viewing them as a patient. During these encounters students enquire about social, psychological, environmental and health impacts on the life of the senior, while practicing communication skills taught in clinical skills. Students also attend debriefing sessions and submit reflections about their encounters addressing relevant learning objectives using a reflective framework.

The presenters will talk about the outcomes of the initiative.

#4U Conference Workshop

4U

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1400-1530

Location of Workshop: Room L8, Level 1

Reviewing for MedEdPublish - enhancing scholarship

PRESENTER(S):

- Richard Hays, MedEdPublish Editor
- Trevor Gibbs, MedEdPublish Associate Editor
- Ken Masters, MedEdPublish Associate Editor
- Kerrie McKay, MedEdPublish Administrator
- Claire Macrae, AMEE Education Officer
- Joanne Greer, MedEdPublish Technical Support

ABSTRACT

Background: MedEdPublish is an exciting new venture in academic publishing, combining post-publication review, rapid processing, low submission costs and academic mentoring for those wishing to contribute to learning within the medical education community. Reviewing papers is an important academic task, but how to compose a review is a skill that needs to be developed. This workshop will introduce AMEE conference attendees to the process of conducting a review and posting a review online, aiming to improve skills and confidence as we expand our pool of reviewers.

Who should attend? All conference participants who would like to learn about how to conduct a review of an academic paper are welcome to attend. We are particularly keen to welcome new potential reviewers, as well as to meet with those who have already provided some reviews.

Structure of the workshop: The session will begin with a brief overview of the requirements of a review for a paper published in MedEdPublish. We will then work either in small groups or individually to write a review of a recently published paper that we will provide.

Please bring a laptop or tablet with you if you have one available. The aim is to compose a review and submit the review in the journal online during the workshop. Prior to the workshop commencing, it is a requirement that the individual must have an active MedEdPublish account which can be set up via the journal website at www.mededpublish.org. If you require support in setting up your account, please contact us at mededpublish@dundee.ac.uk prior to attending the conference.

Intended outcomes: Participants should develop a better understanding of how to write a review of an academic paper and posting it online, and should gain confidence in their reviewing skills.

Level: All

#4V Conference Workshop

4V (545)

Date of Workshop: Monday, 26 August 2019

Location of Workshop: Room 0.11-12, Level 0

LILAC: Longitudinal Integrated Leadership Advanced Curriculum

PRESENTER(S):

- Paul Crampton, Hull York Medical School & Monash Centre for Scholarship in Health Education, UK
- Jennene Greenhill, Flinders University, Australia
- Ian Couper, Stellenbosch University, South Africa
- Roger Strasser, Northern Ontario School of Medicine, Canada

ABSTRACT

Background: Longitudinal integrated clerkships (LICs) continue to be implemented in many different contexts and countries across the world in various shapes and sizes. Leadership has been a key proponent in driving this change, both through its enactment within the curriculum and to engage local stakeholders whilst maintaining an excellent educational experience. Social accountability has been highlighted as a key facet in bringing together healthcare structures, medical schools and local populations to foster less fragmented education and coherent service delivery. Through transformative learning experiences, LICs enhance student knowledge about psychosocial determinants of health, develop compassion, and reinforce clinical skills. Learning is facilitated through independent time with patients, which promotes deeper learning about the role of the doctor. The integrated and immersive structure of LICs places students in complex situations, often delivering healthcare for patients in challenging social and economic conditions. In this workshop we will tackle the issues faced when implementing longitudinal integrated clerkships in a range of settings and how to sustain momentum for continuation.

Who Should Attend? Educators and students with an interest in longitudinal integrated clerkships and those interested in leading change in community based medical education.

Structure of Workshop:

1. Introductions
2. Brief inputs: Supporting local rural clinical academic leaders (Ian Couper) Medical school and faculty leadership (Roger Strasser) Leading change in underserved and disadvantaged communities (Paul Crampton) Preparing students as future leaders (Jennene Greenhill)
3. Small group activity discussions will focus on the following issues in relation to implementation and sustainability of LICs:
 - Social accountability and community engagement
 - Supporting community practitioners as clinical teachers and role models
 - Intense interaction with patients as a driver of student learning
 - Students and alumni as agents of change and continuity.
4. Plenary feedback

Intended Outcomes: By the end of this session participants will be able to:

- Describe the key elements of LICs in community settings
- Develop a faculty recruitment and development plan for implementing a LIC
- Outline the facilitators of success in leading LIC implementation

Level: Intermediate

#4W Conference Workshop

4W (951)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1400-1530

Location of Workshop: Room 0.49-0.50, Level 0

Sharing is Caring: Designing and Developing Shared Curricular Ecosystems

PRESENTER(S):

- Tao Le, ScholarRx, USA
- Charles Prober, Stanford University, USA
- Robbert Duvivier, University of Maastricht, Netherlands
- Katerina Dima, IFMSA, Greece

ABSTRACT

Background: New digital platforms are transforming learning in higher education and providing high-quality education content at little or no cost. Educators can now reach large, even global audiences. Yet, many medical schools continue to develop and maintain custom curricular content despite having limited faculty and financial resources. This duplication may be addressed by shared curricular ecosystems with reusable learning materials, developed around core competencies and foundational learning objectives while allowing customization to local needs. Shared ecosystems may have areas of focus defined by geography, curricular domain (eg, assessments), subject matter, primary audience, and other factors. They may also span medical and health professional schools to support interprofessional education. This workshop explores the potential benefits and challenges of such ecosystems and provides participants with the opportunity to design their own.

Who Should Attend? Anyone with an interest in designing and developing shared curricular ecosystems that extend beyond a single institution.

Structure of Workshop: This highly interactive workshop will feature five components.

1. Introduction: introduce facilitators and identify participants' goals.
2. Principles: discuss potential benefits, requirements, and challenges of a shared curricular ecosystem. Present examples of current and past shared curricular models.
3. Application: in facilitated small groups with worksheets, participants discuss shared curricular needs in their countries/regions and developing a plan to address it.
4. Discussion: participant groups present proposed solutions and discuss benefits and obstacles to implementation.
5. Wrap up: revisit workshop goals and summarize lessons that can be applied in participants' education ecosystems.

Intended Outcomes: Upon completion of this workshop, participants will be able to:

1. identify benefits and challenges to developing a shared curricular ecosystem
2. discuss examples of shared curricular ecosystems
3. identify shared curricular needs in their countries/regions
4. develop possible shared curricular models.

Level: All

#4X Conference Workshop

4X (866)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1400-1530

Location of Workshop: Room 0.96-97, Level 0

Using Conceptual Frameworks to Shape and Situate your Scholarly Work

PRESENTER(S):

- Maryellen Gusic, University of Virginia School of Medicine, USA
- Sandy Cook, Duke-NUS, Singapore
- Melissa Klein, Cincinnati Children's, USA
- Patricia O'Sullivan, University of California, San Francisco, USA
- Matthew Zackoff, Cincinnati Children's, USA

ABSTRACT

Background: Conceptual frameworks provide a critical foundation for scholarly work in education. These theories provide the “lenses” through which we seek to understand the complex phenomena of teaching and learning in the health sciences and are fundamental in applying a systematic approach to the design, implementation, and evaluation of educational interventions. Currently, however, the use of conceptual frameworks is not universally applied early in the design of educational activities nor is their use explicitly described by authors of submitted manuscripts, limiting educators’ success in publishing their educational research in the health sciences literature and restricting our collective ability to advance what is known about our current pedagogies and to further elaborate on the frameworks that underlies our work.

Who Should Attend? Front-line educators and educational researchers who would like to learn more about conceptual frameworks and are interested in turning an idea for an educational activity and/or research project into a meaningful intervention with clear goals, appropriate methods, measurable and significant results and that has the potential for scholarly dissemination.

Structure of Workshop: In this interactive workshop, participants will engage in hands-on exercises to examine how the selection of a conceptual framework in conjunction with the use of established best practices in curriculum/program design and evaluation will enhance one’s work and the ability to investigate and measure the impact of this work. Brief didactic presentations will be used between small group activities to prepare participants to explore various conceptual frameworks and practice applying selected frameworks to design and measure meaningful outcomes related to educational interventions. By completing a structured worksheet and incorporating feedback from peers and the facilitators during the session, participants will leave ready to use this approach in their own work and prepared to engage with the international community of educators in enhancing the rigor of educational scholarship through the use of conceptual frameworks.

Intended Outcomes: Participants will gain knowledge and skills through engagement in activities that allow them to apply and practice the concepts being discussed. Attendees will be able to use the feedback of peers and facilitators to create an individual action plan to enhance plans for a current or future educational activity.

Level: Intermediate

#4Y Conference Workshop

4Y (582)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1400-1530

Location of Workshop: Room 2.17, Level 2

Managing & Supporting the Educator in Trouble

PRESENTER(S):

- Alistair Thomson, NACT (UK), UK

ABSTRACT

Background: This workshop will explore the reasons why those involved in teaching and assessing trainees and medical students may have concerns raised about them. It is often the most diligent and courageous educator who gets challenged by their learners and reported to senior faculty.

Who Should Attend? This is relevant for all educational leaders, supervisors, educators and those involved in faculty development. The context will be postgraduate but the principles would be relevant to those involved in undergraduate education.

Structure of Workshop: The NACT UK guidelines “Supporting the Educator 2016” will be applied in small groups to real scenarios from UK practice. These guidelines can be introduced into faculty development programmes.

Intended Outcomes: There will be a practical approach to managing issues and concerns about individual educator, considering ways to provide support in the hospital & centrally in the University / Deanery with consistency and collaboration.

Level: For Postgraduate (and Undergraduate) Faculty supporting and training all trainers. Highly relevant to experienced clinical and educational supervisors.

#4Z Conference Workshop

4Z (2581)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1400-1530

Location of Workshop: Room 2.44, Level 2

Digital Health: Bridging the Gap in Medical Education

PRESENTER(S):

- Lina Mosch, European Medical Students' Association
- Paulius Povilonis, Lithuanian University of Health Sciences, Lithuania
- Justinas Balciunas, Lithuanian University of Health Sciences, Lithuania
- Beatriz Atienza Carbonell, University of Valencia Medical School, Spain
- Evangelos Papageorgiou, European Medical Students Association, Greece

ABSTRACT

Background: Digital health technologies promise to substantially improve healthcare. Yet, they may disrupt the workflow and job profile of future healthcare professionals in the way that digital health literacy and skills in working with new technologies will become prerequisite competencies for future physicians. The European Medical Students' Association (EMSA) initiated a survey to assess the knowledge and opinion of medical students' about digital health and its implementation in the medical education curriculum. Our aim was to identify medical students' needs with regard to their education in digital health as well as their training with respective technologies. Results of the survey including recommendations for a meaningful implementation of digital health into the medical curriculum have been presented in the European Commission.

Who Should Attend? Anyone who is interested in the topic of digital health and inclusion of new technologies to health professions' curriculum is welcomed to participate. We would welcome both students and educators in order for the topic to be discussed from all different aspects. Especially stakeholders that already experience digital health in the medical curriculum are warmly welcomed to share their practices.

Structure of Workshop:

1. Introduction: digital health and digital health literacy
2. Presentation of student-led activities on digital health throughout Europe
3. Main points and conclusions from EMSA's survey on digital health among European medical students
4. Presentation: outcomes of relevant meetings e.g European Commissions eHealth Stakeholder Group, Deans' meeting "Training Future Proof Doctors for the Digital Society"
5. Best practices for inclusion of digital health in health professions' curricula
6. Identification of challenges and concerns on the topic of digital health

Intended Outcomes:

- emphasize the importance of keeping the health professions' curriculum up to date with new technology developments
- give some valuable insight of the students' point of views on Digital Health and their needs and expectations for its implementation into the medical curriculum
- offer guidance to students and educators on how to form valuable partnerships to transform their school's curriculum
- share best practices and discuss about ways to meaningfully implement digital health aspects (training with technologies, ethical and legal aspects, communication skills, research opportunities) into the medical curriculum

Level: Introductory

#4AA Conference Workshop

4AA (1026)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1400-1530

Location of Workshop: Room 2.61, Level 2

Workplace-Based Assessment and Entrustment in the AAMC Core EPA Pilot

PRESENTER(S):

- William Cutrer, Vanderbilt University School of Medicine, USA
- Sandra Yingling, University of Illinois College of Medicine, USA
- Dorothy Andriole, Association of American Medical Colleges, USA
- Jonathan Amiel, Columbia University Vagelos College of Physicians & Surgeons, USA

ABSTRACT

Background: Many U.S. medical schools are implementing the AAMC Core EPA framework within their medical school programs. The EPA pilot is implementing this construct using assessments that are meant to be quickly understood by faculty and students. One method to bridge the gap between construct and practice is the workplace-based assessment (WBA) that provides in situ opportunities for assessment of a student's readiness for unsupervised practice. Another integral part of this framework involves making summative entrustment decisions. Institutions are grappling with content, process, logistics, and resources. Workshop leaders will share lessons learned and engage participants in solving practical problems and overcoming barriers to making summative entrustment decisions. The session is designed to be practical, flexible, and interactive so that common challenges are optimally addressed.

Who Should Attend? Faculty implementing workplace-based assessments and/or establishing a medical school entrustment process

Structure of Workshop: The session will begin with an update about the AAMC Core EPA pilot. Participants will then actively engage in small and large group discussions. Finally, the panel will summarize the approaches generated by the discussion.

1. Introductions (5 min)
2. Brief overview of EPAs and WBA (10 min)
3. Determination of participants experience with EPAs (polling) (5 min)
4. Description of pilot school's approaches to workplace-based assessment (10 min)
5. Small group exploration of implementation challenges (10 min)
6. Large group debrief (10 min)
7. Brief overview of summative entrustment determination (15 min)
 - a. Description of entrustment committees at pilot schools
 - b. Identification of implementation successes and challenges
8. Small group exploration of entrustment committee challenges (20 min)
9. Large group debrief (10 min)
10. Summary and wrap-Up (10 min)

Intended Outcomes:

1. Discuss workplace-based approaches used by the Core EPA pilot to assess student readiness for entrustment
2. Identify barriers to effective WBA implementation and describe practical solutions
3. Compare and contrast entrustment, clinical competence, and promotions committee processes
4. Discuss barriers and facilitators to the entrustment process

Level: Intermediate

#4BB Conference Workshop

4BB (2285)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1400-1530

Location of Workshop: Room 2.83, Level 2

Writing MCQs to Assess Professionalism and Communication Skills across the Continuum

PRESENTER(S):

- Kathleen Holtzman, American Board of Medical Specialties, USA
- Krista Allbee, American Board of Medical Specialties, USA

ABSTRACT

Background: Although medical educators agree on the importance of assessing communication skills, professionalism, and related topics in medical ethics throughout the continuum, questions often ask for definitions rather than assessing whether trainees can apply their knowledge in areas in making patient care decisions. Insufficient consideration is often given to whether topics are appropriate to test early, late, or throughout training.

Who Should Attend? Anyone involved in teaching, writing exams, including directors of introduction to clinical medicine courses, clinical clerkships, and postgraduate training; members of Royal Colleges, specialty boards, and others involved in assessment in the health professions.

Structure of Workshop: This highly interactive workshop begins with a pretest assessing participants' awareness of technical item-writing flaws enabling test-wise examinees to answer items correctly when they do not know the content; review of technical flaws/rules for constructing SBA vignette-based MCQs follows. Participants then work in small groups developing a list of important professionalism topics, then compare topic lists followed by discussion of blueprinting assessments across years of training. The full group then reviews sample professionalism scenarios and discuss how scenarios can be used as a stimulus for MCQ and short answer/essay formats for formative and summative assessments. Participants share ideas for modifying scenarios/options to make them easier or harder for teaching and assessing trainees as they progress through the continuum. Participants reconvene into small groups to revise poorly written Professionalism MCQs, then review/compare items across groups and with items provided by the facilitators. In small groups, participants choose a communication scenario and write options focusing on "how to communicate" and discuss revisions with the full group. Video/multimedia to enrich and increase authenticity will also be discussed with sample illustrative videos shown.

Intended Outcomes: At the conclusion of the workshop, attendees will:

- Recognize/avoid common technical item-writing flaws enabling test-wise examinees to answer items correctly even when they do not know the content
- Write well-structured MCQs testing application of knowledge related to professionalism/communication skills
- Review/improve MCQs written by others
- Develop and use vignettes/video as stimuli for use in formative and summative assessments
- Understand how to use classifications to blueprint communication skills and professionalism content within and across the continuum

Level: Introductory/intermediate

#4CC Conference Workshop

4CC (1810)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1400-1530

Location of Workshop: Room 2.95, Level 2

Online assessment with the students' own devices: An evidence based and practical approach to eAssessment

PRESENTER(S):

- Eeva Pyörälä, University of Helsinki, Faculty of Medicine, Centre for University Teaching and Learning, Finland
- Sanna Siirilä, University of Helsinki, Services for Learning and Teaching Technology, Finland
- Otto Helve, University of Helsinki, Faculty of Medicine, Finland
- Teemu Masalin, University of Helsinki, Faculty of Medicine, Finland
- Debra Sibbald, University of Toronto, Leslie Dan Faculty of Pharmacy, Canada
- Colin Lumsden, University of Manchester, Manchester Medical School, UK

ABSTRACT

Background: The Universities of Helsinki, Manchester and Toronto have fostered mobile learning and integrated the use of digital learning resources into active learning strategies. In Manchester and Helsinki, the Faculty has delivered students tablet computers for their personal and study use. In Toronto, students are encouraged to use their own devices. An important step in creating a full-scale digital learning environment is to develop a versatile use of online assessment.

Who Should Attend? This workshop provides an evidence-based and practical insight into online assessment when using the Bring Your Own Device (BYOD) strategy. We invite all those who are at the outset of or in the middle of fostering formative and/or summative online assessment in their units to share experiences and learn from and with us. The workshop is targeted to all health-care professions, both at graduate and postgraduate level, specialist training and continuing professional development.

Structure of Workshop: The workshop is interactive and facilitates active learning. We provide a short overall view of online assessment based on a BYOD strategy and have a vote on the assessment practices in the participants' units. The Helsinki project reports the pilots of students taking summative online examinations and international progress tests with their own devices without an access to the internet or their own files. The Toronto project highlights students' experiences of introducing a versatile online formative assessment format into large group teaching. The Manchester project presents the tool (FORM²) developed for capturing, documenting and managing the students' progress at the workplace to provide them timely feedback and foster clinical learning. The workshop participants analyse in groups the advantages and challenges developing formative and summative online assessment and adopting a BYOD strategy in assessment. The workshop is concluded with a discussion and a take-home-message.

Intended Outcomes: At the end of the workshop, the participants will be able to

- (1) Outline the principles of formative and summative online assessment,
- (2) Analyse the advantages and challenges of using the students' own devices (laptops, tablet computers and smartphones) in online assessment and
- (3) Recognize the requirements for developing online assessment in their units.

Factors associated with Life Long Learning in Graduates

AUTHOR(S):

- Koonlawadee Netsakkasem, Phichit Education Medical Center, Thailand (Presenter)
- Satabongkot Tangtong, Phichit Education Medical Center, Thailand
- Monchai Siribungrongwong, Lerdsin Hospital, Thailand
- Srikalya Wuttinanchai, Phichit Education Medical Center, Thailand

ABSTRACT

Background: A study of factors associated lifelong learning in Graduates' Identities, Faculty of Medicine Naresuan University. Taking the result to develop teaching and create them continuous lifelong learner.

Summary of Work: A survey of P MEC graduates who graduated 1-3 years. The participants were self-administered through the Google form. The questionnaire consisted of three parts. 1. General information 2. Opportunities and Causes to continuous learning 3. Influence factors.

Summary of Results: Responded questionnaire are 74% which female and male are equal. The average age was 35.07 years, averaged graduate 2.33 years, as general practice 64.24% fellowship are 35.76%. Found that all of them are continuous learning. The reason for continuous learning are 64.3% for treatment, 21.4% Increase knowledge, 14.3% prepare to fellowship. The method of searching knowledge are 57.1% searching engine, 21.4% training and 14.2% read the journal. Teaching methods that encourage continuous learning are 71.4% Problem based Learning(PBL), 28.6% Evidence based medicine (EBM). Barriers continuous learning are 58.3% difficult access search engine, exorbitant workloads are 25%, the reliability of the data source and the age that is an obstacle are 16.7%. Suggestions for development in teaching is adding search engine and reading analysis medical journal.

Discussion and Conclusions: Life Long learning skill is necessary to develop all time. Problem based learning and Evidence Based medicine are the important factors which taking the graduates has life long learning skill. In addition, increasing the potential of technology and increasing the sources of knowledge is important to developing in order for graduates to access more knowledge. Problem based learning, Evidence Based medicine, search engine, and reading analysis medical journal are the factors which encourage life long learner.

Take-home Messages: Life long learning skills can be developed by analytical teaching techniques and using technology to search for information.

Improving Conference Social Media Engagement: The AMEE Twitter Story

AUTHOR(S):

- Eric B Bauman, Clinical Playground, LLC, USA (Presenter)
- Lisa Paganotti, Ross University School of Medicine, Barbados
- Dr Gregory E. Gilbert, SigmaStats© Consulting, LLC, USA

ABSTRACT

Background: Social media use has been on the rise globally over the last several years, including use in the medical community for journals, professional organizations, and conferences. Tweets are distributed globally and quickly amplify conference content engaging larger audiences. Recently, medical societies have promoted Twitter use at conferences promoting discussion and engagement of both attendees and colleagues unable to attend conferences. To our knowledge baseline, Twitter data do not exist for AMEE conferences.

Summary of Work: Our study focuses on Twitter use at the 2018 AMEE conference providing a baseline of Twitter use in preparation for further analysis. Each day Twitter data was exported and downloaded. Data for the conference were combined and descriptive statistics generated using R version 3.4.3 (Vienna, AT) software.

Summary of Results: Unique Twitter handles accounted for 55% of conference registrants. A Twitter handle is the unique identifier or nickname identifying a user engaged in the Twitter social media platform. Eleven Twitter handles made up the top quartile of unique tweets. The number of tweets peaked on days three and four of the conference (3593 & 3590, respectively). The unique handles tweeting for days one through five were; 216, 621, 985, 944 and 629. Unique content represented 37% of the tweets. The most common hashtags used were #amee2018 (49%) and #meded (12%). The remaining hashtags represented less than 2% each.

Discussion and Conclusions: Twitter is a useful tool for timely dissemination of medical education information at AMEE conference allowing those not attending to gain value from the conference and participate in knowledge sharing. As with other medical organizations sponsoring conferences, Twitter can be used by AMEE to enhance conference experience generating interaction between attendees as well as those worldwide. We encourage AMEE to investigate novel uses of Twitter for conference learning and engagement such quizzes about conference presentations and facts about the conference venue.

Take-home Messages: Baseline Twitter data has been documented to allow for future comparisons of engagement in social media during AMEE conferences. To maximize the conference experience, AMEE can use this information to broaden the audience and social media engagement of participants.

A pilot study on feasibility and acceptance of a learner-centered e-journal as a continuing education program for medical technologists in Taiwan

AUTHOR(S):

- Chiao-Ni Wen, Department of Laboratory Medicine, Linkou Chang Gung Memorial Hospital, Taoyuan, Taiwan (Presenter)
- Hsiao-Chen Ning, Department of Laboratory Medicine, Linkou Chang Gung Memorial Hospital, Taiwan
- Pi-Yueh Chang, Department of Laboratory Medicine, Linkou Chang Gung Memorial Hospital, Taiwan
- Tsung-Han Yang, Department of Medical Laboratories Administrative Center, Chang Gung Medical Foundation, Taiwan
- Huey-Ling You, Department of Laboratory Medicine, Kaohsiung Chang Gung Memorial Hospital, Taiwan
- Kuo-Chien Tsao, Department of Medical Laboratories Administrative Center, Chang Gung Medical Foundation, Taiwan

ABSTRACT

Background: Journal-based learning in continuing medical education (CME) appears to be a valuable method of undertaking life-long learning. However, based on current investigations, the challenge for CME providers is to facilitate self-directed learning while taking learners' views and preferences into consideration. This research was conducted to develop a learner-centered e-journal for medical technologists to make CME programs more effective.

Summary of Work: We conducted a survey to explore what readers perceived as barriers on CME through an online questionnaire among medical technologists. After that, this journal was designed to remove readers' barriers on CME and available in e-book format. Finally, a multicenter cross-sectional study was conducted in 2018 among 294 medical technologists in Taiwan through an online structured questionnaire regarding readers' sociodemographic factors, feasibility, acceptability and overall satisfaction of this e-journal after their reading. This study was approved by the Ethics Committee of Chang Gung Memorial Hospital (IRB no. 201800144B0).

Summary of Results: The questionnaire was completed by 133 medical technologists from 2 medical centers. Based on our pilot study, long articles were the strongest barrier on CME, and the lack of time was the moderate barrier among medical technologists. After reading the e-journal, 82.6% of medical technologists reported the lengths of articles in e-journal are optimal, and they had high willingness to assess this journal. They also reported good satisfaction about the content of the e-journal and the feasibility of assessing e-journal, the average scores were 4.11 and 4.18 out of 5. As for the overall satisfaction, the average scores were 4.14 out of 5.

Discussion and Conclusions: This presentation describes a strategy for developing an e-journal to support the learning of advancements in knowledge and technology for medical technologists at their own convenience. Based on our survey, most of medical technologists took the positive attitude toward the learner-centered e-journal. It is hoped that a well-designed format combining journal-based learning with learner-centered learning will prove of value in the field of continuing medical education.

Take-home Messages: To make on-line CME programs more effective, it is important to facilitate self-directed learning while taking learners' views and preferences into consideration.

Opportunities and Challenges of attending Continuing Professional Development in Myanmar

AUTHOR(S):

- Wunna Tun, Myanmar Medical Association, Myanmar (Presenter)
- Tin Tin Hla Mya Win Hnit, Myanmar Medical Association, Myanmar

ABSTRACT

Background: Continuing Professional Development is a fundamental part for all doctors as medicine advanced quickly and it is the doctors duty to keep abreast with latest development in order to provide a safe and high quality care to the patients. Lack of continuous quality improvement undermine the quality of healthcare offered by doctors in Myanmar. Accreditation in CME will encourage doctors to do continuous quality improvement. However, every doctor cannot attend CME programs offered by Myanmar Medical Association. The courses are still lacking systematic, comprehensive, accredited and regulated environment. MMA is the only provider in Myanmar conducting CME activities for all doctors as an imperative to nurture a culture of lifelong learning.

Summary of Work: We have conducted questionnaires to attendee at one of regular CME session. They were asked about why they are attending CME and CPD organized by MMA and challenges facing to attend these courses.

Summary of Results: We found that doctors attending CME are mainly to keep abreast with their medical knowledge and lack of post graduate degree or specialist training. Majority of respondents have busy clinical work as barrier of attending CME followed by having no one to relieve them, transportation distance form course venue, cost fees, family responsibilities, lack of support from seniors and loss of Income due to absence from clinic.

Discussion and Conclusions: Doctors prefer to attend course that encourage actively participation rather than online learning. Doctors working in rural region have more knowledge gap as they have difficulty in attending the course in urban. There is no reimbursement program offered by hospital and clinic in Myanmar. The major barrier is doctor shortage in hospital and hospital appoint more doctors is essential. Doctors who want to do CME need to fund themselves and hospital allocate funding for all doctors in hospital is needed. There need to be development on eLearning system for all practicing doctors in Myanmar. To conclude, Ministry of Health and hospital administrator have to fulfill the need of barrier for CME participation to have high quality health care offered by Myanmar doctor.

Take-home Messages: Every doctor in the country wherever they will be able to access CME should be necessary.

The changing landscape in Canada of CPD/CME targeting physicians: A scoping review

AUTHOR(S):

- Francesca Luconi, McGill University, Canada (Presenter)
- Elizabeth Wooster, University of Toronto, Canada
- Morag Paton, University of Toronto, Canada
- Meron Teferra, McGill University, Canada
- Andrea Quaiattini, McGill University, Canada

ABSTRACT

Background: In North America, despite the urgency to implement a widespread significant healthcare reform, change has been slow or non-existent due to the misalignment among health system components. In order to keep up with the healthcare reform, CME/CPD needs to explore those forces that shaped its mandate in the past to better embrace its role as an effective agent of change. This scoping review explores the landscape of CME/CPD in order to identify those forces that have affected the planning, deployment and evaluation of CME/CPD targeting physicians in Canada.

Summary of Work: This scoping review followed Arksey & O'Malley's 6-stage framework and covered published and grey literature. The research question was refined based on defining parameters and the type of the target audience. Publications targeting practicing physicians in Canada, published between 2008-2019 in English and French were included. The coding system followed an adaptation of MacIntosh-Murray et al. (2006) thematic analysis of publications in The Journal of Continuing Education in the Health Professions from 1981-2004. Studies were coded independently and reviewed in pairs to ensure accuracy and reliability.

Summary of Results: Preliminary results only covers published literature. From the original 3760 references, a sample of 43 articles that met our inclusion criteria were selected. The majority of the target audience were physicians (70%) or physicians working in an interprofessional team (14%). Forty percent of articles focused on continuing education techniques and approaches and 23% discussed clinical content areas. Simulation (39%) and workshops (31%) were the most commonly used instructional methods. Only 12% of articles explicitly cited a theoretical framework. The terms 'CPD' and 'CME' exclusively appeared in 34% and 32% of articles, while 10% used the terms 'CE/CPD' and 'CME/CPD' interchangeably.

Discussion and Conclusions: This scoping review explores the forces that influence the changing landscape of CME/CPD in Canada and may impact the alignment between CME/CPD and the healthcare system reform.

Take-home Messages: This scoping review aims to contribute to the evolution of the CPD field by: a) keeping physicians up-to-date as clinical practitioners, teachers and scholars, b) informing CPD developers, c) offering an understanding of the Canadian context to licensing, regulatory bodies and policymakers, and d) identifying gaps for future research.

What are the differential diagnoses that Japanese final-year medical students need to consider for 37 common clinical features defined in the national model core curriculum? A modified Delphi study

AUTHOR(S):

- Yuka Miyachi, Kyoto University Hospital, Japan (Presenter)
- Makoto Kikukawa, Kyushu University, Japan
- Masatomi Ikusaka, Chiba University Hospital, Japan
- Junji Otaki, Hokkaido University, Japan
- Hiroshi Nishigori, Kyoto University, Japan

ABSTRACT

Background: In Japan, the national model core curriculum for undergraduate medical education was revised in 2016. In the aim of promoting teaching and assessing clinical reasoning competence of medical students, it newly introduced lists of differential diagnoses for 37 common symptoms to be learned in the formal undergraduate curriculum. The purpose of this study was to validate the items in the list based on the consensus among experts in clinical reasoning education to medical students. The research question was 'what are the differential diagnoses that Japanese final-year medical students need to consider for the 37 symptoms listed in the national model core curriculum?'

Summary of Work: Using modified Delphi process, we developed a consensus among a panel of expert physician-teachers in clinical reasoning from across Japan utilizing the existing differential diagnosis list (277 items). The expert panels anonymously evaluated the items by a 5-point Likert scale whether the disease should be hypothesized by final-year medical students considering a given symptom and added other diseases if any. We defined the positive consensus as both a 75% panel agreement and a mean of 4 or higher with a standard deviation less than one on the 5-point Likert scale. We conducted this study between September 2017 and March 2018, approved by the institutional research board of Kyoto University.

Summary of Results: Twenty-three experts from different medical schools and teaching hospitals across Japan participated as the panel; 22 completed the first and second round (96%). The final consensus list consisted of 275 items (the median of 7), while 79 items of the initial list were eliminated after the second round.

Discussion and Conclusions: Though the list developed in this study may be specific to the Japanese context, the validating process thereof would be transferable to other countries to build a national consensus on learning contents. The results can be beneficial in developing a future assessment for diagnostic competence of medical students as well as newly graduated physicians.

Take-home Messages: We developed the list of differential diagnoses Japanese medical students should master based on the 37 common symptoms listed in the national model core curriculum.

Faculty Reflections about Participating in International Curriculum Development

AUTHOR(S):

- **Margaret McDonald, University of Pittsburgh School of Medicine, USA (Presenter)**
- Amar Kohli, University of Pittsburgh School of Medicine, USA
- Russell Schuh, University of Pittsburgh School of Medicine, USA
- Michael Elnicki, University of Pittsburgh School of Medicine, USA
- John Mahoney, University of Pittsburgh School of Medicine, USA

ABSTRACT

Background: Nazarbayev University School of Medicine (NUSOM), located in Astana, Kazakhstan, selected the University of Pittsburgh School of Medicine (UPSOM) to guide NUSOM's development and model it after UPSOM's curriculum. UPSOM faculty members helped develop NUSOM's curriculum, including travel to NUSOM. This study sought to interview UPSOM faculty members asked to participate in the UPSOM-NUSOM project. We assessed motivations for accepting or rejecting the offer to participate. Those accepting the offer were asked about benefits and negatives.

Summary of Work: A one-to-one, qualitative open-ended interview study was conducted. Nineteen UPSOM faculty members participated in 30-minute interviews. Interviews were digitally recorded and transcribed by a second author independently. Two authors independently coded all transcripts and analyzed them for common themes.

Summary of Results: Participants believed that reviewing their home courses improved them. One noted, 'going through the entire pulm[onology] course...with fresh eyes...I could see overlaps, holes. I could see jumps in logic.' Most noted an increased sense of altruism and improvement as leaders and educators. Although many eagerly participated, some faculty members expressed concerns or declined to participate. Some interviewees felt angst in sharing the curricula they had worked hard to build. Travel was a challenge, 'I guess the hardest part was being away from my family for a week...' However, the role of new technologies, like Skype, allowed easier communication and sharing of ideas. Participants did note that having a tangible reward for devoting their time would have been ideal.

Discussion and Conclusions: This study highlights emotions and outcomes during the process of creating an internationally affiliated medical school. UPSOM faculty members devoted time and materials to the project. Rewards included an improved UPSOM curriculum and personal and professional enrichment. Time constraints and distance were the main challenges participants felt and were the primary reasons others declined. More transparency regarding expectations and the degree of assistance NUSOM needed may have assuaged these fears.

Take-home Messages: Building an affiliated medical school internationally requires a dedicated faculty and administrators who provide upfront details on expectations. These themes will help to guide future experiences.

Evaluation of the Joint Program for European Medical Studies 2018

AUTHOR(S):

- Tudor Calinici, UMF Cluj-Napoca, Romania (Presenter)
- Anca Dana Buzoianu, UMF Cluj-Napoca, Romania

ABSTRACT

Background: One of the most appreciated ways of gaining memorable and lasting experiences during study years is participation in student mobility. In medical sciences, because of different specific issues, joint programs are less common and usually the students must fit in to a host institution program.

Summary of Work: The JPEMS program consists of a semester of pre-clinical teaching, centered on biological sciences and research issues, implemented by a consortium of European universities: Angers (France), Szeged (Hungary), Cluj-Napoca (Romania), Naples (Italy) and Timișoara (Romania). It is fully accredited within the home-institution curricula for all students. Between September 2018 and December 2018, the program was implemented by the 'Iuliu Hatieganu' University of Medicine and Pharmacy Cluj-Napoca.

Summary of Results: Twenty-two students from four universities participated in JPEMS 2018, taking modules in Medical English, Medical Informatics and Biostatistics, Immunology, Physiopathology, Medical Genetics, Microbiology, and Medical Research. Forty-five members of teaching staff from all of the universities in the consortium were actively involved in teaching and evaluating the program. The students were assessed using specific tests in Immunology, Physiopathology, Medical Genetics and Microbiology, with the grades for the rest of the modules obtained by the evaluation of a research report.

Discussion and Conclusions: There were a lot of challenges, but as a whole, the program was a success. The students were satisfied with both the educational and the social parts of the program. This statement is supported by the evaluations made of the students at the end of each module, at the end of the program, and also from informal discussions between the students and the teaching and administrative staff who were involved in the program.

Take-home Messages: Despite the difficulties, joint programs in medical studies can be done and could be successful in the future. In the context of globalization, those programs could be a viable instrument in the education of future health professionals.

International Accreditation of Resuscitation Courses by American Heart Association (AHA) at Sultan Qaboos University Hospital (SQUH), Oman

AUTHOR(S):

- Asma Said Al Balushi, Sultan Qaboos University Hospital, Oman (Presenter)
- Shalini Baskaran, Sultan Qaboos University Hospital, Oman
- Abdulhakeem Al Hashim, Sultan Qaboos University Hospital, Oman

ABSTRACT

Background: Globally, the leading causes of death are heart disease and stroke. Despite the ongoing advances in resuscitation science, cardiac arrest survival rates remain suboptimal for both in and out-of-hospital settings. This study aimed to describe the AHA accreditation journey at SQUH to meet international standard in resuscitation and its contribution to community service.

Summary of Work: This retrospective descriptive study included all the data related to AHA courses and community service activities conducted at Directorate of Training & Continuing professional Development(DT&CPD), from December 2013 to December 2018. The data was analyzed using descriptive statistics.

Summary of Results: A total of 188 BLS provider/renewal courses were conducted and attended by 3257 healthcare professionals. 661 participants attended ACLS provider/renewals courses and 325 participants attended PALS provider/renewal courses. A total of 291 participants were trained in Heartsaver courses. Community awareness programs in view of heart saver month were conducted. In 2015, a total of 489 people participated in 'Feel the beat' program at Muscat City Centre and in 2018 a total of 2136 students and 297 faculties were trained on 'Hands Only CPR' at SQU.

Discussion and Conclusions: Accreditation process had implemented international standards in resuscitation courses training among the health care providers at SQUH and also extended the service to the community. It is required to assess the impact of standardized training on the survival outcome of cardiac arrest victims at SQUH.

Take-home Messages: Internationally accredited courses play an integral role in the training of healthcare professionals for better quality patient care.

A DARE-ing binational medical education program: the Danish-American Research Exchange (DARE)

AUTHOR(S):

- Kala Mehta, University of California, San Francisco, USA (Presenter)
- Shomit Ghose, Onset Ventures, USA
- Steve Goodman, Stanford University, USA
- Andreas Kjaer, Copenhagen University, Denmark
- Peter Chin-Hong, UCSF, USA

ABSTRACT

Background: The overall goal of the Danish-American Research Exchange (DARE) Program is to promote biomedical research collaboration between Danish and US medical institutions and to incorporate disruptive thinking in the program. The program brings five Danish medical students to two universities in the Bay Area, for 10 months. DARE students are introduced to interdisciplinary thinking through the '§10 Challenge'. This study examines program characteristics, learner outcomes and change in thinking in DARE students.

Summary of Work: We conducted a mixed-methods study of DARE alumni over three years (2015-2018, n=15, mean age 24, 73% women). Research metrics included completion of the research project, primary authorship on publications, collaborative authorship on publications, graduation from and intent to pursue a joint MD-PhD. All alumni were invited to a focus group, where probes included 1) transition from USA back to Denmark 2) Changes in thinking/orientation and 3) intention to pursue leadership positions. Focus group discussion was transcribed, redacted and coded using deduce software.

Summary of Results: Most DARE students conducted clinical secondary data research projects (70%), followed by basic science projects (20%), health services research (5%) and primary clinical data collection (5%). Research projects represented a wide variety of medical disciplines, with 100% completion. Twenty-seven percent of students were accepted into a PhD program, 60% intend to pursue a PhD program and the remaining 13% were undecided in October, 2018. In terms of publications, the average first author publication rate is 1.8 publications/year per DARE alumni, with the majority showing evidence of bi-national collaboration (60%). From the focus group, key themes were: the value of immersion in a new social/scientific culture, increased confidence, taking scientific risks, learned persistence, gaining an international network and entrepreneurial thinking 'helping' their science.

Discussion and Conclusions: This study shows preliminary learner outcome data for the DARE program. Compared to Danish national averages, DARE alumni have high publication rates. Additional benefits include international collaboration as well as qualitative impacts on learners. Future steps are to examine the relationship between markers of disruptive thinking and research productivity.

Take-home Messages: Bi-national programs can be potentially useful in stimulating undergraduate medical research. Research outcomes of undergraduate medical learners may be improved by entrepreneurial thinking.

Scaling expertise to reach local & worldwide learners to positively impact the determinants of health using a massively open online course

AUTHOR(S):

- Daniel Nicklas, University of Colorado School of Medicine, USA (Presenter)
- Janet Corral, University of Colorado School of Medicine, USA

ABSTRACT

Background: Improving health outcomes globally is dependent on providing evidence-based content to learners. Simultaneously, time-pressed faculty need to engage educational solutions that scale their expertise while providing learners with opportunities for deliberate practice. A massively open online course (MOOC) is one strategic way to improve access to asynchronous evidence-based content locally and globally.

Summary of Work: Two MOOCs, 'School Health' and 'Newborn Care', were intentionally developed to help practitioners learn and apply knowledge and clinical reasoning skills through case-based activities. Each specialization includes four 1-month courses, ~16 week-long modules, formative in-video questions, weekly summative reflections and case-based activities, peer-peer assessments, and a capstone project. Learners receive feedback and peer-assessments from their global peers as part of intentionally building a global community who can learn with, and from, each other.

Summary of Results: The first 3 of 4 total courses in each specialization were launched in January 2019, with enrollments from every continent except Antarctica. Total enrollments for each week-long course are 228, 121, and 169 respectively for the Newborn Baby Care and 126, 185, and 87 respectively for the School Health. All courses are open and free, though enrollees may opt to pay for a certificate. Future plans for program evaluation include: number of course completions, global reach based on completions, qualitative analysis of the capstone project, and analytics of learner engagement with content within the MOOC.

Discussion and Conclusions: Education is a reciprocal undertaking. MOOCs fulfill the University service mission to assist underserved populations, while building opportunities for global and local learners to co-create shared knowledge and potentially contribute to a primary care education fund. These education and service programs within the community are chronically underfunded. Third, participating in a MOOC with global reach extends the University's international reputation. Fourth, the MOOC has provided educational scholarship opportunities to faculty and students, and extended our university's capacity to engage in digital education innovations.

Take-home Messages: MOOCs have provided a mechanism to scale educational outreach to an international audience to meet local and global education missions.

Developing a Course of Medical Ethics and Law by Using Situation Learning Theory

AUTHOR(S):

- Chihchia Wang, Department of Family Medicine, School of Medicine, National Defense Medical Center, Taiwan (Presenter)
- Chung-Pei Fu, College of Medicine, Fu Jen Catholic University, Taiwan
- Jen-Jiaun Liaw, School of Nursing, National Defense Medical Center, Taiwan
- Cheng-Yi Cheng, School of Medicine, National Defense Medical Center, Taiwan

ABSTRACT

Background: In the past, the course of medical ethics and law are commonly taught by using lectures and small group tutorials. The challenges are that students lack motivation to learn, and feel hard to apply what they learn in class to the clinical practice. The study purpose was to develop a situation-based course of medical ethics and law for the senior medical students, and examine their qualitative and quantitative learning outcomes.

Summary of Work: We developed some case scenarios related to medical ethics and law based on the learning objectives of chapters, and arranged students to visit and observe the court. Totally one hundred and thirty-five senior medical students took this course. The situation-based course was designed to bridge the gap between knowledge and practices, to increase students' motivation, to develop students' empathy to patients, and to improve their communication skills. In addition to classroom teaching, students received 1 hour for court and technical court briefing, and robe fitting, 1 hour for attending the litigation in the public gallery, and 2 hours for discussions, including judges, prosecutors, and physicians. After the class, we examined the students' satisfaction and practicality, and evaluate their knowledge, attitude, and skills on medical ethics and law.

Summary of Results: Ninety-seven questionnaires were received (response rate: 71.9%). Most of the students (77.0%-89.4%) were satisfied or very satisfied with the court-based learning. Most of them (80.2%) thought more empathy to patients and better communication skills were developed after the class. 78.2% of them were more interested in medical ethics and law, and 78.1% of them recommended the court-based learning to the underclassmen. The students' qualitative reports suggest that they felt positive about the situation-based learning. They experienced the importance of medical profession, physician-patient communications, respect and empathy to the patients, the information asymmetry, and had confidence in justice of the court trial. The situation-based course is more interesting and practical as compared with other courses.

Discussion and Conclusions: Situation-based course bridged the gap between knowledge and practices. It increased students' learning motivation, developed students' empathy, and improved the communication skills.

Take-home Messages: Situation-based learning is a creative strategy for helping current medical students in learning medical ethics and law.

The 'Learning Cycle' in the Basic Life Support (BLS) Curriculum Develops Students' and Teachers' Outcomes: Successful Multidisciplinary Cooperation for BLS Lessons at Our Medical University

AUTHOR(S):

- Ichiro Kaneko, Teikyo Simulation Education Research Center (TSERC), Teikyo University School of Medicine, Japan (Presenter)
- Yasuo Takeuchi, Teikyo Simulation Education Research Center (TSERC), Japan
- Nobu Akiyama, Teikyo Simulation Education Research Center (TSERC), Japan
- Masami Yokoyama, Teikyo Simulation Education Research Center (TSERC), Japan
- Keiji Maruyama, Teikyo Simulation Education Research Center (TSERC), Japan
- Masafumi Kawamura, Teikyo University School of Medicine, Japan

ABSTRACT

Background: BLS is one of the core competencies of medical school students. It is based on a common protocol because quality CPR (cardiopulmonary resuscitation) can be carried out by the multidisciplinary professional team. Our simulation education committee provided a BLS protocol, an instruction manual, simulators, and faculty development plan for the common BLS lessons at the school. Development of the faculty and lessons over the years is reported.

Summary of Work: For our medical, pharmacy, and medical technology school, we designed a development cycle that consists of creating an instructor manual for teachers (planning); providing BLS lessons with a mutual help among teachers (experience); reflecting BLS lessons with updated guideline (reflection); and providing BLS instructor course (BIC) for teachers with annual update (generalization) after Kolb's learning cycle. Outcome-oriented BLS lessons were designed with skill evaluation test at the end of each BLS class to assess learners' competency. Resources, such as manikins equipped with the real-time feedback device Q-CPRTM, a training room, and a teaching manual were shared. Recently, the real-time feedback function was applied for lesson protocol and was also used for the assessment of students. BIC for teachers was designed as a faculty development (FD) workshop, and the concept of inter-professional peer education was introduced. Lesson plans, feedback, debriefing, and assessment were discussed.

Summary of Results: In total, schools conducted BLS classes for 4,055 students during 2015- 2018 with favorable outcomes. For each lesson, multidisciplinary teachers cooperated under the common lesson protocol. The teachers determined that lessons can be carried out with confidence. Meanwhile, BIC for teachers was held five times over four years. Overall, 101 faculty members participated in BIC. The course evaluation questionnaire for teachers participating in the fifth BIC showed overall satisfaction scores of 4.9 out of 5 and relatively low 'facilitation' score of 4.2 .

Discussion and Conclusions: With reflective practice, peer coaching, communities of practice in FD, high-quality and sustainable BLS curricula for university students were successfully conducted by faculty. Continuous implementation of classes may contribute to improving the outcome for students and also improving the instruction competency of teachers.

Take-home Messages: Multidisciplinary cooperation in FD improves BLS outcomes at our university.

A year-long medical simulation curriculum for pre-med students: Do you know what you are getting into?

AUTHOR(S):

- Robert Sasso, Central Michigan University College of Medicine, USA (Presenter)
- Mena Khan, Central Michigan University College of Medicine, USA

ABSTRACT

Background: Trends in the U.S. have demonstrated that medical school applicants are looked upon favorably when the applicant has shadowed a physician in practice, served as a hospital orderly, has a physician relative, or has other experiences in actual clinical medicine. Admission committees commonly view these as important exposures to the medical real world, allowing one to make a more informed decision about physician training. Many U.S. medical students express a different sentiment and feel that they are well into their medical training before attaining an understanding of the profession and its demands. U.S. medical schools continue to have a 4-7% overall drop-out rate. Commonly stated reasons for leaving medical school are overconfidence/lack of preparation and picking the wrong profession.

Summary of Work: Our Simulation Center was approached by a local college to develop a boot camp for their premedical students as an exposure to actual medical training and expectations. A year-long curriculum of 4 workshops was created as follows: Workshop 1: Introduction to Simulation; Orientation to Simulation Lab; Task training in intubation/CPR; High Fidelity Scenario #1 Workshop 2: Basic Life Support training and certification Workshop 3: Lectures on Acute Coronary Syndrome and Stroke; Participation as first responders in High Fidelity Scenarios: Acute MI and Acute Cerebrovascular Accident Workshop 4: Lecture: Stop the Bleed' and Anaphylaxis'; Participation in High Fidelity Scenarios: Acute Trauma; Acute Shortness of Breath.

Summary of Results: Surveyed students after each workshop showed a high level of satisfaction and enthusiasm for the platform. Students were appreciative of the ability to ask clinicians and healthcare professionals progressively more insightful questions about the medical profession.

Discussion and Conclusions: Students became increasingly more confident and mature in their approach to the ill patient. Healthy competition was noted in performing medical tasks and developing psychomotor skills. All learners expressed a greater appreciation of the scope and demands of medical training.

Take-home Messages: Deciding to train as a physician is a difficult one. A medical boot camp curriculum with realistic training and scenario exposures may allow pre-medical students to attain a greater appreciation of medical training and a medical career.

Developing a Global Health Curriculum in Singapore: Learning Experientially about Social Justice through Engagement with Low-Wage Migrant Workers

AUTHOR(S):

- Calvin W.L. Ho, National University of Singapore, Singapore (Presenter)
- Victor Loh, National University Hospital, Singapore
- Teem Wing Yip, Maluk Timor, Timor-Leste

ABSTRACT

Background: Social justice is a key domain comprising competencies that should underscore and guide global health curricula and professional identity formation in medical schools. This domain is aimed at enabling medical students to analyze strategies that are directed at minimizing health disparities and inequities across socially, demographically or geographically defined populations. This paper reports on a novel global health education intervention spearheaded by a major medical school in Singapore, in partnership with HealthServe, a local voluntary welfare organization that provides free healthcare services to low-wage migrant workers. Through linking global health and community engagement, this global/local intervention suggests that there is a common set of transferable skills (or competencies) that could be adapted and applied in professional identity formation.

Summary of Work: While male low-wage migrant workers constitute 13% of the population of Singapore, they are mostly not integrated with the local population and often rendered more vulnerable due to the lack of access to various forms of medical, financial and social support. Through an experiential learning elective during the Family Medicine placement, third (of five) year medical students were provided with the opportunity to engage with these workers through programs offered by HealthServe. A reflective report was submitted by each student at the end of their elective.

Summary of Results: A primary aim of the elective was to enable students to appreciate the meaning of their ethical and professional roles and responsibilities of a health care provider in a global health context. Through personal interaction with these migrant workers, they were able to deepen their understanding of the values of respect for persons and person-centered care in professional identity formation. Analysis of their reflective reports revealed themes that could help to guide future pedagogical interventions.

Discussion and Conclusions: Awareness of global health issues may be gained experientially without the costs of overseas travel. Reflective learning led to discovery of self, the other, and most importantly, of our common humanity, which is one step in the training of future health professionals to be competent to practise in a globalized world.

Take-home Messages: Awareness of global health issues supports professional identity formation and may be gained experientially without the costs of overseas travel.

How to Market Your Course? Integrating Course Experience with Promotion in Social Media Engages Students in your Classroom

AUTHOR(S):

- Hung-Chen Chen, Center for Education in Medical Simulation, Taipei Medical University, Taiwan (Presenter)
- Hao-Yu Chen, Center for Education in Medical Simulation, Taiwan
- Wen-Cheng Huang, Center for Education in Medical Simulation, Taipei Medical University, Taiwan
- Che-Wei Lin, Center for Education in Medical Simulation, Taipei Medical University, Taiwan

ABSTRACT

Background: It is no longer attractive enough to catch students' attention by traditional website if there is a new course going to launch. We thus apply a theory of selling products on the new course we wanted to introduce: a pilot course, by letting few students take part first, to attract more attention and curiosity. Moreover, we shared pictures of what we do during the course on social media and then promote it with infographic before course selection. We hope to increase students' learning engagement and interaction by integrating multi-promoting.

Summary of Work: Firstly, we posted information about the course on our Facebook page, with limited participants, encourage students to play a part and share their experiences with others. Secondly, we uploaded pictures to let others know what the course is about while also make it more inquisitive. Finally, we point out the differences between the new course and traditional ones by an introduction infographic.

Summary of Results: 1. We conducted 6 pilot courses within 8 eight months. In total, 56 students attended with 4.87 out of 5 on satisfactory scale. 2. 116 students selected the course while there were only 30 seats. The selected students will be chosen by drawing straws. 3. There were 13 posts on our Facebook page in the past year with average 540 people original reached and 130 post engagement. However, the post about this new course has reached 1,284 people and 359 times post engagements.

Discussion and Conclusions: The research shows that such promoting way is rather helpful: there is just about a quarter of students who selected the new course can actually be in. The post also topped the page's history on both reached people and post engagement. We can conclude that the method we use is supportive for promoting in terms of students' course selection and engagement.

Take-home Messages: Integrating multi-promoting on social media can increase students' learning initiatives, effectively strengthening course introduction and students' learning engagement as well as interaction.

Drawing as a Methodology: An Innovative Transitions of Care Curriculum for Postgraduate Year 1 Residents

AUTHOR(S):

- Fang-Yih Liaw, Tri-Service General Hospital, Taiwan (Presenter)
- Yaw-Wen Chang, Tri-Service General Hospital, Taiwan
- Chih-Chia Wang, Tri-Service General Hospital, Taiwan

ABSTRACT

Background: Transitions of care is a critical component of medical service. Currently, physicians don't receive much formal education on improving patient care transitions. The draw and write technique is generally employed in the setting of the classroom and increasingly popular in health education research. To develop a sustainable and effective Transitions of Care Curriculum (TCC) and know the potential to enable all resident to participate and improve the quality and relevance of the curriculum, we use draw and write technique, a 'bottom-up tool, to enhance residents' participation.

Summary of Work: TCC was delivered to 35 PGY-1 residents in internal medicine rotation at an academic hospital. TCC consisted of didactic lecture, practicing and case sharing. In the beginning of TCC, residents were asked to illustrate their imaginary home in their senior age and explain their lives within. Then, experiential learning occurred through direct patient care at the time of discharge.

Summary of Results: The illustrates created opportunities to explore resident's perceptions on transitions of care. The emphasis on the self-experience of drawing and the thematic use of the 'home' and 'when they are getting old' as drawing subject led to reflective discussions about post-discharge care and understanding. That indicated residents had a meta-cognitive awareness of the learning shifts that had occurred, and the sessions provoked constructive self-reflective explorations of transition care.

Discussion and Conclusions: This study showed that there may be potential learning outcomes for drawing of their home and disability life. More motivations, beliefs and the impact of such learning elements on PGY-1 residents are needed to explore. Moreover, further research is needed to explore their value and applicability to transitional care education.

Take-home Messages: Illustrating the imaginary home in his/her own senior age could create connection and enhance residents' motivation in transitions of care.

To Inform and Delight: Developing Medical Humanities Course for Medical Students in the Middle East

AUTHOR(S):

- Suhad Daher-Nashif, College of Medicine-Qatar University, Qatar (Presenter)
- Tanya Kane, College of Medicine-Qatar University, Qatar

ABSTRACT

Background: This presentation will shed light on medical students' experiences in learning an elective course on 'Medicine and the Arts' in the Middle Eastern context. Two behavioral scientists in the College of Medicine at Qatar University structured the course aiming to visualize the link between humanities, visual arts, and medical practices

Summary of Work: Twenty semi-structured interviews were conducted with year two and year three students, who participated in the course. Following the students' written consent, the interviews were recorded. Transcription and thematic analyses conducted by the researchers to all interviews. For validation, the researchers used triangulation and experts reading qualitative strategies.

Summary of Results: The research results revealed the flexibility and openness of medical students to see medical practices in alternative and artistic tools. They approached medical practice, professionalism, patient perspectives and ethics in new ways. The data collected indicates that the students enhanced their skills in observation, reflection, metacognition, criticism and an open mind to different cultures and human differences.

Discussion and Conclusions: The course 'Medicine and the Arts' is a powerful tool to change medical students' attitudes towards the role of art and humanities in the medical practice. It provides them with tools to see doctoring from different cultural and behavioral angles and perspectives. Conclusion: Using arts and humanities in medical education can be an excellent way to humanize medicine and also to cultivate and enhance important clinical skills. This can be a leading cause to change medical students' perception of doctoring from only treating the body to healing the body and soul.

Take-home Messages: A medical humanities course should be part of the core curriculum in the medical education programs and not an elective course. It is an excellent tool to humanize medicine and enhanced the future doctors' clinical, interpersonal and communications skills.

Medical Education in Mongolia

AUTHOR(S):

- **Angela Fan, National Yang-Ming University, Taiwan (Presenter)**
- Urangoo Boldbaatar, National Yang-Ming University, Taiwan
- Russell Kosik, Tenth People's Hospital, Tongji University School of Medicine, Shanghai, China
- Yunung Hsu, National Yang-Ming University, Taiwan
- Qi Chen, Nanjing Medical University, China

ABSTRACT

Background: Mongolia is located on the plateau of Central Asia, between Russia to the north and China to the south. Its population has reached 3,240,861 in January 2019 with life expectancy 65.7 for male and 74.2 for female. Mongolian people have an enormous need for high quality medical care, however, there are not enough systematic investigation and evaluation of its current medical education system.

Summary of Work: Extensive review of literature as well as data from medical universities, the Ministry of Education, Science, Culture and Sports, and Center for Health Development of Mongolia have been acquired and thoroughly examined at the end of 2018.

Summary of Results: The National System of Higher Education in Mongolia had significantly changed over the last 25 years. Numerous private universities had entered the system since. Currently, there are eight medical universities and colleges with four state and four private in Mongolia. Among the eight, six offer degree program to train Physicians-to-be and two offer post graduate clinical training for clinical specialization, course specialization, master's degree, and PhD degree.

Discussion and Conclusions: Private medical universities do not have adequate supply of faculty members while many faculty members are existing the system, neither enough development of post graduate clinical training, sub-specialization, and PhD programs are created and maintained. In order to meet the growing demand of the population, Mongolia medical education system needs to improve in many ways, including updated curriculum and technology to reach the international standard.

Take-home Messages: At the era of globalization and modernization, an objective evaluation of the Mongolia medical education system is needed for international communication and collaboration. This study has done a preliminary study of the current status of physician training in Mongolia. More systematic and comprehensive evaluation of its curriculum, post graduate programs, and accreditation are recommended.

Will eye tracking video feedback enhance simulator performance?

AUTHOR(S):

- **Ninos Oussi, Division of Surgery, Department of Clinical Science, Intervention and Technology (CLINTEC), Sweden (Presenter)**
- Linnea Groph, KTH Royal Institute of Technology, Sweden
- Jessica Ho, KTH Royal Institute of Technology, Sweden
- Ann Kjellin, Division of Surgery, Department of Clinical Science, Intervention and Technology (CLINTEC), Sweden
- Markus Castegren, Department of Anesthesia, Surgical Services and Intensive Care (PMI), Karolinska University Hospital, Sweden
- Lars Enochsson, Division of Surgery, Department of Surgical and Perioperative Sciences, Umeå University, Sweden

ABSTRACT

Background: The introduction of eye trackers has been shown to distinguish experts from novices in laparoscopic practical skills and improve novices' skills when following gaze patterns of experts. Our aim with this pilot study, was to, through group interviews seek answers regarding participants' motivation, and perception in feedback mechanism in surgical training.

Summary of Work: A randomized pilot study, with surgical residents performing two laparoscopic simulator (Simball box) tasks (rope race and basal suturing) with eye-tracking glasses (Tobii Pro Glasses 2) using A. gaze (red ring) or B. no gaze, for feedback (Pilot study flowchart). After signed informed consent, a questionnaire for background info was completed. The performed tasks were video recorded, and replayed for the residents as means for feedback. Using eye tracking glasses, group A had gaze for feedback while group B saw no gaze while watching the video and receiving feedback. All subjects performed a final questionnaire following a group interview (Table 1).

Summary of Results: 10 surgical residents (3 females and 7 men) volunteered. Due to interruptions or interfering clinical work only 3 participated in the following group interview. These aspects were also present in the discussion, and formulated as Dislikes/Likes (Table 2). Furthermore, they preferred having a more experienced surgeon when acquiring a new practical skill, as well as receiving instant feedback during ongoing procedures. All participants mentioned lack of time as the crucial point.

Discussion and Conclusions: Limitations to this study were the small number of participants with even smaller numbers in the following group interview. Therefore, larger numbers are called for in future studies. Nevertheless, the participants were open-minded and pro co-creation in conducting the pilot study. They all agreed on the potential of incorporating eye tracking and visual training as means to enhance training efficiency. Despite, the availability of simulators, work overload was the greater obstacle to efficient simulator training. The discussions show, that time taken from clinical work to practice with laparoscopic simulators seems difficult without a specified mandatory curriculum. They also suggested using a combined video-recording of hands and gaze pattern, due to the importance of hand-eye-coordination when performing laparoscopic tasks.

Take-home Messages: Eye tracking could enhance simulator training efficiency.

E-learning influence on physical examination test performance of Junior Clerkship students

AUTHOR(S):

- Jinting Yan, The University of Hong Kong, Hong Kong (Presenter)
- Kent-Man Chu, The University of Hong Kong, Hong Kong

ABSTRACT

Background: For most Junior Clerkship MBBS students in the University of Hong Kong, they are directly involved in clinical environment for the first time. Physical examinations, as foundation skills remain key parts in Junior Clerkship Surgery Block. The Department of Surgery originated a series of 18 e-learning videos, demonstrating physical examinations and basic surgical procedures. Videos were uploaded on Clinical Skills Online Learning Platform in Li Ka Shing Faculty of Medicine. These videos as blended resources are facilitating teachers demonstrating standardized clinical skills, as well as supporting students reviewing and practicing clinical skills. Students' physical examination skills were tested at the end of Surgery Block.

Summary of Work: Research was implemented on influence of e-learning videos on Junior Clerkship students' physical examination tests performance. 205 Junior Clerkship students' online attendances were collected from the platform. Descriptive data measured students' e-learning participation performance. Physical examination tests were held at the end of Surgery Block and test result differences in high and low participation groups were compared by independent t-test.

Summary of Results: Students' e-learning participation were much beyond expectation. The most popular video, Hernia Examination, attracted 79% students participation. Individual performance varies from none to fully participation. Students were evenly divided in two groups based on their participation difference; students viewed 10 out of 18 videos or less were in low participation group and those viewed 11 or more were in high participation group. Test result between these two groups was compared by independent t-test. Mean scores of physical examination results had significant difference between low participation group 2.959 and high participation group 3.129 ($p=0.038$).

Discussion and Conclusions: Junior Clerkship students physical examination test result can be significantly influenced by their e-learning participation performance. The physical examination test result of students viewed more videos are higher than those viewed less videos.

Take-home Messages: This study highlighted that e-learning providing students an effective learning approach. Future studies of e-learning influence in other groups of students are required.

The Efficacy of Virtual Reality Learning in the Acquisition of Arthroscopic skill: a Systematic Review and Meta-analysis

AUTHOR(S):

- Liang-Tseng Kuo, Chang Gung Memorial Hospital, Chiayi, Taiwan (Presenter)
- Cheng-Ting Hsiao, Chang Gung Memorial Hospital, Chiayi, Taiwan

ABSTRACT

Background: Surgical training has evolved since the implementation working-time restrictions and increasing complexity of modern surgical techniques. Virtual reality (VR) learning has proved effective in varieties of surgical training including laparoscopic surgery. This study aimed to determine the effectiveness of VR simulator-learning, specifically in arthroscopic skills, via a systematic review.

Summary of Work: A systematic review of randomized controlled trials (RCTs) comparing outcomes of participants who did and did not receive VR training in arthroscopic surgery. We searched MEDLINE, Cochrane Central Register of Controlled Trials, and EMBASE (Jan 1st 1990 ~ Jan 15th 2019). Risk of bias was assessed and calculated pooled risk estimates.

Summary of Results: Ten RCTs comparing VR/non-VR training in arthroscopic surgery (shoulder, n=5; knee, n=3; shoulder and knee, n=2) were included (n=282 participants: VR n=130; non-VR; n= 52). Anatomical learning (1/10) and technical task performance (9/10) were assessed following training (live patients, 4/10; cadaveric model/simulators, 6/10). 8/10 reported significant effects for VR training.

Discussion and Conclusions: Six studies reported time-to-task completion. Global rating scales were used in 7/10 trials. The meta-analysis is ongoing, results will be reported. Most studies reported significant improvements with VR training. Due to inherent heterogeneity of trials (eg. different simulators), caution should be taken when applying results to real-world practice. VR training leads to an improvement of technical skills in arthroscopic surgery. However, further trials may be needed to validate the proper training module for different anatomical location and different level of trainees.

Take-home Messages: VR stimulation is an effective learning tool in improving the skills in arthroscopic surgery for different kinds of medical trainees. However, the maintenance of the skills acquisition from VR still needs continuing clinical practice or training.

Evaluation of Operating Room Learning Environment for UAE Obstetrics-Gynecology Residents using STEEM

AUTHOR(S):

- Ebtehal Alramsi, Cornich Hospital, SEHA, UAE (Presenter)
- Neha Gami, Healthplus Family Health Clinic, UAE

ABSTRACT

Background: The learning environment in the surgical theatre has been acknowledged as vital for high-quality training of surgical trainees and simple tools have been designed to measure the perception of residents about this environment. Cassar developed Surgical Theatre Educational Environment Measure (STEEM), an instrument that measures the learning environment in the surgical operating theatre. STEEM consists of 40 questions and includes four subscales dealing with teaching and training, learning opportunities, the atmosphere and supervision/workload/ support. However, no studies were found that assessed this in the context of Obstetrics and Gynecology residency programs in the UAE.

Summary of Work: This was a cross sectional, questionnaire based study with 31 respondents using the pre validated STEEM questionnaire. The responses on the online survey used were translated onto an excel sheet using a likert scale. Cronbach's alpha and Intraclass correlation were used to establish the internal consistence and reliability of the questionnaire. The average score for each hospital and overall for all residents was calculated and compared using Student's test.

Summary of Results: The overall score on the STEEM for residents of both hospitals taken together was 142.1 (71.05%). The score for Corniche hospital residents was 134.9 (67.45%) and that for Al Ain was 152.2 (76.1%). The scores for Al Ain were significantly better on the questionnaire as a whole and on three out of the four domains.

Discussion and Conclusions: This small study has shown that the OBGYN residents in Corniche and Al Ain hospitals of UAE, perceive the learning environment in the surgical theaters to be healthy and encouraging. It has also highlighted those areas that need improvement and those that are the strengths of the program. A more qualitative approach to understanding the individual factors that determine this perception will help to maintain high quality of surgical training in the residency programs in the region.

Take-home Messages: The study revealed a positive perception of the residents with respect to the learning environment in the surgical theaters and that STEEM is a valid tool for assessing this aspect of residency training.

The effect of training on laparoscopic hysterectomy-module in virtual reality simulator on residents' first laparoscopic hysterectomy: a randomized controlled trial

AUTHOR(S):

- Ewa Jokinen, Helsinki University Hospital and University of Helsinki, Finland (Presenter)
- Tomi Mikkola, Helsinki University Hospital, Finland
- Päivi Härkki, Helsinki University Hospital, Finland

ABSTRACT

Background: In Obstetrics and Gynecology, changes in gynecological surgery and in resident education has diminished residents exposure for live operations. Fortunately, technology offers solutions in form of laparoscopic simulators. While hysterectomy is one of the most common gynecological operations, in this study, our objective was to evaluate the effect of training on laparoscopic hysterectomy module in virtual reality simulator on residents' first laparoscopic hysterectomy as a first surgeon.

Summary of Work: This randomized prospective study was carried out in Helsinki University Hospital and Hyvinkää Hospital, Finland. We recruited twenty residents in Obstetrics and Gynecology, of which half trained ten times on laparoscopic hysterectomy module in virtual simulator, and the rest comprised the control group. Participants' first laparoscopic hysterectomy as a first surgeon was video recorded and assessed later by two assessors, whom were blinded for the operator and his/her study group. The assessment was done by using Objective Structured Assessment of Technical Skills (OSATS) forms for Global Rating Skills (GRS) and for laparoscopic hysterectomy (LH-OSATS), and Visual Analogue Scale (VAS). The scores and surgical outcomes were compared between the groups.

Summary of Results: We found statistically significant difference both in OSATS- and VAS-scores between the groups. The mean OSATS score for GRS was 17.0 in the intervention group and 11.2 in the control group ($p=0.002$). The mean procedure specific OSATS score was 20.0 and 16.0 ($p=0.012$), respectively, and the mean VAS-score was 55.0 and 29.9 ($p=0.001$), respectively. Operative time was 144 min in the intervention group, and 165 min in the control group, but the difference of 21 min was statistically insignificant. In blood loss or direct complications there was no difference between the groups.

Discussion and Conclusions: Based on this study, skills gained in the virtual simulator, seems to be transferable into operating room. Clinical practice under supervision is needed to learn a new operative procedure, but training in a simulator is most likely to shorten the training period.

Take-home Messages: While training program in the virtual reality simulator is relatively easy to implement, it should be included in laparoscopic hysterectomy training curriculum and precede live operations.

Introduction to Surgery and Anaesthesia (ISA): the impact of a student led surgical course at one year

AUTHOR(S):

- Irena Norman, Guy's, King's and St Thomas' School of Medical Education, UK (Presenter)
- Charles Southey, Guys, Kings and St Thomas School of Medical Education, UK
- Akshaya Rajangam, Guys, Kings and St Thomas School of Medical Education, UK
- Jacques-Henri Meurgey, Guys, Kings and St Thomas School of Medical Education, UK
- Somain Verma, Guys, Kings and St Thomas School of Medical Education, UK

ABSTRACT

Background: With increasing emphasis on general practice and psychiatry in medical school, surgical education is becoming increasingly neglected. Our medical school has followed this trend, having removed a dedicated surgical rotation, which may be problematic to students interested in these specialties ' especially as early engagement is essential to achieve success at securing training posts.

Summary of Work: To help combat the shortfall in surgical teaching we developed an 8-week surgical course in January 2018 aimed at early-years medical students. The course comprised of teaching in surgical and anaesthetics skills, surgical anatomy, clinical teaching and surgical career building. In addition, based on a student poll, we offered two sessions on cardiac surgery and plastic surgery voted by the students to help increase their engagement run by specialist trainees. One year later we assessed the impact the course had on students by assessing the proportions of students engaging in research, assisting in surgery and being involved in extra-curricular surgical activities compared to their results the previous year. Ethical approval was obtained. chi square tests were performed to assess the proportions of students participating in activities.

Summary of Results: 15 students took part in the ISA course. The mean age of participants was 21 \pm 1.6, with 73.3% being female. In the year before the course 13.3% of participants had assisted and the year after 53.3% had assisted in surgery ($p = 0.06$). 13.3% were involved in research project prior to the course and 60% were involved in research projects after the course ($p = 0.02$). 0% had a surgical logbook before the course and 60% kept a surgical logbook after the course ($p=0.001$). The feedback following the course was also overwhelmingly positive with 100% of participants rating the course as either very good or excellent on a 5 point Likert scale.

Discussion and Conclusions: Our course resulted in significantly increased engagement in a number of surgical extra-curricular activities in the following year.

Take-home Messages: Offering a near-peer surgical course would be an effective way to increase student's engagement and to help facilitate them gaining surgical posts in the future.

Basic Suturing Skills Training using the Four-component Instructional Design (4C/ID): Perceptions of Educators and Learners

AUTHOR(S):

- Zaw Lwin, Department of Emergency Medicine, KK Women's and Children's Hospital, Singapore (Presenter)
- Ronald Ming Ren Tan, Department of Emergency Medicine, KK Womens and Childrens Hospital, Singapore
- Sashikumar Ganapathy, Department of Emergency Medicine, KK Womens and Childrens Hospital, Singapore

ABSTRACT

Background: As the suturing skills are one of the required competence in the children's emergency (CE) department, the pediatricians in collaboration with pediatric surgeons conducted a basic suturing skills training session for the medical officers posted in the CE department.

Summary of Work: The authors designed the training session by adopting van Merriënboer's four-component instructional design (4C/ID). The session consisted of a 2-hour face-to-face workshop and the workplace training over three months period. In the workshop, the trainers provided a sequence of learning tasks (the first component) such as pre-workshop readings, the lectures, and the hands-on practice of suturing on the mannequin; supportive information (the second component); and just-in-time information (the third component) required for the learning tasks. After the workshop, the trainers allowed the trainees to perform part-task practice (the fourth component) of suturing to patients under supervision. The authors explored the perceptions of the trainees by using a survey questionnaire and a semi-structured interview of selected trainees.

Summary of Results: Thirty-two medical officers attended the training session, and the majority of them found the session useful and practical as they could learn the different suturing techniques systematically. They enjoyed the hands-on experience of skills training on the mannequins, and they commented that feeling confident to perform the procedure on the patients. They also valued the support of the trainers in providing information and constructive feedback. The trainees suggested to allocate more time for the hands-on session and to increase the trainer-trainee ratio. The trainers closely supervised the trainees' suturing procedure on patients and remarked that their performance was satisfactory.

Discussion and Conclusions: This small-scale study demonstrates an essential role of 4C/ID model in training of complex surgical skills. It also highlights the critical role of trainers in the scaffolding of trainees' performance skills by providing necessary information, supervision and constructive feedback. The trainers should review the duration of the workshop, and the number of trainers and trainees to maximize the outcomes of the training session.

Take-home Messages: The 4C/ID model can be used as a blueprint for the training of the surgical skills in the CE department.

The role of peer observation in the acquisition of surgical skills in virtual reality tasks in medical students

AUTHOR(S):

- Hsin-Yi Chiu, Taipei Medical University Hospital, Taiwan (Presenter)
- Chia-Che Chen, Taipei Medical University Hospital, Taiwan
- Po-Li Wei, Taipei Medical University Hospital, Taiwan

ABSTRACT

Background: Peer-assisted learning has been regarded as an adjunct to teaching modalities. It remains inconclusive regarding the benefits of peer observation in skills learning. Hence, we investigated whether the active engagement(AE) of peer observation in addition to expert demonstration would facilitate the performance in the virtual reality tasks.

Summary of Work: The programs involved four VR tasks including basic (camera targeting), intermediate (energy dissection and energy switching), and advanced (suture sponge) tasks in the da Vinci Skills Simulators, which were set up in the operating room at Taipei Medical University Hospital. Fifty medical students participated in the study. The AE of the participants was defined as the total number of peer observations in addition to expert observation before their performance. We assessed the correlations between AE and surgical task performance using Pearson correlation and the concept of learning analytics.

Summary of Results: AE was correlated with the energy dissection task ($r = 0.329$, $p = 0.02$) and marginally associated with the energy switching task ($r = 0.271$, $p = 0.057$). However, AE was not correlated with either task scores for camera targeting ($r = 0.096$, $p = 0.509$) or task scores for suture sponge ($r = 0.091$, $p = 0.529$).

Discussion and Conclusions: Our findings suggest that AE of peer observation may facilitate learning energy dissection task, which is an intermediate-level task, but not in other basic or advanced tasks in a VR context. The study highlights the potential effect of AE of peer observation on surgical learning based on a distinct level of tasks. Tasks that fit the learners' level are recommended. Nevertheless, the effectiveness of peer observation on surgical training still has to be explored to ensure favorable results and optimal learning outcomes.

Take-home Messages: 1. We applied LA to evaluate the impact of peer observation on learning skills. 2. AE of peer observation had no obvious effect on the basic task. 3. AE of peer observation had potential benefits in the intermediate tasks. 4. AE of peer observation had a negative correlation in the advanced task. 5. Training tasks that fit the learners' level are recommended.

Rethinking Stress and Surgeon Performance: Identification of Stress States in Surgery

AUTHOR(S):

- Sydney McQueen, University of Toronto, Canada (Presenter)
- Melanie Hammond Mobilio, University of Toronto, Canada
- Aidan McParland, University of Toronto, Canada
- Natashia Seemann, University of Toronto, Canada
- Ranil Sonnadara, McMaster University, Canada
- Carol-anne Moulton, University of Toronto, Canada

ABSTRACT

Background: Stress in surgery has a direct impact on surgeon performance and wellness. Stress is not only a manifestation of physiology, but also involves cognition, thought, and emotion, expressed in a sociocultural milieu, combining to produce various 'stress states'. Acknowledging the multidimensional aspects of a surgeon as human, this study took a holistic approach to study stress in surgery. The purpose of this study was to develop a conceptual framework for understanding how physiology, cognition, thought, and emotion come together to produce the various 'stress states' in the performance of surgery.

Summary of Work: We conducted semi-structured interviews with 24 staff surgeons at the University of Toronto, purposively sampled for different experience levels and surgical practices. Data were coded and analyzed iteratively by three researchers using a constructivist grounded theory methodology until theoretical saturation was achieved. Questions explored the different dimensions of surgeon stress and how these facets come together to shape the stress experience.

Summary of Results: Although surgeons identified stress as being a critical part of practice, they lacked a shared vocabulary to describe these experiences. A theoretical framework was co-constructed to identify surgeon stress states, with each state being multidimensional in nature. For example, the state of distress was associated with negative emotions including fear and anxiety, a physiologic stress response, and cognitive impediments including a reduced ability to think clearly and make sound decisions. The state of engagement was identified as having less physiologic activation, enhanced cognition, and positive emotions. Participants described how the sociocultural environment can influence the experience and expression of different states. Some states, such as readiness to perform and flow, were identified as desirable and actively sought after, while others, including burnout and disengagement, were identified as hazardous.

Discussion and Conclusions: Providing a framework for understanding the stress states in surgery may help surgeons recognize these states. Future investigations should identify strategies for negotiating states, which may be used to enhance performance and physician wellness.

Take-home Messages: Considering the physiologic, cognitive, emotional, and sociocultural dimensions of the surgeon stress experience allows for the identification of 'stress states' in the performance of surgery.

Simulated Laparoscopic Skills Training Program by Surgical Residents

AUTHOR(S):

- Raquel Peixoto, Federal University of Ceara, Brazil (Presenter)
- Ricardo Barreto, Unichristus, Brazil
- Hermano Rocha, Unichristus, Brazil
- Glaydison Borges, Unichristus, Brazil
- Arnaldo Peixoto Júnior, Unichristus, Brazil
- Luiz Moura Júnior, Unichristus, Brazil

ABSTRACT

Background: Simulators for video-surgery has been proposed as teaching tools, allowing training of students under more controlled and safe conditions.

Summary of Work: 12 residents of surgery from four different hospitals were trained in video simulators in seven sessions over seven months. In a quantitative longitudinal experimental study, the assessment of the progression of laparoscopic skills was carried out by two structured scales, Objective Structured Assessment of Technical Skills (OSATS) and the Progression of Proficiency Scale (EPP), and by participant's perception. Anova and chi square tests were performed to compare variables, and correlations between numerical variables were verified through linear regression. The Average Ranking was calculated for Likert scale analysis. This study was approved by the Research Ethics Committee of the institution.

Summary of Results: There was a statistically significant improvement in the OSATS score in relation to the items: Respect to the tissue ($p = 0.006$), Time and movement ($p = 0.001$), Knowledge and handling of instruments $p = 0.002$), Circulation flow ($p = 0.001$), Knowledge of the specific procedure ($p = 0.001$). The total number of points by EPP and the mean score in the tests by the modified OSATS were significant (< 0.001 and < 0.001) over the months. The training program contributed to the development of surgical skills in the students perception, with the best evaluated items being the handling of tweezers and needle holders and the knitting. The worst evaluated items were the hapticity and the gait step.

Discussion and Conclusions: There was significant gain in skills by the residents during the seven months of simulated training. At each stage of the training, individualized feedback was provided to participants. The structured evaluation instruments have been useful in guiding curricular changes as well as identifying individualized learning needs. The maintenance of learning beyond the seven months of study was not evaluated. There was great satisfaction with the facilitators and with the work environment, without evasion.

Take-home Messages: Virtual reality training has been an effective complement in the training of surgical performance. Reflecting on their practice after structured assessments allows trainees to improve their perceptions about learning.

Developing and gathering validity evidence for a simulation-based tool to assess technical expertise in open aortic aneurysm repair

AUTHOR(S):

- Leizl Joy Nayahangan, Copenhagen Academy for Medical Education and Simulation, Denmark (Presenter)
- Jonathan Lawaetz Rasmussen, Copenhagen Academy for Medical Education and Simulation, The Capital Region of Denmark, Denmark
- Michael Strøm, Department of Vascular Surgery, Rigshospitalet, Denmark
- Louise Rosenørn de la Motte, Department of Vascular Surgery, Rigshospitalet, Denmark
- Lars Konge, Copenhagen Academy for Medical Education and Simulation, and The Capital Region of Denmark, Denmark
- Jonas Peter Eiberg, Department of Vascular Surgery, Rigshospitalet, Denmark

ABSTRACT

Background: Systematic and objective assessment is needed to ensure competence in open resection of infrarenal aortic aneurysms (AAA). A sound assessment provides clear learning objectives and is used for structured feedback. Few assessment tools are available however rigorous validation using a contemporary framework is needed. The aims of this study were to develop a procedure-specific assessment tool for open AAA, gather validity evidence to ensure that training objectives are met and establish a pass/fail standard.

Summary of Work: Messick's framework was used to gather validity evidence from different sources. To ensure content evidence, three experts of open AAA surgery and an expert of assessment and validation developed the assessment tool (open aortic aneurysm repair assessment of technical expertise (OPERATE)). Integrity of test data was collected in a standardized simulation-based setting. Twenty-five vascular surgeons with varying experiences performed open AAA surgery and were video-recorded. All tests were scored independently by three blinded raters. The Angoff method was used to investigate a pass/fail score to determine consequences of testing.

Summary of Results: Sixteen novices and nine vascular surgeons highly experienced in open AAA surgery were enrolled. The OPERATE achieved a high internal consistency (Cronbach's alpha = .92) and inter-rater reliability (Cronbach's alpha = .94, intraclass correlation = .83). The performances of the two groups were compared with novices performing inferior to the experts as expressed by mean OPERATE scores of 14.91 and 25.63, respectively ($p = 0.01$). The pass/fail score was set at 38.4 points. None of participants passed the test.

Discussion and Conclusions: Solid validity evidence was established for the OPERATE tool and can be used in both testing and training scenarios with different levels of supervision. The high pass/fail score underlines that achieving minimum competences in all levels of a complex and potentially dangerous open surgical procedure is challenging. The fact that the experts failed accentuates that even experts cannot be thrown into a simulator and peak perform but need 'warm-up' and time before real performance is estimated.

Take-home Messages: Expert participants need to 'warm up' on the simulator before their results reflect their true expertise. The OPERATE is a highly reliable, procedure specific tool to assess competency during open AAA training and testing.

Scan, plan, print, practice, perform: Development and use of a patient-specific 3-dimensional printed model in Video-Assisted Thoracoscopic Surgery (VATS) lobectomy

AUTHOR(S):

- Hsu-Kai Huang, Tri-service General Hospital, Taiwan (Presenter)
- Kuan-Hsun Lin, Tri-service General Hospital, Taiwan
- Yi-Jhih Huang, Tri-service General Hospital, Taiwan
- Tsai-Wang Huang, Tri-service General Hospital, Taiwan
- Hung Chang, National Defense Medical Center, Taiwan

ABSTRACT

Background: Video-Assisted Thoracoscopic lobectomy(VATS lobectomy) is a preferred treatment for early-stage lung cancers. This high-risk operation needs intense training before surgical residents develop competency. Conventional training usually relies on computer simulation, living animals or human cadavers. Currently, performing surgical maneuvers on a patient-specific simulator is possible with 3D printing technologies. To date, there was no simulator designed with patient-specific models, pulmonary blood flow and single-lung ventilation.

Summary of Work: We developed this high-fidelity 3D-printed simulator for safety learning of VATS lobectomy. The whole surgical maneuvers such as dissection of the hilum, dissection and stapling of the vessels and bronchus, and finally stapling of the fissure and dissection of lymph nodes are just like real-life surgery.

Summary of Results: We enroll 3 experienced board-certified surgeons into the study for validating of the simulator that designed for standard VATS lobectomy and 3 novice surgeons for learning the surgical skills. The experience surgeons convince to do surgery in the 3D-printed simulators is almost like real-life surgery. After the training programs, the novice surgeons developed great independence and self-confidence throughout the whole training.

Discussion and Conclusions: Training methods of VATS lobectomy include animal model, human cadaver, computer simulation, and 3D printing simulation model. The human cadaver is an ideal model because of the anatomic accuracy and elastic tissue. Training on the live animal is also very helpful. However, there are some problems including ethics and cost. Computer simulation presents an opportunity to 'rehearse' this technically demanding procedure, but lack of haptic feedback during the training process. Our 3D-printed simulator with the accurate anatomy and vascular sheath structures allows performing surgical maneuvers that simulate VATS lobectomy. It is a convenient and reproducible method to assess the capability and competency of trainees to perform VATS lobectomy.

Take-home Messages: This high fidelity 3D-printed simulator presents with excellent functions such as haptic feedback, patient-specific design, pulmonary blood flow, and single-lung ventilation. The training model provides the trainees independence and self-confidence throughout the whole procedure of VATS lobectomy.

Using a Virtual Reality Ophthalmic Surgery Simulator to Improve Surgical Observation Experiences for Medical Students

AUTHOR(S):

- Daniel Hutter, University of Miami Miller School of Medicine, USA (Presenter)
- Kara Cavuoto, University of Miami Miller School of Medicine, USA

ABSTRACT

Background: Medical students pursuing a career in ophthalmology spend considerable amounts of time observing eye surgery. The benefit of the time spent in surgical observation is unclear, as students may not possess the knowledge to appreciate the nuances of surgery.

Summary of Work: To assess whether training with a virtual reality haptic ophthalmic surgery simulator improves the surgical observation experience for medical students who plan to go into ophthalmology. Medical students answered questions to assess their experience in the ophthalmology operating room, both before and after training on the HelpMeSee ophthalmic surgery simulator. Training consisted of half-day sessions with one or two students led by an ophthalmologist with expertise in simulation education. These sessions covered surgical ergonomics, surgical microscope adjustment, and uses/features of surgical instruments. The study employed a mixed methods design: quantitative data derived from selected-response written survey items, and qualitative findings comprised of responses to open-ended written and semi-structured interview questions.

Summary of Results: Based on students' mean ratings on representative written survey items, respondents were more active observers in the OR and were more prepared to observe in the OR after simulation-based eye surgery training. Representative student responses to post-simulation open-ended written survey questions included: 'Going through the simulation provided me with an improved understanding of the technical skills and surgical steps required to complete cases in the OR. It also helped reinforce the steps and improved my retention.' 'Prior to going through the training session, my focus would only be on the screen displaying the surgery. After, I split my focus between watching the surgery on the screen and actually watching what the surgeon was doing with their hands/feet and what instruments they were using.'

Discussion and Conclusions: Virtual reality simulation improves medical students' observation experience in ophthalmic surgery.

Take-home Messages: After learning about the basics of ophthalmic surgery in my simulator session, it was a much more enriching experience to be in the OR. Having the chance to sit down on the simulator and actually attempt some techniques made it possible for me to better appreciate what I was observing in the OR.

Educational experience: Surgical skills workshop for ENT residents

AUTHOR(S):

- **Gabriela Perez Raffo, Instituto Universitario Hospital Italiano, Argentina (Presenter)**
- Florencia Fernández, Hospital Italiano de Buenos Aires, Argentina
- Ana Laura Cajelli, Hospital Italiano de Buenos Aires, Argentina
- Matías Parreño, Hospital Italiano de Buenos Aires, Argentina

ABSTRACT

Background: There is a well-recognized need for the development of surgical skills of junior trainees in all branches of medicine. The resort to human cadavers, animal, or human-simulated plastic models is widely practiced. In medical training, simulation offers a safe and realistic environment. A medical simulator is a physical object that reproduces a real clinical scenario. With the help of simulators, medical students and junior residents can perform a series of standardised surgical and non-surgical tasks under the direct observation of an expert tutor. Simulation can be used to develop the surgical skills of otolaryngology residents prior to application in a clinical environment. Surgical simulation is becoming a powerful tool for teaching, and also for planning surgery.

Summary of Work: The aim of this study is to examine the effects of the first procedure simulation workshop performed by the ENT residents, on self reported procedural confidence and competence and to grade the residents satisfaction with this new modality of work. ENT residents attended the first one-day procedure workshop, rotated between 4 procedure low fidelity simulation stations: basic nasal station, advanced nasal station, otologic and laryngeal station. Residents completed a survey immediately after the workshop to self-assess procedural confidence, competence and satisfaction. The instructors evaluated the residents competence and skills in each station.

Summary of Results: Nine residents participated in this procedure simulation workshop. In all the stations the level of self-confidence before the practice was low, and this level increased in all PGY to a moderate to high level after the practice. The major change in self-confidence level was obtained at the 'basic nose' station. A 100% of the surveyed considered that the simulation workshop as a very good complement of their theoretical knowledges.

Discussion and Conclusions: In our experience, the major increase in self-reported confidence level among the junior residents was a reflex of the acquirement of basic technical skills. For future procedure simulation workshop, as each resident progresses and with the addition of high-fidelity simulators, they may will apply the basic technical skills they practiced while acquiring new ones.

Take-home Messages: Simulation improves residents self-assess procedural confidence and competence, and promote a dynamic learning environment, reinforcing interpersonal relationships.

Comparison of Faculty versus structured Peer feedback: implications of technical skills training

AUTHOR(S):

- **Guy Sheahan, Queen's University, Canada (Presenter)**
- Richard Reznick, Queen's University, Canada
- Don Klinger, University of Waikato, New Zealand
- Leslie Flynn, Queen's University, Canada
- Boris Zevin, Queen's University, Canada

ABSTRACT

Background: The surgical training environment has been required to adapt to multiple changes in recent years. Two challenges have placed significant burdens on traditional training methodology: the emerging need for critically reflective clinicians, and restrictions in the traditional methods of technical skills training. Implementing training for these disparate elements is challenging. Simulation-based training has been widely used to teach technical and non-technical skills, however consistent access to faculty feedback during training and implementation of critically reflective activities remains problematic. Self-regulated learning can be used to both provide the mechanism by which skill acquisition and critical reflection can occur.

Summary of Work: This research consisted of two complimentary studies examining technical skill acquisition and self-regulated learning in medical students using structured peer-feedback to learn technical skills. The technical skills study consisted of two non-inferiority randomized-controlled trials comparing structured peer-feedback versus traditional faculty feedback for the acquisition of a technical skill. The peer-feedback group provided feedback to each other based on structural support provided through pre-training in the assessment tool. Participants completed five attempts at the skill over four days. The impact on self-regulated learning was examined using thematic analysis of: student responses to multiple surveys, and the written feedback provided by the peer-feedback group.

Summary of Results: Performance in the peer-feedback group was not inferior to faculty group across all assessment criteria used in the study: blinded expert assessment, time to completion and functional stress test. Students developed increasingly sophisticated assessment and feedback skills through regular small exposures to the assessment task. Students' self-regulated learning was demonstrated by their improving technical performance, improving evaluative judgement of their peer's performance, self-identification of the benefit of these assessment skills to their own learning, and subsequent implementation of these skills in other contexts. Despite improved assessment skills students did not believe the feedback they provided was beneficial – likely due to a lack of external feedback on their assessment skills from faculty.

Discussion and Conclusions: This research has demonstrated that with appropriate support, structured peer-feedback can be used to augment traditional faculty led training, whilst additionally developing student's evaluative judgement and self-regulated learning.

Characteristic of medical students mentoring in Walailak University, Thailand

AUTHOR(S):

- Waritsara Leepaopan, Vachira Phuket Hospital Medical Education Center, Thailand (Presenter)
- Patpawi Ngamsing, Vachira Phuket Hospital Medical Education Center, Thailand
- Withita Jangiam, Vachira Phuket Hospital Medical Education Center, Thailand

ABSTRACT

Background: Medical education and training can directly contribute to the development of psychological distress in medical students. For medical students, having a physician who serves as a mentor may be one of the most valuable resources on the path to becoming a doctor. To make a mentorship between medical students and advisor, mentee has to searching for a good mentor to guide the creative ways. The aim of our study is to seeking good mentor's characteristics of medical staffs to enhancing undergraduate medical student academic performance, research productivity, career planning, and overall satisfaction.

Summary of Work: A cross-sectional study was conducted among 1st-5th year of medical students in Walailak university. A questionnaire was disseminated to the medical students about characteristics of a good mentor that they are appreciated which divided into five topics; personality, knowledge, how mentor care of a patient, morality and commination skill. Data collection was provided by Google form. Descriptive statistics were used to analyze data.

Summary of Results: Mentees are perceived to have primary responsibility for finding a suitable mentor. Characteristics of effective mentors include being trustworthy(58.29%), having counselling knowledge(37.71%), providing the best care for the patient(36.00%), being honest(35.43%) and a mentor who acts in the interests of the mentee and be a good listener(17.71%).

Discussion and Conclusions: The answer of medical students suggest that the advisor should give them a positive reinforcement, have an appropriate knowledge go hand in hand with virtue and be a good doctor model. The characteristics that found in our study should demonstrate to the medical center for improve mentoring relationships and medical students are perceived as a mutually satisfying and effective instrument for key issues in medical students' professional development.

Take-home Messages: The effectiveness of the mentoring program is supported by several factors that, as a whole, lead to the development of a professional graduate. Let's be an effective mentor to get a good doctor.

Factors affecting medical students burnout and motivation in the new mentoring program

AUTHOR(S):

- Thunyaporn Pruangmethangkul, Faculty of Medicine Ramathibodi Hospital, Mahidol University, Thailand (Presenter)
- Winitra Kaewpila, Mahidol University (Ramathibodi Hospital), Thailand
- Pongtong Puranitee, Mahidol University (Ramathibodi Hospital), Thailand

ABSTRACT

Background: Because of burnout epidemic among medical students and professionals, attempts to alleviate burnout is intensified. According to the JD-R model, burnout is mainly predicted by high job-demands and lack of job-resources. At Ramathibodi Medical School, a new mentoring program has been launched for second-year students aimed at promoting social support/community, self-development, and a culture of respect and appreciation. This study aims to explore the following question: Which factors of the new mentoring program do medical students perceive as having an impact on their stress/burnout and motivation?

Summary of Work: This is the second-phase of an explanatory mixed-methods study. The first-phase was a quantitative study to identify burnout levels using the Maslach Burnout Inventory (MBI). The second-phase involves a qualitative approach. Eighteen participants with highest levels of burnout identified at the first-phase were individually interviewed. Content analysis of the interview transcriptions were independently analyzed by the authors, followed by consensus meetings.

Summary of Results: Factors in the mentoring program students perceived as helping to alleviate burnout were: a) fun and relaxing atmosphere of the activities, b) peer/group interaction with shared feeling/experiences and support, c) mentor's advice and support, d) mentor as a role model. Major activities students perceived to improve motivation were: patient/clinical-exposure experiences and mentor's retreat sessions. These activities improve students' motivation by: creating connection from classes to real-life clinical experiences, providing empathetic and dedicated physician/mentor role models, and improving students' self-efficacy. Factors hindering students' motivation were: competing priorities of tasks (e.g. examination), lack of mentor's contact-time and engagement, the gap-generation (made it difficult to build rapport with the students) and failing to create a safe space for group sessions.

Discussion and Conclusions: The interventions pointed towards a decrease in burnout and improved motivation, through three main paths: a) increase the value of the learning activities and professional work, b) improve students' self-management (self-efficacy, time-management and emotional regulation), c) improve the sense of community/belongingness.

Take-home Messages: Burnout and motivation interventions should be addressed on these two domains: a) improving students' and mentor's engagement, b) creating a safe environment for group interaction.

What do undergraduate medical students say about supervision activities shown by their clinical mentors during their final clinical year?

AUTHOR(S):

- Angelika Hofhansl, Medical University of Vienna, Teaching Center, Austria (Presenter)
- Gerhard Zlabinger, Medical University of Vienna, Teaching Center, Austria
- David Taylor, University of Liverpool, School of Medicine, UK
- Anita Rieder, Medical University of Vienna, Teaching Center, Austria

ABSTRACT

Background: In 2014 the Medical University of Vienna implemented a fully hospital-based clinical 6th year into the undergraduate medical curriculum. Each cohort (640 students) spend 48 weeks in the University Hospital or in accredited hospitals across Austria and abroad. Students are supervised in a 1:1 setting by clinical mentors. Though we informed all clinical mentors beforehand about our intended aims and outcomes, we did not give detailed specifications regarding single supervision activities. The aim of this retrospective study was to assess students' needs in this regard and how the mentors met them.

Summary of Work: After completing 48 weeks of clinical placements we asked students from 3 cohorts in their final year (2015-2017) using questionnaires about different aspects of clinical supervision as shown by their mentors. We provided a list of 26 activities relevant for clinical supervision and mentoring (items mainly derived from the list published by Kilminster et al., 2007). First we asked about the actual occurrence of each activity, then the students indicated those 5 activities which were most important to them. We did this separately for Internal Medicine and for Surgery.

Summary of Results: We analyzed questionnaires from a total of 1712 students. Supervision activities most important for students were "Discussing individual patients", "Discussing the management of specific disorders", "Teaching specific techniques and procedures", "Bedside teaching" as well as "Providing informal feedback". According to the extent of discrepancies between need and fulfillment the majority of supervision activities was found to be in a tolerable range for both internal medicine and surgery. In contrast, "Providing informal feedback" emerged to be substantially less fulfilled by supervisors in both specialties.

Discussion and Conclusions: Students' needs for supervision activities were comparably met for Internal Medicine and Surgery except for "Providing appropriate feedback". Needs were also qualitatively similarly apparent among student for both specialties. Those findings are highly relevant for faculty development and should be complemented by mentors' perspectives.

Take-home Messages: In order to enhance the quality of clinical education make sure that all supervisors are informed about what students find most important in the clinical learning environment.

Comparison of desired mentor characteristics in regular and strengthening tract medical students

AUTHOR(S):

- Nonglak Butdee, Phichit Medical Education Center, Thailand (Presenter)
- Nalinrat Chaikitthai, Phichit Medical Education Center, Thailand

ABSTRACT

Background: Mentoring is proved supporting medical student's performances, problem solving, career planning and satisfaction. Good relationship with mentor results in positive outcomes. There are 2 tracts of medical students in Naresuan University, the regular one which accepts the students from high schools and the strengthening one which admits the scientific graduates. The two groups of students are different in age and backgrounds. Therefore, it is beneficial to know the preferred mentor characters in each groups.

Summary of Work: Qualitative and quantitative online questionnaire was done in 4th-6th years medical students in 5 medical centers of Naresuan university. We assessed desired mentor characteristics and problems that need supports and consultations.

Summary of Results: The total of 122 medical students were enrolled which 68.8% are from strengthening tract and 31.2% from normal tract. Majority of respondents was from 4th year medical students (42.7%). Almost all students (81.5%) would like to have an unmarried young-aged female staff as a mentor. Pediatrics was the most popular specialty while internal medicine and psychiatric were subsequently chosen (37.9%, 24.2% and 21%). The top 3 problems that required consultation were learning problem, career planning and problem in communication (47.6%, 37% and 4%). The desired characters were friendly (87.1%), approachable (79.5%), good listener (78.2%), positive thinking (55.6%), and keep information confidential (50.8%). There was no difference in character of mentor and common consulted problem between the two groups.

Discussion and Conclusions: Despite the difference in backgrounds of the students, the desired mentor characteristics dose not differ. Positive characters of mentor which are friendly and approachable can be the general characteristics found in pediatrician.

Take-home Messages: All medical students require mentor who is friendly, approachable, good listener and trustworthy regardless of their backgrounds. Pediatricians characters can be the good example of mentor.

Mentoring program in a resource-limited setting: what do students want?

AUTHOR(S):

- Suchadavee Wongchaipawatt, Medical Education Center Chiangrai Prachanukroh Hospital, Thailand (Presenter)
- Piti Phloenchaiwanit, Medical Education Center Chiangrai Prachanukroh Hospital, Thailand

ABSTRACT

Background: The medical staff currently has heavy workloads and not enough time to supervise medical students. The students also have various life and learning management issues. Individual selection of mentors according to the students' needs would yield the best results.

Summary of Work: Questionnaires were distributed to clinical-year medical students to survey their most preferred mentoring system out of three options - 1) one advisor supervising one student throughout three clinical years (One-to-one), 2) one group of advisors supervising a group of students with two to three students from each year (Family) and 3) one group of advisors supervising one group of students from the same year of study. A focus group interview was employed to obtain opinions on the expected qualities of a teacher and a mentoring system in comparison to current situations and suggestions for improvement.

Summary of Results: The family mentoring system is the most preferable because it creates an environment for students to deliberate problems amongst their groupmates, which leads to a wider range of issues being presented to mentors and problem-solving discussions within groups. Having groupmates also makes students more comfortable in approaching mentors. The most expected teacher quality was the facilitator role by stimulating thinking processes and promoting discussion. The students did not require a lecturing role because of the high availability of learning materials. They perceived that the nature of lecturing provides less knowledge retention than self-study.

Discussion and Conclusions: Monitoring and providing support to medical students are two of advisors' roles, but classmates and seniors are capable of helping them in some problems in their study and personal life. This is the benefit of the Family mentoring system. We experienced that the ratio between advisors and students is crucial but the quality of the advisors is even more important. Therefore, a training system for advisors should be provided in order to enhance care and support for medical students.

Take-home Messages: Medical schools with limited time and staff resources can utilize this system to enhance their mentoring programs to maximize the support for students.

Mentor in Mobile

AUTHOR(S):

- **Katja Pura, University of Oulu, Finland (Presenter)**
- Piia Rantakokko, University of Oulu, Finland

ABSTRACT

Background: University of Oulu's Medical School has been developing students' mentoring system. Mentoring aims to provide career counselling, develop professionalism, increase students' interest in research and support students in personal and professional growth. We have faced certain challenges in mentoring. First, medical students have unmet needs in the areas of developing professionalism and sharing their difficult experiences during studies and practical training. Second, mentors worried whether they did enough for their students. Third, how committed mentors are to their mentoring relationships and how do they get support to mentoring.

Summary of Work: The aim was to create structured, focused and target oriented mentoring system to all students covering their whole study period. Milestones: * To add curricular components for providing a purpose and structure to online mentoring system via appropriate tool. * To create safe group communication channel. From the students' point of view the accessibility of a mentor and development in the contents were the prior aims. Busy doctors need a tool which is available easily and includes the most important issues that will help them in their work as a mentor. It is also important that these issues are initially linked to the curriculum. Students seem to need different type of counselling so planning the mentoring issues with different specialists of counselling is an important requirement to success.

Summary of Results: We ended up developing a mobile app in which mentoring groups can discuss, arrange meetings and get themes to meetings. The key elements were framework, flexibility and structure. Flexibility refers to meeting the individual and changing needs of students. Structure concerns ensuring consistency in mentoring and compliance with prevailing codes of conduct and standards of practice. The contents were designed so that there are certain university level issues and degree programme issues which were designed with noticing curriculums and timetables.

Discussion and Conclusions: All the materials on the app are available to all students and mentors during the whole circle of studies. In future we will collect feedback of the app and its functionality and then develop the system.

Take-home Messages: * Thematical framework supports mentoring * Online material access * Structure and developing structure by feedback.

Coaching intervention improves physician well-being

AUTHOR(S):

- Lara Solms, Erasmus Medical Center & University of Amsterdam, the Netherlands (Presenter)
- Anne P.J. de Pagter, Erasmus Medical Center, the Netherlands
- Tim Theeboom, University of Amsterdam, the Netherlands
- Jessie Koen, University of Amsterdam, the Netherlands
- Annelies E.M. van Vianen, University of Amsterdam, the Netherlands
- Matthijs de Hoog, Erasmus Medical Center, the Netherlands

ABSTRACT

Background: Both work engagement and well-being are crucial for the optimal functioning of physicians. Yet, the stressful demands in healthcare put physician functioning severely at risk, posing a threat to patient care and safety.

Summary of Work: This two-wave intervention study evaluates the effectiveness of 6 individual coaching sessions with medical specialists and residents in two academic hospitals in the Netherlands. Physicians who received coaching (N=57) were expected to show an increase in personal resources, motivation, and well-being as compared to non-participants (control group; N=57). No changes were expected for job demands and job resources. To assess the effect of the intervention, we measured physicians' well-being (i.e., burnout, stress, coping, recovery, work-life balance) and motivational outcomes (i.e., task proficiency, work engagement), personal (i.e., psychological capital, self-compassion, reflection, psychological flexibility, proactivity), and job resources (i.e., social support, autonomy, psychological safety), as well as job demands (i.e., workload, job insecurity, competition, work-life-interference) before the intervention (T1) and after the intervention (T2). All constructs were measured with validated questionnaires.

Summary of Results: We tested our hypotheses with separate 2 (treatment vs. control group) x 2 (time) ANOVAs for each variable. For a more in-depth analysis of the variables, we followed up on these analyses with a series of paired comparisons. Our results showed support for our hypothesis. Specifically, physicians in the treatment group showed increases in well-being (e.g., exhaustion, stress, work-life balance) and personal resources (e.g., psychological capital, self-compassion, proactivity) at T2, with all p 's < .05, while there were no such changes in the control group. Effects of the intervention were mostly of medium size based on calculation of Cohen's f . No effects were found for motivational outcomes. As expected, also the majority of job demands and job resources had not changed.

Discussion and Conclusions: Our results imply that the intervention group strengthened their resources and showed improved well-being after the coaching intervention.

Take-home Messages: This study suggests that coaching is an effective way to increase especially personal resources and promote well-being that ultimately help to foster optimal functioning among physicians.

A Systematic Scoping Review of Ethical Issues in Mentoring in Internal Medicine, Family Medicine & Academic Medicine

AUTHOR(S):

- Clarissa Wei Shuen Cheong, Yong Loo Lin School of Medicine, National University of Singapore, Singapore (Presenter)
- Wen Jie Chua, Yong Loo Lin School of Medicine, National University of Singapore, Singapore
- Fion Qian Hui Lee, Yong Loo Lin School of Medicine, National University of Singapore, Singapore
- Ying Pin Toh, National University Health System Singapore, Family Medicine Residency, Singapore
- Lalit Kumar Radha Krishna, Yong Loo Lin School of Medicine, National University of Singapore; National Cancer Centre Singapore, Singapore

ABSTRACT

Background: Mentoring's success in boosting the career and development of mentees and mentors, and enhancing the reputation of host organizations pivots upon successful mentoring relationships. However, with mentoring processes poorly overseen, and the lack of mentor training and support there are concerns over the failure and abuse of mentoring processes. A scoping review is undertaken to study prevailing ethical issues facing mentoring in medicine.

Summary of Work: Arksey and O'Malley (2005)'s methodological framework for conducting scoping reviews was employed to evaluate the size, gaps and scope of ethical concerns in medicine. Databases PubMed, ScienceDirect, ERIC, Embase, Scopus, Mednar and OpenGrey were searched for articles published between 1st January 2000 and 31st December 2017 concerning ethical issues in mentoring in general medicine. Based on an agreed upon selection criteria, the authors sieved and retrieved final articles for open coding and thematic analysis.

Summary of Results: 3391 abstracts were identified, 412 full-text articles were retrieved, 98 articles were included and thematically analysed. Themes include ethical issues at the level of the mentor and mentee, the mentoring relationship and host organisation. Each contained three subthemes - ethical issues faced, predisposing factors and possible solutions.

Discussion and Conclusions: The combination of poor matching, training, oversight and structuring of the mentoring process invites consideration of the culture of mentoring programs, which stems from the manner that breaches in mentoring practice are perceived. The poor alignment of expectations between mentors and mentees underscores the need for ethical codes, oversight and quality appraisal of the mentoring process by host organizations. It is interesting to note that many behaviours deemed egregious in the past would be acceptable today. Such shifts in conceptions and the influence of prevailing social and professional practices warrant further consideration.

Take-home Messages: Concerns on the potential abuse of mentoring practice are well-founded. Host organizations are best placed to lead all stakeholders, in addressing problems caused by the complex interwoven nature of mentoring relationships. Better understanding of the issues at hand and clear direction for future research on mentoring structures, assessment tools, host organizations and the mentoring environment must be pursued.

Understanding mentoring structures through a systematic scoping review of mentoring programmes in medicine and surgery between 2000 and 2017

AUTHOR(S):

- Wen Jie Chua, Yong Loo Lin School of Medicine, National University of Singapore, Singapore (Presenter)
- Clarissa Wei Shuen Cheong, Yong Loo Lin School of Medicine, National University of Singapore, Singapore
- Fion Qian Hui Lee, Yong Loo Lin School of Medicine, National University of Singapore, Singapore
- Ying Pin Toh, National University Hospital Singapore, Family Medicine Residency, Singapore
- Lalit Kumar Radha Krishna, Yong Loo Lin School of Medicine, National University of Singapore; National Cancer Centre Singapore, Singapore

ABSTRACT

Background: Growing evidence of the benefits of mentoring has spurred efforts to integrate mentoring processes into formal medical training. However, a holistic and longitudinal appreciation of mentoring processes and the structure that underpins it remains unclear, making proper oversight and accountability challenging. This systematic scoping review aims to evaluate the extent, range and nature of existing accounts of mentoring structures across all specialties in medical education.

Summary of Work: Under the guidance of an experienced librarian, the authors performed literature searches of accounts of mentoring programmes published between 1 January 2000 to 31 December 2017 in PubMed, ScienceDirect, ERIC, Embase, Scopus, Mednar and OpenGrey databases. Articles involving mentoring in medical and surgical specialties were selected based on a selection criteria that is agreed upon. A data collection coding book was created and thematic analysis was carried out. Final themes were arrived upon through negotiated consensus amongst all authors.

Summary of Results: The initial search revealed 3391 abstracts, 412 full-text articles relevant to the topic of interest were retrieved, 67 articles were selected. The themes identified were grouped into 5 broad categories: the pre-mentoring phase, matching process, establishment of a mentoring relationship, process of the mentoring relationship, and evaluation of the mentoring process. These themes correlate with specific stages within the mentoring process.

Discussion and Conclusions: Though the style and context varied, similarities amongst various mentoring programmes provide general insights into mentoring structures. To help balance structure and flexibility, we forward a mentoring framework that will also ensure effective oversight of the mentoring process. Effective oversight is challenged by a lack of holistic and longitudinal assessment tools and it calls for the creation of evidence-based mentoring evaluation processes.

Take-home Messages: Mentoring structures are critical to the oversight of mentoring programmes. Mentoring structures pivot on a balance between structure that ensures compliance with acceptable standards and flexibility to meet individualised mentoring needs.

Examining requirements for doctor mentors in Taiwan: A mixed methods study

AUTHOR(S):

- Liang-Shiou Ou, Chang Gung Medical Research Center, Chang Gung Memorial Hospital, Taiwan (Presenter)
- Yi-Fang Tsai, Chang Gung Medical Research Center, Chang Gung Memorial Hospital, Taiwan
- Lynn Monrouxe, Chang Gung Medical Research Center, Chang Gung Memorial Hospital, Taiwan
- Ren-Huei Fu, Chang Gung Medical Research Center, Chang Gung Memorial Hospital, Taiwan
- Kuo-Chen Liao, Chang Gung Medical Research Center, Chang Gung Memorial Hospital, Taiwan
- Chang-Chyi Jenq, Chang Gung Medical Research Center, Chang Gung Memorial Hospital, Taiwan

ABSTRACT

Background: Sometimes undergraduate students and postgraduate trainees present with difficulties in learning, which causes problems ranging from minor misconduct to serious criminal offence. This study aims to examine the difficulties instructors encounter when mentoring such students, their needs for relevant training, and expectations for institutional support.

Summary of Work: A questionnaire was developed from the literature and a focus group discussion. The questionnaire was promoted and collected online. Participants comprised mentors across different managerial positions and medical facilities. The questionnaire asked many questions, including information around their mentoring experiences, difficulties and needs. Data were analysed using SPSS 24.0.

Summary of Results: 148 valid questionnaires were returned. 56.2% of respondents reported encountering students-at-risk, of these, 45.1% never reported it. The top 3 reasons why were: confidence in handling the situation personally; reporting is futile; and concerns around workload. Respondents consistently disagreed that faculty training courses sufficiently provided knowledge and skills for mentoring.

Discussion and Conclusions: Participants without mentoring experience believed that they could identify students with difficulties significantly more than did those with mentoring experience ($P < 0.001$), suggesting that either novice instructors are most likely to underestimate the risk of encountering students with difficulties, or that they overestimate their own abilities. Current faculty development programmes might fail to provide instructors with the skills needed to mentor students with difficulties. This situation might lead to instructors' misevaluation of students-at-risk or even negligence of the relevant risk.

Take-home Messages: Institutions need to support instructors at all levels, and provide training courses that more fully: meet their needs to improve their ability to identify undergraduate students and postgraduate trainees with difficulties; enhance their knowledge and skills in managing students with difficulties; and increase their willingness to report such cases.

“Sisonke, Rekaofela, Together”: Experiences of mentors in a peer mentoring program

AUTHOR(S):

- Carol Hartmann, University of the Witwatersrand, South Africa (Presenter)
- Braney Modiba, University of the Witwatersrand, South Africa
- Lesedi Mohlala, University of the Witwatersrand, South Africa
- Aluwani Madzhia, University of the Witwatersrand, South Africa
- Siseko Dlanjwa, University of the Witwatersrand, South Africa
- Reginald Maloka, University of the Witwatersrand, South Africa
- Emmanuela Boachie, University of the Witwatersrand, South Africa

ABSTRACT

Background: Anecdotal reports from the medical program at the Faculty of Health Sciences, University of the Witwatersrand, South Africa, suggest that students entering university after graduating from under-resourced schools struggle to adapt to university life in their first year of study. The literature suggests that peer mentoring improves the experience of first-year students and helps them adapt to the university environment. Therefore, in 2018 a peer mentoring program was initiated in which six third year medical students, who had graduated from under-resourced schools, mentored 18 first year medical students from similar backgrounds. However, it soon became apparent to the mentors that the mentees were not the only ones benefiting from the program. Therefore, through this study the mentors aimed to document their experience of the peer mentoring program.

Summary of Work: All six mentors took part in a group discussion in which nominal group theory was used to identify and rank the benefits and challenges mentors experienced in the peer mentoring program.

Summary of Results: Challenges centred around development and maintenance of the mentor-mentee relationship, continuing commitment to the program and self-confidence in interacting with the mentees. The mentors overwhelmingly ranked their growth in interpersonal skills as the main benefit. Additional benefits included development of a broader social network - a “pseudo-family”, increased self-awareness and confidence, a sense of fulfilment and improvements in academic skills, including a greater appreciation for deeper learning.

Discussion and Conclusions: The positive benefits of the peer mentoring program experienced by the mentors are similar to those described in the literature with the addition of a perception of improved academic skills and the transition to academic approaches which support deeper learning over surface learning. Such programs can help students to assist each other in the transition to university life and develop a range of skills that benefit mentors as well as mentees in their university careers.

Take-home Messages: Peer mentoring programs for students from under-resourced schools have important benefits for the growth and development of mentors as well as mentees.

Addressing Social Determinants of Health: Developing and Delivering Timely, Actionable Audit Feedback Reports to Healthcare Providers

AUTHOR(S):

- Harriet Fisher, New York University, USA (Presenter)
- Jeffrey Wilhite, New York University, USA
- Lisa Altshuler, New York University, USA
- Kathleen Hanley, New York University, USA
- Khemraj Hardwar, New York University, USA
- Colleen Gillespie, New York University, USA

ABSTRACT

Background: Does actionable feedback on patient safety indicators and responses to disclosed social determinants of health (SDoH) impact clinical behavior? We sent Unannounced Standardized Patients (USPs) with SDoH-related needs to care teams in two urban, safety-net clinics. Data collected on practice behaviors were used for cycles of audit and feedback on the quality of electronic health record (EHR) documentation, team level information sharing, and appropriate service referral. Reports contained an evolving educational component (e.g. how to recognize, refer, and document SDoH). We disseminated reports to teams (doctors, nurses, physician's assistants, medical assistants, and staff) at routine meetings and via email.

Summary of Work: Three audit feedback reports have been distributed to date. Survey data was collected at two time points, 2017 (n=77) and 2018 (n=81), to assess provider attitude changes and integration of feedback into clinical practice. Measures included change in team knowledge and attitudes towards SDoH, and response to/ documentation of presented SDoH (measured via post-visit checklist and EMR).

Summary of Results: Preliminary data shows no change or improvement in documentation of SDoH and limited variation between firm-level responses. Only 7% of providers reported feeling strongly confident in knowing how to make referrals for social needs in 2018; no improvement since 2017. Despite regular report distribution, 58% of providers reported having received no formalized feedback on responding to SDoH. 24% reported maybe or not sure. 86% of 2018 survey participants self-reported having referred a patient to appropriate services when a social need was identified. Our referral data says otherwise, referrals occur for less than 30% of visits with SDoH-related needs.

Discussion and Conclusions: Results suggest disconnect between team data and individual reporting: most report they refer but data suggests few do. Deeper integration of reports into team processes, attachment of feedback to curricula, and increased frequency of regular feedback may be needed for accountability. These preliminary results help refine audit feedback methodology but research is needed to understand motivation and systems barriers to referral and documentation.

Take-home Messages: Providers struggle report referring patients with SDOH, but results reflect differently. Future research will look at provider attitudes toward referral processes.

Continuing professional development for interprofessional collaboration: Fun and games

AUTHOR(S):

- Theresa Schindel, University of Alberta, Canada (Presenter)
- Teresa Paslawski, University of Saskatchewan, Canada

ABSTRACT

Background: The World Health Organization recognizes interprofessional collaboration (IPC) as an important component of health care. Health professional education programs deliver education to develop collaboration competencies often through interprofessional experiences. Post-graduate and continuing professional development (CPD) programs to support further development of these competencies are not mandatory. As the focus of pharmacists' roles shift to emphasize patient care as members of healthcare teams, CPD educators need approaches that complement learning at work and learning with other health care professionals. Little is known about effective instructional approaches for uni-professional CPD. Games have been associated with student engagement in professional programs to enhance IPC.

Summary of Work: Educational games adapted from work by Lake et al. focused on knowledge and skills required for collaboration. The games involved low-stakes activities that did not require disciplinary expertise. The first involved building a structure and the second to plan a social event. Pharmacists enrolled in a post-graduate program at the University of Alberta participated in the games. Pre-games, pharmacists reviewed background theory, delivered group presentations, and reflected on prior experiences with collaboration. Post-games, pharmacists engaged in a debrief and an evaluation.

Summary of Results: Through participation in the games, pharmacists demonstrated competencies in leadership, communication, and teamwork. Pharmacists initially viewed the games as a fun and entertaining approach to CPD. The debrief, a critical component of the games, facilitated discussion of prior assumptions, authentic emotions, and new insights related to collaboration in practice. Pharmacists identified strategies to improve individual contributions to IPC.

Discussion and Conclusions: Based on our three years of experience with the games, pharmacists reported a high level of satisfaction; games facilitated enjoyment in the classroom and learning about collaboration. The debrief with a uni-professional group allowed exploration of pharmacists' individual competencies required for IPC. The uni-professional setting created a space for disclosure of tensions, challenges, and opportunities unlikely to surface in an interprofessional environment. These games are adaptable to CPD for other disciplines.

Take-home Messages: A uni-professional debrief can have a positive impact on interprofessional learning. Incorporating low-stakes activities like games in CPD for IPC competencies facilitated fun and learning.

Use of Health Team Resource Management Model to Improve Nurses' Teamwork

AUTHOR(S):

- Ching-Wen Hu, Tungs' Taichung MetroHarbor Hospital, Taiwan (Presenter)
- Shu-Zhen Chen, Tungs' Taichung MetroHarbor Hospital, Taiwan
- Ching-Hwa Teng, Tungs' Taichung MetroHarbor Hospital, Taiwan
- Tsu-Sang Chen, Tungs' Taichung MetroHarbor Hospital, Taiwan

ABSTRACT

Background: The unit is a newly established single ward in the Division of General Medicine and the nursing team members consist of senior nurses from wards in different divisions. The unit leader was the head nurse, who used important elements of the health team resource management model as strategies to improve the nurses' teamwork.

Summary of Work: Firstly, the head nurse used leadership as an important element of the health team resource management model to hold daily morning meetings and handover procedures. The process included the use of briefing, huddles, debriefing, and the I'm SAFE checklist to confirm the status of the nurses and adjust work task assignments in a timely manner. During the implementation of work tasks, the head nurse improved members' mutual support and cooperation and used the ISBAR for the nursing handover process.

Summary of Results: The nurses identified with the unit leader's attention to teamwork, flexible adjustment of tasks, and effective message sharing, which reduced errors and workloads.

Discussion and Conclusions: The use of the Health team resource management model enabled the unit leader to provide members with accurate and clear orders that improved the cooperation of team members, increased nurses' confidence in keeping track of the work progress, and enhanced their cohesion.

Take-home Messages: 1. Use of health team resource management model can improve teamwork and patient safety. 2. Improving and confirming nurses' sufficient safe executive ability is an important factor for maintaining patient safety.

Effects of Integrating Social Media LINE with High Fidelity Simulation in Emergent and Critical Management Training on Trainee's and instructor's Learning Outcomes

AUTHOR(S):

- Yung-Chi Hsu, Tri-Service General Hospital, National Defense Medical Center, Taiwan (Presenter)
- Go-Shine Huang, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Li-Chen Lin, Tri-Service General Hospital, Taiwan
- Hui-ju Chen, Tri-Service General Hospital, Taiwan
- Ya-Chuan Chang, Tri-Service General Hospital, Taiwan

ABSTRACT

Background: Little is known about the best teaching model of how to manage emergent and critical conditions through team-based learning for health care teams. The Community of inquiry (Col) model is a suitable tool for analyzing learning outcomes, including social (SP), teaching (TP) and cognitive (CP) presences. According to Col framework, social media LINE (LINE) offers SP, and high fidelity simulation (HFS) enhances TP. Besides, both LINE and HFS promote CP. The study purposes were to examine the effects of integrating LINE and HFS on trainees' learning outcomes (attitudes toward learning, self-efficacy of group learning, satisfaction of learning activity, and flow experience).

Summary of Work: Three health care teams received training of "simulation scenario competition" conducting by the joint commission of Taiwan (JCT) for assessing management of emergent and critical conditions through Team Resource Management (TRM) in 2018. Trainees joined different LINE programs and designs of HFS based on their learning needs and specialties, and attend the JCT "Simulation Scenario Competition Health Care Team". There were totally 18 participants including 4 instructors, 14 trainees who completed outcome assessment. Via LINE, participants could raise questions, discuss standard operation procedures of scenario management, TRM concepts and skills, and openly communicate with affective expressions. Besides, trainees received HFS once a week by simulator. Learning outcomes were measured by using validated 5-point Likert scales by ZUVIO before and after training. Data were analyzed using generalized estimating equation (GEE)

Summary of Results: Results suggest that integrating LINE with HFS in emergent and critical management could facilitate trainees' attitudes ($B=5.00$, $p=0.001$), self-efficacy ($B=6.21$, $p=<0.01$), satisfaction ($B=8.41$, $p=0.001$) and flow experience ($B=8.429$, $p<0.001$). Besides, our program could enhance the instructors' flow experience ($B=8$, $p<0.001$). Moreover, the health care teams gained award provided by JCT.

Discussion and Conclusions: Integrating LINE with HFS significantly improved participants' learning outcomes, and three health care teams were successful while compared with others in JCT. The results also support the Col framework.

Take-home Messages: We can apply the integration of LINE with HFS to the management of emergent and critical conditions and TRM in health care teams.

A Systems Approach to Professionalism

AUTHOR(S):

- Julia Humphreys, University of Manchester, UK (Presenter)

ABSTRACT

Background: Objectives: To explore systems that promote professionalism in medical education. Little research has been done to investigate the systems that underpin and support the identification of professionalism within medical education institutions. We explored the perceptions of senior members of department hospital and Yale Medical School (Chairs of Departments with core clerkship), Chief Residents and Clerkship Directors, using thematic analysis of interviews and focus groups from responses to the following questions: 1. What promotes professional behaviour? 2. Give examples of: (a) a scenario(s) which demonstrate(s) definite unprofessional behaviour (b) a scenario(s) which demonstrate(s) unclear unprofessional behaviour 3. What encourages and allows people to speak up about professionalism? 4. Are there specific strategies that can, or might, help you to continue to promote professionalism in the faculty?

Summary of Work: Design: Qualitative research study, involving a stratified random sample of senior-level members of department hospital and Yale Medical School staff, including Core Clerkship Directors, Chief Residents and Clerkship Directors. Individual face-to-face interviews and focus group discussions were conducted by the Principal Investigator (Dr Julia Humphreys, University of Manchester) during a 3-week sabbatical visit to Yale Medical School in October 2018.

Summary of Results: TBC. The following themes will be discussed:

Question 1: Role modelling, Medical student reporting, Root cause analysis, Measurability, Guidance, Reflective practice, Training, Clear expectations, Accountability, Leadership, Structural support, Efficient reporting systems, Research Incentives

Question 2: Clear: Bullying, Harassment, Illegal activity Unclear: 'Militant' training in the name of 'good cause', Swearing in OR, Tone of speech, Vulgar language/humour Preferential treatment, Body language, Physical contact with patients, Dress codes

Question 3 : Forums that explicitly encourage this, Avoiding witch-hunts, Avoiding black/white good/bad terminology Schwarz rounds, Top-down approaches, Candid and honest feedback (tends to occur towards the end of placements)

Question 4: Open conversations, Critical incident sessions, Reflective writing workshops at end of each clerkship, Self-reflection and correction, Identification of the 'culture', Resilience building from induction, Leading by examples (retreats), Awards? Or citizenship metric

Discussion and Conclusions: TBC

Take-home Messages: Suggestions for: systems that may promote and support professionalism, applicable across other institutions systems that facilitate the reporting of both good and bad exemplars of professionalism dealing with lapses in professional behaviour.

Leaving the Laboratory: Using Bedside Teaching to Enhance the Professionalism of Medical Technologists

AUTHOR(S):

- Chih-Hung Chen, Department of Internal medicine, Kaohsiung Chang Gung Memorial Hospital, Taiwan (Presenter)
- Chia-Te Kung, Department of Emergency Medicine, Kaohsiung Chang Gung Memorial Hospital, Taiwan
- Eng-Yen Huang, Department of Radiation Oncology, Kaohsiung Chang Gung Memorial Hospital, Taiwan
- Meng-Chih Lin, Department of Pulmonary and Critical Care, Kaohsiung Chang Gung Memorial Hospital, Taiwan

ABSTRACT

Background: The role of the Medical Technologist has expanded, no longer merely confined to the laboratory. To cultivate professionalism among such workers (and in general), Social Cognitive Theory recommends the development of values and the ability to identify with others through group interaction and participation.

Summary of Work: 1. From 2017-18, a total of 40 medical technologist interns volunteered to partake in the study (IRB number 201600978BoC501). Before and after the internship program, students filled out information on standards of professionalism: questionnaires involving scenario-based challenges and self-evaluations of their performance through separate stages of the program. They also took part in a group interview. 2. Doctors conducted bedside teaching sessions as the interns observed from the side, trying to gain a better grasp on the patients conditions, the process of providing care, and the relationship between doctor, patient, and nurse. After the sessions, the interns split into small groups and discussed and reflected on their own personal fields.

Summary of Results: 1. In testing conducted prior to and following the program, the areas in which students described noticeable improvements on their self-evaluation reports include: caring for patients, standard of professionalism, and growth and learning on the job. 2. The results of the bedside teaching, students from different internship programs exhibit no significant margin in the number of correct responses provided. 3. About scenario-based challenges, on-the-job medical technologists selected the top two correct answers far more often than interns did when it came to queries such as confidential agreements, patients rights, relations between doctors and patients. 4. The lowest scores on questions related to sexual harassment.

Discussion and Conclusions: 1. Bedside teaching is viewed as instruction and learning that occurs outside the context of regular classes. Via role modeling in hospital wards, educators in the field of medicine can provide instruction in professional standards, medical ethics, humanism, as well as communication and clinical skills. 2. To re-emphasize the importance of professionalism, the training of teachers (role models) should reflect this focus.

Take-home Messages: Stepping out of the laboratory and having real-life contact with patients, learning through role-modeling, and cross-disciplinary interaction are all effective methods for raising the standard of professionalism among medical technologists.

Teaching professionalism in the acute medical setting: assessment and feedback from medical student simulation

AUTHOR(S):

- **Dominic Brown, Medical Education Department, Princess Alexandra Hospital Trust, UK (Presenter)**
- Yuji Suzuki, Medical Education Department, Princess Alexandra Hospital Trust, UK
- Andrew Foster, Medical Education Department, Princess Alexandra Hospital Trust, UK
- Gemma Beadle, Medical Education Department, Princess Alexandra Hospital Trust, UK
- Helen Wiggins, Medical Education Department, Princess Alexandra Hospital Trust, UK
- Lucy Evans, Medical Education Department, Princess Alexandra Hospital Trust, UK

ABSTRACT

Background: Professionalism is an essential part of the medical curriculum and the General Medical Council (GMC) states medical schools should “Give professionalism parity with other parts of the curriculum and integrate it in teaching, don’t separate it out but make it visible and acknowledge it”¹. Despite several studies evaluating methods of teaching professionalism, there is no consensus on how best to integrate this into the medical curriculum.² Research has demonstrated simulation to be an effective method of medical education, particularly for skill acquisition³. Incorporation of professionalism into acute simulation scenarios has not been widely explored and may demonstrate the complexities of clinical care and the real-life application of these skills.

Summary of Work: During high-fidelity simulation training for final year medical students (n = 10) professionalism scenarios were included within acute medical scenarios (8 in total). Scenarios were selected to be realistic and enhance clinical learning. Student feedback was collected after each session with further data collection on-going.

Summary of Results: Quantitative and qualitative feedback was collected. Students responded to statements including; ‘The inclusion of professionalism improved the simulation session’ (1=strongly disagree - 5=strongly agree). The mean response at the final session was 4.124 (range 2-5) increasing from 3.4 in session one possibly reflecting the students’ greater familiarity with and understanding of professionalism. Feedback was largely positive; however some did not appreciate this teaching innovation as they felt it was not reflective of their examinations.

Discussion and Conclusions: Developing professionalism is an essential skill for medical students. Incorporating professionalism into acute medical scenarios demonstrates its real-life applicability. This method of teaching was found to be acceptable to medical students with acceptance and satisfaction increasing with exposure. One challenge in implementation is overcoming the students’ exam focused learning styles. If professionalism was represented in assessments to a greater degree students may be more amenable to learning focused around this skill.

Take-home Messages: Professionalism should be incorporated throughout medical training and assessment. Integration into high-fidelity simulation training is acceptable to medical students with many reporting it to improve sessions. This method may highlight the real-life application of this important skill.

The Development, over 5 Years, of a Consecutive Curriculum for Cultivating Professionalism in Medical Students in Japan

AUTHOR(S):

- **Michito Hirakata, Keio University School of Medicine, Japan (Presenter)**
- Toshiaki Monkawa, Keio University School of Medicine, Japan
- Masatoshi Nara, Keio University Faculty of Letters, Japan
- Kimio Yoshimura, Keio University School of Medicine, Japan
- Koichi Matsuo, Keio University School of Medicine, Japan
- Kou Sueoka, Keio University School of Medicine, Japan

ABSTRACT

Background: Professionalism is a core competency for medical students and physicians to possess. Globally, there have been many challenges in establishing curricula that cultivate Professionalism and bring a more humanistic focus to students studying medicine. However, a validated educational program for teaching and evaluating this essential proficiency has not yet been established due to its abstract concept and subjective nature.

Summary of Work: To demonstrate and nurture Medical Professionalism and humanism in our students, we have developed a consecutive, comprehensive, and compulsory curriculum called the “Medical Professionalism Program (MeP).” This program consists of: 1st year) primers of bioethics, law jurisprudence, and psychology; 2nd year) interdisciplinary approach to health care and economic theory; 3rd year) research ethics; 4th year) clinical research ethics, principles of medical ethics, medical communication, and perceptions of “a Good Doctor”; 5th year) health policy and patient-centered care; and 6th year) the dignity of life and medical safety. Students have been encouraged to discuss key issues in groups before presenting their ideas in a collaborative learning approach and have been evaluated through peer-to-peer assessment, integrated measurement of attitudes, and reports by educators. This is especially encouraged in the program designed to create a student-authored-oath in our “White Coat Ceremony,” prior to commencing clinical clerkships, and in debates about end-of-life care, brain death determination, organ transplantation, and selection of reproductive techniques in the final year, prior to graduating.

Summary of Results: Throughout the MeP, over 6 years, our students shared their experiences and ideas on the important attributes of professionalism or the benefits to society and reaffirmed their dedication to the ethical care of patients.

Discussion and Conclusions: We found that our students were encouraged to develop competencies of professionalism and humanism by building on their dedication to the fundamental ethical principles of medicine: beneficence, respect for patient autonomy, and justice, and motivated to consider humanism and professionalism in clinical medicine.

Take-home Messages: The MeP is a valuable curriculum to emphasize the importance of professional behavior to our medical students and to develop their aspirations and commitment to Medical Professionalism.

Interventions for Medical Student Unprofessional Behavior: Factors Influencing Success

AUTHOR(S):

- Michael Ainsworth, Univ of Texas Medical Branch - Galveston, USA (Presenter)
- Karen Szauter, Univ of Texas Medical Branch - Galveston, USA

ABSTRACT

Background: Relationships between unprofessional behavior and academic outcomes are complex. We report insights from tracking and remediating student professionalism concerns.

Summary of Work: We use an Early Concern Note (ECN) program to identify professionalism lapses and provide individualized recipient feedback. We monitor the reason for the ECN -integrity/responsibility (IR), motivation to excellence/insight (ME), and compassion/respect (CR) - and student recognition of, and taking responsibility for, their actions. School-based intervention occurs for students receiving >3 ECNs, including continued monitoring, leave of absence, professionalism remediation program (PRP), or dismissal. The PRP is based on student behavior and may include working with faculty role models, reflective writing, community service, professional counseling, etc. We analyzed the reason for and student reaction to the ECN, interventions made, and academic outcomes of ECN recipients from 2010-2017 (N=344 students).

Summary of Results: Most students receiving ECNs received 1-2 during enrollment. Their academic outcomes were indistinguishable from students without ECNs. Twenty-one students (6%) had ≥ 3 ECNs, spanning a wide range of behaviors. During feedback meetings, all 21 had been classified as substantially challenged by professional behavior expectations, either “resistant but adaptable” (N=4) or “unwilling/unable to adapt” (N=17). Interventions included monitoring without sanctions, leave of absence, PRP, or dismissal. Ultimate academic outcomes were unrelated to reason for the ECN or participation in a PRP. All students classified as “resistant but adaptable” progressed/graduated regardless of whether a PRP had been prescribed. For students classified as “unwilling/unable to adapt”, 5 were allowed to continue without sanctions or take a temporary leave of absence - all progressed satisfactorily. Of the remaining 12 students, 6 were ultimately dismissed, either outright or after a PRP due to ongoing professionalism issues.

Discussion and Conclusions: Supportive interventions for students with 1-2 ECNs acknowledges that problematic behaviors may be transient, isolated and not indicative of long-term risk. Most students with ≥ 3 ECNs were able to progress or graduate with limited assistance, but those with the least insight/adaptability had a high recidivism rate.

Take-home Messages: Remedial interventions have a role in addressing unprofessional behavior, but learner capacity to adapt to professionalism norms appears to heavily impact ultimate success.

Impact of a Professionalism Curriculum: Exploration of Undergraduate Students' Attitude

AUTHOR(S):

- **Wen-Lin Lo, Department of Medical Education, Hualien Tzu Chi Hospital, Taiwan (Presenter)**
- Li-Chuan Kuo, Department of Medical Humanities, School of Medicine, Tzu Chi University, Taiwan
- Mei-Lin Hsieh, Department of Nursing, School of Medicine, Tzu Chi University, Taiwan
- Yu-Hsien Lai, Division of Nephrology, Hualien Tzu Chi Hospital, Taiwan

ABSTRACT

Background: The trend of practicing medicine has gradually changed from physician-centred to interdisciplinary and inter-professional care. Recent studies have shown that skills such as teamwork, communication, and conflict resolution could be taught in the undergraduate curriculum. Based on constructivist theory, these topics are incorporated into the professionalism curriculum as part of a spiral curriculum of the seven-years medical education. The study aims to investigate the impact of the content and the curriculum on students' attitude in preparation for the development of social competencies.

Summary of Work: From 2017 to 2018, a total of 96 medical students in the 3rd year of Tzu Chi medical school in Taiwan participated in this 16-hours curriculum where each session was 4 hours. A didactic lecture was given first followed by experience sharing of invited speaker specialized in medical dispute. The third session was on interprofessional education. Health professionals in practice shared their experience, and a simulated video on clinical conflict was shown. The last session was on conflict resolution. Students filled out a questionnaire to learn their style under high stake situation. Concepts and demonstration of conflict resolution were taught by physicians. Students submitted a reflective assignment after completion of the curriculum.

Summary of Results: Qualitative data using thematic content analysis revealed that students' reaction to the course was mainly positive. Many students found the questionnaire to be helpful with emotional self-awareness. Most students faced interpersonal conflicts and were able to dissect and resolve conflicts. About half of the students felt offended by comments on the negative qualities of physicians during the interprofessional session.

Discussion and Conclusions: Students found the session on conflict resolution skills useful mainly due to high relevance to their daily life. The negative impact on the interprofessional session could be due to the gap in expectation of the competence of a physician in collaborative care as a result of a lack of clinical exposure. Perhaps positive role modeling of physicians' role would be more helpful for undergraduate students.

Take-home Messages: The design of the teaching format and objectives should correspond to the students' current developmental phase and situational need in a spiral curriculum.

How pre-clinical medical students report their perceived medical professionalism

AUTHOR(S):

- **Chiung-hsuan Chiu, Taipei Medical University, Taiwan (Presenter)**
- Chung-jen Wei, FuJen Catholic University, Taiwan

ABSTRACT

Background: While the authors designed medical professionalism instrument based on the code of conduct of major medical associations in the world, it deduced and defined medical professionalism with five dimensions: 'medical knowledge and clinical skills', 'interpersonal skills with patients', 'teamwork', 'duty for public health', and 'protection of patients' rights'. We are therefore able to define good doctoring and guide medical students to understand their roles of professionals based on the boundary of professionalism. To understand how medical students perceived their roles of physicians before practicing in clinical setting, this study is aimed to assess medical professionalism of pre-clinical medical students.

Summary of Work: This study collected data from 381 medical students of their pre-clinical (i.e. 1st to 4th year students) years of Taipei Medical University from March to May, 2018. This instrument to measure self-reported of medical professionalism included 50 items. Institutional Review Board (IRB) approval was obtained from Taipei Medical University (approval #201501031).

Summary of Results: Respondents consist of 203 male and 148 female. Result show that pre-clinical medical students report highest in 'protection of patients' rights', and lowest in 'duty for public health'. Medical students observe their colleagues and give lower evaluation to colleagues' medical professionalism, compared to their evaluation on their own professionalism.

Discussion and Conclusions: This result suggests that pre-clinical medical students place emphasis more on required competencies of healer, i.e. 'protection of patients' rights', 'teamwork', but less on public health obligations. Current curriculum should include public health issues and let medical students to assume their obligations of physicians.

Take-home Messages: 1. This result suggests that pre-clinical medical students place emphasis more on required competencies of healer, i.e. 'protection of patients' rights', 'teamwork', but less on public health obligations. 2. Current curriculum should include public health issues and let medical students to assume their obligations of physicians.

What Medical Students Learned about Professionalism in a Hidden Curriculum: Medical Teacher and Resident Perspectives

AUTHOR(S):

- Saranya Prathaithep, Sunpasitthiprasong Hospital, Thailand (Presenter)

ABSTRACT

Background: According to a pilot study at Sunpasitthiprasong Hospital, Ubon Ratchathani, Thailand in 2018, students' perceptions on professionalism were explored from narrative writing about what events that thought them about professionalism during practice in internal medicine rotation. The findings suggest that role modelling is the most active learning process to transmit professional values throughout the hidden curriculum. This study aim to explore the perceptions of medical teachers and residents in internal medicine department who involved in students' learning processes at the same learning environment.

Summary of Work: Two main methods for collecting qualitative data were narrative writing with opened end question and focus group with semi-structured interviews. Firstly, the opened end question is "what events that students can learned about professionalism during practice in internal medicine rotation" was distributed by online questionnaire. Secondly, the questions for focus group designed to elicit their perspectives and attitudes toward teaching and evaluating professionalism for medical students. Thematic analysis of 9 narrative writing stories and semi-structured interview of 2 focus group were conducted.

Summary of Results: Nine narrative writing consisted of positive, negative and hybrid elements. Most of their experiences are in inpatient setting. The medical students, teachers, and patients are the main models in the stories. 4 main areas of professionalism are identified as attitude, knowledge and performance, appearance and ethical issues. Most of participants indicates that students learned about professionalism from either positive and negative role models. In focus group, most of them noticed that emotional issue might arise unprofessional behaviour due to stress and hard work in real situation. Additionally, they suggested emotional intelligence training might be an alternative approach to teaching professionalism to students.

Discussion and Conclusions: Narrative writing and reflection from focus group are rich of information to explore residents and teachers perspective on professionalism learning and teaching in hidden curriculum. Most of them perceived professionalism is essential to develop a good doctor. Role model is the most active learning process as a result from pilot study. The participants suggested that emotional training might be a training process to develop professional doctor. Ultimately, medical educators may use this results as the effective ways to develop professionalism competency.

Professionalism development through two different clinical clerkship programs: an autobiographical narrative approach

AUTHOR(S):

- Hsin-Mei Pan, National Defense Medical Center, Taiwan (Presenter)

ABSTRACT

Background: Comparing to other medical schools in Taiwan conducting rotation-based clerkship only, National Defense Medical Center is the one that provides two different clinical clerkship programs, both aiming to support the future doctors to develop professionalism, referring to the six core ACGME competencies: rotation-based clerkship (RBC) and longitudinal integrated clerkship (LIC). The students are expected to choose between these two programs base on personal interests. Those choosing RBC are required to complete their clerkship on a biweekly-and-specialty base while observation and shadowing of clinical work in inpatient units account for the most of their learning experience. As for LIC trainees, their clerkship is divided into two parts: the first is a five-month multi-specialty integrated clerkship emphasizing on the continuity of patient-centered care and self-discipline approach of their clinical schedule while the followed second part is designed the same as RBC program. Due to the structure of LIC, the LIC trainees have the feasibility to explore their professionalism development in the context of two different clinical clerkship programs.

Summary of Work: This work aims to reveal the authors, a pre-LIC-trainee, journey of professionalism development and highlight the significance of analyzing learning experience when it comes to the discussion of medical education. The method applied is autobiographical narrative, through which the author engages herself thoroughly, looks back on the experience systemically, and reflects critically on the events during clerkship that mark as the transition points and/or milestones of her medical professionalism development.

Summary of Results: The author's professionalism development couldn't be completed without any of the learning experience from two different clinical clerkship programs. The author acknowledges the LIC program empowers her with the art of practice lasting lifelong while the RBC program enables her clinical reasoning capability and orients her to pursue further medical specialty.

Discussion and Conclusions: The conclusion of this autobiographical-narrative-based work may not be applied universally, however, this work signifies the importance of comprehensive and multi-approach of medical education: any of the program mentioned alone may fail to fulfill the author's professionalism development.

Take-home Messages: Students' critical reflection on their learning experience and comprehensive, multi-approach methodology are the key elements when it comes to the future of medical education.

Ethics and Professionalism Training in Pakistani Medical Education: STMU/Shifa Experience

AUTHOR(S):

- **Muhammad Saeed, Shifa Tameer e Millat University, Pakistan (Presenter)**
- Muhammad Iqbal Khan, STMU, Pakistan
- Rafeh Saeed, CPSP, Pakistan
- Tatheer Zahra, STMU, Pakistan
- Manahil Saeed, UHS, Pakistan
- Ashraf Hussain, STMU, Pakistan

ABSTRACT

Background: There has been growing interest in the instruction and assessment of professionalism. Shifa College of Medicine, Shifa Tameer e Millat University (STMU) introduced instruction of Medical Ethics & Professionalism longitudinally throughout five year MBBS integrated spiral curriculum, through Role modelling; Role plays; Video demonstrations; Case studies and Didactic instruction by regular faculty and visiting community leaders. Professionalism is perceived differently from one culture to another. We, therefore, conduct this research to identify the attributes of professionalism in Pakistani medical students.

Summary of Work: The study consists of two stages. Using grounded theory approach and triangulation, we interviewed 15-randomly selected 3rd year MBBS students, to identify good and bad behaviours of Medical students. The interviews were continued until the data was saturated. The emerging issues were then arranged into the questionnaire. In 2nd stage, medical students were asked to rate the importance of each issue on a 5-point Likert scale (1-not important & 5-absolutely important).

Summary of Results: In the first stage, 50 issues arose from interviewing 15- randomly selected undergraduate medical students (10-girls and 5-boys). The importance of these items, at the end of the second stage, ranged from 2.80 to 4.85. Three most important items highlighted by the students were: (1) being late or absent from class; (2) posting a patient's/ peer's/teacher's photo on social media without prior permission; and (3) giving incorrect information to teachers/administration of medical college/patients. The items with lowest scores were: (1) sleeping in classroom; (2) taking photos of medical records; and (3) eating in the class rooms/ Labs.

Discussion and Conclusions: It is interesting to know that Pakistani Medical students are well versed with the medical ethics and professional values at the very beginning of their professional career. Our students valued punctuality, honesty, integrity and informed consent as important professional attributes of professionalism. We hope that our research will contribute to the literature in professionalism.

Take-home Messages: Medical Ethics & professionalism instruction and assessment is an integral component of undergraduate medical education. It is quite possible even in a resource constrained environment, like STMU-Pakistan.

What do Medical Students Learn about Professionalism from Observation Learning in Patient and Family Advisory Councils in China?

AUTHOR(S):

- **Shaoting Feng, The First Affiliated Hospital, Sun Yat-sen University, China (Presenter)**
- Ming Kuang, The First Affiliated Hospital of Sun Yat-sen University, China
- Suqing Yang, The First Affiliated Hospital of Sun Yat-sen University, China
- Jingsong Wang, The First Affiliated Hospital of Sun Yat-sen University, China
- Haipeng Xiao, The First Affiliated Hospital of Sun Yat-sen University, China
- Tinghuai Wang, The First Affiliated Hospital of Sun Yat-sen University, China

ABSTRACT

Background: Observation Learning in pre-clinical years is an important part of early involvement in clinical practice for medical students in China. Initiated by Sun Yat-sen University, it has been widely accepted and playing a significant role in medical professionalism education in many medical colleges after 20 years development. Increasingly, healthcare organizations are adopting patient and family advisory councils (PFACs) as a key strategy to improve patients' healthcare experience. The project consisted of pre-clinical students taking the program of "early involvement in clinical practice" in the First Affiliated Hospital of Sun Yat-sen University, who were from Grade 1 to Grade 3 of medical college. In 2018, 268 students participated in this program were arranged to observe the PFACs in their elective departments of our hospital during their winter/summer vacations. 257 Narratives based on their observations were collected and each student offered his or her reflections on their own narrative

Discussion and Conclusions: Students' responses were overwhelmingly positive in both written and oral feedback. The majority (95%) were deeply impressed by the observation learning in PFACs. It not only illustrated them how doctors communicating with patients, but also offered them opportunities hearing voices of the patients, exerting an imperceptible influence on their mind of essential principles of medical professionalism, such as humanism, responsibility, altruism and excellence. Reinforcement on medical professionalism were shown in students' narratives and reflections. Observation learning in PFACs for pre-clinical students is a positive way for shaping professionalism in pre-clinical years of medical education. It can help developing students' empathy with patients, communication skills, as well as better understandings for the doctor-patient relationships. Narratives and reflections written by students could deepen their understandings of the values and principles of professionalism in pre-clinical years.

The essential attributes of professionalism in Family Medicine: opinions from program directors in Taiwan

AUTHOR(S):

- Chi-Wei Lin, E-Da Hospital/ I-Shou University, Taiwan (Presenter)
- I-Ting Liu, E-Da Hospital/ I-Shou University, Taiwan
- Ruyi Huang, E-Da Hospital/ I-Shou University, Taiwan
- Jin-Shang Wu, National Cheng-Kung University, Taiwan
- San-Nan Yang, E-Da Hospital/ I-Shou University, Kaohsiung
- Ming-Nan Lin, Dalin Tzu Chi Hospital, Taiwan

ABSTRACT

Background: Professionalism is an important basis in forming medical profession. As possessing the double roles of healer and professional, the generally accepted attributes of medical professionalism are not easy to define, let alone for specific specialists. This research aims to explore the opinions of program directors and tries to reach a consensus within family medicine society in Taiwan.

Summary of Work: We conducted a survey in October 2018 during an academic conference held by Taiwan Association of Family Medicine. The differences of professionalism between Taiwan and western societies, differences of professionalism between Family Medicine and other specialties, and the most favorable framework of professionalism for family medicine in Taiwan were investigated. Meanwhile, the participants were asked to select 10 most relevant attributes of professionalism for family physicians from 28 attributes derived from literature review.

Summary of Results: There are 45 participants completed this survey. Most participants (68.9%) regarded that there are no major differences of professionalism between Taiwan and western societies in definition. More than half of the participants (53.3%) considered the attributes of professionalism are similar between family physicians and other specialists. Most participants (60%) suggested the four aspects of professionalism in The Family Medicine Milestone Project initiated by ACGME and ABFM could be the suitable reference framework. Finally, the highly ranked attributes of professionalism for family physicians picked by the participants are competence, altruism, continuity, communication, and accountability. The least important attributes are respecting for the healing function, resilience, self-regulation, confidentiality and maintaining self-health.

Discussion and Conclusions: Most participants regarded there are no major differences in professionalism between Taiwan and western societies, or between family physician and other specialists. But more participants disagreed the identity of professionalism between specialties than different cultural backgrounds. Maintaining continuous care and communication are uniquely valued in family medicine. On the other hands, some newly emerging topics such as resilience and maintain self-health are not yet the main consideration among these directors.

Take-home Messages: General professionalism framework could be practical reference for family medicine but need some modification to fit in specific specialty and local cultural context.

Medical professionalism: Development of an evaluation instrument for the resident physician

AUTHOR(S):

- Ruth Dias, Universidade José do Rosário Velano - Hospital Universitário Alzira Velano - Unifenas, Brasil (Presenter)
- Ranielly Andrade, Universidade José do Rosário Velano - Hospital Universitário Alzira Velano - Unifenas, Brasil

ABSTRACT

Background: The attributes and functions used to define professionalism are to recognize the behaviors that must be evidenced in the doctor-patient relationship, which is its essence, but also in relations with other physicians, colleagues in the health care system, society and of himself. All attitudes must be aligned with the values and attitudes that form a collective barrier of professionals that have emerged within medicine.

Summary of Work: This study was divided into 2 phases: Adaptation and Application of a methodologically based instrument (Based on the evaluation and the certification examination of the residents of the Family Medicine of Canada - The College Family Physicians of Canada) to measure physician professionalism in the resident doctors of the University Hospital Alzira Velano, aiming to evaluate their degree of professionalism in 12 topics, comparing the variables such as gender, age group, year of residence and academic performance.

Summary of Results: Under the reliability analysis in the application of both preceptors, we obtained a high Cronbachs alpha index. We found a higher degree of professionalism in residents of the second year of residence and the highest and lowest averages found in the groups with more and less professionalism respectively and without differences in sex and age group, but can not be proved statistically. In the analysis of conglomerates, we obtained 3 different groups (minor, intermediate and higher professionalism) that did not present significant difference in the correlation with academic performance.

Discussion and Conclusions: The evaluation of professionalism implies the need for collective information to provide feedback. The scale of evaluation of professionalism showed a high internal consistency, but with highly correlated items. Factors such as gender and age did not show a significant difference in the degree of medical professionalism, as well as the year of residence. There was no correlation between academic performance and the degree of statistically significant professionalism. More studies will be necessary, with a higher n, to determine their use in undergraduate contexts and to study the associations of students attitudes towards professionalism.

Take-home Messages: Evaluating professionalism is more difficult than teaching professionalism because of the subjectivity of the elements and because no single assessment tool can capture all the elements.

A Study of Medical Professionalism in 6th Year Medical Students and Intern Doctors in Vachiraphuket Hospital

AUTHOR(S):

- Patipan Juntamongkol, Medical Education Center Vachiraphuket Hospital, Thailand (Presenter)
- Apiporn Puengdej, Medical Education Center Vachiraphuket Hospital, Thailand
- Warisa Archeewarangabrok, Medical Education Center Vachiraphuket Hospital, Thailand
- Withita Jangiam, Medical Education Center Vachiraphuket Hospital, Thailand

ABSTRACT

Background: Medical professionalism is an essential skill for medical practitioners. According to American Board of Internal Medicine, medical professionalism consists of 6 aspects: altruism, accountability, excellence, duty, honor/integrity and respect for other. Medical students can learn these skills during clinical clerkship in a medical school theoretically by lectures and practically by imitating their seniors and staffs. In Vachiraphuket hospital the 4th and 5th year medical students are in close contact with 6th year medical students and intern doctors. These personnel are crucial role model for medical student in professionalism.

Summary of Work: We conducted a survey in 44 6th year medical students and intern doctors by using a questionnaire developed by Sumalrot, T. (2017) which is modified from The Penn State College of Medicine Professionalism Questionnaire (2007). It contains 32 items and the score ranges from 0 to 5 in each item. It also collects the individual information including sex, income, school record, years of work and specialty interest to evaluate the correlation between these factors and professionalism. The results were analyzed by SPSS.

Summary of Results: Out of 44 cases, 31 were female. Professionalism was assessed in 6 attributes and reported in average score in each attribute and totality. Maximum 6-attributes average score was 4.94, minimum was 2.44 and mean was 4.04. Altruism was the highest score while excellence and duty were the lowest. Based on ANOVA test, sex, income, school record, year of work and specialty interest did not have statistically significant difference in assessed knowledge of medical professionalism.

Discussion and Conclusions: Majority of 6th year medical students and intern doctors in Vachiraphuket Hospital have medical professionalism in good level. Other factors do not impact on medical professionalism. However, medical students learn these values during their formal education, certain aspects of professionalism seem to be underdeveloped in medical students and need to be targeted for teaching and assessment in order to develop professionally responsible practitioners.

Take-home Messages: Medical student could learn medical professionalism by imitating their senior students and intern doctors and also it is necessary at the undergraduate and postgraduate levels will certainly be a requirement of the continuing professional development of the future.

Attitudes and awareness of healthcare professionalism in social media

AUTHOR(S):

- Surasak Aumkaew, Buriram Medical Education Center, Thailand (Presenter)
- Narin Chindavech, Buriram Medical Education Center, Thailand
- Rungnapa Pengprakhon, Buriram Medical Education Center, Thailand
- Yada Siriphannon, Buriram Medical Education Center, Thailand

ABSTRACT

Background: In this era, healthcare personnel have widely used social media for searching information, expressing idea, personal opinion, interest and communication. However, in some situation social media is not only limited to one ordinary person but also issue of professionalism aspect. Acknowledgement in attitudes and behavior in physicians will find the solutions and solve this social media conflicts.

Summary of Work: A cross-sectional analytic-study in tertiary, non-university hospital with online questionnaires consisted of attitudes in 16 of case-scenarios in social media used were sent to clinical years of medical students, junior doctors and medical staffs. The data was analyzed in 7 dimensions according to professionalism in Thailand social media guideline for healthcare personnel 2017.

Summary of Results: One hundred and three questionnaires were replied; 70 (68%) medical students, 15 (15%) junior doctors and 18 (17%) medical staffs. Medical staffs had significantly better social media awareness by ten points rating scales (5.40, 4.20 and 6.77 in medical students, juniors doctor and medical staffs, respectively; $p=0.00$). In aspects of 7 dimensions of professionalism, the medical staffs had better attitudes than other groups in 5 dimensions of I) "Pausing before posting", II) "Appropriate behavior online", III) "Privacy setting and separating personal and professional information", IV) "Periodic self-auditing" and V) "Professional boundaries with patients" but no significantly different in the remaining dimensions VI) "maintaining professionalism" and VII) "Professional boundaries with others".

Discussion and Conclusions: All medical students, junior doctors and staff had positive attitudes in social media using in protection of patient privacy, from harm and beneficence but might had better opportunity to improve attitude in emotional expression, appropriate behavior whether on duty or not. The privacy setting should be bounded between doctors and patient and determined appropriate relationship. Better professionalism attitude of staffs might be from more working periods and life experience. Medical students should realize double-edged swords of social media, all dimensions of professionalism in social media must be aware contributed to proper and appropriate used in the communication era.

Take-home Messages: Multidimensional aspects of professionalism augment better attitudes and concern of social media use in healthcare personnel.

Virtual Interactive Patient Encounter to Teach Evidence-Based Medicine and Pharmacotherapy in Pre-Clinical Undergraduate Medical Students

AUTHOR(S):

- Alexander Mozeika, Rutgers New Jersey Medical School, USA (Presenter)
- Rijul Asri, Rutgers New Jersey Medical School, USA
- David Cennimo, Rutgers New Jersey Medical School, USA
- Sophia Chen, Rutgers New Jersey Medical School, USA
- Sangeeta Lamba, Rutgers New Jersey Medical School, USA

ABSTRACT

Background: Medical education is increasingly employing practical and simulation-based learning for key clinical concepts due to their comparative efficacy to didactic modalities. However, current practices, such as evidence-based medicine (EBM) education, are limited in breadth of content due to their significant costs. We propose a novel Virtual Interactive Patient (VIP) system to introduce more simulation-based, practical education in preclinical curriculum.

Summary of Work: The VIP system, generated using broad-access survey technology, requires learners to select necessary aspects of the patient workup, including history, physical examination, laboratory studies, and imaging studies, to generate a differential diagnosis and management strategies. The system expands traditional Observed Standardized Clinical Encounter models to better simulate real clinical practice. Our study utilizes this VIP system to administer a capstone exercise in a longitudinal preclinical EBM curriculum.

Summary of Results: Student-reported comfort with evidence-based resources to manage clinical scenarios significantly increased (29.7%, $p < 0.01$) after completion of the exercise, with 79.1% of students citing a validated evidence-based resource. EBM-oriented behaviour captured in the VIP system showed 83.6%, 88.1%, and 7.90% of students correctly focusing their history, physical examination, and laboratory options, respectively. Of all students with the correct differential diagnosis, 97.7% administered a complete order, with 69.4% covering for fungal etiologies, 31.2% covering for bacterial etiologies, 5.88% covering for viral etiologies, 3.53% recognizing PCP prophylaxis, and 87.6% minimizing IRIS-risk.

Discussion and Conclusions: The VIP system provides a resource-effective mechanism to teach and assess clinical behaviour of preclinical students. The practical nature of the VIP system allowed for the capture of student reaction, indicated by increased student comfort with EBM resources, and of student learning, indicated by the completeness of final treatment regimens. It also allowed for an assessment of student behaviour, a traditionally elusive assessment, through real-time data analysis. Deficiencies identified through the VIP system better inform targeted curricular change.

Take-home Messages: Several aspects of medical education require early, practical exposure for effective learning, but current modalities incur high costs. Our VIP system, characterized here as an effective tool for teaching and assessing EBM, minimizes these concerns, thus improving integration of simulation-based exercises in preclinical education.

A reflective practice case study on guiding organization of knowledge in teaching pharmacology to large groups

AUTHOR(S):

- Gavin Dawe, National University of Singapore, Singapore (Presenter)

ABSTRACT

Background: As learners progress from novice to expert they develop increasingly interconnected and structured organization of knowledge. Without a coherent knowledge framework, novice students frequently learn pharmacology by memorizing lists of drugs and their characteristics. In contrast, experts anchor understanding of the same drugs within a highly structured and densely connected knowledge framework. Starting from the premise that “how students organize knowledge influences how they learn and apply what they know,” approaches were implemented to guide students in developing organization of knowledge.

Summary of Work: A reflective practice case study examined practices to guide organization of knowledge in teaching pharmacology to large groups. The case selected was teaching on non-steroidal anti-inflammatory drugs for year two undergraduate medical students. Teaching practice over the last five years was examined. Teaching involved a lecture to approximately 300 medical students. During the lecture, strategies to encourage organization of knowledge included (1) explicit sharing of expert knowledge organization, (2) contrasting examples to illustrate organizational features, (3) explicitly drawing attention to connections and structural principles. Knowledge organization was further reinforced with (4) sorting quizzes delivered by live interactive audience polling, and post-lecture by (5) knowledge organization tasks online, and (6) identification and explanation of problems with knowledge organization through online tutoring.

Summary of Results: Qualitative feedback was positive and suggested that guiding students to develop organization of knowledge was well received. However, student comments did not explicitly reflect an awareness of being guided in knowledge organization. Instead, they reflected an appreciation that the lecturer was “systematic and clear in his explanations,” and that “the content is structured logically” such that it “increases understanding” and “helps us with application of knowledge.”

Discussion and Conclusions: Organization of knowledge is essential for the advancement of learners from novice to expert. Without appropriate knowledge organization, students resort to rote memorization, which makes them perceive the topic as difficult, adversely affecting motivation to learn. Even in large group settings, students can be guided to develop interconnected and structured frameworks of knowledge.

Take-home Messages: Strategies to guide the organization of knowledge in teaching pharmacology to large groups can facilitate student learning.

Student Recognition of Prescription Opioid Misuse

AUTHOR(S):

- Karen Szauter, University of Texas Medical Branch, USA (Presenter)
- Dawnelle Schatte, University of Texas Medical Branch, USA

ABSTRACT

Background: In the USA, 46 people die every day from prescription opioid overdose. Many opioid abusers acquire medications from a friend or relative, and drug diversion is a factor in 50% of overdose fatalities. We questioned whether medical students would identify, discuss, and/or document opioid misuse during a patient encounter.

Summary of Work: Data for this study were obtained from a standardized patient (SP)-based clinical skills assessment (CSA). In 2018, two scenarios (chronic pain) were modified to include opioid misuse. When prompted about modifiers of pain, the SP freely volunteered Vicodin (acetaminophen-hydrocodone) use, having obtained it from a friend (Case 1) or her husband (Case 2). Students wrote a patient note after the encounter. We reviewed encounter video-recordings and documented whether/how the student responded to the admission of non-prescribed opioid use. We grouped responses as clarification (e.g.: “how much did you take”) or patient education (e.g.: “you should not use another person’s medications”). We transcribed the relevant note content. Chi-square and effect size were calculated.

Summary of Results: Case 1 (n=110): 71(64.5%) students discussed the patient’s Vicodin use and 83(75.5%) documented it in the patient note. In contrast, Case 2 (n=112): 30(26.7%) students discussed, and 97(86.6%) documented. Rates of discussion differed between the two cases, chi-square (1, n=222) = 31.909, p=.000 with a medium effect size (Phi=.379). When discussed, a patient education response occurred for Case 1: 40/71(56.3%) and Case 2: 14/30(46.7%). No verbal/written acknowledgment was noted for approximately 9% of students for each case.

Discussion and Conclusions: The majority of our students did acknowledge the patient’s Vicodin use (verbally or written) but opportunities to educate the patient about prescription opioid misuse were typically missed. Differences between the two cases was striking. Possible explanations for our findings include discomfort in addressing this with patients, or a rationalization for use based on the drug source.

Take-home Messages: Addressing the opioid crisis is complex and urgent. Providing foundational education and practice opportunities for learners to identify and counsel all patients with opioid misuse is a beginning. Additionally, prevention of drug diversion is necessary. Training students to counsel every patient receiving prescription opioids on the safe use, storage, and disposal of these drugs is essential.

“Makes me like a real doctor”. A students’ & instructors’ evaluation of students using e-prescribing program

AUTHOR(S):

- Hemmaraj Sukapun, Lampang Medical Education Center, Thailand (Presenter)
- Wachiraporn Arunothong, Lampang Medical Education Center, Thailand
- Ravin Sony, Lampang Medical Education Center, Thailand

ABSTRACT

Background: The skills of using an electronic health records (EHR) is essential for clerkship medical students. Practically, there are concerns that result in refuse permission of medical students to use full function of EHR. Students are allowed only read and access to EHR. They have never completed the full steps of using EHR before graduation.

Summary of Work: We developed an e-prescribing program for clerkship medical students. This program is an extended program that embedded in our hospital’s EHR. We create specific accounts for students, and allow them to access, read, and write on the records. The program does not execute students’ notes, diagnoses, or orders. The instructor needs to approve before executing. This program aims to use in an OPD teaching class. Besides, it aims to teach ICD-10, and how to prescribe medications accordingly. Before implementation, we trained both students and instructors. At the OPD teaching class, each student used the program while taking history and examining his/her patient. After completing patient’ evaluation and document, each student presented his/her case to the instructor to review and approve. Students and instructors’ rated their satisfaction of the program on the evaluation forms.

Summary of Results: All of the students and instructors completed the evaluation forms. 75% of both groups satisfied with the program. Majority of the students said they read a drug alert sign before prescribing. With the instructors’ confirmation after examining the patients, students felt confident of making a diagnosis with ICD-10 and prescribing. However, 50% of them still had difficulty using the program and thought that the program interfered doctor-patient’s communication. All of the instructors agreed that the program helps students concisely documenting the doctor’s note, precisely using ICD-10 to make a diagnosis, and carefully reading a patient’ history and a drug alert sign.

Discussion and Conclusions: E-prescribing improves students’ skills in using ICD-10 to make diagnoses. Students gained confident after practicing the program with the instructors. The program provides opportunities to prepare medical students for their future roles.

Take-home Messages: Our own developed E-prescribing program provides experience of using a real-world EHR to the students.

Evaluation of an evidence-based medicine educational intervention for Radiology Technologist Interns

AUTHOR(S):

- Yi Hsin Su, Taipei Medical University Shuang-Ho Hospital, Taiwan (Presenter)
- Yi Chun Huang, Taipei Medical University-Shuang Ho Hospital, Taiwan
- Ming Hui Chang, Taipei Medical University-Shuang Ho Hospital, Taiwan
- Yi Hsien Lin, Taipei Medical University Shuang-Ho Hospital, Taiwan
- Chen Yu Chien, Taipei Medical University Shuang-Ho Hospital, Taiwan
- Chi Jen Chen, Taipei Medical University Shuang-Ho Hospital, Taiwan

ABSTRACT

Background: Evidence-based medicine is the process of finding, appraising, and using contemporaneous research findings as the basis for medical decisions. Radiology Technologist Intern's EBM teaching was restricted by lack of curriculum time, trained tutors and teaching materials. This study aimed to measure the effectiveness of these integrated EBM skills development project activities for Radiology Technologist Intern.

Summary of Work: The experimental group was made up of Radiology Technologist Intern from the hospital. The Intern received training on EBM. During the regular academic sessions, clinical questions requiring EBM literature searching skills were incorporated in the curriculum. Tests on knowledge and self-assessment of competencies were administered to all participants at the beginning and at the end of the semester. Data were analyzed using SPSS 20.

Summary of Results: Totally seventeen participants in the experimental group. In the knowledge test, there was a significant difference between the initial and final testing for the experimental group ($p < 0.0001$). On the other hand, Self-assessment of competencies test, There was a significant difference between the initial and final self-assessments for the experimental group ($p < 0.0001$).

Discussion and Conclusions: Overall, the intervention had a positive effect on knowledge and self-perception of competencies for intern in the experimental group. The Intern increased their knowledge of EBM with the training sessions. Results from the self-assessments were consistent with results from the knowledge test, suggesting that intern gained more knowledge, but also felt more comfortable and competent to use their newly acquired skills.

Take-home Messages: The study demonstrated that the educational intervention used to integrate EBM learning in a Radiology Technologist Intern was effective as students gained knowledge about this topic and were more confident to use their EBM skills. It also demonstrated that longitudinal integrated learning activities were more effective in acquiring knowledge and mobilizing student EBM competencies. Hopefully, this study will contribute to ensuring that future Radiology Technologist Intern be better equipped for EBM practice at whatever site they are trained.

Long-term impact of the Primary Trauma Care course in the Kongo Central province of the Democratic Republic of Congo

AUTHOR(S):

- **Timo Tolppa, King's Kongo Central Partnership, Democratic Republic of Congo (Presenter)**
- Achim Vangu, King's Kongo Central Partnership, Democratic Republic of Congo
- Constant Balu, Université Joseph Kasa Vubu, Democratic Republic of Congo
- Patricia Matondo, Hôpital Provincial de Référence de Kinkanda, Democratic Republic of Congo
- Elizabeth Tissingh, King's Kongo Central Partnership, UK

ABSTRACT

Background: Trauma constitutes a growing burden of disease, yet trauma care remains rudimentary. One effective approach to improving trauma care is education.

Summary of Work: The two-day Primary Trauma Care (PTC) course was introduced to improve trauma care in Kongo Central province of the Democratic Republic of Congo. The aim of this study was to evaluate the impact of PTC on the long-term knowledge and attitudes of healthcare workers, as knowledge attrition may inform timing of refresher courses and persisting attitudes may impact the acceptance of trauma systems development. A retrospective cohort study was carried out comparing multiple-choice questionnaire (MCQ) results of PTC attendees prior to the course, immediately after and at the time of follow up at either 12, 16 or 24 months. A semi-structured questionnaire was administered to assess attitudes.

Summary of Results: A total of 51 participants (63.8%) responded. Participants were predominantly male (71.2%) with a mean age of 41.6 years. There was an increase of 4.8 in MCQ scores post-PTC ($p < 0.01$). Compared to post-course, MCQ scores did not decline after 24 months ($p < 0.01$). A total of 61% reported that equipment has not been available for procedures and 88.2% felt trauma systems could be improved. Most (84.7%) felt PTC made a positive impact to patient care and all believed trauma services to be important.

Discussion and Conclusions: We have not demonstrated significant knowledge attrition over 24 months, suggesting there is no need for a refresher course within two years. Participants felt that PTC resulted in better care for patients. However, participants also felt that their environment was not conducive to good trauma care, due to lack of equipment and underdeveloped trauma systems. Ultimately, participants' positive views regarding the importance of trauma may promote the development of trauma services in their region.

Take-home Messages: 1) This first study into the long-term effects of PTC found that significant knowledge attrition does not occur within two years post-course. 2) In resource-limited settings, education represents an important first step in improving access to trauma care and may produce advocates for the development of effective trauma systems.

Effectiveness of aviation physiology and medicine training course among medical students in Taiwan

AUTHOR(S):

- Chung-Yu Lai, Aviation Physiology Research Laboratory, Kaohsiung Armed Forces General Hospital Gangshan Branch, Taiwan (Presenter)
- Min-Yu Tu, Aviation Physiology Research Laboratory, Kaohsiung Armed Forces General Hospital Gangshan Branch, Taiwan
- Chun-Cheng Liu, Kaohsiung Armed Forces General Hospital Gangshan Branch, Taiwan
- Hsin Chu, Institute of Aerospace and Undersea Medicine, National Defense Medical Center, Taiwan

ABSTRACT

Background: National Defense Medical Center (NDMC) is the only military medical college in Taiwan. Since 2018, NDMC has added the topic of aviation physiology and medicine in clerkship to increase the diversity of the contents. The purpose is to make medical students learn more about this specialty.

Summary of Work: Aviation Physiology Research Laboratory (APRL) collaborated with NDMC to plan, organize and implement this 2-day aviation physiology and medicine training course for 5th-year medical students. The course focused on three flight safety issues, including hypobaric hypoxia (HH), spatial disorientation (SD), and G-force induced loss of consciousness (GLOC). Hypobaric chamber, SD trainer, and human centrifuge were applied to be teaching equipment. The goal is for students to be able to introduce individual flight safety issue integrated with related training equipment after the course. We adopted pretest and posttest design to evaluate the effectiveness of this intervention. Flight safety issue apprehension was assessed by four dimensions, including oral expression, physiological effect, equipment function, and time control. The range of score was from 0 to 25. Statistical analysis was performed using SPSS 22 software.

Summary of Results: From October 2018 to January 2019, 74 medical students completed this course. There were 64.9% male and 35.1% female students, whose mean age was 23.7 years. Pretest scores were 5.3, 4.9, and 4.9 for the topics of HH, SD, and GLOC, respectively; while the corresponding posttest scores were 17.8, 18.5, and 17.2. The pretest and posttest scores for the three topics were significantly different examined by pair t test (all p values <0.001).

Discussion and Conclusions: After completion of this course, we improved students' knowledge of aviation physiology and medicine in specific topics. Practical training is a good way to enhance students' performance in this field. This short-term training also encourages them to explore the difference between aviation medicine and clinical medicine.

Take-home Messages: A well-designed clerkship in APRL provides an opportunity for students to appreciate the goal of aviation physiology and medicine: understand physiological changes in flight, design countermeasures to maintain the safety and performance of aircrews.

Students' evaluation on Traditional Medicine course in 4th year medical students: Qualitative study

AUTHOR(S):

- Watcharin Ratanakasetsin, Medical Education Center Chiangrai Prachanukroh Hospital, Thailand (Presenter)

ABSTRACT

Background: Presently, traditional medicine is the most popular trend of global health. It has been reintroduced and integrated into Thai national health system as a means to promote health and self-care of people. There is a challenge for integrating traditional medicine into the medical curriculum in the modern medicine era. As WFME Global standards suggested, evaluation on the designed curriculum needs to be assessed to improve student's experience and learning outcome.

Summary of Work: A qualitative research by content analysis method was used to evaluate 4th year medical students' attitudes toward traditional medicine courses in year 2017. There were 2 patterns of learning modes. The older one was lecture-based learning. The new one was Practice-based learning. The evaluation was divided into different aspects including learning experience, application to the patient care, organizing activities and course feedback. Attitudes toward old and new courses were compared and analyzed

Summary of Results: From 44 participants, almost all of the students in practice-based learning group (95.45%) mentioned that the hand-on practice was helpful for them to learn and understand more about the value and the components of Thai traditional medicine. 59.09% feel more confident to advise and choose the appropriate traditional medicine for patients, compared to lecture-based learning. And 63.64% of both groups would like to further study traditional medicine. The baseline characteristics of both groups were not different. Additionally, summation of evaluation scores in post-tests of the new group tended to increase compared with pre-tests, which reflected the knowledge part of the students.

Discussion and Conclusions: In the conclusion, traditional medicine courses can open new perspectives and experiences for medical students and can encourage them to offer traditional medicine as a part of their treatment. As medical students didn't have any basics of traditional medicine before class and limited learning periods in both groups, the practice-based learning group was better than lecture-based learning.

Take-home Messages: Integration of Thai traditional medicine into the medical curriculum can promote its value and usage in Thai national health system.

Human Papilloma Virus in Portugal: Biomedical Sciences students' knowledge and perceptions

AUTHOR(S):

- Amadeu Borges-Ferro, Escola Superior de Tecnologia da Saúde de Lisboa - Instituto Politécnico de Lisboa, Portugal (Presenter)
- Ana Chinita, Escola Superior de Tecnologia da Saúde de Lisboa - Instituto Politécnico de Lisboa, Portugal

ABSTRACT

Background: Human PapillomaVirus (HPV) is responsible for a high number of infections in the sexually active population, especially in individuals between 16 and 25 years old and in the first years after sexual initiation. It is proven the association of this infection with malignant tumors, particularly Cervical Cancer. The relationship of HPV and other malignancies, such as cancer of the penis and oropharynx, has gained importance in recent decades. HPV is therefore a major health problem that affects both women and men. It is important to understand the knowledge of undergraduate health students since they will be future professionals who will play an important role in HPV prevention, diagnosis and treatment.

Summary of Work: The main goal of this study is to verify the level of HPV knowledge and awareness among undergraduate students of Biomedical Sciences in Portugal. To investigate students knowledge about HPV, a 34 questions online questionnaire was developed. A total of 111 questionnaires were obtained, with most of the participants being girls (92.24%) and 21 years old the most frequent age (23.28%).

Summary of Results: All respondents stated that they had heard about HPV and all indicated Cervical Cancer as the most important consequence of HPV infection. Most individuals specified that educational institutions were the main source of their HPV knowledge (93.1%). When questioned about the association of HPV with different diseases, only 14.66% of individuals selected wrong answers. Considering HPV prevention, 52.24% selected wrongly "Use of oral contraceptives". Most participants were correct about HPV transmission and risk behaviours. However, 55.78% answered incorrectly concerning HPV symptoms. Knowledge about vaccination showed only 11.08% wrong answers.

Discussion and Conclusions: In general, satisfactory knowledge about HPV was observed, with most individuals achieving final scores between 51% and 75%. We can conclude that the general knowledge is good. However, there is still wrong information and some lack of knowledge mostly about prevention and symptoms.

Take-home Messages: Portuguese Biomedical Sciences students have satisfactory levels of knowledge about HPV. It is important to strengthen matters concerning HPV prevention and symptoms.

Innovative pre-clinical infectious diseases course in English in Japan

AUTHOR(S):

- Harumi Gomi, International University of Health and Welfare, Japan (Presenter)
- Kazi Selim Anwar, International University of Health and Welfare, Japan
- Harque Khandakar, International University of Health and Welfare, Japan
- Shiro Endo, International University of Health and Welfare, Japan
- Yasuyuki Kato, International University of Health and Welfare, Japan
- Tetsuya Matsumoto, International University of Health and Welfare, Japan

ABSTRACT

Background: The subspecialty of infectious diseases has been under development in Japan. There are still few clinical infectious diseases specialists in Japan. Given this fact, historically, segmental microbiology courses such as bacteriology, virology, or parasitology have been taught by basic microbiologists as part of pre-clinical subjects in Japan. Our international medical university was founded strategically two years ago to provide integrated curriculum in English in Japan for the first time. This study is to describe how our pre-clinical integrated infectious diseases course was provided in 2018 for the second-year medical students.

Summary of Work: Full time faculty members with expertise in infectious diseases were in the teaching group of the course in 2018. The expertise included basic microbiology, clinical infectious diseases, infection control, tropical medicine including management of Ebola virus, and global health. This comprehensive infectious disease expert group had multiple meetings before, during, and after the course to design, adjust, and improve the course.

Summary of Results: A total of 140 second-year students took this course. The course consisted of 45-hour sessions within two weeks. The sessions included 30-hour didactic interactive lectures and 15-hour practical microbiology or simulation center exercise. Each session was evaluated by the students online as part of the routine class survey. Among the students who gave feedback, this course was highly appreciated.

Discussion and Conclusions: To understand the needs among the students and faculty members is challenging. The student online survey and discussions among the faculty members before, during and after the sessions seemed very effective to adjust the content and the depth of the course.

Take-home Messages: Comprehensive integrated infectious diseases course has been successfully provided in English in Japan. This model can be utilized in other institutions to integrate basic microbiology, clinical infectious diseases, infection control, and public health.

Three-step kidney ultrasound course for medical students: a pilot study

AUTHOR(S):

- Chih-Chin Kao, Taipei Medical University Hospital, Taiwan (Presenter)
- Shu-Ching Yeh, Taipei Medical University Hospital, Taiwan
- Yi-No Kang, Taipei Medical University Hospital, Taiwan
- Jeng-Cheng Wu, Taipei Medical University Hospital, Taiwan
- Chien-Yu Chen, Taipei Medical University Hospital, Taiwan
- Chun-Chao Chang, Taipei Medical University Hospital, Taiwan

ABSTRACT

Background: Ultrasound is an easy-accessible and important diagnostic tool in clinical practice. However, the medical students had little chances to perform it. We conducted a three-step course of kidney ultrasound and designed an evaluation protocols to explore the performance skills of students.

Summary of Work: There were 44 medical students participated in a three-step course of kidney ultrasound in this study. First step is remote learning by the on-line videos for ultrasound introduction. Second step is basic kidney ultrasound exercise on the colleagues. Third step is direct operating in the clinical patients. We measured the relevant outcomes of basic operating performance and kidney ultrasound operating performance. A visiting staff tested students' performance skills with structured checklist, which was a three-point observational scale with ten observational items. According to the scale, the study used value 1, 2 and 3 to represent poor performance, fair performance, and good performance respectively. One-sample t-test served qualification of learning performance of kidney ultrasound with threshold value 2. Generalized linear model (GLM) with multiple comparisons served the analysis of learning diagnosis.

Summary of Results: In the overall performance, students' performances in kidney ultrasound (2.24 ± 0.37 , $p < .001$) were well. However, the results of GLM analysis showed that performance of detector position and direction were better than image adjustment and body mark usage ($p < .001$). Regarding kidney evaluation, the kidney size measurement was performed better than other items (kidney chronicity evaluation, stone / cyst evaluation, $p < .001$).

Discussion and Conclusions: This three-step kidney ultrasound course help students familiar with this diagnostic skills. It may be an effective approach in teaching kidney ultrasound skills to medical students. Nevertheless, the course should be modified according to this learning diagnosis analysis. We reinforced ultrasound performance skills (including body mark usage, kidney chronicity evaluation, or stone / cyst evaluation) by the on-line videos.

Take-home Messages: This three-step kidney ultrasound course improved medical student kidney ultrasound performance. Several aspects of ultrasound techniques need to be reinforced.

Application of point-of-care ultrasound (POCUS) in clinical care for medical students and post-graduate year residents

AUTHOR(S):

- Wang-Huei Sheng, National Taiwan University Hospital, Taiwan (Presenter)
- Nin-Chieh Hsu, National Taiwan University Hospital, Taiwan
- Chih-Wei Yang, National Taiwan University Hospital, Taiwan
- Hung-Bin Tsai, National Taiwan University Hospital, Taiwan
- Shan-Chwen Chang, National Taiwan University College of Medicine, Taiwan

ABSTRACT

Background: Point-of-care ultrasound (POCUS) has become a ubiquitous tool in clinical care. We established a standardized POCUS educational program for under-graduate senior medical students and post-graduate year (PGY) residents to identify and evaluate the competency, improvement and feedback from trainees after participating the program.

Summary of Work: A 14-month longitudinal standardized POCUS educational curriculum was conducted from Sep 2017 to Nov 2018. We organized five hands-on individual fields of teaching sessions (cardiac, abdomen, lung, musculoskeletal and protocols). The whole training program was designed to be completed in a monthly rotation. Quality assurance and feedback were performed after each session by an on-line survey scored from 1 (the lowest) to 10 (the highest).

Summary of Results: Compared to medical students, PGY residents scored significantly higher baseline competency on both knowledge and skills of ultrasonography (5.9 vs. 3.1, $p=0.001$ and 6.6 vs. 3.1, $p=0.006$, respectively), and significant higher in all five individual fields. Medical students scored significant higher self-rated improvement of overall knowledge and skill after curriculum (2.9 vs. 0.7, $p=0.002$ and 2.7 vs. 0.4, $p=0.030$, respectively). The lung session resulted in the highest scored skill improvement for PGY residents. PGY resident scored significant higher for the usefulness in clinical care as compared to medical students (9.4 vs. 7.8, $p=0.027$).

Discussion and Conclusions: A longitudinal POCUS educational curriculum is effective to improve competency of ultrasonography for both medical students and PGY residents. While medical students perceived more significant improvement in knowledge and skills in using ultrasonography, PGY residents perceived higher usefulness in assisting their clinical care. The lung session resulted in the highest scored skill improvement for PGY residents. POCUS instructors may need to adjust the learning objective for different population.

Take-home Messages: POCUS education enhances both medical students' and PGY residents' knowledge and skills of ultrasonography. POCUS is perceived more useful in clinical care for residents compared to medical students.

What Are You Looking At? Ensuring That Admissions Tests and Desired Constructs Align

AUTHOR(S):

- Darryl Kraemer, Altus Assessments, Canada (Presenter)
- Christopher Zou, Altus Assessments, Canada
- Harold Reiter, McMaster University, Canada

ABSTRACT

Background: The emergence of situational judgment tests (SJTs) from human resource literature has tied the development of these selection tests to job performance and the job context, rather than as general constructs. In their literature review, Christian et al. noted advantages of using general constructs instead - improved predictive validity and more meaningful score comparison with other selection methods. In this study, the second advantage is examined by subjecting a general construct-developed SJT used in medical admissions to data analyses comparing it to well-established and validated tests of medical student selection.

Summary of Work: We collected the various admission metrics gathered by New York Medical College in 2015 - grade point average (GPA), old Medical College Admissions Test (MCAT) including all section sub-scores, new MCAT 2015 including all section sub-scores - in addition to an online video-stem construct-developed SJT (CASPer). Pearson correlations were derived among all scores, and a Principal Components Analysis (PCA) using varimax rotation with Kaiser normalization on the correlation matrices.

Summary of Results: 9,096 students completed secondary applications, of which 1,656 came to MMI. Both Pearson correlations and PCA pointed to similar conclusions - Tests designed primarily as cognitive assessments (GPA, science subsections of MCAT) and those designed primarily as personal competency assessments (MMI, CASPer) clustered as two separate groups. Tests designed as reflections of composite cognitive and personal competencies (verbal and behavioural science subsection of MCAT) straddled the two groups.

Discussion and Conclusions: The results of this study lend further validity evidence to the tools that are used in the admissions process. When introducing new selection measures, programs should consider data analyses akin to that described in this study, to ensure that the constructs being measured are well defined and that those constructs align with institutional mission statements.

Take-home Messages: The various admission tools used in the current selection process assess two general constructs: cognitive competencies and non-cognitive competencies.

Building Regional Campuses: Considerations Regarding Development of Admissions and Recruiting Practices

AUTHOR(S):

- Carol Elam, University of Kentucky College of Medicine, USA (Presenter)

ABSTRACT

Background: Medical schools across the world are expanding the numbers of graduates they produce by opening regional campuses. This work describes our approach to developing recruitment and admissions procedures at three regional campuses of the University of Kentucky College of Medicine (UKCOM).

Summary of Work: Mindful of our experience building a two-year clinical campus in 2008, we embarked on opening two four-year regional campuses, with a total enrollment of 65 students, starting in 2016, by 2019. As with other aspects of planning a regional campus, devising admissions practices involves demonstrating leadership, developing partnerships, building support, understanding the potential demand, adapting policies and procedures, adhering to accreditation requirements, developing staff and faculty training, and creating marketing and communications plans.

Summary of Results: Meeting regularly with local admissions working groups comprised of leaders from the established medical school, regional medical campus, affiliated regional undergraduate university, Area Health Education Center, and local medical center, we examined ten-year applicant and matriculant pools from regional universities and liberal arts colleges, and from all counties in each region. Based on that review, we developed the following recruitment initiatives: 1) Caring for the Commonwealth Initiative inviting community and higher education leadership to the regional campus; 2) Community Open Houses and outreach to area high schools and colleges targeting prospective students and parents; 3) Early Assurance contracts with the regional universities and colleges providing assured admission for selected students; 4) special educational opportunities unique to each regional campus; 5) local scholarship support, and 6) print and web-based promotional materials. Particular admissions procedures including screening, invitation for interview, selection and interviewer and admissions staff training follow UKCOM procedures and accreditation guidelines.

Discussion and Conclusions: Recognizing that environments and needs may change after initial admissions plans are made, we built a regular monitoring and feedback system regarding recruitment and admissions initiatives, and put programs, such as Early Assurance, in place for three-year cycles, subject to review. Working with local partners in each regional setting created a sense of shared investment in goals, activities, and outcomes.

Take-home Messages: Designing new recruitment initiatives locally builds trust in adopting established admissions procedures.

Approximation to vulnerable students' academic trajectories: between background effects and personal merits potential

AUTHOR(S):

- **Natalia Harden Diaz, Universidad de Chile, Chile (Presenter)**
- Javiera Esturillo Pinet, Universidad de Chile, Chile
- Valentina Flores Castro, Universidad de Chile, Chile
- Diego Pacheco Sandoval, Universidad de Chile, Chile
- Sandra Flores Alvarado, Universidad de Chile, Chile
- José Peralta Camposano, Universidad de Chile, Chile

ABSTRACT

Background: There exists, at a worldwide level, an increase regarding access to higher education by new social sectors; however, these new students show less academic performance, associated to their socioeconomic condition. Admission to higher education doesn't settle the inclusion problem, rather demanding attention to the student's educational process.

Summary of Work: This study's purpose was to determine if there exist different academic trajectories, measured by performance, between regular and socioeconomic prioritized admissions, identifying whether this difference can be explained by academic merits, the student's vulnerability condition, or a combination of both. This was addressed by modeling both the half-year term GPA and the half-year term approval rate through mixed linear models over the total of students that entered the Universidad de Chile's Medicine Faculty between the years of 2013 and 2018.

Summary of Results: The results show a gap in the academic trajectory according to the admission way, evidencing its effect on performance. This is, however, independent from the remaining used variables, such as sex, score at the national admission test and high school's ranking obtained score.

Discussion and Conclusions: Considering the utilized academic and demographic variables, the results concur with literature, except at the prediction granted by high school's performances. Finally, we suggest that the performance gap between different groups might be explained by the higher vulnerability of those students that are admitted via equity prioritized ways.

Take-home Messages: The developed study emphasizes the need to pay attention to how university policies should be oriented to reduce the existing gaps between different groups of students, not only in their entry to higher education, but also in their persistence and graduation. Taking into account all those elements, it is possible to advance forward to greater educational equity.

Socio-demographic variables in Brazilian new-entrant medical students

AUTHOR(S):

- **Renata Kobayasi, School of Medicine of University of Sao Paulo, Brazil (Presenter)**
- Guilherme Keichi Nakandakare, School of Medicine of University of Sao Paulo, Brazil
- Paulo Roberto Palma Urushima, School of Medicine of University of Sao Paulo, Brazil
- Fernanda Magalhaes Arantes-Costa, School of Medicine of University of Sao Paulo, Brazil
- Milton Arruda Martins, School of Medicine of University of Sao Paulo, Brazil
- Vitor Mendonça, School of Medicine of University of Sao Paulo, Brazil

ABSTRACT

Background: Medical students suffer from high rates of anxiety and depression. In recent years there has been an increasing focus on the need to improve support and treatment services for those in difficulty. Knowing student characteristics makes it easy to offer the support needed for adaptation to the challenging years of medical education.

Summary of Work: We aimed to assess the characteristics of 175 new-entrant medical students enrolled at University of SAo Paulo, Brazil in a cross-sectional study, with a sixty-question self-reported questionnaire, comprising socio-economics information, study habits, use of stimulant substances, family support or demands.

Summary of Results: Response rate was 49.1%. Mean age of students was 18.9 years, 32.9% were female. There was a prevalence of Whites and Asians (89.6%) and low participation of Blacks (10.4%). Sixty-two percent of the students came from private schools during high-school. Students' mean hours' class on was seven hours and extra-class study period was five to six hours. Seventy-four percent of students regularly used stimulants, especially caffeine to maintain routine study. Only thirty-six percent of the students kept practicing physical activities during the year of preparation for medical school, and the majority (63.5%) indicate lack of time for leisure to practice sports. Students pointed out material and psychological support by the family, and denied excessive pressures and family charges.

Discussion and Conclusions: We still have male predominance in our medical school, in spite of the higher participation of women in medicine. Our data also highlight a higher proportion of whites and students from private high-schools in spite of the selection policies to promote equitable and fair access for all candidates.

Take-home Messages: New-entrant medical students in our institution were in the majority male and white. Time devoted to the studies during weekday ranged from 11.4 hours to 12.4 hours per day. Although they had heavy study routine they pointed out family psychological and material support without excessive pressures and charges.

The Relationship Between Undergraduate Teaching Settings, Graduate Outcomes, and Foundation Programme Allocation - A Single Centre Study

AUTHOR(S):

- Hassan Baig, University of Aberdeen, UK (Presenter)
- Ioannis Georgiou, University of Aberdeen, UK
- Qaisar Khan, University of Aberdeen, UK
- Usman Rasul, University of Aberdeen, UK

ABSTRACT

Background: Currently, British standards of medical education have set high expectations at an international level. The University of Aberdeen (UoA) is one of the highest-ranking universities for medical education in the UK. The Situational Judgement Test (SJT) is an exam focused on team-work, leadership and patient-centred care, for which communicative and real-life exposure is paramount. The Educational Performance Measure (EPM) is a scale which creates an academic profile for each student, based primarily on a combination of the grades achieved throughout the academic years. This research analysed the relationship between the hours spent within different clinical teaching settings and the SJT results of graduates, demonstrating what the 'integrated' style of delivering medical education has achieved.

Summary of Work: The total number of hours allocated for the teaching of clinical skills were coded for the academic year 2015/2016. Data allocation was based on the year of study and the clinical setting in which the students were taught. Three parameters were identified for the teaching of clinical skills; Communication (C), Practical (P) and Ward-based (W).

Summary of Results: The cumulative number of hours spent teaching clinical skills over the five years was 3,353.8 (C: 25.8, P:68, W:3160). Stratification based on year of study showed the following hours were spent in each clinical setting: Year 1 (C:42, P:9, W:9), Year 2 (C:15.5, P:36.5, W:46), Year 3 (C:20.3, P:22.5, W:41), Year 4 (C:0, P:0, W:1792) and Year 5 (C:48, P:0, W:1272).

Discussion and Conclusions: The analysis of the UoA 'integrated' teaching technique reveals that an increased delivery of teaching hours within wards has resulted in a combined SJT and EPM of 78.76, which is insignificantly below the national average of 80.31. Additionally, the average SJT score alone was 39.06; below the national average of 39.59. However, 85.06% of graduates were allocated to their first choice of foundation school surpassing the national average of 78.56%.

Take-home Messages: Emphasis on clinical skills is likely to affect the SJT performance, due to the nature of the test, and subsequently improve the percentage achieving first choice of foundation school allocation. However, continued research is required via a multi-centre comparative approach to further this hypothesis.

Do graduate entry medical students with non-science backgrounds have a greater tolerance of ambiguity during the transition to clinical placements compared to those with a science degree?

AUTHOR(S):

- Jack Mowatt, Warwick Medical School, UK (Presenter)
- Louise Davis, Warwick Medical School, UK

ABSTRACT

Background: There is good evidence that the arts may help to improve tolerance of ambiguity. Tolerance of ambiguity is important for any healthcare professional and this extends to medical students. There is a lack of research comparing tolerance of ambiguity in the clinical phase between science and non-science graduates studying graduate entry medicine (GEM); therefore this study aims to determine whether those with a non-science background have a greater tolerance of ambiguity in the clinical phase than science graduates at Warwick Medical School, a UK graduate entry medical school.

Summary of Work: Using a mixed methods approach, a questionnaire was designed combining the TAMSAD (Tolerance of Ambiguity in Medical Students and Doctors) scale and background questions. This was emailed to 328 phase 3 medical students at The University of Warwick. Statistical analysis was used to compare any differences between non-science and science respondents and, in addition, descriptive analysis was conducted on the background information provided by participants. The students were also invited to participate in a semi-structured focus group and the data was analysed using thematic analysis.

Summary of Results: 60 responses were analysed with a science:non-science ratio of 2:1. Although the Mann-Whitney-U test showed no significant difference between the two samples, analysis showed non-science students were more likely to have had previous paid healthcare experiences and a gap between their first degree and starting GEM; this was theorised to have contributed to a higher percentage of non-science students feeling more confident before and a month after starting the clinical phase. Six students participated in the focus group (non-science:science ratio 4:2) and six themes were identified. Data from some of the themes suggested that non-science students had a greater skill set to mitigate uncertainty due to previous experiences.

Discussion and Conclusions: Descriptive and qualitative data suggests that non-science students had more experiences to draw upon to increase their tolerance of ambiguity. This was due to non-science students having a greater period of time between their first degree and starting GEM. Non-science students were older and more mature in their approach to uncertainty.

Take-home Messages: Non-science students had more experiences to draw upon to increase their tolerance of ambiguity.

Association between entrance marks, academic performance and the National Medical Exam

AUTHOR(S):

- Ricardo Afonso, Department of Biomedical Sciences and Medicine, University of Algarve, Portugal (Presenter)
- Ana Marreiros, Department of Biomedical Sciences and Medicine, University of Algarve, Portugal
- Isabel Palmeirim, Department of Biomedical Sciences and Medicine, University of Algarve / Algarve Biomedical Center, Portugal
- António Pêgas, Department of Biomedical Sciences and Medicine, University of Algarve, Portugal
- Sandra Silva, Department of Biomedical Sciences and Medicine, University of Algarve, Portugal
- Sofia Nunes, Department of Biomedical Sciences and Medicine, University of Algarve, Portugal

ABSTRACT

Background: The Integrated Master of Medicine of the University of Algarve (MIM-UAAlg) is 4 year medical degree that enrolls graduate students exclusively with an integrated PBL based curriculum. Student's selection process consists: 1st phase - a set of cognitive skills tests and a proof of English language knowledge and 2nd phase - a set of 10 multi mini-interviews. The assessment system has the following components: knowledge assessed using Progress Testing (the Personal Progress Index (PPI) developed by McMaster University); practical skills assessed using Objective Structured Clinical Examinations (OSCE's); clinical tutors in Primary Care and Hospital context assess professionalism, communication and clinical reasoning.

Summary of Work: The aim of this study was to evaluate if there is any association between entrance examination marks, academic achievement and the results of the National Medical Exam (NME). Data were analyzed with SPSS. Descriptive analysis were performed for univariate approach and complemented with a multivariate classification analysis - considering the NME as the dependent variable. 5 cohorts, from 2009 to 2013, in a total of 161 students were considered for this study.

Summary of Results: A multivariate classification approach applied for all variables showed that the first variable with the greater differentiating power in the NME was Clinical Practice 3 (CLI 3). With a cut-off point of 17 values we verified that OSCES 4 and the final PPI of the 3rd year are important in the NME outcome. Considering exclusively the variables of entrance marks, academic performance and the NME, it was verified that it is possible to differentiate the results of the NME by stratified average of the academic performance. In addition, it was found that there was a significant association between the 4 intervals of the final mean of the course and the mean scores of the cognitive tests ($p = 0.000 < 0.05$ -Kruskal Wallis).

Discussion and Conclusions: We concluded that the "latent dimensions", the cognitive scores and the final mean, were effectively related to the NME. However, analyzing each assessment moments there are other important predictors like CLI 3, OSCES 4 and PPI 3_3.

Take-home Messages: Results of National Medical Exam of UAAlg medical graduates can be anticipated from student selection process and academic achievements.

The Influence of “Wanna Be a Doctor Camp” on Thai High School Students’ Decision to Study Medicine

AUTHOR(S):

- **Anawin Anomasiri, Chiang Mai University, Thailand (Presenter)**
- Komson Wannasai, Chiang Mai University, Thailand
- Kriengkrai Srithanaviboonchai, Chiang Mai University, Thailand
- Manussabhorn Phatsara, Chiang Mai University, Thailand
- Volaluck Supajatura, Chiang Mai University, Thailand

ABSTRACT

Background: Many factors influence Thai high school students’ study decision at higher education, especially in Medicine. In Chiang Mai, “Wanna Be a Doctor Camp” have been held annually for many years to provide information about medical education for high school participants and to improve their decision making on higher study.

Summary of Work: This study aims to assess the influence of the Wanna Be a Doctor Camp among high school participants by inquiring their understanding about medical education and their decision to study medicine. Questionnaires were sent to participants (n = 200) of the camps organized during 2014-2016. The information collected include: year participated, age and education during the camp attendance, present education, willingness to study medicine before and after the camp (yes or no), levels of willingness to study medicine and understanding in medical education before and after the camp (both were rated from 1-10). Data were analyzed using descriptive statistics, Chi-square and paired-samples T tests at < 0.05.

Summary of Results: Eighty-five participants (44%) completed the questionnaires. The proportion of respondents who were willing to study medicine increased from 77.6% to 84.7% (p = 0.18) after attending the camp. The level of willingness to study medicine and that of understanding in medical education increased from 6.9 to 7.9 (p < 0.01) and 5.7 to 8.2 (p < 0.01), respectively.

Discussion and Conclusions: The levels of both willingness to study medicine and understanding in medical education are significantly increased via participation of high school students in the Wanna Be a Doctor camp. The camp did not significantly change the participants’ decision in higher education since most of the respondents remained their willingness to study medicine after the camp participation. However, non-response bias might have introduced due to moderate response rate so the results should be interpreted with care.

Take-home Messages: Information about medical education and related issues should be provided to high school students who would like to pursue medical education beforehand to assure that they execute informed decision.

Multiple Mini-Interviews in Medical Student Selection

AUTHOR(S):

- **Anant Khositseth, Faculty of Medicine Ramathibodi Hospital, Mahidol University, Thailand (Presenter)**
- Somnuek Sungkanuparph, Faculty of Medicine Ramathibodi Hospital, Mahidol University
- Pongsak Khowsathit, Faculty of Medicine Ramathibodi Hospital, Mahidol University
- Orapan Charoonchay, Faculty of Medicine Ramathibodi Hospital, Mahidol University

ABSTRACT

Background: Multiple mini-interviews (MMIs) has been widely used for medical student selection. We generally recruited candidates relied on higher score in examination. Alternatively, another track using portfolio and MMIs was developed. This study was to determine the process of MMIs.

Summary of Work: One-hundred students (regular schools) and 53 (international schools) applied the program. Using portfolio (personal statement and past experiences) scoring by 7 independent reviewers. Studying in the international schools was significantly correlated with selection (OR 3.288 [95% CI, 1.643-6.581], p=0.001). Forty-five candidates enrolled in MMIs including psychiatric screening and portfolio verification (no scoring) and 8 stations including station (1) service orientation, (2) social skills, (3) teamwork&leaderships, (4) capacity for improvement, (5) self-awareness, (6) handling stress, (7) ethics, and (8) communication, Each station (8-minute) has two interviewers/observers independently scoring for each candidate (scale A, B, C, D, F).

Summary of Results: Kappa analysis (K) demonstrated poor agreement in station (1) to (5) (K -0.01 to K 0.17); fair agreement in station (6) and (7) (K 0.33, K 0.39); and moderate agreement in station (8) (K 0.47). Since the score mark was transformed to continuous variables scaling from 0 to 4, Kendalls coefficient of concordance (W) demonstrated good agreement in station (5), (7), and (8) (W 0.5878, 0.5688, 0.6398); fair agreement in station (4) and (6) (W 0.2964, 0.2789); and poor agreement in station (1) to (3) (W 0.275, 0.2349, 0.025). Twenty-eight candidates selected by MMIs had significantly higher proportion of students studying in the international schools but not related to the higher score from portfolio. The scores from all stations except station (4) and (7) significantly predicted selection by MMIs. Station (5) was the strongest predicting factor for selection by MMIs, followed by station (1), (2), and (3).

Discussion and Conclusions: There were variation in scoring between 2 observers. Self-awareness was the strongest predictor for the selection. There was no correlation between portfolio rating and MMIs scoring.

Take-home Messages: Two observers in MMIs station tend to be better than single observer. We propose using both portfolio and MMIs in the final process of medical student selection.

Does multiple mini-interview pick medical students different from those admitted by written examination?

AUTHOR(S):

- Chyi-Her Lin, Department of Pediatrics, E-Da Hospital, I-Shou University, Taiwan (Presenter)
- Mei-Hua Chen, Department of Pediatrics, National Cheng Kung University Hospital, National Cheng Kung University, Taiwan
- Charity TC Tsai, Department of Medical Humanities and Education, Kaohsiung Medical University, Taiwan
- Williams J Huang, Department & Institute of Physiology, National Yang-Ming University, Taiwan

ABSTRACT

Background: Multiple mini-interview (MMI) has been adopted by many medical schools in selecting medical students. It is a tool to screening applicants' non-cognitive traits. Whether medical students picked by MMI are different from those by other tools are unclear. This study was to compare the characteristics of medical students admitted to the same schools by MMI or written examination (WE).

Summary of Work: We enrolled the first year medical students of 7 medical schools who were selected by either MMI or WE in Taiwan. Exclusion criteria: students enrolled with college or higher degrees or by other special channels. A semi-structured questionnaire was designed with content including: admitted to medical school by MMI or WE tools, gender, location (urban or rural) and ownership (public or private) of high schools, parents' socioeconomic status (SES), motivation of studying medicine and approach of learning (motive and strategy, deep vs surface). The questionnaire was distributed to medical students participated freely. We compared the differences in characteristics of medical students admitted either by MMI or WE.

Summary of Results: A total of 543 medical students were surveyed and 513 of them responded, but only 493 (90.8%) of questionnaires were valid for study; 103 were excluded and finally 390 respondents were analyzed (205 students in MMI and 185 students in WE groups). Compared to WE, MMI selected medical students of more female (29% vs 48%, $p < .01$), more from private high schools (14% vs 28%, $p < .01$), and higher scores of learning with surface motive (3.96 vs 4.24, $p < .01$). There were no differences in location of high schools, parents' SES and motivation of studying medicine between the two groups.

Discussion and Conclusions: MMI selected higher proportion of female medical students, graduates of private high schools and students learnt with surface motive than by WE. Its impact on their school performance and career choices after graduation warrant further follow up.

Take-home Messages: MMI picks medical students with different characteristics from those by WE.

Modified Multiple Mini Interview for Suranaree University of Technology Talented Scholar Selection

AUTHOR(S):

- Piya-on Numpaisal, Institute of Medicine, Suranaree Univeristy of Technology, Thailand (Presenter)
- Nantana Sirisup, Thailand
- Jennene Greenhill, Flinders Rural Health South Australia, South Australia

ABSTRACT

Background: Suranaree University of Technology (SUT) desired to grant 94 full scholarships for talented students who had remarkable cognitive and non-cognitive competency. Academic performance could present cognitive ability but non-cognitive intelligence needs more sophisticated tool. SUT student core properties; communication skill, problem solving skill, language proficiency (Thai and English) and ethical awareness, were considered as the requirement for our talented students. To assess these skills, multiple mini interview (MMI) was proposed.

Summary of Work: SUT talented scholars were offered to all institutes; Science, Engineer, Management, Agriculture, Medicine, Public Health and Nursing. To mutualize this selection, MMI questions were modified by applying group activity, hand on task, reading and writing in MMI stations. Station 1, group activity was assigned for 6 candidates, communication and interpersonal skills were observed by the raters. Problem solving skill were evaluated by questions from given scenario in station 2 and hand on task in station 5. Station 3, candidates had to express their point of view on a dilemma situation. Station 4, a 500-word Thai article was given, candidates had to give title, main idea in Thai and argumentative statement in English. Total scores were calculated and weighted according to institutional criteria for the candidate ranking. After Modified MMI (MoMMI), the candidates and raters were asked to complete the questionnaire voluntarily without any identification. The satisfaction and perception were analyzed.

Summary of Results: 154 candidates and 75 raters participated in MoMMI, 149 and 65 responded to the questionnaire. 87.9% and 89.3% of candidate though MoMMI was fair and could reflect their potential, 75.9% agreed that MoMMI was suitable for the selection. 75% and 76.6% of raters accepted for fairness and transparency. 71.8% perceived that MoMMI was reliable and 60.3% though it was cost-effective for high stake-student selection.

Discussion and Conclusions: MoMMI using multiple activities could assess various non-cognitive intelligence and can be used for professional diversity student selection. For medical student, MoMMI could present variety of skill such as interpersonal and hand skills which mandatory for our professional.

Take-home Messages: MoMMI offers more variety and diversity of non-cognitive ability assessment which is preferable for current medical student selection.

Screening for situational judgement: utilising an online video-based SJT for medical student selection in Australia

AUTHOR(S):

- Lyndal Parker-Newlyn, University of Wollongong, Australia (Presenter)
- Kylie Mansfield, University of Wollongong, Australia
- Kelly Dore, McMaster University, Canada

ABSTRACT

Background: A key challenge for medical schools worldwide is identifying appropriate tools to select students ideally suited for medical practice from a competitive applicant pool. Situational Judgement Tests (SJT) are one such tool, designed as an ability measure of emotional management and predicting future professional behaviour. CASPer is a video-based online SJT developed by McMaster University and widely used in Canada. We aimed to determine validity evidence for CASPer in Australian medical student selection.

Summary of Work: University of Wollongong (UOW) delivers a 4-year graduate entry medical program with a focus on producing Australian doctors with a desire to practice medicine in rural areas. UOW medical student selection algorithm includes GPA, GAMSAT, extracurricular portfolio and MMI interview. Scores are added for rural background/education. In May 2018 UOW undertook a pilot administering an Australian specific CASPer to MD applicants (n=1,548). Resulting scores were correlated with other selection measures and demographics.

Summary of Results: Significant correlation exists between CASPer and MMI ($R=0.38, p<0.0001$) particularly in applicants with a CASPer score <1 SD below mean. At MMI these applicants were more likely to score poorly and/or receive a “red flag” for concerning behaviour. Weaker correlations exist between CASPer and admissions portfolio ($R=0.19, p<0.0001$) and GAMSAT score ($R=0.23, p<0.0001$); particularly sections humanities and writing sections of GAMSAT. Minimal correlation exists between CASPer and GPA, age, gender, and rurality. The test was widely accepted by applicants with 86% indicating that they were satisfied, very satisfied or extremely satisfied with the CASper test experience.

Discussion and Conclusions: This study is the first widespread use of online SJT for medical selection in Australia. It demonstrated less gender bias than existing selection measures, and no bias against rural applicants. CASPer screened effectively for MMI score and demonstrated sensitivity in identifying applicants who display concerning behaviours at interview. Further research aims to establish the role of CASPer in assessing in-course situational judgement, along with analysis of influence of educational discipline and demographics.

Take-home Messages: • SJTs offer an opportunity to pre-screen medical school applicants based on personal qualities. • CASPer SJT in Australia proved to be an acceptable, reliable test with good predictive validity for interview performance and little bias.

A qualitative analysis of the Portuguese National Seriation Exams for access to residency programs

AUTHOR(S):

- Rui Jorge Silva, Life and Health Sciences Research Institute (ICVS), School of Medicine, University of Minho, Portugal (Presenter)
- José Miguel Pêgo, Life and Health Sciences Research Institute (ICVS), School of Medicine, University of Minho, Portugal

ABSTRACT

Background: In Portugal, up to 2018, access to medical residency programs was achieved by a public tender, whose selection method is a Knowledge Test designated the National Seriation Exam. This exam was criticized by medical students, graduates and clinicians, because it was based on the recall of medical factoids. In 2019, a new National Access Exam is being implemented, which mostly focuses on application of knowledge and the test of reasoning and clinical thinking of presented clinical problems.

Summary of Work: In this study, we performed a qualitative analysis of 10 National Seriation Exams (2009-18; 1000 items), to evaluate and identify the most common item flaws, according to NBME® Gold Book and the study by Rush (2016), and understand the basis of the criticism of the former exam.

Summary of Results: Our data shows that almost all items were based on the recall of medical factoids and a considerable number had at least one flaw. Three of the most prevalent item flaws were the use of negative stems, unfocused questions and the presence of vague or generalizing terms. Conversely, use of “all of the above”, use of “none of the above” and use of complex or k-type questions were among the least found item flaws.

Discussion and Conclusions: Concluding, a very significant number of items on the former exam had errors, which presents a problem in the process of seriation of the graduates. This study creates a basis of comparison to the new exam, allowing future studies in this area and the direct comparison of the exams with the considered methods.

Take-home Messages: The former Portuguese National Seriation Exam was characterized by items focused on recall of medical factoids and a considerable number of items had at least one flaw. This study allows future comparison of the two models by future studies.

Innovative Selection Criteria of Residents for a Specialty Postgraduate Program: Using Multiple Mini Interviews Scenarios to Assess Insight, Reflexivity, and Reception of Feedback

AUTHOR(S):

- **Natalie Buu, McGill University, Department of Anesthesia, Canada (Presenter)**
- Carlos Gomez-Garibello, McGill University, Centre for Medical Education, Canada
- Rachel Fisher, McGill University, Department of Anesthesia, Canada
- Catherine Paquet, McGill University, Department of Anesthesia, Canada
- Maryam Wagner, McGill University, Centre for Medical Education, Canada

ABSTRACT

Background: Selection of residents using multiple mini-interviews (MMIs) allows postgraduate medical programs to identify desirable/concerning traits difficult to discern solely by examination of candidates' application files and traditional interviews. Characteristics identified by our program as important in an ideal candidate was insight, reflexivity, and reception to feedback. In response, we developed two MMI scenarios (MMI+) to assess these skills. These complex scenarios were designed specifically to assess the aforementioned criteria. We evaluated the extent to which the new stations (MMI+) were successful in identifying candidates to the program.

Summary of Work: Between 2016 and 2018 a total of 183 candidates were interviewed for admission into the program using the MMI+. Of these interviewees 89 met the program's selection standards; 14 were admitted to the program. The 14 residents were assigned to 3 groups based on their performance on the MMI+ (from highest to lowest). These residents' clinical performance through their residency thus far was also analyzed using a qualitative approach. All comments on the residents' clinical assessment forms (e.g., daily evaluations, summative assessments, EPAs) were analyzed to distinguish learners' performance and identify trends in the criteria of interest (insight, reflexivity, and reception to feedback).

Summary of Results: Comparison of the residents' clinical assessments with the highest (HMMI+), middle (MMMI+), and lowest (LMMI+) MMI+ performances revealed that the LMMI+ group were more likely to be resistant to feedback than the HMMI+ group. The MMMI+ group's clinical performance demonstrated that some residents struggled with received feedback (on average), while others in the same group did not.

Discussion and Conclusions: Preliminary evidence about the MMI+ suggests that the new scenarios positively contribute to identifying suitable candidates for the residency program. Of the additional three criteria assessed in the MMI+, reception to feedback was found to be most frequently addressed in learners' clinical assessments. This finding could indicate that this criterion is either most relevant to the clinical setting, and/or more easily observable.

Take-home Messages: There is evidence to support that an MMI that measures insight, reflexivity and response to feedback can positively contribute to the selection of ideal candidates to a residency program.

A near-peer mock interview programme to prepare junior doctors for specialty interviews

AUTHOR(S):

- James Kent Bramer, Chelsea and Westminster Hospital, UK (Presenter)
- Orhan Orhan, Chelsea and Westminster Hospital NHS Foundation Trust, UK
- Fiona Macauslan, Chelsea and Westminster Hospital NHS Foundation Trust, UK

ABSTRACT

Background: Specialty interviews are mandatory and anxiety provoking for Junior Doctors hoping to enter medical or surgical training. Competition in London is especially fierce (imtrecruitment.org.uk, 2019). The benefits of medical student mock interviews and peer-assisted OSCEs have been demonstrated (Young, 2014; Hueston, 2016). A dearth of literature evaluates mock postgraduate interviews. We aimed to identify if mock interviews can improve the confidence of applicants for Integrated Medical Training (IMT) and Core Surgical Training (CST) and, if so, which aspects they perceived most beneficial.

Summary of Work: The programme was near-peer led and delivered. Interview questions were based on specialty guidelines and the experience of near-peer specialty interviews. The formal interview format was replicated with three 10 minute stations: 'clinical', 'portfolio' and 'ethics and professionalism & governance' (IMT)/'management and leadership' (CST). Each station had two interviewers (including a medical or surgical trainee) increasing authenticity. Candidates received five minutes feedback after each station. Candidates' confidence was assessed pre- and post-interview using questionnaires (likert scales). Qualitative data was collected on candidates' concerns regarding interviews prior to the session, and any perceived benefits of the mock interview once this was completed. Further evaluation is planned post formal interview.

Summary of Results: Nine IMT and four CST candidates were interviewed.

IMT mean interview confidence scores (1-10): - Ethics/professionalism: pre= 4.2, post= 7.6 (increase 81%) - Portfolio: pre= 5.1, post= 7.5 (47%) - Clinical: pre= 5.1, post= 7.6 (46%).

CST mean interview confidence score (1-10): - Management/leadership: pre= 5.5, post= 7.5 (32% increase) - Portfolio: pre= 5.8, post= 8.3 (43%), - Clinical: pre= 6.0, post= 8.0 (33%).

Concerns pre-interview: unfamiliarity with interview format and questions; "blinking" when questioned; answering with confidence; "is my portfolio good enough"?

Perceived benefits: Individual feedback; portfolio review; authentic interview structure; same specialty interviewers.

Discussion and Conclusions: We describe a near-peer mock interview programme, which dramatically improved IMT and CST candidates' confidence across all interview stations. The program is likely to be transferable to other settings.

Take-home Messages: Mock specialty interviews can increase IMT and CST candidates' confidence for formal interviews. There is scope for their implementation by Postgraduate Departments to prepare Junior Doctors for interviews.

Madness or a method? E-learning as one of the methods of teaching communication skills

AUTHOR(S):

- Antonina Doroszewska, Medical University of Warsaw, Poland (Presenter)
- Wojciech Oronowicz-Jaskowiak, Medical University of Warsaw, Poland
- Agnieszka Oronowicz-Jaskowiak, Medical University of Warsaw, Poland
- Joanna Michalik, Medical University of Warsaw, Poland

ABSTRACT

Background: The development of communication skills has become a compulsory element of medical curriculum on an increasing number of Polish medical universities. There are no national guidelines regarding the number and form of the classes. Each university uses a different didactic approach, and the number of hours devoted to communication training varies. On the Medical University of Warsaw, both lectures and practical classes concerning medical communication are conducted. The aim of the online lectures presented on an e-learning platform is to introduce theoretical concepts as well as show exemplary conversations with patients that aim to illustrate how the discussed theories can be applied in practice.

Summary of Work: The aim of the poster is to discuss the benefits and limitations of online teaching of communication skills, as well as to present differences in student's perception of the course depending on their field of study.

Summary of Results: The students perceive the e-learning course as a good introduction to practical classes. The respondents believed that e-learning was a better option when compared with traditional lectures. The most important advantages of the course, as listed by the respondents, were the possibility to divide the material into small parts, as well as the possibility to take classes at any time and during the weekends. The evaluation of the course differed between students of different fields of study.

Discussion and Conclusions: The students usually took the classes on weekends and a few days before the deadline for the final paper. The obtained results show that teaching communication online is not only possible, but also positively evaluated by the students.

Take-home Messages: In the Medical University of Warsaw, classes in medical communication are conducted using the blended-learning approach. This method can be of benefit to the didactic process, and is also a practical solution taking into account the limited number of hours devoted to communication skills. Using e-learning platform makes it possible to provide students with more practical exercises during the practical classes, as they are already familiar with theoretical concepts, enables to introduce more interactive elements when compared with lectures, and is more convenient for students than traditional lectures.

Doctors as Storytellers: Promoting medical student confidence and storytelling skills through performance training for oral case presentation

AUTHOR(S):

- Katherine Stevenson, Severn Postgraduate Medical Education Foundation School, UK (Presenter)
- Hannah Fuller, North Bristol Academy, UK

ABSTRACT

Background: Oral case presentation (OCP) is the principal mode of communication between doctors to convey the pertinent details of patient cases in a safe and timely fashion. OCP is also often used as means of assessment in both undergraduate and postgraduate examinations. Despite this, educational interventions in the teaching of OCP skills are virtually non-existent. Medical students are typically expected to learn case presentation skills through trial and error, with a recognisable lack of teaching on the underlying structure and linguistic principles required to effectively case present.

Summary of Work: Doctors as Storytellers (DaS) was introduced into Bristol University's curriculum in 2018. Forty-nine second year medical students attended an introductory session on the structure, format and style of the OCP and were assessed on their patient presentations using a newly validated mark scheme. They then attended two 1.5-hour sessions co-led by a clinician and actor to develop their confidence, body language and storytelling skills utilising performance training techniques. They were then re-assessed on new patient cases and were surveyed on their experiences of the programme.

Summary of Results: Students scoring a 'Good Pass' on 'Confidence' increased by 20.68% ($p=0.02$), 'Overall Organisation' by 21.64% ($p=0.019$), 'Storytelling skills' by 25.48% ($p=0.0024$), 'Engagement with listener' 25.96% ($p=0.0024$) and 'Speaking style' by 30.45% ($p=0.0015$) after the Doctors as Storytellers programme. 89% of students agreed or strongly agreed that DaS furthered their understanding of the communication skills required to orally case present.

Discussion and Conclusions: Performance training co-delivered by an actor and clinician, can significantly improve medical students' confidence, overall organisation, speaking style, engagement with their listeners and their storytelling skills for OCP. Medical students enjoy performance training and see its' value in practice. Medical schools should be working towards creating competent oral case presenters in order to enhance inter-professional communication and henceforth patient care.

Take-home Messages: • OCP structure and style is currently poorly taught, if taught at all. • Performance training significantly improves medical student case presentation and communication skills.

Breaking Bad News: Assessing Medical Student Skills

AUTHOR(S):

- Pirunrat Jiaraksuwan, Surin Hospital Medical Education Center, Thailand (Presenter)
- Pinyok Srisansanee, Surin Hospital Medical Education Center, Thailand

ABSTRACT

Background: Breaking bad news is one of a most challenging tasks for physicians. The process involves providing information and responding to patients' emotional reactions simultaneously. Medical students need to learn to develop these skills. This study aims to identify areas that medical students can improve when delivering bad news to patients.

Summary of Work: In this cross-sectional study, a mock session was used to assess the 6th year medical students on their ability to discuss positive HIV test results to a patient and provide 1:1 counseling. Following the session, the students completed questionnaires and scored their own performances.

Summary of Results: Of 36 medical students participated, 69.4% reported feeling confident during the counseling. Almost all had practiced previously with either simulated patients (97.2%) or real patients (94.4%). Nearly half of the students acknowledged overlooking these areas during the counseling: determining patient's readiness for the news (44.4%), assessing patient's reactions after hearing the news (41.6%), and discussing referrals and next steps of management (38.8%). Fifty percent of students stated that they did not give patients enough time to process the news. Notably, majority did not ask about the patient's support system or their plan to deliver news to family members and/or sexual partners (72.2%).

Discussion and Conclusions: Ineffective counseling was clearly demonstrated in a group of 6th year medical students during a mock session on delivering bad news. Possible reasons for poor performance include inadequate training, inability to communicate effectively, failure to understand patient's state of mind, and insufficient counseling time. In addition, the students were aware of the simulated teaching scenarios and could exhibit different behaviors when interacting with real patients. Findings from this study suggest that medical students would benefit from additional training on breaking bad news, particularly assessing patients' emotional state and identifying family support. Conclusions Simulated sessions on breaking bad news followed by feedback are a useful self-evaluating tool for medical students.

Take-home Messages: Effective communication skills need practice, self-awareness, and feedback.

Educating health professionals in audio-visual communication. A Medical Education Perspective: Systematic review

AUTHOR(S):

- Maria Rosa Fenoll-Brunet, Universitat Rovira i Virgili, Spain (Presenter)
- Ariadna Roca-Fernandez, Universitat Rovira i Virgili, Spain

ABSTRACT

Background: Communication is an essential competence in medical education. In this context, audiovisuals can be key instruments to facilitate learning for trainees and trainers and also for patient's education. Nowadays, the digital facilities for video editing have replaced the analogical edition of images and audio from the past. These digital facilities are available in nearly all Smartphone devices and videos can be easily widespread through their use on social media platforms, but most are not adequately educational purposes. As a consequence, it has become a rising, complex and controversial issue worldwide which and, as a recommendation, healthcare professionals should become competent in audiovisual communication during their training period.

Summary of Work: We investigated for competences to train medical students by using audiovisual tools in seven databases (MEDLINE/Pubmed, SCOPUS, Web of Science, ERIC, CINAHL, Cochrane Library and Science Direct). Methods for qualitative data collection included a PRISMA protocol for systematic review. Articles published between 2014 and 2018 were identified according to predefined inclusion and exclusion criteria.

Summary of Results: 69.086 potential studies were initially found, of which 30 were included. This review identified essential competencies needed to face current challenges in medical audiovisual communication education. Including new educational methods, patients education and different medical and surgical areas.

Discussion and Conclusions: This review discusses the great impact of audiovisuals in medical education and their usefulness for patient's education. Main conclusions are: 1. Video has been successfully used at different stages of medical training. Such as undergraduate and postgraduate education and residency programs, as well as in continuing medical education, in particular for surgery education. 2. Medical trainees accessing video resources performed significantly better. 3. Recommending patients to target specific videos, it has been noted that adherence to protocols and treatments improves. 4. Health education videos provide added value as an educational tool. Moreover, they are portable, can be viewed multiple times at convenience and can be tailored to individual needs.

Take-home Messages: Medical education trainers must take advantage of using audiovisuals properly but also training health professionals the main skills to ensure self-creating video-messages professionally and ethically correct.

Communication in everyday clinical practice from the point of view of different professions - A study on the perception of communication processes and requirements at a urological clinic

AUTHOR(S):

- **Barbara Hinding, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy (IMPP), Germany (Presenter)**
- Nicole Deis, IMPP, Germany
- Dominik Fugmann, Universitätsklinikum Düsseldorf, Klinisches Institut für Psychosomatische Medizin u. Psychotherapie, Germany
- Markus Giessing, Klinik für Urologie, Universitätsklinikum Düsseldorf, Germany
- Peter Albers, Klinik für Urologie, Universitätsklinikum Düsseldorf, Germany
- Jana Jünger, IMPP, Germany

ABSTRACT

Background: The promotion of interprofessional communication skills is an important goal for medical education and training in Germany. This applies not only to undergraduate medical studies, but especially to further training as a specialist. To date, there is hardly any content and learning objectives available for this, as these have to be developed in a subject-specific manner. The present study therefore focuses on the field of urology with the aim of determining the specific need for communication-related training among assistant physicians and nursing staff.

Summary of Work: We conducted a study on the perception and assessment of communication and communication requirements at a urological clinic to derive contents and learning objectives for communication. 15 nurses and 6 assistant doctors passed individual interviews, additionally two group interviews with 7 assistant doctors and 6 nurses were carried out. They were evaluated according to qualitative content analysis with a focus on critical interaction events and their social and organizational context.

Summary of Results: Nurses and doctors reported similar challenges. These include, for example, emotionally stressful situations such as dealing with patients with advanced tumor diseases or uncertain prognoses, as well as dealing with mistakes. Equally important was the communication between the professions that was often described as deficient. The most frequently mentioned situations are the handover and the rounds, where problems often arise with the passing on of information up to the loss of information. However, there is also a lack of structures for exchange across situations.

Discussion and Conclusions: The results for this urological clinic show great agreement in the desire for improved communication between professional groups as well as in critical communication requirements. Therefore, not only the further development of interprofessional cooperation can be jointly elaborated, but also the training of communicative competences for interaction with patients can be carried out with both professional groups together.

Take-home Messages: We would therefore recommend training doctors and nursing staff together.

3D Sensor for Health Professions' Education - Interaction Analysis in Medical Interview by Kinect Sensor

AUTHOR(S):

- Yoichiro Iwashita, Kagoshima University, Japan (Presenter)
- Reiko Yoshida, Kagoshima University, Japan
- Yuko Matsumoto, Kagoshima University, Japan
- Takayuki Oto, Kagoshima University, Japan
- Tetsuya Sakuta, Kagoshima University, Japan
- Norihiro Taguchi, Kagoshima University, Japan

ABSTRACT

Background: There are some difficulties at quantitative assessment of medical interview in health professions' education. In medical interview assessment, verbal and non-verbal communication and counseling activities were assessed. In previous work (AMEE 2016), we analyzed dental trainees' medical interview by 3D sensor (Microsoft Kinect Sensor(C)) and found correlation between trainers' evaluation score and time for facing or talking with simulated patient (SP). In this work, we analyzed connected movement of dental trainee (interviewer) and SP.

Summary of Work: In medical Interview of dental trainee's OSCE, Kinect sensor and video camera were used to acquire verbal and non-verbal communication data in 5-minutes examination time. The angle of the head and neck to a vertical direction of the dental trainee and SP during a medical interview was measured by Kinect sensor, and calculated the cross correlation function of angles in dental trainee and SP. Dental trainees were divided into 3 groups according to trainers' evaluation, high, mid, and low score groups. Maximum value in cross correlation function of the angle for dental trainee and SP were compared in each group.

Summary of Results: Maximum absolute value of cross correlation function of the angle in high score group tend to be smaller than that in low score group. In low score evaluation group, larger peaks of cross correlation function were observed.

Discussion and Conclusions: These results suggest that dental trainees in high score evaluation group tend to talk facing to SP. On the other hand, dental trainees in low score group tend to move following SPs movement. 3D sensor has potential to evaluate communication skills in medical interview quantitatively. We would like to promote the possibility and future applications of a further health professions' education field.

Take-home Messages: Potential of 3D sensor technology such as Kinect for medical education was shown.

Communication in Emergency Department: How red is red?

AUTHOR(S):

- Krittaya Kanjanarut, Udonthani Hospital, Thailand (Presenter)

ABSTRACT

Background: Curriculum of Medicine bachelor has been developed at Medical Education Center of Udonthani Hospital in 2016. The Curriculum intends to improve teaching course of communication skills. This study aimed to evaluate the communication skills and to identify the association of sex, rotating groups of students and level of triage with these skills in Emergency Department (ED).

Summary of Work: Seventy-four medical students of the sixth year were enrolled in the course for 4 weeks. The ED has used five-level triage system of Emergency Severity Index. The communication skills were evaluated using the observation forms at two points of time during the course periods. Data were analyzed using descriptive, repeated measures ANOVA and paired samples test.

Summary of Results: Overall, the communication scores significantly improved overtime. (7.06 ± 0.96 to 7.73 ± 1.23 , $p < 0.05$). Sex and rotating groups of students were not associated with communication skills ($p > 0.05$). Level of triage was associated with the communication skills ($p = 0.00$). The results of the level 1 showed that the communication skills of students categorized into 5 different subtypes were not significantly improved over time ($p > 0.05$). The communication scores did not significantly improve overtime in 4 subtypes; initiating communication (6.43 ± 0.64 to 6.68 ± 0.78 , $p > 0.05$), giving information (6.59 ± 0.64 to 7.01 ± 0.59 , $p > 0.05$), building relationship (5.66 ± 0.63 to 5.73 ± 0.67 , $p > 0.05$) and closing communication (6.50 ± 0.62 to 6.64 ± 0.61 , $p > 0.05$). In contrast, the results of the other levels showed that the communication skills of students categorized into 5 different subtypes were significantly improved over time ($p < 0.05$).

Discussion and Conclusions: The level-1 patient will be sent to Red Zone. The Red Zone has many variables within the emergency setting affect communication. Although the course was structured in three parts, the results of the Red Zone did not improve. In the ED, overall the communication skills of students significantly improved overtime. Observational design of the study might be both advantages and weaknesses for analysis.

Take-home Messages: Communication in the Red Zone has been challenged; the strategy to further advancements is prepared.

Standardized and deliberate learning as an effective method to deliver phone drug information consultation skills to pharmacy students

AUTHOR(S):

- Cheng-Yi Chao, Tri-Service General Hospital, Taiwan (Presenter)
- Chin-Sheng Lin, Tri-Service General Hospital, Taiwan
- Nai-Yung Hung, Tri-Service General Hospital, Taiwan
- Shiao-Ping Wang, Tri-Service General Hospital, Taiwan

ABSTRACT

Background: Providing phone drug information to patients is complex and remains a big challenge for pharmacy students. Medical simulation offers great chances of deliberate learning and objective assessments for medical staffs and young faculties to promote patient safety and medical quality. In this study, we evaluated the effects medical simulation with standardized and deliberate learning on the delivery of phone drug information consultation skills to pharmacy students.

Summary of Work: We established standard criteria with the components of queries collection, solution searching, and response skills and design clinical scenario to evaluate the phone drug information consultation skills to pharmacy students. After first simulation activity, instructors provided feedback and discussed with students for the key components of the standardized consultation skills. Then the students performed practice with different cases. Following deliberate learning, the second simulation activity was conducted. During simulation activities, two senior instructors evaluated and guided the students. The performance outcome before and after deliberate learning was evaluated by McNemar test. Chi-square test was used to compare the outcome with previous curriculum, which contains only one simulation activity after case practice.

Summary of Results: The capacities of queries collection (4.44 ± 1.3 v.s 5.85 ± 0.36 , $p < 0.001$), solution searching (2.54 ± 1.57 v.s 4.15 ± 1.25 , $p < 0.001$), response skills (1.67 ± 1.47 v.s 3.95 ± 1.22 , $p < 0.001$), and self-confidence (5.47 ± 2.75 v.s 7.03 ± 1.66 , $p < 0.001$) significantly improved after these activities. Compared with previous similar curriculum, these consultation skills of pharmacy students significantly enhanced in the current curriculum. Moreover, students proposed their notable improvement in consultation skills and self-confidence after repeated simulation activities.

Discussion and Conclusions: Increasing evidence suggests the encouraging role of simulation-based medical education, which effectively achieves the education goals by deliberate learning. Our studies demonstrated the significantly beneficial effects of repeated simulations on the improvement of queries collection, solution searching, and response skills, which are essential components of consultation skills, and promoted self-confidence and learning motivation for pharmacy students.

Take-home Messages: Repeated medical simulations with standardized and deliberate learning is an effective and promising way to deliver phone drug information consultation skills to pharmacy students.

Physician Assistant Training in the Effective Use of Interpreters

AUTHOR(S):

- Chris Gillette, Wake Forest School of Medicine, USA (Presenter)
- Brian Peacock, Wake Forest School of Medicine, USA
- Carol Hildebrandt, Wake Forest School of Medicine, USA
- Jamie Blalock, Wake Forest School of Medicine, USA
- Sonia Crandall, Wake Forest School of Medicine, USA

ABSTRACT

Background: According to Street's theory of how communication can heal (2009), provider-patient communication has the potential to improve health outcomes through direct and indirect routes, including information exchange, fostering relationships, and enabling self-management of health conditions. When language barriers impede effective provider-patient communication, the potential for an avoidable negative patient outcome exists. In a time of growing global migration, it is imperative that healthcare providers effectively communicate with diverse patient populations.

Summary of Work: An observational study followed five cohorts of physician assistant (PA) students in the USA. Students received training from a certified medical interpreter and a faculty member about effective use of medical interpreters in patient encounters. Afterward, students interviewed a non-English speaking standardized patient via an interpreter. Interpreters evaluated students using a validated instrument. Internal consistency of the instrument was assessed using Kuder-Richardson-20; data were analyzed using non-parametric tests. Approximately 6 months after graduation, students completed a questionnaire asking about their experience of using medical interpreters during clinical rotations.

Summary of Results: There were usable data on 439 PA students from five cohorts (n=439). The median number of areas students performed or partially performed was 10 out of a possible total of 12 (Interquartile range=3). Internal consistency was shown to be 0.68, indicating adequate reliability. Areas for further refinement of training were: (a) Asking patient to repeat instructions (n=203); (b) thanking the interpreter (n=170); and (c) not allowing the interpreter to paraphrase (n=146). Based on the graduation questionnaire, all students completed at least one clinical rotation that included the use of medical interpreters. The rotation site with the greatest use of medical interpreters was Emergency Medicine.

Discussion and Conclusions: Improving communication among future health care professionals is imperative for improved patient outcomes. A training activity for PA students in the USA that focused on the effective use of certified medical interpreters found that the rubric had acceptable internal consistency and that students generally performed well on the assessment.

Take-home Messages: Improving provider-patient communication in a time of growing global migration is critical. Future studies could explore specific communication strategies to improve communication with diverse patients.

The shortcomings of medical record writing in different levels of trainees

AUTHOR(S):

- Chiu-Ping Kuo, MacKay Memorial Hospital, Taiwan (Presenter)

ABSTRACT

Background: Accurate and complete medical records is essential for the communication between members of the healthcare team and the safety of the patient care. A teaching program of medical record writing has been started at a teaching ward of general medicine since July 2018. This study is to evaluate the competence and to identify the shortcomings of medical record writing in different levels of the trainees (senior residents, PGY-1 and medical students) before starting the teaching program.

Summary of Work: The study was performed in July 2018 by reviewing the medical records (focused on admission note and progress note) made by different levels of trainees and scored with our designed scoring checklist. There are several scoring sub-items in each section of a medical record. The results were analyzed with SPSS (statistical Product and Service Solutions) software.

Summary of Results: In admission note, the average score is lowest in PGY-1 (70.3%). All levels of trainees obtained the lowest scores in assessment & plan (59%~68.3%). Senior residents obtained lower scores (84%) than other levels of trainees in personal history and allergy. Medical students obtained lower scores (82%) than other levels of trainees in chief complaints. In progress note, the average score is lowest in medical students (68.6%). Medical students obtained lower scores than other levels of trainees in problem list (67.3%) and clinical reasoning (57.3%). Residents and PGY-1 are inferior in the structure and composition of progress note.

Discussion and Conclusions: There are different shortcomings in medical record writing in different levels of trainees. Generally, medical students have better structure and composition concepts but are inferior in chief complaints, problem lists and clinical reasoning. PGY-1 and senior residents are inferior in the structure and composition. All levels of trainees need to improve the writing of assessment and plan.

Take-home Messages: There are different shortcomings of medical record writing in different levels of trainees. Clinical teachers may design different teaching interventions to improve their medical record writing.

If you didn't write it, it didn't happen - can documentation skills be taught in simulation?

AUTHOR(S):

- **Andrea Pereira, Great Western Hospital, UK (Presenter)**
- Giles Dixon, Great Western Hospital, UK
- James Ross, Great Western Hospital, UK
- Garazi Zubikarai, Great Western Hospital, UK
- Andrew Stanton, The Newcastle-upon-Tyne Hospitals NHS Foundation Trust, UK

ABSTRACT

Background: Written documentation is a vital form of medical communication, however teaching in it is minimal. Documentation is particularly difficult with an acutely unwell patient - frequently encountered out-of-hours and without supervision. We investigated the abilities of final year medical students in documentation. We then evaluated whether brief teaching could improve pre-defined objective documentation measures.

Summary of Work: After an acute medical simulation, students were asked to document their review. To enhance fidelity they were given a time limit and supplementary material such as test results. One half of the group was given teaching at the start of their session, the other half completed the task with no additional guidance. All students had a debrief, including feedback on documentation produced and received guidance at the end of the course. Students completed surveys to before and after their simulation. Documentation was marked using pre-determined criteria -based on published guidance from the GMC, MDU and RCP. Markers were blinded regarding group. Results were analysed using unpaired t-tests in SPSS .

Summary of Results: 30 students participated in the pre-simulation survey, 24 completed the post-simulation survey. 79.2% of students had documented in medical notes before - of these, 89.5% on a ward round, 78.9% as a patient clerking and only 42.1% as an on-call review. None had received teaching on documenting. 96.7% had never documented in simulation. The mean score of students without teaching (n=7) was 18/31, this improved significantly to 23.4/31 with teaching (n=12). Mean difference of 4.7 (95% CI 2.57-6.82, p<0.05). The pre-task mean confidence for all students was 1.97/5 (5= extremely confident), this improved to 2.5/5 in the group with practice and 4/5 in the group with brief teaching and practice. Commonly missed areas were discussion with patient/relative, name of the senior advising doctor and signature.

Discussion and Conclusions: Our survey confirms lack of teaching as indicated in literature and that experience is particularly lacking in acute situations. Practice was well-received, and the statistically significant improvement in the scoring indicated the efficacy of the intervention.

Take-home Messages: Simulation regularly involves practice of other communication e.g. SBARs handovers. Our study confirms it is a good opportunity to address written documentation skills too.

Awareness of professional and academic literacy among Swedish dental students

AUTHOR(S):

- Nikolaos Christidis, Karolinska Institutet, Sweden (Presenter)
- Sofia Louca Jounger, Karolinska Institutet, Sweden
- Maria Christidis, The Swedish Red Cross University College, Sweden
- Viveca Lindberg, Stockholm University, Sweden

ABSTRACT

Background: Reading and writing are seen as self-evident academic literacy competences in contemporary dental education. It takes time to become a skilled dentist; what seems less obvious is that it also takes time to become a skilled writer in academia. However, dental work also requires professional literacy competence. The aim was to scrutinise Swedish dental students' writing in an academic setting: what students are expected to read and write, how they are expected to do this, for what purposes they read and write.

Summary of Work: This study is framed within the tradition of New Literacy Studies, and was conducted during the third year of the study-programme in dentistry, during the modules "orofacial pain and jaw function 1 and 2", at Karolinska Institutet. Literacy events were mapped throughout all activities (lectures, clinical work, examinations). During clinical work, only field-notes were taken. The material consists of: a) curricular documents; b) ethnographic data from lectures and clinical work (sound-recordings and field-notes during lectures, textbooks, hand-outs and student notes from given lectures, multiple-choice questions from the digital examination and clinical instructions); c) interviews with students.

Summary of Results: During lectures, PowerPoints were used for structuring knowledge related to orofacial pain and jaw-function. All slides were distributed in advance to students via a digital learning-environment. Most slides were multimodal: text and graphical pictures of anatomical and physiological information, as well as pathology and treatment. While some students predominantly wrote complementing text, others copied and/or reformulated text. Some made notes directly in the PowerPoint, others took notes separately. The purposes of students' note-taking revealed both professional and academic purposes.

Discussion and Conclusions: A general pattern for students' handwritten notes was copied text from the teacher-constructed PowerPoint, while for digital notes was complementary information. When slides comprised figures or pictures, students tend to describe and explain them using own words. Less amount of text on slides seem to enable students to produce independent notes. Interviews revealed that students complemented their notes afterward based on lectures and course-literature.

Take-home Messages: Dental students display awareness of the need for professional and academic literacy and can distinguish between these.

Franco Doc: Developing French-speaking health human resources in Francophone minority settings

AUTHOR(S):

- Geneviève Moineau, Association of Faculties of Medicine of Canada, Canada (Presenter)
- Danielle Barbeau-Rodrigue, Northern Ontario School of Medicine, Canada
- Aurel Schofield, Association of Faculties of Medicine of Canada, Canada
- Philippe Leblanc, Association of Faculties of Medicine of Canada, Canada

ABSTRACT

Background: The Association of Faculties of Medicine of Canada in association with community partners launched the Franco Doc project. Having identified the need to provide better access to health care for French-speaking Canadian in official language minority communities, Franco Doc was launched to address this problematic.

Summary of Work: The goals of the Franco Doc initiative were to identify and mobilize Francophone and Francophile students, prepare and equip them for work in the community and recruit them for placements in official language minority communities.

Summary of Results: By working in partnership with community partners, Franco Doc helped to facilitate alliances among faculties of medicine, community health networks and other organizations to set up a liaison committee between each faculty and the community in order to encourage them to maximize the recruitment and facilitate the integration of French-speaking health care professionals in these communities.

Discussion and Conclusions: By placing the communities at the center of the initiative, it allowed communities to take an active role in educating learners and education establishments about their particular realities and for faculties to respond appropriately. The Franco Doc project discovered that approximately 200 French-speaking medical students enter the Canadian medical schools each year.

Take-home Messages: Our 14 faculty-community liaison committees along with those student representatives collaborate together to develop and offer interactive learning activities and networking events in order to provide those new students with a better understanding of the reality of accessing health care services in Francophone minority communities. The model of the project could be duplicated and implemented all over the world in other minority communities in need as well.

Assessing the Hidden Curriculum for the Care of Patients with Limited English Proficiency: An Instrument Development

AUTHOR(S):

- **Claudia Rosu, MGH Institute for Health Professions, USA (Presenter)**
- Tiffany Kenison, Department of Medicine, Mount Sinai Hospital, USA
- Chijoke Nze, Department of Medicine, Brigham and Womens Hospital, USA
- Alexander R. Green, Division of General Internal Medicine, Massachusetts General Hospital; Harvard Medical School, USA

ABSTRACT

Background: Patients with limited English proficiency (LEP) are a growing population in the USA at risk for disparities in quality and safety of care. Medical student competency to care for patients with LEP is impacted by a hidden curriculum (HC) that undermines the learning experience; yet to date, there is no way to measure it. Thus, we designed an instrument to assess this HC.

Summary of Work: Based on findings from previous qualitative work and input from medical students and experts in LEP and psychometrics, we developed a 23-item survey with four domains. We e-mailed this to 3rd and 4th year students from two medical schools in the US. We conducted principal axis factoring to determine the instrument's construct validity. Only items with a factor loading ≥ 0.50 were retained.

Summary of Results: We obtained 111 complete responses. Twenty-two of the 23 original items were retained. Four factors/ components emerged, which did not support the original proposed domains. Three factors loaded on a mix of role modeling, and learning environment, structural, and organizational variables, while the fourth factor retained two role modeling items. Based on the factor extraction solution, we restructured the instrument into three domains: role modeling, demonstration of effective systems, and consequences of structural barriers for patients with LEP (Cronbach's alpha: 0.81–0.95, total variance accounted for 53.7%).

Discussion and Conclusions: The results led us to reassess the domain structure to create an instrument representing students' perceptions and context. Our instrument, the LEP-HC, will allow medical educators to investigate a specific and important HC and improve teaching about care of patients with LEP.

Take-home Messages: Principal axis factoring applied to a 23-item instrument assessing the hidden curriculum for the care of patients with limited English proficiency resulted in a restructuring of the instrument into three domains different from the ones obtained through qualitative analysis combined with student and experts' input.

Does emotional competency at the time of admission affect the subsequent levels of academic achievement?

AUTHOR(S):

- Koji Tsunekawa, Department of Institutional Research for Medical Education, Japan (Presenter)
- Keiko Abe, Aichi Medical University, College of Nursing, Critical Care Nursing, Japan
- Toshiki Shioiri, Department of Institutional Research for Medical Education, Japan

ABSTRACT

Background: It is essential for medical students to cultivate attitudinal competency. Previous studies have shown that emotional competence is an important factor that influences patient-physician relationships and patient care. This study aimed to investigate the influence of new medical students' emotional intelligence (EI), empathy and personality on their future academic achievement.

Summary of Work: The research participants were 398 first-year medical students at Gifu University from 2008 to 2011. They were classified into retention (n=52) and non-retention (n=346) groups. Then we compared the assessments of EI as per the Trail Emotional Intelligence Questionnaire-Short Form (TEIQue-SF), empathy as per the Jefferson Scale of Physician Empathy (JSPE) and personality as per the NEO-Five Factor Inventory (NEO-FFI), which explores five dimensions of personality: Neuroticism (N), Extraversion (E), Openness to experience (O), Agreeableness (A) and Conscientiousness (C).

Summary of Results: In the t-test following a Bonferroni correction, the non-retention group was significantly higher in the E dimension of NEO-FFI than the retention group ($p=0.037$, $d=0.40$) but not in TEIQue-SF, JSPE and other dimensions of NEO-FFI. Furthermore, a logistic regression analysis with the E dimension of NEO-FFI added to the known variables such as gender, age at admission, location of and academic performance in secondary school and scores on admission tests was also carried out. The low score of E dimension of NEO-FFI was a significant variable ($p=0.027$) in retention along with distant location ($p=0.012$), low academic performance in secondary school ($p=0.025$) and male ($p=0.046$).

Discussion and Conclusions: In previous research, students getting high scores in the E dimension of personality testing tend to be sociable and like gathering in big groups for meetings. These results indicate that studying in a group aids in acquiring positive outcomes in medical school. Further studies will be required to demonstrate that EI and empathy may relate to more detailed outcomes such as assessment of clinical clerkship in medical students.

Take-home Messages: By examining the results of the personality tests at the beginning of the year, it may be possible for new students to be aware of their own risks and for faculties to assist them.

Teaching Practices Reflecting Emotional Intelligence among University Teachers in Higher Learning

AUTHOR(S):

- Norul Hidayah Binti Mamat, International Medical University, Malaysia (Presenter)

ABSTRACT

Background: Emotional intelligence abilities of university teachers are more likely established conducive emotional teaching and learning environment through their teaching practices, thus promotes learning motivation and engagement among the students. Despite the emphasis on the importance of teachers' emotional intelligence abilities in teaching, it continues being less acknowledged and under developed. This is evidenced by fewer studies reported on the relationship between emotions and teaching approaches in higher education. This study therefore attempts to explore the roles of emotion and teaching practices reflecting emotional intelligence among university teachers in higher learning, guided by Four-Branch Emotional Intelligence Ability Model by Mayer, Salovey and Caruso (2004).

Summary of Work: Qualitative design of descriptive case study was applied with a total of ten university teachers recruited based on the inclusion criteria and semi structuredly interviewed. As case study requires multiple data sources, interviews were subsequently conducted with five university students and a Deputy Vice Chancellor. In addition, scores from Wong and Law Emotional Intelligence Scale (WLEIS) of the university teachers were obtained and tabulated.

Summary of Results: Findings established the emergence of twelve themes and nine subthemes that include essential roles of emotion in teaching, alignment between emotional intelligence and teaching practices and acknowledging own emotion. Subsequently, the other themes corresponded to the emotional intelligence abilities of perceiving, facilitating, understanding and managing emotion based on Four Branch-Emotional Intelligence Ability Model. Those were further supported by university teachers' scores of Wong and Law Emotional Intelligence Scales which were found to achieve a median of 5 and above based on seven Likert scale on four major domains namely self-emotional appraisal, other's emotion appraisal, use of emotion and regulation of emotion.

Discussion and Conclusions: The study has shown the importance of developing emotional intelligence abilities as it directly influences teaching and learning processes. As a matter of fact, the abilities have been unconsciously embedded and demonstrated through teaching practices.

Take-home Messages: Having observed considerable amount of emotional intelligence skills reflected through teaching practices and the equally felt impact by the students, trainings of emotional intelligence may need to be developed and perhaps it could be included as one of the competencies of university teachers.

Emotional Intelligence: diagnosis and evaluation in medical students

AUTHOR(S):

- Rosalba Esther Gutierrez Olvera, Anahuac University, Mexico (Presenter)
- José Marcos Felix Castro, Anahuac University, Mexico
- David Cerdio Dominguez, Anahuac University, Mexico

ABSTRACT

Background: Emotional Intelligence (EI) is the ability to identify peoples emotions to discriminate and use them to guide thought and act. There are 4 main competences: The ability to perceive emotions, use emotions to facilitate thinking, understand and manage emotions. In the 1950s, Abraham Maslow wrote about how people could improve their emotional, physical, spiritual and mental strengths; later Peter Salovey made the correlation between intelligence and emotions determining that emotions should be recognized as a substantial value.

Summary of Work: Several studies have been carried out exploring the mental health of medical students throughout the professional training, finding EI is directly related to well-being. Objective: Make a situational diagnosis about EI in medical students. Hypothesis: The medical students don't have a clear knowledge about the EI. Materials and Methods: 256 Surveys were carried out in the following semesters: 4th, 8th and 11th regarding the knowledge of EI.

Summary of Results: N=256: (93.4%) state that they know what EI is, (57%) of the respondents answered they hadn't had training on this topic. (60.2%) mentioned that no subject provided basic knowledge, (37.9%) received this information in Medical-Patient Communication. (86%) managed to define EI, (98.4%) considered it's importance in medical practice, (16.4%) considers not to have adequate training on this topic, (20%) mention not knowing how to identify their emotions. (75.4%) managed to apply the concept of EI.

Discussion and Conclusions: Despite the general consensus regarding the importance of Emotional Intelligence, there are multiple challenges to overcome, it seems that the same training process limits the development of this competence since there is a deterioration in the EI of physicians attributable to the desensitization of the depersonalized training. It is therefore vitally to re-evaluate the education plans, giving greater relevance to the development of EI. Medical students are aware of the lack regarding EI, which is why a review is proposed based on the students perception to favor teaching not just of theoretical-practical knowledge but also of medical humanities.

Take-home Messages: It is necessary to extend the study to the actual evaluation of EI, by means of a validated instrument.

Personality characteristics of incoming medical students: a Big-Five model perspective for educational strategies design

AUTHOR(S):

- Renata Rocha Giaxa, University of Fortaleza, Brazil (Presenter)
- Helena Paro, Federal University of Uberlandia, Brazil
- Carlos Clayton Aguiar, University of Fortaleza, Brazil
- Iana Castelo Rodrigues, University of Fortaleza, Brazil
- Patrícia Tempski, University of Sao Paulo, Brazil
- Milton de Arruda Martins, University of Sao Paulo, Brazil

ABSTRACT

Background: Medical education studies reveal correlations between big five personality factors and many dimensions of undergraduate medical education: academic performance, life style, learning style and specialty choice. Identifying those factors at first years of academic life may orient educational strategies, once there is a critical opportunity when it is possible to adapt and improve many learning interventions by knowing students personality characteristics.

Summary of Work: Incoming students (n=377) from a Brazilian medical school (classes of 2016 and 2017), were invited to respond the NEO Psychological Inventory - Revised (NEO-PI-R).

Summary of Results: 347 (92,1%) of students participated. Of these, 215 (61,9%) students showed high neuroticism and 176 (46,7%) had low conscientiousness scores.

Discussion and Conclusions: High neuroticism is related to anxiety, depression and vulnerability, suggesting impairment of students mental health. Low conscientiousness is associated with personality aspects such as effort, self discipline and competence, which may be connected to difficulties on professional commitment. Results show the need of planning and implementing educational strategies on undergraduate level for early management of neuroticism and conscientiousness.

Take-home Messages: Personality assessment may help educators to plan strategies that meet the needs of incoming medical students' personal development at the beginning of their academic careers.

Effects of breakfast consumption on the learning ability in medical students

AUTHOR(S):

- Natnicha Pongbangli, Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand (Presenter)
- Piyaporn Sirijanchune, Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand
- Sasivimon Jai-Aue, Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand

ABSTRACT

Background: Previous studies have shown that consuming breakfast is associated with better cognitive performance compared to fasting. However, no studies regarding breakfast consumption have been done in medical students. The aim of the study was to evaluate the effects of breakfast consumption on the learning ability in medical students.

Summary of Work: We conducted questionnaires and visual analogue scales to evaluate the effects of breakfast consumption on the learning ability in medical students. The medical students were asked to compare 4 aspects of learning ability including concentration, happiness, alertness, and cognitive ability, comparing those who had breakfast to those who did not have breakfast. The sum of the score of 4 aspects (total score) was examined. The association between the learning ability score and frequency of breakfast consumption was investigated.

Summary of Results: 120 Medical students were enrolled into the study. The frequency of breakfast consumption was divided into 4 groups (group1; <1 day/week, group2; 1-3 days/week, group3; 4-6 days/week, group4; everyday). The prevalence of breakfast consumption in group 1 to group 4 was 16%, 39%, 25%, 20%, respectively. We demonstrated that medical students gave significantly higher score in all 4 aspects of learning ability when they had breakfast compared to that when they did not have breakfast, irrespective of their frequency of breakfast consumption. The medical students with more frequency of breakfast consumption had greater total scores if they had breakfast (group1;29.3±5.8, group2;30.2±4.7, group3;32.1±3.8, group4;33.1±3.1, $r=0.308$, $p=0.001$) and lower scores if they did not have breakfast, compared to those with less frequency of breakfast consumption (group1;21.2±8.6, group2;19.5±5.6, group3;18.4±5.1, group4;16.4±7.8, $r=-0.229$, $p=0.012$).

Discussion and Conclusions: The medical students in all 4 groups gave a significantly higher score of learning ability when they had breakfast compared to when they did not have breakfast. This indicated that all medical students had more satisfactory learning abilities if they had breakfast, regardless of their frequency of breakfast consumption. Breakfast consumption had a positive effect on the learning ability in medical students, Irrespective of their frequency of breakfast consumption.

Take-home Messages: Breakfast consumption should be encouraged in all medical students.

Self-esteem is Associated with Happiness but not Academic Performance in Thai Medical Students

AUTHOR(S):

- Phakdee Kaewpangchan, Nakornping Medical Education Center, Thailand (Presenter)
- Worachet Teacharak, Nakornping Medical Education Center, Thailand
- Pornsuda Krittigamas, Nakornping Medical Education Center, Thailand

ABSTRACT

Background: Low self-esteem has been reported to deleteriously affects individual's mental health and performances. However, little evidence exists to describe the association of self-esteem with happiness and academic performance in Thai medical students.

Summary of Work: This study aimed to describe self-esteem, happiness, and academic achievement and examine their relationship among Thai medical students. This cross-sectional analytical study was conducted in 4th-6th year medical students at Nakornping Medical Education Center, Thailand in December 2018 to 15th January 2019. The students were asked to complete an online self-administered questionnaire including the 62-item Rubin's self-esteem scale, the Thai Happiness Indicators (THI-15). Academic performance was evaluated using student's grade point (GPA). The relationship between self-esteem, happiness, and GPA were analyzed using Pearson's correlation and linear regression.

Summary of Results: Among 55 medical students, 33(60%) were female, with an average±SD age of 24.67±3.66 years and 64% having normal body mass index (BMI). Almost three-thirds of the students came from families with excellent relationship, and 73% decided to study medicine on their own. Thirty-three students (64.7%) had a moderate level of self-esteem, while 44% had high level of happiness. Students' mean±SD GPA was 3.23±0.34 out of 4. There was significantly high correlation between total self-esteem scale and happiness score ($r=0.88$, $p\text{-value}<0.001$). However, both self-esteem, and happiness scores were not significantly associated with average grade. with regards to differences in gender, and governmental or private college students. In linear regression, total self-esteem scale and BMI were two factors that were significantly associated with happiness scores (Beta 0.35 (95%CI 0.30-0.40), $p<0.001$, and -0.35(-0.67,-0.02), $p=0.038$, respectively). Solely, academic year was significantly associated with GPA (Beta -0.18(-0.38,0.03), $p=0.090$, -0.33(-0.54,-0.12), $p=0.003$, for 5th and 6th year students respectively compared to the 4th year).

Discussion and Conclusions: Self-esteem was related to happiness but not academic performance. In order to enhance medical students, more interventional programs are recommended to strengthen the self-esteem.

Take-home Messages: The less self-esteem, the less happiness is found in medical students. Activities to enhance self-esteem needed to be integrated in medical courses curriculum to fulfill their happiness leading to success in medical profession.

Conceptual analysis of Resourcefulness

AUTHOR(S):

- Mei Fei Hsieh, Chi Mei Medical Hospital, Taiwan (Presenter)

ABSTRACT

Background: This term was used as an intelligent strategy for The Three Kingdoms period in Chinese history. In the fifty-ninth chapter of the romance, it is said: I am also a Jew, not with four eyes and two mouths, but with many wisdom and ears. At present, although there is literature discussion about resourcefulness at home and abroad, most of them are historical elaboration and reliability and validity test of scale development, and there is no systematic conceptual analysis.

Summary of Work: Based on Walkers and Avants conceptual analysis steps, this paper conducts conceptual analysis of resourcefulness, elaborates on its defining features and attributes, lists typical cases, marginal cases, related cases and contrary cases, clarifies its concepts, and then confirms the preset factors and consequences of resourcefulness, and examines relevant empirical data.

Summary of Results: The above dictionary and related literature were used to construct (1) positive self-statement (1) use of positive self-expression; (2) problem solving; (3) gratification of delay; (4) perceived self-efficacy. Sufficient resourceful skills enable individuals to apply their internal and external resources in the face of environmental change and pressure, control the state of imbalance caused by internal and external changes, alleviate personal emotions, and timely solve problems to cope with pressure and difficulties. The follow-up is adaptive function, life satisfaction, perceived health, mental health, physical function and positive health practice.

Discussion and Conclusions: Studies have shown that resourceful training leads to increased use of both individual and social resourceful skills, which are considered important factors for intervention. But in the studies above mentioned intervention had training of ethnic group in the elderly and caregivers, may towards clinical violence or in the face of crisis events give had related training course, people in the face of environmental change and pressure, can apply the resources of different control because of the different change caused by unbalanced state, alleviate personal emotions, timely solve the problem, in response to stress and trouble.

Take-home Messages: We hope to use this conceptual analysis to increase the understanding of resourcefulness and provide the knowledge and methods of evaluation of resourcefulness, which can be applied to solve problems faced by people and lead a high-quality life.

Exploring self-efficacy in computational medicine students

AUTHOR(S):

- Caroline Morton, Imperial College London, UK (Presenter)
- Jo Horsburgh, Imperial College London, UK

ABSTRACT

Background: Medical students and doctors are often faced with problems that are outside their existing experience and skillset. Understanding their own abilities to deal with these problems (called Self Efficacy) and developing strategies to deal with the problem should be encouraged. Students on the Computational Medicine module at Imperial College London learn to write computer code, something which is outside their current experience and skills. Given these challenges, we were interested in exploring the learning strategies that students develop and how these align with the concept of self-efficacy.

Summary of Work: In order to address this aim a qualitative interpretative approach was adopted and students were invited to take part in focus groups at the end of the course. The focus groups were audio recorded and transcribed before being independently analysed for themes by both researchers.

Summary of Results: Students found the course challenging and 'a steep learning curve', with many able to identify previously successfully learning strategies, such as cramming, which were not useful in learning to code. Many found this emotionally difficult but recognised that they developed tenacity and perseverance through identifying alternative ways to problem solve. Students identified some characteristics that made for a successful coder, including taking a logical approach, but even those who did not identify those characteristics in themselves were able to see how they developed these over time. They also recognised that the teachers did not always know the answer but found this reassuring.

Discussion and Conclusions: Generally students demonstrated self-efficacy in that they were able to solve the problems that they faced, could identify resources to do this and demonstrated flexibility and perseverance to achieve the end goal. Many students reported that developing new ways to learn, although difficult, was a useful experience.

Take-home Messages: Students can develop new learning strategies when faced with novel learning environments and subject matter, but need the right educational support and access to resources to do so. Faculty are key in signposting resources as well as encouraging students to make accurate attributions about their successes and failures.

Student Personality Types and Learning Outcome of Medical Students in Udonthani Medical School

AUTHOR(S):

- Inchaya Sansak, Udonthani Medical Education Center, Thailand (Presenter)
- Pitchayanan Kuwatjanakul, Udonthani Medical Education Center, Thailand

ABSTRACT

Background: Contemplative practices are recently supported by many studies that they help medical students relieve stress. Before the clinical year, medical students in Udonthani Medical School were invited to attend the contemplative class, where personality type identification using enneagram was a part of this class. We aimed to study about personality types and learning outcome of medical students.

Summary of Work: One to three years after attending the contemplative class, learning outcome by grade point average (GPA) was collected and evaluated. Student perceptions about the class were reflected.

Summary of Results: Fifty one medical students were enrolled in this study, 43/51 (86.3%) knew their personality types, with the distributions of 30.2%, 27.9%, 11.6%, 9.3%, 9.3%, 6.9%, 2.3% and 2.3% in type 9, type 7, type 4, type 5, type 2, type 8, type 3 and type 6, respectively. The GPA ranged from 2.10 to 3.84 with an average of 3.19 (SD=0.37). The average GPA were 3.26, 3.21, 3.20, 3.18, 3.17 and 3.10 in type 9, type 8, type 5, type 4, type 2 and type 3, respectively, with no statistical significance (p-value = 0.25). 53.5% of them thought that enneagram helps them achieve their learning outcome, while 32.6% did not agree and 13.9% were not sure, with the average GPA of 3.16, 3.26 and 2.94, respectively, with no statistical significance (p-value = 0.25). All students were satisfied with the class and agreed that learning enneagram helps them understand themselves and others, resulting in being better at dealing with their stress and working better with their colleagues.

Discussion and Conclusions: Type 9 personality type was the most frequent in our study. All the personality types have their unique characters both in positive or negative nature without inferiority among the types. The study showed that any types can achieve good learning outcome, although the sample size was too small to conclude and needs more research to confirm. All students agreed that the class was helpful.

Take-home Messages: All personality types have the potential to achieve desirable learning outcome. Contemplative class is helpful and should be implemented as it might improve other aspects of students to become better doctors.

Foundation Rounds - a Balint-style group for final year medical students aiming to increase preparedness for work as a doctor

AUTHOR(S):

- Laura Archer, Royal Wolverhampton NHS Trust, UK (Presenter)
- George Greenlees, Royal Wolverhampton NHS Trust, UK
- Helen Campbell, Birmingham Womens and Childrens NHS Foundation Trust, UK
- Isabelle Akinojo, Birmingham and Solihull Mental Health Trust, UK

ABSTRACT

Background: The General Medical Council advise UK medical schools to ‘make emotional resilience training an integral part of the medical curriculum’. (Horsfall 2014) There is currently no universally accepted way to do this. There is evidence to suggest that medical students would value training in this area. (Houpy, Lee, Woodruff, Puncavage 2017). It is also our local experience that students are increasingly struggling with the emotional aspects of medicine. With this project we aim to create programme that improves final year medical student’s ability to cope with stress and challenges. Balint groups are currently used in GP and Psychiatry training. A member of the group presents a case from their clinical experience. Discussion focuses on the emotional aspects of the case e.g. doctor-patient relationship.

Summary of Work: A group of ten final year medical students attended a one hour Balint-style session for 14 weeks. During these sessions students brought cases they had seen which had played on their mind. The discussion focused on the emotions evoked by the case and understanding the feelings and motivations of parties involved e.g. students, doctors and patients. It was facilitated by two teaching fellows who are near peers.

Summary of Results: At the beginning and end of the series of sessions students completed a fear of compassion scale. A control group who had the same placement but not these sessions also completed it. Full results awaited (project completion May 2019). Students will also be asked for feedback and responses regarding how well they felt prepared for beginning work as doctors.

Discussion and Conclusions: Awaited in full but will comment upon the following. Whether Balint-style sessions are valued by final year medical students when framed as something to help prepare for managing difficult situations as a doctor. Whether near-peer facilitation of Balint is preferred by students. Whether Balint-style sessions improve student’s self-reported emotional preparedness (resilience) for starting work as a doctor.

Take-home Messages: Finalised after completion of project but focusing on if Balint-style sessions are a feasible way to improve self-reported emotional resilience and compassion amongst medical students.

“Trait”-ing Students Uniquely: A Study on Personality Distribution and Preferred Learning Approaches

AUTHOR(S):

- Constance Scarlett Yim, The Chinese University of Hong Kong, Hong Kong (Presenter)
- Hin Ching Chow, The Chinese University of Hong Kong, Hong Kong
- Isabel Hwang, The Chinese University of Hong Kong, Hong Kong

ABSTRACT

Background: Existing literature suggests benefits catering education for individual students personality types (Dunning, D. (2008); Melvin, J.(2017)). However, personality research in Hong Kong medical schools is still uncharted territory. This novel study is the first HK study collecting data of personality types of local medical students, linking personality types with preferences in learning approaches.

Summary of Work: 102 medical students (projected graduation year: 2022-2023) from CUHK were surveyed for Myers-Briggs personality types and evaluation of various teaching strategies and personal learning approaches. MBTI was determined by the 20-item Myers-Briggs Preference Questionnaire. Other survey questions used a variety of teaching examples to determine students learning preferences.

Summary of Results: The most common MBTI personality type was INFP (14.6%), followed closely by INFJ (12.6%). Comparison of other Myers-Briggs pairs: Introverts(66.6%)/Extroverts(32.4%);

Sensing(56.3%)/Intuition(42.7%); Feeling (63.7%)/Thinking (36.3%); Judging(52.0%)/Perceiving(48.0%). No statistically significant personality differences between admission methods or gender were found.

Extraversion predicted greater preference in interactive in-class learning modes, e.g. games or flipped classroom quizzes and collaborative activities. Sensing students were uncomfortable missing details whilst intuition students reported a preference of mindmaps in obtaining a big picture of lectures. Judging was a significantly better predictor of preference in individual studying than introversion, and reported higher levels of preparation and more collaborative participation in dissections.

Discussion and Conclusions: Linkages between personality components and learning preferences may shed light to areas of improvement to enhance students learning. E.g. Introverts found anatomy to be more challenging than extroverts. This is hypothesized to be linked to collaborative nature of dissection - introverts reported preferring to learn from specimens/models; extroverts enjoyed the collaborative process more during dissection. Faculty members may consider how personality affects the extent to which students learn from learning experiences and design a wider variety of resources catering to individuals need. Whilst individual differences were evident, there were also very universal feedback on many learning resources, e.g. clinical skills acquisition and practicals.

Take-home Messages: Personality plays a significant role in the preferred learning approaches in students: further development of the medical school curricula of Hong Kong may wish to consider personality-oriented learning opportunities. However, universality of preferences in learning approaches should also be considered when evaluating existing teaching methodologies.

How Thai Medical Students spent their time

AUTHOR(S):

- **Suparat Kanjanavanit, Nakornping Hospital Medical Center, Thailand (Presenter)**
- Nantawan Su-Angka, Nakornping Hospital Medical Center, Thailand
- Koonkaow Roekworachai, Nakornping Hospital Medical Center, Thailand
- Pornsuda Krittigamas, Nakornping Hospital Medical Center, Thailand
- Worachet Taecharak, Nakornping Hospital Medical Center, Thailand

ABSTRACT

Background: Our previous survey found that about 80% of our students had a high to severe stress score level. Therefore, it may be useful to see how they manage their time to plan and design curriculum and activities. **Objective:** To describe 24-hour time management of 4th, 5th and 6th year medical students.

Summary of Work: A cross-sectional study in 4th, 5th and 6th medical students was carried out using time spent questionnaire including study and non-study related time used in 24 hours. We analyzed data presenting in median, inter-quartile range (IQR), Wilcoxon's ranksum test and Kruskal-Wallis test were used when appropriate.

Summary of Results: Twenty-two students (38.5%) completed the questionnaire, 72.7% was female. Overall time spent in classroom, self-study, homework, lesson-reviewed, ward and on duty time were 4(4), 2(2), 2(3), 1(2), 4(5) and 16(8) hours respectively. The only time significantly differed among medical years were ward and on duty time, the 6th year students claimed the highest hours. Meanwhile, time spent on other activities, family or private time were not significant. In non-study time, male significant spent time in playing online games. Bed time was 6(1.7) hours which was indifferent in sex or medical years.

Discussion and Conclusions: This is the first study of 24-hour time spent in Thai medical students. They spent two-third of their time in study-related activities, and only few hours to spend with their close ones or leisure. Time management has been reported to improve student performance, but it seems that our students need more time for work and life balancing. Further study of association with humanistic outcome such as quality of life, stress, and their study performance should be carried out. Medical students spent much more of their time in ward and on duty activities which increased by medical years, while there was lower proportion of time spent on non-patient or leisure activities.

Take-home Messages: Time spent in medical students mostly was in the area of patient care or studying related that resulted from our course syllabus. Balancing appropriately of our students' time with more extra-curriculum activities may be an issue to help producing humanized doctors.

Diary for improvement of time management skill in medical student

AUTHOR(S):

- Kitiya Vutibenjarasamee, Obstetrics and Gynecology Department Khon Kaen Hospital Thailand, Thailand (Presenter)
- Maleechat Sripipattanakul, Obstetrics and Gynecology Department Khon Kaen Hospital Thailand, Thailand
- Thumwadee Tungsiriwattana, Obstetrics and Gynecology Department Khon Kaen Hospital Thailand, Thailand

ABSTRACT

Background: Time management skill accepted as an educational tool to help better organization of time and important key to success in academic performance. Time management is one of problem for medical student. The diary was designed to record the medical students' time management behavior.

Summary of Work: Fourteen of fourth year medical students attended at Obstetrics and Gynecology department were instructed to record the diary in 7 days two times before mid block and final evaluation. The activities were divided into daily activity, class activity, homework, writing report, self study, social media, meeting friends and family, exercise and sleep. The diary was explored and analyzed. Focus group for reflection and feedback activity were also performed at one week before mid block and final evaluation.

Summary of Results: The diary of fourteen fourth year medical students were completed. After focus group for reflection and feedback activities were performed, the medical students spent less time in social media use, median (IQR) 74 (47-120) versus 59 (34-81) minutes per day, spent more time for self study, median (IQR) 98 (85-145) versus 166 (72-214) minutes per day. After reflection and feedback process, the medical student concerned their quality of life by increase in sleeping time, median (IQR) 339 (274-390) versus 380 (360-385) minutes per day and exercise, median (IQR) 0 (0-60) versus 75 (0-120) minutes per week. After first focus group process, the problem in writing report was identified and discussion. Time to spend for writing report was shorter, median (IQR) 585 (390-690) versus 330 (90-780) minutes per week.

Discussion and Conclusions: The diary can explore the time management behavior of medical student. Using the diary with reflection and feedback process can guide the medical student in spending daily time more effectively to improve their quality of life and academic achievement.

Take-home Messages: The diary should be implemented to improve time management skill.

Quality Criteria for Core Medical Training - Impact on educational experience

AUTHOR(S):

- Warren Lynch, Joint Royal Colleges of Physicians Training Board, UK (Presenter)
- Miriam Armstrong, Joint Royal Colleges of Physicians Training Board, UK
- Mumtaz Patel, Joint Royal Colleges of Physicians Training Board, UK
- Alastair Miller, Joint Royal Colleges of Physicians Training Board, UK
- David Black, Joint Royal Colleges of Physicians Training Board, UK

ABSTRACT

Background: In 2015 the Joint Royal Colleges of Physicians Training Board (JRCPTB), acting on behalf of the three UK (UK) Royal Colleges of Physicians, launched a set of quality criteria designed to improve the quality of training and educational experience of Core Medical Trainees (CMTs) in the UK.¹ These were implemented by UK postgraduate schools of medicine in 2015. This study evaluates the impact of these criteria on the quality of training.

Summary of Work: The criteria were developed with key stakeholders from Core Medical Training (CMT) and were grouped into 4 domains which included: a. Structure of the programme b. Delivery and flexibility of the programme c. Supervision and other ongoing support available to trainees d. Communication with trainees. Questions related to each of the domains were developed and included in the annual GMC National Training Survey (NTS) as programme specific questions. The survey results were analysed over 2015-2018 to evaluate the effectiveness of the criteria.

Summary of Results: There were trainee-reported improvements from baseline (2015-2018) in at least 8 out of the 13 core criteria measured. These included improvements in attending: • Post-take ward rounds and handovers (B1), • Outpatient clinics to meet curriculum requirements (B2), • Learning events bleep-free (B3), • Simulation training (B4), • Curriculum-relevant and Practical Assessment of Clinical Examination Skills (PACES) teaching (B5), • Departmental Induction (C2), • Pre-Annual Review of Competence Progression (ARCP) appraisals and agreeing training plans before attempting Membership Royal College of Physicians (MRCP)(UK) exams (C6)

Discussion and Conclusions: The results demonstrate that a co-ordinated UK-wide approach to quality improvement, focused on a specific set of clearly-defined and measurable outcomes that galvanise trainer engagement, can lead to greater trainee satisfaction in a demanding area of medicine without significant additional resources.

Take-home Messages: • Implementation of the Core Medical Training Criteria have led to significant improvements in quality of training and educational experience over the last 3 years. • Where implemented, they can help improve trainee workload-to-learning balance, provide enhanced educational support and, together with critical learning opportunities, help better prepare trainees for the General Internal Medicine Registrar role.

The Reform of Post Graduate Medical Education in Italy Through Curriculum Design

AUTHOR(S):

- **Antonella Lotti, University of Genoa, Italy (Presenter)**
- Giulia Bartalucci, St George's Hospital, UK
- Chiara Riforgiato, University of Genoa, Italy
- Stefano Sartini, University of Genoa, Italy
- Mario Amore, University of Genoa, Italy
- Rakesh Patel, University of Nottingham, UK

ABSTRACT

Background: In Italy Post Graduate Medical Education is planned and implemented by Universities. According to an Italian law, each Post Graduate Medical School should give the opportunity to each resident to do a given number of technical procedures but there isn't any standard to design an educational plan with competences and learning outcomes, learning-teaching-assessment methods, human resources. Residents complain that they don't have clear objectives to reach, don't receive a formal education and don't have proper feedback. To address this need, the University of Genoa, School of Medicine, and Italian Society of Medical Education, designed and implemented a series of 3 workshops detailing a systematic approach to Postgraduate Medical Education curriculum design. The series was open to 7 pilot schools interested in create and verify a framework of curriculum design to propose afterwards to the Italian Ministry of Health and Ministry of University.

Summary of Work: 7 Italian Pilot schools (Postgraduate school of Nephrology, Occupational Medicine, Geriatrics, Pediatric Surgery, Hygiene and Preventive Medicine, Emergency Medicine, Nuclear Medicine) attended 3 workshop dedicated to UK General Medical Council 's Guidelines and Standards for PGME, curriculum design standards, teaching methods, learning methods, evaluation methods. Participants created a framework for Italian context and filled this framework.

Summary of Results: All the 7 Pilot schools defined the Mission and Vision, competences and learning outcomes (general and specific), identified Teaching-Learning-Assessment methods, identified the necessary human teaching resources (teachers, educational supervisors, clinical supervisors).

Discussion and Conclusions: This series of 3 workshops is well suited to introduce fundamental concepts in post graduate medical education curriculum design and inspire Faculty members to draw an agreed framework. Teaching and supervision by international experts facilitated the work. The Italian general framework for PGME is an adaptation of the UK framework to the Italian context.

Take-home Messages: A framework coherent with the curriculum design standards has been created in Italy by a group of 7 Pilot schools led a group of international and Italian experts in Medical Education. A series of 3 workshops dedicated to PGME was an important issue to agree on a framework and on essential factors which influence curriculum design.

Usefulness of Learning Methods in Post-Graduate Training

AUTHOR(S):

- Rishita Shah, East and North Hertfordshire NHS Trust, UK (Presenter)
- Charmilie Chandrakumar, Medway NHS Foundation Trust, UK
- Gayathri Bhaskaran, University Hospitals of North Midlands NHS Trust, UK

ABSTRACT

Background: The initial years of postgraduate training are an integral part of a doctor's career. A variety of educational methods are available to enhance clinical knowledge, practical skills and career development. Resources include teaching from senior peers, mandatory teaching consisting of lectures and practical skills organised by hospitals, online and external courses (often self-funded). Furthermore, all trainee doctors are allocated supervisors for clinical and career progression. UK doctors are required to complete a Foundation Year (FY) Programme after undergraduate training. This is followed by either core (CT) or run-through training (ST); successful completion of which is required to enter higher training in the chosen speciality. Aim: To assess which resources trainees find useful in learning clinical theory, practical skills and for further career progression.

Summary of Work: Questionnaires were sent to junior trainees across the UK. The usefulness of various learning methods from hospital teaching, external courses, assigned supervisors, informal peer teaching and online resources were demonstrated by using Likert scales. These were further explored by open-ended questions to understand the rationale behind the scoring of the methods. Trainee demographics were also surveyed.

Summary of Results: 60 trainees with an array of speciality interests (42 FYs, 18 CT/STs; 30 females, 30 males) completed the questionnaire. Informal peer teaching (85.6%), online resources (77.4%) and external courses (72.8%) were popular methods of learning clinical theory. Similarly, for practical skills, informal peer teaching (89.7%) and external courses (76.9%) along with assigned supervisors (68.2%) were favoured choices. For career progression, trainees found supervisors (78.4%), peers (77.4%) and online resources (75.9%) helpful. Hospital mandatory training (57.4%) was found to be the least useful learning methods in all three aspects.

Discussion and Conclusions: Senior colleagues highly valued across all three assessed criteria: Doctors appreciate their approachability usually in a one-to-one setting and find the information, feedback or advice delivered by senior peers to be of direct relevance. On the contrary, doctors felt that mandatory hospital teaching was often variable in quality within trusts and specialities, and provides little hands on experience, which trainees perceive to be key in gaining clinical and practical competence.

Take-home Messages: Future efforts should improve on existing favourable learning methods to enhance post-graduate training.

Making a Difference - experience of using an internal survey for junior doctors in a UK teaching hospital

AUTHOR(S):

- Joanne Kirtley, University Hospitals of Leicester, UK (Presenter)
- Luke Ruffle, University Hospitals of Leicester, UK
- Sue Carr, University Hospitals of Leicester, UK

ABSTRACT

Background: Ensuring high quality education provision is essential for recruitment and retention of junior doctors. We adopted the validated 'SPEED'1 survey in a large UK teaching hospital in 2016, to provide detailed and real-time feedback on the quality of Postgraduate Medical education. Data from this survey was used as a tool to identify emerging areas of concern and as an adjunct to national surveys and quality processes.

Summary of Work: The bi-annual survey, delivered using an on-line software package, has collected anonymised data from more than 5,000 junior doctors over a 2 year period. Survey data is demographically analysed to include specialty and grade specific information. Summaries of outcomes are shared with Clinical Directors and hospital management as well as junior doctors.

Summary of Results: Over 2,000 surveys have been completed (response rate 44.1%). By providing Specialty specific data which is compared to overall survey outcomes, the survey acts as a useful diagnostic tool to identify positive and negative outliers. Trends reports are also generated to provide 'early warning' alerts as well as giving positive feedback where improvements have been made. Free text comments are analysed for recurrent and emerging themes to inform future work streams The hospital has a formal process for monitoring strategic, clinical and financial performance; our education survey outcomes are now included in this process

Discussion and Conclusions: The survey response rate is higher than average for internal surveys (44.1% compared to average 30-40%). Junior doctors have suggested that the brevity of the survey and ease of access has encouraged completion. The inclusion of educational data as part of the hospital performance process ensures that education quality is considered at board level alongside finance and clinical performance.

Take-home Messages: Local surveys provide valuable data to organisations and the opportunity to give dynamic feedback and respond to challenges in a timely manner. Hospital management boards will include educational data if presented in a clear, concise format.

Junior Doctors' Experiences of their Medical Internship: Compelling evidence for a rigorous introductory service

AUTHOR(S):

- Yvonne Carlsson, Sahlgrenska Academy, Sahlgrenska University Hospital, Sweden (Presenter)
- Matilda Liljedahl, Sahlgrenska Academy, Sahlgrenska University Hospital, Sweden
- Stefan Bergman, Sahlgrenska Academy, Sweden
- Anna Nilsson, Sahlgrenska University Hospital, Sweden

ABSTRACT

Background: There is evidence that the transition from medical school to medical practice is stressful. In several countries, a postgraduate internship bridges the gap between medical school and residency, introducing the doctor-to-be to clinical work by allowing the intern to practice and develop knowledge and experiences learnt in medical school. Although there is research exploring experiences of the medical internship, there is a dearth of research from a Scandinavian context.

Summary of Work: This paper reports on research aimed to explore Swedish medical interns' experiences of their internship. A qualitative design was adopted since human experiences were in focus. Using the approach of qualitative description, data was collected through twelve individual, in-depth interviews, followed by content analysis.

Summary of Results: In summary, our findings suggest that being a medical intern implies feeling increasingly comfortable in the role as a doctor (Finding one's feet) through taking responsibility and working as a doctor by way of necessary help and assistance (A doctor with support). Additionally, the interns experienced the internship as an opportunity to practice clinical work in various settings (A healthcare sightseeing). Although appreciating the concept of the internship as such, it tired the interns to repeatedly be new at work and they felt stuck in predetermined and rigid framework (Stuck in the zoo).

Discussion and Conclusions: The internship provided a safe environment to learn and start one's career as a clinician. Interestingly, reports on experiences of heavy stress and mental exhaustion were absent in our data. Thus, this kind of medical internship, with well-defined support in combination with trusted responsibility for the patient, fulfils its purpose of being a justifiable introduction to clinical work. Moreover, it is essential that patient-related tasks are not merely seen as work, but as authentic learning opportunities to be designed as such.

Take-home Messages: *Ensure a thorough introductory service to mind the gap between medical school and residency; *Trust the intern with responsibility in order to drive learning while simultaneously providing sufficient support; *Acknowledge work as an essential part of learning and abandon the work-vs-learning-paradox

A study of the first-year interns' satisfaction in training experience at Udon Thani Hospital

AUTHOR(S):

- Titima Nasomtrug, Udon Thani Hospital, Thailand (Presenter)

ABSTRACT

Background: Medical students in Thailand are required to complete three-year internship as part of their postgraduate. Udon Thani Hospital(UTH) is a training hospitals that take the first-year interns to complete their internship in six departments;Medicine,Surgery,Obstetric and gynecology(OB-GYN), Orthopedics,Pediatrics,and Emergency medicine(EM). The first-year internship is the most challenging period of the students to achieve, the host hospital should ensure its training arrangement will bring the best outcomes for interns and organization. This study aims to study the first-year interns'satisfaction at UTH regarding their training experience in order to develop the internship training program.

Summary of Work: A questionnaire was used for data collection for the rating of interns' satisfactory degrees toward their training experience at six departments. The open-ended questions were designed to collect the opinion about working,medical teachers,colleagues,academic activities(AA),and welfare.

Summary of Results: UTH has 1,022 beds,115,590 outpatients/month,30,690 inpatients/month,168 medical specialists,37 first-year interns from 58 available positions. The satisfactory scores for Medicine,Surgery,Orthopedics,Pediatrics,OB-GYN,and EM were 3.18,1.96,3.90,4.72,3.29,and 2.67respectively. Opinions are made by interns as following. Excessive workloads and duties are in Medicine and Surgery. Supervision provided by staffs from Surgery,EM,Medicine,and OB-GYN are inadequate;and less friendly working relationship is found between EM and Surgery staffs. They feel that the Medicine staffs are less approachable for consultation. Some have decrease opportunity practice medical procedures. AA are adequately but less attending by interns due to busy schedules. The salary is not enough comparing to the workloads. Good accommodation is provided but maintaining service needs improvement.

Discussion and Conclusions: Low scores are associated with less satisfaction in excessive workloads, inadequate supervision, unwell relationship among the staff, and AA absence. Lowest satisfaction scores are for Surgery, EM, Medicine, and OB-GYN. Satisfaction of the interns is associated with workloads, availability of staff supervision, healthy relationship among the staffs, frequency of academic activities attending, adequate payment, and quality facility services.

Take-home Messages: Good balance of workloads, adequate and coordinate-staff, regular participation of academic activities, appropriate payment, and adequate medical procedural training are important for the interns' satisfaction.

What do doctors value from generic teaching in the UK Foundation Programme? A qualitative analysis of feedback

AUTHOR(S):

- Eleanor Boddy, Health Education East of England, UK (Presenter)
- Alexandra Rowland, Health Education East of England, UK
- Helen Johnson, Health Education East of England, UK

ABSTRACT

Background: The UK Foundation Programme provides a curriculum-driven, structured approach to development of newly qualified doctors. Foundation Doctors are required to attend a generic teaching programme that should be mapped to the curriculum, but with content and structure set locally by Trusts. There is limited understanding from education literature of what doctors value in generic teaching.

Summary of Work: We collated feedback for generic teaching at six Trusts in the East of England Foundation School over the 2017/18 academic year. This qualitative data was thematically analysed using Nvivo software to establish feedback themes pertaining to the highest and lowest rated sessions.

Summary of Results: A wide variety of topics were reviewed, with teaching on clinical skills or acutely unwell patients consistently receiving higher ratings. These topics were felt to be “useful”, the educator “interesting”, and the teaching style “engaging” or “practical”. Medico-legal and management topics consistently received lower ratings, however, “useful” remained a common theme. Occasionally doctors specified reasons for lower ratings, but written feedback was sparse when compared to highly rated teaching.

Discussion and Conclusions: Foundation Doctors are consistent in their description of teaching that they rate highly, and value being taught practical skills or knowledge that they can use in an acute setting. When teaching is poorly rated, lack of richness in feedback makes it difficult for Trusts to understand how they can improve programmes. Is there a way to reconcile providing teaching that doctors prefer, whilst exposing them to curriculum requirements? We propose exploring this using a series of focus groups to gain greater depth of understanding of what Foundation Doctors mean when they use non-specific words in feedback, and why they prefer skills-based teaching. This knowledge of what doctors value will help Trusts to tailor generic teaching programmes to meet their educational needs.

Take-home Messages: Foundation Doctors prefer teaching on certain aspects of the curriculum that they perceive to be useful or practical. There is a national requirement to educate doctors on all aspects of the curriculum. We need to rise to the challenge of ensuring that mandatory teaching is valued by newly qualified doctors.

Implementation of a simulation-based regional practical skills course for foundation trainee doctors

AUTHOR(S):

- Kathrine Redington, Maidstone & Tunbridge Wells NHS Trust, UK (Presenter)
- Angela McCallum, Maidstone & Tunbridge Wells NHS Trust, UK
- Natalie Shields, Maidstone & Tunbridge Wells NHS Trust, UK

ABSTRACT

Background: As former foundation trainees we found that exposure to practical procedures varied considerably between rotations and hospitals. Consequently, we identified a need for additional training in procedural skills for foundation trainees, which may be best performed in a simulation-based environment.

Summary of Work: We organised and taught on a regional practical skills course for foundation doctors. Our aim was to provide theory, hands-on teaching and allow exposure to a variety of skills. We advertised to regional post-graduate education centres in Kent, Surrey and Sussex in the south east of England. We offered 20 candidates small group workshops using simulation trainers on airway management, non-invasive ventilation, ascitic tap and drains, arterial and central line insertion, joint aspiration, fracture management, lumbar puncture, suturing, plus medical and surgical chest drains. All were led by specialist trainees we'd recruited over a 2-day weekend course in November 2018. Participants were asked to rate the programme in a structured questionnaire.

Summary of Results: 100% of attendees found that the content was relevant, the course was useful, enjoyable, delivered at an appropriate level with enough time allowed to practice each skill and ask questions. All workshops received scores of good to excellent, with 90% scoring 4 or 5 out of 5. Additional comments thanked us for excellent, expert, hands-on teaching and an interactive, rewarding course and remarked that they now felt more confident clinically following the course. All participants would also recommend our course to a colleague.

Discussion and Conclusions: Given the demand for the course as it was significantly oversubscribed, plus the high participant-based scoring of the teaching provided, there is a clear desire for foundation trainees to have more practical skills teaching. We have since been asked to also provide a similar session for medical registrars highlighting the need for further training opportunities. As such, it could be incorporated into their local teaching programmes or also undertaken by other hospitals with simulation departments.

Take-home Messages: Additional practical skills teaching is required for foundation trainees, which can be achieved using simulation training.

A Survey of Imposter Phenomena in UK Foundation Year 1 Doctors

AUTHOR(S):

- Sara Warraich, PGME, Great Ormond Street Hospital, UK (Presenter)
- Esther Park, Oxford University Hospitals, UK
- Denis OLeary, University of Oxford, UK

ABSTRACT

Background: Described in 1978 by Clance and Imes (1), thoughts of being an impostor came to our notice while teaching medical students. Impostor phenomena (IP) often led students to isolate themselves from peer learning opportunities and from formal learning supports offered by the University. We became concerned that distressing IP may be present in newly qualified doctors who many have unmet learning support needs in this respect.

Summary of Work: Our study's primary aim is to describe the frequency of IP in newly qualified doctors enrolled in a training programme. A secondary aim is to explore the relationship, if any, of self-reported changes in self-efficacy (SE) and IP. **Methods:** All foundation year 1 doctors will be invited to complete the Clance Impostor Phenomenon Scale (2) (pending copyright permissions). Baseline data will include age and gender and an additional question on changes to self-efficacy over time. Participants' informed consent will be documented. The study has been approved as evaluation by the hospital's ethics and research committee.

Summary of Results: We will report the range, mean etc. of CIPS scores and IP categories for whole group and by gender. These results will be compared with published findings from other cohorts as applicable. An additional analysis.

Discussion and Conclusions: The implications of the findings for establishing the presence of IP in newly qualified doctors for the first time in a UK cohort will be discussed. The conclusions will focus on the extent of any required additional learning supports and will be of particular interest to clinical and educational supervisors and post-graduate training programme leads.

Take-home Messages: Although discussed widely, the frequency and severity of IP phenomena in young UK doctors has not been reported. This study addresses this issue and will identify the need for any relevant learning supports. References will be provided on the poster.

Influence of Role Models on First-Year Medical Students' Perceptions of Professionalism

AUTHOR(S):

- Jariya Jiranukool, Faculty of Medicine, Mahasarakham University, Thailand (Presenter)
- Peem Eiamprapai, Faculty of Medicine, Mahasarakham University, Thailand
- Sujittra Somsanguan, Faculty of Medicine, Mahasarakham University, Thailand

ABSTRACT

Background: Many medical schools have been concerning about professional development for medical students. Bringing professionalism into classroom such as lecture and small group discussion might not be enough. Observation is one of the teachings that clinical teacher serves as role model for students to learn the knowledge, attitudes, and behaviors. This study aimed to evaluate the influence of learning through observation on first-year medical students' perceptions of professionalism.

Summary of Work: This quasi-experimental study was conducted in "Learning how to learn" class, which is the compulsory subject in first-year medical curriculum. The participants were 65 first-year medical students. After introductory lectures on professionalism, all participants were instructed to complete 32-item self-assessed Medical Professionalism Scale (MPS). MPS consists of 6 elements including altruism, accountability, excellence, duty, honour and integrity, and respect for others. Then, participants were divided into 17 groups to observe their medical education advisor (clinical teacher) in clinical practice of variable settings. The four-hour learning activity consisted of 1) observation of professional behavior 2) facilitated group discussion 3) critical reflection. Two weeks later, participants completed MPS again. A paired t-test was used to compare MPS scores before and after intervention.

Summary of Results: Most of participants were female (63.1%), aged 18-19 (mean 18.5). There was a significant difference in MPS scores for pre-observation ($M=161.7$, $SD=11.58$) and post-observation ($M=164.7$, $SD=12.21$) conditions; $t(64)=2.64$, $p=0.01$. However, the significant differences were only for three of six elements: accountability (mean change = 0.54, $SD=2.0$, $p=0.03$), excellence (mean change = 0.59, $SD=2.3$, $p=0.04$), and duty (mean change = 0.91, $SD=2.1$, $p=0.001$).

Discussion and Conclusions: These results suggest that learning medical professionalism through observation (role modeling) influences the perceptions of professionalism in first-year students. In agreement with previous study, students identified role modeling as important aspect of professionalism. Not all elements of professionalism were influenced. We concluded that first-year students were aware of their accountability, excellence, and duty through role modeling; however, they were not yet aware of altruism, honour and integrity, and respect for others as they lacked of patient care experience.

Take-home Messages: Teaching professionalism can be provided since the beginning of medical studies.

Medical Students' Perceptions of Physicians as the Role Model: Insights From an Intensive Shadowing Experience

AUTHOR(S):

- **Chung-Yi Cheng, Division of Nephrology, Department of Internal Medicine, Taipei Medical University, WanFang Hospital, Taiwan (Presenter)**
- Wen-Cheng Huang, Department of Emergency Medicine, Taipei Medical University Wan Fang Hospital, Taiwan
- Che-Wei Lin, Clinical Skill Center, Taipei Medical University Wan Fang Hospital, Taiwan
- Yuh-Moe Sue, Department of Internal Medicine, Taipei Medical University Wan Fang Hospital, Taiwan
- Fat-Moon Suk, Department of Internal Medicine, Taipei Medical University Wan Fang Hospital, Taiwan

ABSTRACT

Background: An innovative Role Modelling Learning curriculum is designed to supplement to the didactic lecture for medical students during their clinical rotation. The learning objective is to facilitate students learning and assist in the development of professional identity through self-reflection after an intensive shadowing experience.

Summary of Work: A team-based shadowing experience entitled, Role Modelling Learning, is devised to recruit students in their clinical rotations to participate in the course. Ten physicians from various specialities are invited to share their daily activities with the participating students. Two students per group are randomly assigned to a physician and follow his/her clinical activities for a day. Intensive shadowing experience allows students to observe physicians clinical competence, teaching skills and personal qualities. Students are asked to share their perception upon completion of shadowing experience. The remaining of the class composed the audience. Overall, 68 students attended the class each year.

Summary of Results: The "Role Modelling Learning" program has been operating in three consecutive years in our hospital. Ninety-six per cent of students showed their great appreciation to attend the class. Students recognize communication skills as one of the important characteristics of a role model. This finding is in line with existing evidence^{1,2}. Professionalism and patient care are also indicated as the important characteristics of role models. Despite the importance of teaching and learning as well as guiding personal and professional development, these attributes are considered to be least important by our students.

Discussion and Conclusions: Role modelling has been highlighted as an essential component of medical education. However, it remains elusive, as there are no standards and the relative strengths of role modelling when compared with more traditional approaches to teaching is not fully understood. Our innovative program facilitates learning from role models through observation and reflection. By analysis students feedbacks, we have gained insights into students perception of clinicians as a role model.

Take-home Messages: The integration of direct observation and reflection in the shadowing experience is the key element to succeed in our "Role Modelling Learning" program. A further qualitative designed study may be needed to validate the outcomes.

A comparison of knowledge, skills and attitudes in post graduate psychiatric training for 1st internship physicians in Tak province

AUTHOR(S):

- Chalorwat Inpa, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand (Presenter)
- Chakrapong Puwaysa, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand
- Natakorn Lathalapkul, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand
- Sudarat Samchimchom, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand

ABSTRACT

Background: Recently, psychiatric problem and diseases is upward trend in Thailand but the psychiatrists are still insufficient. Thus general practitioners, who are in the primary care in the community & receive the program of post graduate psychiatric training for 1st year internship (PGPT), may be responsible for treating psychiatric patients in their hospital. This research has objective to compare the knowledge, skills, attitudes, Health Accessibility of psychiatric patients (proportion of diagnosis and drug use of psychiatric patients) in two group between PGPT and non-PGPT in second year general practitioners in primary care setting in Tak province.

Summary of Work: An analytical cross-sectional study was conducted to compare two sample groups. Sample size was 138 second year general practitioner who practiced in secondary medical care of Tak province from 2012 to 2016. Data were collected by online questionnaire and hospital database. These data were subsequently interpreted by descriptive statistic and chi-Square test with computer program.

Summary of Results: A total of 42 questionnaires followed criteria were returned and reported that two groups were not different in psychiatric knowledge, skills and attitudes, whereas a total of 60 hospital database followed criteria were search and found that the health accessibility (diagnosis of psychiatric disorder) in PGPT group which were higher statistically significant at 0.05.

Discussion and Conclusions: Post graduate psychiatric training (PGPT) that enhanced patient to access the medical and community psychiatric service is the important program.

Take-home Messages: Thus a Psychiatric and public health policy should promote and provide training program before general physicians work in primary medical care.

After-work Meetings - Effect on Social Relations and Cohesion as well as Professional Learning among Junior Doctors

AUTHOR(S):

- **Soginy Antony, Hospital of Southern Jutland, Denmark (Presenter)**
- Sofie Louise Hjorth Boye, Hospital of Southern Jutland, Denmark
- Bjarke Kryger, Hospital of Southern Jutland, Denmark
- Bettina Ravnborg Thude, Hospital of Southern Jutland, Denmark

ABSTRACT

Background: Social relations constitute an important role regarding learning and learning plays a significant role throughout medical practice. After-work meetings attempt to create social relations and are held monthly with presentations from two different departments and present an opportunity to network. This research paper aims to investigate the effect of after-work meetings in relation to strengthening social relations and cohesion between junior doctors at Hospital of Southern Jutland, and their contribution to professional learning.

Summary of Work: The study was conducted as an intervention study with questionnaires handed out to the attendees after every meeting. The questionnaire focuses on social relations, loneliness, professional learning, and an evaluation of each meeting. Additionally, a focus group interview is conducted with four out of 25 junior doctors from different departments based on select inclusion criteria.

Summary of Results: According to the questionnaires, preliminary results indicate a higher degree of loneliness at work, compared to outside of work. Questionnaires suggest a great interest in meeting with people from their own departments, but less affiliation with doctors from other departments. Attendees experience social and learning benefits from participating in the meetings, and all attendees would gladly recommend after-work meetings to colleagues. The interview supports these answers. Furthermore, there is a strong agreement among the interviewed junior doctors that social relations contribute to cohesion, job satisfaction, and learning.

Discussion and Conclusions: Literature describes the importance of social relations in relation to job satisfaction and learning. This research indicates that there is great interest in getting to know colleagues, especially within one's own department. Yet, well-known faces in other departments contribute to increased contact with and learning from each other. All participants would recommend the after-work meeting to colleagues, citing accessibility as a major factor for participation. To increase benefit from after-work meetings, the interviewees suggest higher-level learning with workshops or cases that can be related to everyday work. In conclusion, the preliminary results suggest increased social relations and cohesion between junior doctors and contribute to professional learning.

Take-home Messages: After-work meetings can equally contribute to cohesion and professional learning.

The Use of an In-house Survey in a London Teaching Hospital

AUTHOR(S):

- Leila Taheri, Chelsea & Westminster Hospital, UK (Presenter)
- Leyla Osman, Chelsea and Westminster NHS Foundation Trust, UK
- Orhan Orhan, Chelsea and Westminster NHS Foundation Trust, UK

ABSTRACT

Background: Junior doctors (JD) are highly valuable members of the medical workforce. At a time when JD morale is low (Fmlm.ac.uk, 2019), it is of great importance to ensure their rotations are meeting their training needs and providing a safe working environment. All UK doctors in training are sent an annual national training survey from the General Medical Council (GMC). This is a compulsory survey which is used to ensure that high quality and safe training is being delivered (Gmc-uk.org, 2019). However as JD rotate frequently, they often miss the changes that have been implemented.

Summary of Work: This trust has recognised the significance of doctors seeing improvements from their feedback whilst they are in post. An annual in-house survey aims to deliver real time responses based on the views of JD. This survey is sent to all JD, with questions based on the key points from the GMC survey around topics that are of particular importance to the Postgraduate Department (PGD). We have further modified and streamlined the survey making it less time consuming for doctors.

Summary of Results: In total we had 90 responses, covering all grades of JD. There were responses from all but two specialities within the hospital. This represented a third of JD within the hospital, with the survey being sent to 265 JD. The PGD analysed the results and have provided each speciality with a report highlighting the key points from the results and suggested areas for improvement.

Discussion and Conclusions: We are aware that JD are asked to complete large numbers of surveys, but feel this survey is beneficial to their current working lives. It not only allows changes to be made whilst still in post, but also gives feedback to departments with small numbers of trainees who would not normally get feedback from the GMC survey. There is work still to be done to maximise JD response. This survey will continue to be modified to meet the current areas for development.

Take-home Messages: Our in-house survey provides an opportunity to collate feedback from JD and deliver improvements that the current cohort of doctors can benefit from.

The Implementation of a Formalised Medical Handover Structure and its Impact as a Learning Tool for Junior Doctors

AUTHOR(S):

- Junaid Aamir, East Lancashire NHS Hospitals Trust, UK (Presenter)
- Suzanne Gawne, East Lancashire NHS Hospitals Trust, UK
- Damien Lynch, East Lancashire NHS Hospitals Trust, UK

ABSTRACT

Background: The high-quality handover of large numbers of patients is essential in helping deliver effective care within any hospital. Current literature encourages hospitals to adopt formalised handover structures resulting in better shift-to shift handovers in order to enhance patient safety and team working. Alongside this, it has been identified that shift handovers can be utilised as a learning tool for the team.

Summary of Work: The medical handover at East Lancashire NHS Hospitals Trust (ELHT) was overhauled and a formalised structure was implemented. A handover proforma was introduced containing information about acutely ill patients who may require attention. Furthermore, any incidents or near-misses that may have occurred during the shift are identified and a “lessons learnt” discussion allows the team to reflect upon experiences of the shift and discuss cases in a supportive environment facilitated by a senior supervisor.

Summary of Results: The General Medical Council (GMC) national training survey was used as an outcome measure alongside feedback from forums and external monitoring visits. The GMC survey displayed a year-on-year increase in the satisfaction of trainees following the introduction of the formalised handover. The improvement in satisfaction was in a number of domains, particularly, “handover”, “educational supervision”, “levels of feedback” and “supportive environment”. Moreover, Health Education England Northwest (HEENW) visiting reports have produced positive feedback about medical handovers regarding levels of education, support and education governance. Our Trust has been approached by trainees at 5 other Trusts in the North West to seek permission to replicate our processes.

Discussion and Conclusions: The introduction of a structured handover has helped improve the quality of care delivered by the medical team. Furthermore, the structured handover has been invaluable in ELHT in improving trainee satisfaction in a number of domains. Through the use of case-based discussion and active reflection, it has been shown that the ELHT medical handover is an effective learning tool for junior doctors.

Take-home Messages: Formalised and structured handovers are essential in the effective running of a hospital. High quality handovers have a direct positive impact on patient safety. Shift handovers can be extremely beneficial learning environments for trainees.

Developing and implementing a strategy for postgraduate medical education

AUTHOR(S):

- **Thomas Hertel, Odense University Hospital, Denmark (Presenter)**
- Sune Laugesen, Odense University Hospital, Denmark
- Christine Dichmann, Odense University Hos, Denmark
- Mette Worsøe, Odense University Hospital, Denmark
- Lasse Bugge, Odense University Hospital, Denmark
- Michael Dall, Odense University Hospital, Denmark

ABSTRACT

Background: Postgraduate medical education in a large university hospital may often have different outputs and outcome in different departments and thus medical education of variable quality. Furthermore, a leadership focus on education is essential in a university hospital. Our hospital has an ambition of excellent medical education in order to provide the best possible care for the patient. In order to streamline medical education in our hospital among medical doctors training to become specialists we therefore developed a strategy for medical education.

Summary of Work: We involved 10 doctors in different charges and departments in our university hospital including a chief medical officer in order to secure a broad base. The process also included three outside medical educators and user involvement (workshop for 80 educationally involved doctors). The outcome was a strategy with a focus on four main areas: Leadership in medical education, quality in education, management of education and lifelong learning. Follow-up was done using interviews with every department heads, the medical director for education and junior doctors preceded by a questionnaire.

Summary of Results: Our preliminary results show that the strategy was well received among leaders and directors for medical education as well as junior doctors. A medical director for education said that the strategy gave him legitimacy in his work with medical education. Follow-up on targets for our 41 departments for 2018 and 2019 showed full achievement of 2018 targets in 55 % of departments and partially in 37 % of departments. The 2019 targets were already by the end of 2018 achieved fully in 54% of the departments and partially in 34 % of the departments.

Discussion and Conclusions: The development of a strategy for medical education has given our educational community at our hospital a better tool for working with medical education and has also increased awareness and legitimacy of our educational obligation.

Take-home Messages: In order to strengthen medical education in a large university hospital, development of a strategy for postgraduate medical education is a valuable tool. Follow-up on targets set by the strategy is essential.

Social self-perception as a determining factor in interpersonal relationships and professional ethics in resident physicians

AUTHOR(S):

- Jessica Pelaez Jaquez, Universidad Autónoma de Chihuahua, Mexico (Presenter)
- Haydee Parra Acosta, Universidad Autónoma de Chihuahua, Mexico
- Jose Lopez Loya, CIFE, Mexico
- Jorge Alonso Garay Ortega, Universidad Autónoma de Chihuahua, Mexico

ABSTRACT

Background: Resident doctors need to develop a professional identity, this refers to the way of being and relating in professional contexts (Goldie 2012). Social identity or self-perception, defined as the opinion that people have about themselves, influences professional performance (Massenzana 2017).

Summary of Work: Multicentric cross-sectional study. 212 residents participated from different specialties of Schools and Faculties of Medicine associated with AMFEM. A questionnaire was applied and evaluated three complex variables, through 28 simple variables. The instrument was previously validated by two techniques: 1) Expert Judgment, sent to 20 researchers with experience in the subject. 2) It was applied to a pilot group of 30 resident physicians to analyze its internal consistency, obtaining a Crombachs Alpha = 0.94. The processing and analysis of the information was carried out through different statistical analyzes: univariate, bivariate and multivariate, using descriptive and inferential statistics, with a level of significance of $p < 0.05$.

Summary of Results: In social self-perception, resident physicians consider that in hospitals they often have opportunities to interact with patients and colleagues (4.68). However, they state that sometimes cheating is a problem in their hospitals (2.74) and that it is disappointing to study in their hospitals, because they do not meet their expectations (2.27). Regarding interpersonal relationships, it was observed that residents almost always identify that there is respect for the ideas of others (5.25) as well as learning to relate with patients and colleagues (5.23). Regarding Professional Ethics, it was observed that resident doctors consider that they inform patients and their families more about the procedures to be performed (5.72), treat their patients with respect and patience (5.59), respect their decisions (5.55). However, to a lesser extent they consider it acceptable to lie to them (0.33). Which refers to the manifestation of an acceptable professional ethics.

Discussion and Conclusions: Social self-perception has a significant positive correlation with interpersonal relationships and professional ethics. Simple variables such as assertive and adequate communication were related to professional ethics.

Take-home Messages: Social self-perception significantly affects interpersonal relationships and professional ethics.

#4NN Meet & Ask the ASPIRE Winners

Date of Clinic: Monday, 26 August 2019

Time of Clinic: 1400-1530

Location of Clinic: Suite E, Level 0

ASPIRE Team:

- Marko Zdravkovic, outgoing ASPIRE Academy Chair
- Harm Peters, incoming ASPIRE Academy Chair
- Representatives of ASPIRE Award Winning Schools

The ASPIRE initiative, now in its ninth year, recognises excellence in education in a medical, dental or veterinary school in areas including Assessment, Curriculum Development, Faculty Development, Simulation, Social Accountability, Student Engagement, and – the latest addition - Inspirational Themes. Criteria against which to judge excellence have been compiled by international groups of experts in each of the above areas. The criteria, which are on the www.aspire-to-excellence.org website, help schools to benchmark themselves against the criteria necessary for ASPIRE recognition. If your School is considering applying for an ASPIRE award but is unsure of the process or would like information from successful schools about what ASPIRE recognition has meant for them, come along to this “Meet the ASPIRE winners” session to find out more.

Crossing the MedEd Threshold: Gateways to medical education from young educators to young educators

Presenters:

- Rille Pihlak, University of Manchester, UK
- Matthew J. Stull, Case Western Reserve University, USA
- Robbert Duvivier, Maastricht University, The Netherlands
- Margot Weggemans, University Medical Center Utrecht, The Netherlands
- Kevin Garrity, University of Glasgow, UK
- Susannah Brockbank, University of Liverpool, UK
- Kevin Gervin, University of Glasgow, UK

Summary of theme and why it is important: Many trainees enter medical education as clinical teachers or by developing educational projects with only limited teacher training. The field of medical education has rapidly expanded over the past 50 years into a specialist area of research and practice, which can often be inaccessible to trainees. This means that there is a mismatch between what the trainees entering the field expect and the reality of the world of medical education. Unless trainees take up structured training or degrees in medical education, they might feel lost in conferences such as AMEE where majority of the discussion is in a different 'language'.

The transition from student to teacher often happens quickly in clinical practice and, unfortunately, there is rarely any formal educational training and support available. If one tries to read the literature on one's own, it can be daunting and filled with unfamiliar concepts. Many trainees who come to medical education conferences have similar difficulties identifying sessions that might be accessible, interesting or useful. Furthermore, presentations and discussions may be littered with casual references to fundamental concepts, leaving junior educators feeling alienated from the conversation. We propose that this is, in part, because junior educators have not yet grappled with some of the ideas that are fundamental to developing a broader understanding of medical education, so-called threshold concepts.

This symposium is organised by young educators as peer teaching for students, junior doctors and new educators, to give an accessible insight into the world of medical education. We will introduce key concepts, explore definitions and application of some threshold educational concepts to give participants a new understanding of terminology and ideas. This will then allow participants to better engage with the medical education community and give junior educators an opportunity to question these concepts in a less intimidating forum.

Who should participate in the symposium? Junior healthcare professions educators from any background, clinical or non-clinical, particularly those attending AMEE for the first time.

What will they gain from participating? Participants will gain:

- A toolkit to better access medical education discourse based on an understanding of key concepts.
- An understanding of how these ideas can be applied to understand their educational practice and projects.
- A critical approach to engaging with AMEE based in educational evidence.

#5C Symposia

Date of Presentation: Monday, 26 August 2019

Time of Presentation: 1600-1730

Location of Presentation: Hall N, Level 2

Controversies and challenges in publishing health professions education research: a discussion with journal editors

Presenters:

- Anna Cianciolo, Teaching and Learning in Medicine
- David Cook, Medical Education
- Erik Driessen, Perspectives on Medical Education
- Peter de Jong, Medical Science Educator
- Val Wass, Education for Primary Care
- Richard Hays, AMEE MedEdPublish

Summary of theme and why it is important: Publishing health professions education research today is very different from 20 years ago. Along with proliferation of research activity, we see new venues for online publication (both peer-reviewed and non-peer-reviewed), evolving standards for publication, increased attention to human subjects' rights, and examples of scientific misconduct of varying severity. This symposium offers an opportunity for journal editors, authors, potential authors and reviewers to discuss these and other issues facing our field.

The panel of Editors of health professions education journals will focus on some of the timely issues related to research publication. New venues for publication, including pre-peer-review publication, expanding open access journals, post-publication peer review, and predatory journals create confusion for authors, reviewers, and editors alike. Reporting guidelines (e.g., CONSORT, STROBE, and extensions to these and other similar guidelines) have encountered both wholehearted acceptance and strong resistance. The standards for "research" meriting journal publication continue to be debated. Criteria for authorship and author order vary across disciplines and journals. Prepublication, duplicate publication, and self-plagiarism are becoming increasingly challenging. We anticipate a lively and thought-provoking discussion amongst panelists and audience participants on these and other related topics.

Who should participate in the symposium? The session will be relevant to all AMEE participants engaged in publication of health professions education research, at any stage of career, including authors, mentors, reviewers, and editors.

What will they gain from participating? During this session, participants will have the opportunity to debate key controversies currently facing the academic community, making known their beliefs and priorities to both editors and peers. They will leave with a deeper understanding of these issues and will be better prepared to navigate the publication process as they look to disseminate their own work.

#5D Symposia

Date of Presentation: Monday, 26 August 2019

Time of Presentation: 1600-1730

Location of Presentation: Room L3, Level 1

The political realities of designing and implementing a selection system: Implications for policy and practice

Presenters:

- Fiona Patterson, Work Psychology Group, UK
- Deborah O'Mara, University of Sydney Medical School, Australia
- Wolfgang Hampe, University of Hamburg, Germany
- Julia Blitz, Stellenbosch University, South Africa

Summary of theme and why it is important: There is over a century of research on selection and recruitment and the field has both matured and expanded significantly over this time. Many of the same challenges remain however, especially regarding diversity and fairness issues. There is growing recognition that selection is a complex, multi-layered and dynamic phenomenon. Such is the complexity, some authors argue selection to medical education is a 'wicked problem' (Cleland et al, 2018).

A new Ottawa consensus statement on selection and recruitment (Patterson, et al, 2018) recommends that greater consideration be given to understanding the political validity of selection practices, to better understand why there remains a persistent gap between the research evidence and policy enactment in many parts of the globe. Given that selection and recruitment practices are inextricably linked to the cultural and social context in which they are conducted, in an opening editorial of a special issue of AMEE MedEd Publish on selection, the editors call for further international research evidence to inform future policy and practice.

With speakers from South Africa, Europe and Australasia, this symposium will explore the political influences upon designing and implementing selection systems, drawing upon case material in each locality. We will facilitate a plenary discussion and invite contributions from others internationally to optimise the learning.

The latest research evidence will first be presented on the issues regarding good quality selection and recruitment methods and systems (both undergraduate and postgraduate) to provide background to the topic areas and the issues. Each speaker will then present research and case material from their home country (South Africa; Germany; Australia; UK), from an institution specific and national perspective.

For example, although Australian medical schools have employed a wide range of strategies in the past 10 years to increase the rural medical workforce, there has been little impact on workforce targets. The potential of designing a selection system that is matched with a targeted delivery of a medical program rather than a one size fits all approach will be explored. In Germany, a judgement of constitutional court forces the legislative to change the highly regulated selection system. We discuss how admission research can influence judges and politicians to change admissions system to criteria which are better validated.

We will engage the audience in participation by asking them to reflect upon experiences in their own locality and encourage them to offer considerations for how countries or institutions could seek to mitigate the challenges. Questions will be offered to the audience to stimulate thinking and discussion including: how are we selecting for diversity within our programmes and are the methods currently employed truly achieving this? How can the political landscape within a country impact on selection within healthcare and what can we do to influence this? What are the challenges to consider in relation to ethnic diversity, language and widening access?

The panel will seek to both share experiences and ask questions to the audience. Throughout the symposium the panel will support the audience debate and seek to reach consensus as to the issues surrounding the complexities within selection experienced, particularly from a political validity perspective before sharing and agreeing on considerations for the future.

Who should participate in the symposium? The symposium will be designed to maximise audience discussion, whilst drawing upon the international perspective both of the panel and the audience. In particular, anyone who has an

interest in selection within healthcare, in particular those that may be experiencing challenges in how best to design their admissions processes or have suggestions to deal with the political influences within selection will find the symposium of great interest.

Within the symposium, each speaker will be limited to 10-15 minutes offering up to 30-40 minutes for discussion. As part of this discussion, views will be sought on other experiences internationally to share learning and experiences in relation to the complexities faced within different institutions as part of selection systems. The varying perspectives and experiences from within the panel will support the audience debate.

What will they gain from participating?

- Gain a greater awareness and understanding of the complexities of selection within healthcare
- Knowledge of risks and opportunities regarding selection in different countries
- Awareness of how other institutions/countries are dealing with the political realities of selection, in particular from institutions and countries that may not be publishing research in a formal way
- An opportunity to interact and discuss these topics with others that may be in similar situations

#5E AMEE Fringe 1

Postcards from the Fringe

AUTHOR(S):

- David Topps, University of Calgary, Canada (Presenter)
- Maureen Topps, Medical Council of Canada, Canada

ABSTRACT

Fringe has always been about withdrawing from the standard PowerPoint Didactic Disaster. Are we addicted to being told how to learn? Over the years, our team has employed a wide range of styles and approaches in trying to draw us away from injections of knowledge. From shadow puppets to online games to improv, a highly mixed cocktail of success and otherwise: not all has worked, with some excruciations appearing at the worst of times. Looking back on over a decade of edgy performances, we take a fond look at some of the themes pursued, techniques employed, emergent activities and lessons learned. Some of these will be useful to future Fringe addicts... er... authors, with technical tips on how to leverage limited resources; some will be caveats of rabbit-holes to avoid. We even manage to show some examples of the impact when these sessions get under your skin, even though their original intent was definitely tongue-in-cheek. And, of course, we will continue to surprise with an infused innovation or two.

View my View - Using Point Of View (POV) with smart glasses

AUTHOR(S):

- Takaaki Sato, Aintree University Hospital, UK (Presenter)
- John Sandars, Edge Hill University, UK
- Jeremy Brown, Edge Hill University, UK
- Simon Rogers, Aintree University Hospital, UK

ABSTRACT

Smart glasses are a wearable computer device that has been adding a splash of colour to clinical education. Smart glasses offer unique functions: voice recognition, a head-mounted screen and a Point Of View (POV) camera. Recent research tested voice recognition function on nursing students in operation theatre training where their hands must be kept sterile. The head-mounted screen was utilised to demonstrate basic surgical skills to medical students. Live-streaming displaying students' POV provides a quantum leap to clinical examinations by eliminating the examiners' "blind spots" and highlighting the students' point of focus when performing a task. In acquiring procedural skills, reviewing the POV video-recording created a positive impact by augmenting self-reflection and feedback.

Our pilot study evaluated the usefulness and usability of POV in a suturing work shop for medical students. On completion, twenty-four students answered the semi-structured questionnaire that exclusively focused on students' perspectives. The students believed the video recording was a powerful tool in self-reflection and feedback. POV live-streaming also showed a positive impact on their experience. The students shared their perspectives in a broader view such as induced anxiety, legal dispute and their innovative applications in undergraduate and postgraduate education.

It seems to me – and I hope that many people will View my View – that this new innovation can change the game of surgical education. My presentation will take the audience on a journey of cutting-edge applications of smart glasses in healthcare education in the recent years. I will share my view by live-streaming my POV during a live performance. I will, then, illustrate how the students' perspectives, which were uniquely identified in our pilot study, are supported by the recent publications. Finally, I will share my vision that smart glasses will revolutionise the surgical training by transforming the trainees' mundane perception of their compulsory work-based assessments.

The beetle-in-a-box: a call to stop measuring the unmeasurable

AUTHOR(S):

- Anne de la Croix, Vrije Universiteit Amsterdam, The Netherlands (Presenter)
- Mario Veen, Erasmus Medical Center, The Netherlands

ABSTRACT

“Suppose everyone had a box with something in it: we call it a "beetle". No one can look into anyone else's box, and everyone says he knows what a beetle is only by looking at his beetle.—Here it would be quite possible for everyone to have something different in his box. One might even imagine such a thing constantly changing.”

- Ludwig Wittgenstein, Philosophical Investigations §293

In this Fringe session, we will use Wittgensteins ‘Beetle-in-a-Box’ as an analogy, in which the beetle is symbolic for private, personal and invisible experiences. Aspects such as reflection, empathy, personal growth, the shaping of an identity are important in medical education, yet are impossible to measure or assess: they are beetles. We cannot see other people’s beetles, we can only talk about them.

We will share with you our concerns when we see researchers aiming to describe & study beetles and when we see educators judge the quality of students’ beetles. Beetles such as empathy, reflection or professional attitude are treated like they are the same kind of beast as measuring blood pressure (skills), or producing the correct answers on an exam (knowledge), yet they are fundamentally different. We call for the medical education community to stop measuring the unmeasurable and to leave students' beetles alone!

We will argue our case with live experiments in which we will playfully assess the audiences private experiences. Are they hungry? Are they happy? Are they tired? Are they in love? Are they inspired? If so, how can we tell? Come and watch us while we attempt (and gloriously fail) to study and judge audience members' beetles.

The Voice

AUTHOR(S):

- Peter Musaeus, Cesu Aarhus University, Denmark (Presenter)

ABSTRACT

The human voice tells a story about our experiences in life, the culture(s) we carry with us, and the body that speaks. We judge (and are judged by) the voice. The voice reveals cues about who we are. Voices fill the air of medical classrooms both by present and non-present agents. However, are we cognizant about the way voice influence us in daily life and in the medical educational setting? Based on my book (Stemmen. 2019. Aarhus University Press), I will tell a story about the cultural-historical psychological aspects of voice. Speaking and playing sound clips, I will illustrate how we believe we can infer personality traits from a voice e.g. in selection processes, patient communication, and personal situations such as partner choice etc. Drawing mainly from rhetoric, psychology, medical humanities and phonology, I will illustrate how the natural voice is a myth. What we think we have heard and hear in a voice depends very much on cultural context, although we also try to infer very much about the innate nature of the speaker. Based on evidence, I will speculate how our perception of voice evolved as soft- and hard-wired. Finally, I will consider the relevance of the voice to medical teachers. The voice is an all-pervasive yet illusive phenomenon, so much more than an instrument, and less than a new secret about teaching. Come and train your sensibility. The presentation will cover: A mixture of sound clips, photographs, and a PowerPoint. The aim is to describe how the voice is a product of culture and biology in order to raise awareness about our own and others' voices.

Hacking Med Ed - A comparison of innovating medical education to running a startup

AUTHOR(S):

- Cynthia Sin Nga Lam, Li Ka Shing Faculty of Medicine, The University of Hong Kong, Hong Kong (Presenter)

ABSTRACT

Education researchers v.s. Entrepreneurs - both lose sleep over worrying about whether any funding comes through; both lose sleep being too excited about funding coming through. Innovate, sustainability, agile, multi-stakeholder, technology-enabled - yes, we share a lot of buzzwords. Running an education research v.s. Running a startup - both evidence-based yet highly unpredictable. There are so many similarities between innovating medical education and running a startup, yet also so many differences. My name is Cynthia, and I am a rookie social entrepreneur, medical education researcher and a TEDx speaker. In this fringe presentation, I will draw from my experience in these different roles and share how combining the hat of an entrepreneur's with that of an education researcher's can be a good idea. I will start by asking the audience to illustrate the distinctions between the two with me - literally, as I will be drawing the differences out. Then I will probe deeper into the differences that carry a significance. For example, entrepreneurs talk about pivoting a lot more than educators do - is it a matter of differences in nature, or should educators start considering pivoting as well? Entrepreneurs communicate very differently from researchers - how can we learn from each other? Entrepreneurship and research should both start lean, but one has got a more structured way of doing so - what can we infer from that? In this session, we will explore how methodologies and theories adopted by entrepreneurs can be modified to become a useful tool for educators and researchers to innovate medical education with. In this session, and in the true entrepreneur fashion of having an ostentatious slogan, we hack med ed.

Swinging Heart: music opens the door for understanding electrocardiography

AUTHOR(S):

- **Marcelo Rivas, Rio de Janeiro State University (UERJ) - Campinas State University (UNICAMP), Brazil (Presenter)**
- Daniel Schubert, Rio de Janeiro State University (UERJ), Brazil
- Anna Moura, Rio de Janeiro State University (UERJ), Brazil
- Marco Carvalho-Filho, State University of Campinas (UNICAMP), Brazil

ABSTRACT

It is 02:00am at the emergency room and you are alone. A new patient comes in with signs and symptoms suggestive of an Acute Coronary Syndrome and you must analyze his EKG strip in less than 10 minutes from the admission. We all know the thrilling sensation that accompanies an EKG strip of an acutely ill patient - its graphic complexity, the dynamic changes, the physiology it represents... Understanding the EKG is a challenge to many medical students and the stakes are high: the correct interpretation is lifesaving, but a mistake can be fatal. But why is it so hard to decipher an EKG? Could we start to introduce the different heart rhythms and their EKG expressions earlier in the undergraduate medical education curriculum? We want to give it a try. Ok, lets set the metronome at 100bpm and start the journey through some rhythm disturbances and arrhythmias. With our playlist, we invite you to create new connections between what you see, listen and feel. Maybe you will only recognize the name of the artists or the song, but the harmony of this activity will develop a friendly atmosphere to guide you through electrocardiographic taxonomy or even further: to medical diagnosis. Record these tracks in your mind until the next night shift. Shall your favorite song lead you to the diagnosis? Let's find out!

'Let's do her a favor and let her absolutely fail': Clinical supervisors' experiences of allowing failure for workplace learning

AUTHOR(S):

- Jennifer Klasen, Kantonsspital Frauenfeld, Zurich, Switzerland (Presenter)
- Erik Driessen, Department of Educational Development & Research, University of Maastricht, the Netherlands
- Pim W Teunissen, School of Health Professions Education, University of Maastricht, the Netherlands
- Lorelei A Lingard, Center of Education Research and Innovation, London Ontario, Canada

ABSTRACT

Introduction: Failure can be a powerful teacher. Recognizing this, educational domains such as business, sports psychology and early childhood education endorse using failure for the purposes of developing skills and resilience. However, a recent narrative review found no literature addressing the phenomenon of allowing medical learners to fail in clinical workplace-based settings (1). While the medical education literature is silent on this topic, it does acknowledge the educational value of failure for postgraduate trainees and the importance of support from the clinical supervisor for learning from failure (2). Therefore, the purpose of this study was to explore whether, why and how clinical supervisors may allow failure for educational purposes. An understanding of this phenomena could inform faculty development strategies to support appropriate use of this powerful, but potentially sensitive, educational strategy.

Methods: With research ethics approval, we individually interviewed 19 clinical supervisors at 10 teaching hospitals in Switzerland and 2 teaching hospitals in Canada in 2018. Interviews lasting 45-65 minutes were audio-recorded, anonymized and transcribed. We purposefully selected participants to include a range of supervisory experience (3-20+ years); more than half the participants also had formal training in medical education. Participants represented a range of specialties including general surgery, obstetrics, emergency medicine, critical care, internal medicine pediatrics and psychiatry. Consistent with constructivist grounded theory methodology, we used iterative data collection and analysis procedures and theoretically sampled to explore emerging themes. The research was informed by sensitizing concepts from workplace learning theory.

Results: All participants reported allowing trainee failure in the clinical environment, although many acknowledged that they had not consciously reflected on the phenomenon prior to the interview. Each participant offered 1-4 specific examples of this supervisory practice. Supervisors reported allowing various kinds of failures, including during operations (e.g., selecting the wrong plane); technical procedures (e.g., misplacing the central line); medication dosing (e.g., overdosing the Vitamin K); communication events (e.g., confusing the patient's family); diagnostic procedures (e.g., selecting the wrong ultrasound program); and patient management (e.g., planning insufficient follow-up). Supervisors talked at length about how they decide whether a particular clinical situation is appropriate for allowing failure. They described that such situations must present both minimal harm to patients and maximal learning for trainees. Supervisors described both a 'gut feeling' and a logical process of weighing patient, trainee and supervisor factors in their calculation of the risks and benefits of allowing failure. Failure under supervision was perceived to be a valuable teaching method for many reasons: firsthand failure is more impactful than repeated supervisor warnings; failure offers a chance to manage critical situations in a protected environment, and today's failure has the potential to safeguard tomorrow's patients.

Discussion & Conclusions: Our results suggest that clinical supervisors allow trainees to fail in the clinical workplace for educational purposes. Employing this strategy in various situations, supervisors make complex judgments about which failures are both safe and educational, striking a balance between patient safety and trainee learning. However, while this strategy is being enacted, it is not being explicitly discussed by our community. This silence may signal a taboo practice: allowing failure is in tension with patient safety culture and the Hippocratic Oath to 'do no harm'. More empirical research is required to excavate this tacit supervisory practice and support its appropriate use in workplace learning.

Gender-specific effects of raising first-year standards on performance and stress levels of medical students

AUTHOR(S):

- Karen Stegers-Jager, Erasmus MC University Medical Center Rotterdam, The Netherlands (Presenter)
- Mesut Savas, Erasmus MC University Medical Center Rotterdam, Rotterdam, the Netherlands
- Jeroen van der Waal, Erasmus University Rotterdam, Rotterdam, the Netherlands
- Elisabeth F.C. van Rossum, Erasmus MC University Medical Center Rotterdam, Rotterdam, the Netherlands
- Andrea M. Woltman, Erasmus MC University Medical Center Rotterdam, Rotterdam, the Netherlands

ABSTRACT

Introduction: Medical schools are challenged to create academic environments that stimulate students to maintain satisfactory progress, while maintaining their health[1]. Studies have found a high prevalence of distress among medical students when compared with age-matched controls, which hampers learning, interferes with professional development and –in the long turn– affects personal well-being and patient care[2]. The present study investigates the effect of raising the first-year standards on academic performance and students' chronic psychological and biological stress levels. We also studied potentially differential effects by gender.

Methods: In 2014 Erasmus MC medical school raised the first-year credit standard from 67% (40/60) to 100% (60/60). We included students from the last 67% cohort (n=410) and the first 100% cohort (n=413) to assess academic performance. Furthermore, subsets of students of both cohorts (n=212 and n=244 respectively) voluntarily completed the 14-item Perceived Stress Scale (PSS) 1,5 months before the final first-year exam. The PSS reflects both general distress and the inability to deal with that stress, with higher scores reflecting higher levels of perceived stress. To determine average biological stress levels during the last 3 months scalp hair samples were collected from student volunteers in both cohorts (n=181;162) at the last day of the academic year. Additionally, students completed a questionnaire on hair colour, washing frequency, use of corticosteroids during last 6 months, other medication use and distressing life events. Main outcome measures were first-year passing rate, mean PSS score and hair cortisol concentrations (HCC). Data were analysed using logistic regression and two-way ANOVA. Analyses on HCC, using log10 transformations, were adjusted for use of corticosteroids.

Results: First-year passing rates were significantly higher for the 100% cohort (OR=4.65; 95%CI=2.79-7.75) and for females (OR=2.05; 95%CI=1.35-3.12). However, there was a significant interaction effect (OR=0.46; 95%CI=0.25-0.86), indicating that raising the standards was more effective for male (passing rate from 38% to 74%) than for female students (from 56% to 73%). PSS scores were also significantly higher for the 100% cohort (67%-cohort=24.1 vs 100%-cohort=27.8; $F(1,474)=15.08$; $p<0.001$, $\eta^2=0.03$) and for females ($F(1,474)=16.29$, $p<0.001$, $\eta^2=0.03$). This applied specifically to females in the 100% cohort (borderline significant interaction effect: $F(1,474)=3.84$, $p=0.051$, $\eta^2=0.01$). The only significant difference on the additional questionnaire items was a higher score for the 100% cohort on distressing life events, mostly referring to taking exams (71.0% vs 41.3%; $\chi^2(1)=30.25$; $p<0.001$; $ES=0.30$). HCC did not differ between the cohorts (67%-cohort=23.8 pg/mg hair vs 100%-cohort=22.7 pg/mg), but was significantly higher for females ($F(1,332)=7.93$; $p<0.01$); there was no interaction effect. In separate models including cohort and gender, both PSS (OR=0.91; 95%CI=0.89-0.94) and HCC (OR=0.38; 95%CI=0.15-0.95) were independent predictors of first-year performance. Only students with high scores on both PSS and HCC were significantly at risk of lower first-year passing rates (OR=0.27; 95%CI=0.11-0.62), in particular male students.

Discussion & Conclusions: Raising the first-year performance standard increased academic performance, most prominent for male students. However, it also increased levels of perceived stress, especially for female students. In particular the combination of high perceived stress and high biological stress levels, as measured by long-term cortisol, is related to poor academic performance. Our study suggests a relation between raising performance standards and students' well-being. Additionally, changes in the academic environment seem to have differential effects for male and female students. Just like in medical practice, we urge medical educationalists to take these differences into account.

Heart on your Sleeve: Exploring the validity evidence for mobile measurements as indicators of psychological stress

AUTHOR(S):

- Vicki LeBlanc, Department of Innovation in Medical Education - University of Ottawa, Canada (Presenter)
- George Mastoras, University of Ottawa, Ottawa, Canada
- Christopher Hicks, University of Toronto, Toronto, Canada
- Philip Aucoin, University of Ottawa, Ottawa, Canada
- Connor O'Rielly, University of Calgary, Calgary, Canada
- Walter Tavares, University of Toronto, Toronto, Canada

ABSTRACT

Background: There is growing interest in how stress influences learning, performance and wellbeing in health professions education. Correspondingly, there is burgeoning enthusiasm towards wearable health technologies (e.g. fitness bands) for real-time tracking of learners' psychological health, with the hope of better developing and evaluating interventions(1). This is especially true for mobile heart rate variability (HRV) apps, which are proposed as indicators of psychological stress. However, in using such tools for measuring stress, there are inherent assumptions that threaten construct validity(2). Prior to using mobile HRV apps to monitor learners' stress, the following hypotheses must be supported: 1) HRV values calculated with a given mobile app should correspond to those calculated by benchmark analysis software; 2) a mobile app's HRV values should differentiate between rest and stress conditions; 3) a mobile app's HRV values should correlate with traditional measures of subjective & physiological stress.

Methods: Ten (10) emergency medicine residents participated in 2 known stressful simulation scenarios and 2 rest periods. The first hypothesis was tested with Pearson correlation coefficients between time-based HRV (rMSSD- root mean square of successive differences; SDNN- standard deviation of NN intervals; pNN50 - proportion of NN intervals that differ > 50ms) and frequency-based HRV (Low Frequency/High Frequency (LF/HF) ratio) values provided by a mobile app (Polar™ H10 chest-strap connected via Bluetooth™ to EliteHRV™) and those generated by a benchmark analysis software (Kubios™). The second hypothesis was examined by testing the app's ability to detect different HRV levels in the stress vs rest conditions. The third hypothesis was tested with Pearson correlation coefficients between the app's HRV values and traditional measures of subjective stress (State-Trait Anxiety Inventory [STAI]) and physiological stress (salivary cortisol).

Results: Correlation analyses revealed that the EliteHRV™ time-domain measures correlated strongly with the Kubios™ ones (rMSSD $r=.96$; SDNN $r=.93$, pNN50 $r=.99$, all $p<.001$), but the frequency-based HRV measures were weakly correlated (LF/HF: $r=.10$, $p=.58$). A multivariate ANOVA indicates that the time-domain HRV measures showed significant differences between rest and stress (p values $<.02$, $\eta^2=.17-.44$). The frequency-domain variables did not ($p=.68$, $\eta^2=.01$). Two time-domain HRV measures, rMSSD and pNN50, showed greater responsiveness to change (standardized response means (SRM): 1.48 & 1.36 respectively) compared to traditional stress measures of STAI and cortisol (SRM: 1.05 & .88, respectively). Correlation analyses revealed that two time-domain HRV variables, rMSSD and pNN50, correlated moderately with STAI ($r=-.49$ & $r=-.46$, $p<.01$) and cortisol ($r=-.63$ & $r=-.59$, $p<.01$). The frequency-based HRV measure showed weak correlations with STAI and cortisol ($r=-.16$ & $r=.11$, NS).

Discussion and Conclusions: The evidence partially supports the assumptions inherent in using mobile HRV apps to assess psychological stress. For time-domain HRV variables, the evidence supports the stated hypotheses. For the frequency-domain variable, the evidence counters the stated hypotheses. Of the time-based measures, rMSSD and pNN50 showed the greatest effect sizes between rest and stress conditions, responsiveness to change, and strongest correlations with traditional stress measures and benchmark analysis software. Accordingly, the evidence supports the use of EliteHRV™'s time-based HRV measures for the assessment of short-term psychological stress in controlled simulation settings. Further research should assess the evidence for generalization inferences(2) (use of mobile apps for long-term measurement of stress in less controlled environments) and implications (risks/benefits of continuously monitoring learners' mental health) of using mobile apps to capture learners' stress.

Understanding the Relationships Between Curriculum Reform, Space and Place in Medical Education

AUTHOR(S):

- Lorraine Hawick, Institute of Education for Medical and Dental Education, School of Medicine, Medical Sciences and Nutrition, University of Aberdeen, Aberdeen, UK (Presenter)
- Jennifer Cleland, Institute of Education for Medical and Dental Education, School of Medicine, Medical Sciences and Nutrition, University of Aberdeen, Foresterhill, Aberdeen, UK
- Simon Kitto, Department of Innovation in Medical Education, Office of Continuing Professional Development, University of Ottawa, Canada

ABSTRACT

Introduction: Undergraduate medical curricula must evolve in order to reflect the changing needs of contemporary medical practice, but making substantial changes to the form and delivery of medical education is challenging (Carraccio et al. 2002). While there is a growing body of research that focuses on curriculum change, relatively little attention is given to the notion of curriculum reform as a process rather than an outcome. In addition, the buildings and learning spaces where curriculum reform and undergraduate medical education are enacted contribute to people's experiences of these spaces. However, this aspect of context is currently neglected in the medical education literature. This thesis aimed to investigate the influences, vision, intentions and unintended consequences associated with a medical curriculum reform, and how the learning space and place of the medical school (where curriculum is translated) is understood and experienced by key stakeholders (e.g., building designers, teaching faculty and students).

Methods: Ontologically and epistemologically grounded within the social constructivist paradigm, the overall thesis aim was achieved through four overlapping empirical studies. Using a qualitative exploratory case study approach (Yin 2003), data were gathered from archived documents, individual interviews and focus group interviews with students and teaching faculty, and enriched by different theoretical concepts (e.g., the hidden curriculum, wicked problems, Foucault's panopticon). The first study set out to explore key stakeholders perceptions and experiences of the curriculum reform processes. The second study explored the experiences of curriculum developers in their endeavour to develop and include professionalism within a curriculum reform. The third study investigated how space and place may affect and be affected by the people who inhabit them; to identify and examine the intentioned and unintended impact of a new medical school building on student experiences and practices. The final study aimed to gain a deeper understanding of the influence and impact of the medical school space on those based in the building.

Results: The first study demonstrated that multiple stakeholders hold different views and values in relation to curriculum reform, resulting in various influences on the process and outcomes of reform, and 'solutions' generate consequences beyond the anticipated advantages. The second study revealed hidden messages and contextual factors can enable or inhibit the translation of new teaching subjects such as professionalism into curricula. In the third study, findings revealed a number of unintended consequences on student experiences as a result of the specific space and place of a medical school facility. In the final study, data analysis demonstrated the complexity of the medical school as an organisational space and how it can unintentionally create conditions of separation and isolation for teaching faculty and students.

Discussion and Conclusion: Acknowledging that each medical school has a unique space and place, and the relationships, dynamics and interactions between people and systems will vary because of context is crucial and cannot be underestimated. The thesis findings demonstrate that such complexity inherently generates successes, failures, unanticipated and unintended consequences which impact on different groups of people in different ways.

Learning from lapses: How to identify, classify and respond to unprofessional behaviour in medical students

AUTHOR(S):

- Marianne Mak-van der Vossen, Amsterdam UMC, Vrije Universiteit Amsterdam, Department of Research in Education, VUmc School of Medical Sciences, Institute for Education and Training, Amsterdam, the Netherlands (Presenter)
- Gerda Croiset, University Medical Center Groningen, Groningen, The Netherlands
- Walther van Mook, Maastricht University, School of Health Professions Education, Maastricht, the Netherlands
- Arianne Teherani, University of California San Francisco, San Francisco, USA
- Rashmi A. Kusurkar, Amsterdam UMC, Vrije Universiteit Amsterdam, Department of Research in Education, VUmc School of Medical Sciences, Institute for Education and Training, Amsterdam, the Netherlands

ABSTRACT

Introduction: Quality of health care depends on physicians acting professionally. Medical students' unprofessional behaviour (occurring in about 3-20% of students) has been shown to predict unprofessional behaviour after graduation. Triggers are often a combination of individual factors (deficits in cognition, skills, attitude) and contextual factors (procedural, cultural, situational, organizational). Unfortunately, educators often fail to provide feedback to students displaying professionalism lapses, thus limiting their learning from these lapses. The literature does not provide sufficient empirical guidance to faculty regarding management of students' lapses. Without clear directions, the guidance of students displaying unprofessional behaviour takes a toll on resources, time and effort of medical schools and their faculties, thus delaying potential remediation and dismissal. This research aimed to provide a framework for identifying, classifying and guiding students who display unprofessional behaviour in medical school.

Methods: This program of research comprised eight interconnected papers: two qualitative studies, one mixed-method study, one systematic review study, one descriptive, one perspective and one practical application papers. We conducted our research from the constructivist paradigm, in which data and analyses are created based on the interaction of both participants and researchers. We chose research methods that allowed for this interaction (content analysis, latent class analysis, thematic analysis, nominal group technique and grounded theory approach) to study the experiences of individuals from different stakeholder groups (frontline teachers, professionalism supervisors, deans, simulated patients and peer students). Thus, the methods jointly generated outcomes that were grounded in the practical perspectives of individuals handling unprofessional behaviour of students.

Results: The main results are: Medical educators can identify unprofessional behaviours among students using the 4 I's model, which comprises 30 descriptors indicating unprofessional behaviours in four domains: involvement, integrity, interaction, and/or introspection. Medical educators can classify unprofessional student behaviour into four profiles (accidental behaviour, struggling behaviour, gaming-the-system behaviour and disavowing behaviour), distinguished by two dimensions (reflectiveness and adaptability). Medical educators can respond to unprofessional student behaviour in three consecutive phases: understand and explore, remediate, and gather evidence for dismissal. Medical students' responses to unprofessional behaviour of faculty and peers are: avoiding, addressing, reporting, and/or initiating policy change.

Discussion: Any student can experience a professionalism lapse due to personal or contextual circumstances. Medical educators could support students in learning from such lapses by enabling a blame-free handling of unsatisfactory behaviour, and discussing both personal and institutional causes for it [1]. This approach aligns with the way another quality issue in medicine is handled: the occurrence of medical errors [2]. If medical educators address lapses, focusing on the student's potential benefit, then their feedback is likely to help not only the student in question but also other students. They can see how educators –their role models– handle unsatisfactory behaviour, and are likely to follow their example. Future research could use ethnographic research methods to understand the meaning inherent in the activities of students whose behaviour is seen as unprofessional.

Conclusions: This dissertation facilitates medical students and educators alike in attending to unprofessional behaviour by providing them with guidance on how to identify and classify unprofessional student behaviours, and

then respond accordingly. Acknowledging unprofessional behaviour –and changing its underlying causes– will promote a culture of excellent professionalism in medical schools. This acknowledgement is likely to benefit the professionalism of aspiring doctors and their future colleagues, and ultimately the safety of their future patients.

Rethinking clinical reasoning in undergraduate medical education: facilitating collective learning in the activity of decision-making by health care students

AUTHOR(S):

- Sarah Berger, Medical Faculty Heidelberg, University of Heidelberg, Heidelberg, Germany (Presenter)
- Katja Krug, Department of General Practice and Health Services Research, University Hospital Heidelberg, Heidelberg, Germany
- Joachim Szecsenyi, Department of General Practice and Health Services Research, University Hospital Heidelberg, Heidelberg, Germany
- Katja Götz, Institute of Family Medicine, Campus Lübeck, University Hospital Schleswig-Holstein, Lübeck, Germany

ABSTRACT

Introduction: Given the complex and dynamic health systems that new medical graduates are entering, students need to be prepared with both the cognitive and collaborative capabilities necessary for effective clinical decision-making in future practice. However, although the significance of collaboration in teams for care quality and patient safety is increasingly being recognized, clinical reasoning continues to be taught primarily in monoprofessional settings with an emphasis on individual rationality. This is despite the fact that emerging evidence from group cognition literature indicates interventions fostering collaboration and participation improve decision quality [1]. The aim of this study was to gain insights into how medical and other health care students articulated their thinking and reasoning during the activity of decision-making as a monoprofessional or interprofessional collective under conditions of moderate complexity.

Methods: An exploratory case study design using direct observation was used and based on a role-play scenario, in which participants discussed three complex patient cases, taking into account clinical and ethical aspects of care, to reach a collective decision. In order to enable a comparison between professionally homogeneous and professionally heterogeneous groups, by means of "purposive sampling", monoprofessional groups (MP) of medical students were recruited and compared with interprofessional groups (IP) of medical and other health care students. The planned cognitive and collaborative complexity of this learning activity increased the likelihood of struggle, uncertainty and the unexpected arising. Engeström's theory of "expansive learning" [2] underpinned this endeavour and explicitly made room for dynamic and unpredictable outcomes to emerge. Data were recorded digitally with video cameras and subsequently transcribed verbatim. Qualitative analysis of transcripts, supported by ATLAS.ti., was inductive and based on Strauss's "Theoretical Coding" to generate themes and categories.

Results: In four MP and four IP groups, a total of 45 students from six health professions participated: medicine (n=31), nursing (n=6), laboratory technology (n=3), orthoptics (n=2), physiotherapy (n=2), and speech and language therapy (n=1). Coding and interpretation of transcripts resulted in the identification of two key themes: a) forms of reasoning and b) collective decision-making. Participants articulated both implicit and explicit reasoning while discussing and defending standpoints. All groups executed decisions based on co-constructed criteria. MP groups decided unanimously, whereas IP group decisions were by majority rule with abstentions and dissensions. Six groups (three MP, three IP) independently came to the same final result.

Discussion: Key findings showed that students moved along a dynamic continuum between implicit and explicit reasoning at different stages of the collective decision-making process. Initial fast mental conclusions articulated early were counterbalanced by conscious weighing up of ideas over time as disagreement and differences of opinion were encountered and addressed. Furthermore, the homogenous nature of MP groups was reflected in collective decisions characterized by a strongly rational approach to evaluation of patient cases against collectively determined decision-making criteria. In contrast, the heterogeneity of IP groups was reflected in collective decisions characterized by a less structured and emergent approach to evaluation of patient cases against collectively determined decision-making criteria.

Conclusion: Intentional provision of interprofessional learning activities for medical students to practice articulating their thinking and reasoning processes and gain collaborative experiences will not only enhance their clinical decision-

making capabilities but also prepare them more appropriately for future practice. However, such measures require further adaptation and evolution of clinical decision-making modules in already densely packed undergraduate curricula.

Cognitive Load Theory and the Teaching and Learning of Procedural Skills: The Case of Gastrointestinal Endoscopy

AUTHOR(S):

- Justin Sewell, University of California San Francisco, San Francisco, USA (Presenter)
- Christy Boscardin, University of California San Francisco, San Francisco, USA
- Olle ten Cate, University Medical Center Utrecht, Utrecht, Netherlands
- John Young, Hofstra/Northwell School of Medicine, Hempstead, USA
- Patricia O'Sullivan, University of California San Francisco, San Francisco, USA

ABSTRACT

Introduction: Teaching and learning procedural skills in the health professions is challenging for teachers and learners alike, largely due to complexity of simultaneous cognitive and psychomotor demands. Cognitive load theory (CLT) is highly relevant to complex learning settings and posits working memory as the 'bottleneck' for learning, as it can manage only a few pieces of information at any moment (whereas sensory and long-term memory are considered infinite)[1]. CLT states that three types of cognitive load impose on working memory. Intrinsic load occurs when learners perform essential task demands. Germane load occurs when learners form and refine learning schemas. Extraneous load occurs when learners attend to internal or external distractions. CLT goals are to optimize intrinsic and germane load, and to minimize extraneous load. The overarching goal of this doctoral research was to examine the role of CLT in an exemplar procedural training setting, gastrointestinal endoscopy, by addressing five primary research questions: (1) How can we measure intrinsic, germane and extraneous load during colonoscopy training? (2) What factors are associated with cognitive load subtypes during colonoscopy training? (3) What lessons can we learn from studies using CLT to examine learning in diverse professional workplace settings? (4) What CLT-oriented strategies do experienced endoscopy teachers report using when teaching endoscopy learners? (5) How are teaching strategies identified in question 4 enacted during actual colonoscopy teaching, and how do learners perceive the strategies as affecting their cognitive load?

Methods: Five studies addressed the five research questions: (1) We developed a survey instrument to measure intrinsic, germane and extraneous load among 477 colonoscopy learners, and collected evidence for validity, using exploratory and confirmatory factor analysis; (2) We examined multivariable models describing associations between cognitive load subtypes and aspects of learners, tasks, teachers and settings during colonoscopy training; (3) We performed a BEME scoping review of studies using CLT to examine learning in professional workplace training settings within and outside of the health professions; (4) In a qualitative study, we analyzed interviews with 16 experienced gastrointestinal endoscopy teachers in the USA, Canada and Netherlands using template analysis; (5) We performed a mixed-methods study observing colonoscopies performed at 2 hospitals in the USA.

Results: In study 1, the most parsimonious model included 3 factors corresponding to intrinsic, germane and extraneous load. Fit parameters were satisfactory; evidence for validity was presented. In study 2, we identified unique sets of factors associated with each cognitive load subtype. In study 3, analysis of 116 included studies yielded multiple theoretical and practical recommendations[2]. In study 4, we characterized 11 specific teaching strategies that experienced endoscopy teachers reported using; these fit well within the CLT framework. In study 5, we analyzed 519 instances of the 11 teaching strategies used during 10 observed colonoscopies. The most common strategies were motor instruction (decreased intrinsic load), feedback (decreased intrinsic load, increased germane load), schema teaching (increased germane load), and checking learner understanding (increased germane load).

Discussion & Conclusions: Our research establishes strong relevance of CLT to procedural skills training in the health professions and addresses ongoing scholarly conversations related to CLT: how to measure cognitive load subtypes and the identity of germane load (our research suggests germane load is a construct distinct from intrinsic load). The research provides practical insights to address the challenges of teaching and learning procedural skills in the health professions.

Unveiling the Hidden Curriculum of Undergraduate Medical Education in Some Sudanese Medical Schools

AUTHOR(S):

- **Alsarah Diab, Sudan Medical Specializations Board, Sudan (Presenter)**
- Nazik Elmalaika Husain, Omdurman Islamic University, Sudan
- Magda Elhadi, University of Gezira, Sudan

ABSTRACT

Background: The hidden curriculum is the set of influences that function at the level of organizational structure and culture. It is more influential than the formal curriculum with rarely harmless effects and recent studies show that it is responsible for the development of professional identity. The hidden curriculum of undergraduate medical education was never studied before in a Sudanese context, therefore this study aimed to explore it in sampled Sudanese Universities.

Summary of Work: This study was conducted from January through October 2018, students were randomly selected from the four oldest Sudanese medical schools from both governmental and private sectors. Qualitative data were collected using focus group discussion (FGD) and content was thematically analysed and recruitment was stopped once saturation was reached for themes.

Summary of Results: Ten FGD sessions were conducted and six themes have emerged. 'Hierarchism' was evident at the level of teachers, universities and specialities. 'The positive and negative role models' were highlighted by all focus groups. 'Gender discrimination' was reported by female participants, perceived through constraints on career choice and prejudice. Also, 'Stereotyping some specialities' with exclusivity for harsh characters was clear in both Obstetrics and Gynaecology and Surgery 'Focus on academic performance and devaluing extracurricular activities' was loud in some university policies that prohibit such activities. Finally 'Undergraduate research as a low priority' as it was taught haphazardly. The participants believed that the hidden curriculum impacts them greatly, it influenced both of their development as doctors, the sort of identity they acquired, and the way in which they choose the speciality.

Discussion and Conclusions: There are both resemblances and uniqueness of the findings of this study with others in Japan and the UK. With exception to the positive role models, the hidden curriculum appears to be negative in Sudan, which could be attributed to the lack of structured training for medical teachers, ignorance about the hidden curriculum and absence of opposing forces through the formal curriculum.

Take-home Messages: In conclusion, the hidden curriculum strongly influences medical students' development and their career choices, continues to devalue some specialities and remains unopposed by the formal curriculum.

Curriculum Redesign of a Graduate Entry Medical Program using Systems Thinking Approach

AUTHOR(S):

- Priya Pathak, University of Sydney, Australia (Presenter)
- Chris Roberts, University of Sydney, Australia
- Stuart Lane, University of Sydney, Australia
- Jane Bleasel, University of Sydney, Australia
- Sabina Cerimagic, University of Sydney, Australia

ABSTRACT

Background: Sound curriculum design is guided by proven health professional education practices, underpinned by sophisticated curriculum theory. It can be implemented using systems thinking, where 'learning' is conceived as an all-encompassing sub-system of 'cognition' (how we learn), 'content' (what we learn), 'pedagogy' (strategies by which we learn) and 'assessments' (what have we learnt), embedded within the supra-system of unpredictable and undefined clinical environments. We applied these principles to produce a distinctive curriculum comprising: early and diverse clinical immersion coupled with inquiry-based blended learning models, leading to guided experiential learning, through to work-integrated learning, and finally preparation for practice. Vertical and horizontal integration and attainment of eight core capabilities was ensured by a programmatic approach to assessments, scaffolded by an e-portfolio/
Summary of Work: Extensive stakeholder consultations (governing bodies, specialist colleges, faculty, patients, and students) informed the design of the new curriculum, providing insights into the embedded agents, beneficiaries, affordances and constraints into various subsystems within the 'real clinical world' as described below.

Summary of Results: In our curriculum, systems of learning progress from cognitive understandings of basic mechanisms and clinical rules (Year 1), to application of these basic mechanisms for formulating basic differential diagnoses, investigation and management (Year 2), leading to attainment of competencies and capabilities associated with more complex diagnostic reasoning and metacognition (Years 3-4). The supporting sub-system of content and related pedagogy flows from common case/problems within Team-based Learning sessions (Y1), and clustering common symptoms within Case-based Learning sessions (Y2), leading towards uncommon and undifferentiated presentations in work-integrated Clinical Reasoning Sessions (Y3-4). A program of assessments integrates these sub-systems and fosters self-directed learning. Evaluation uses a theory-based model.

Discussion and Conclusions: Systems thinking allows the curricula to be more effectively embedded within complex and ill-defined clinical teaching environments. This enables agility for better integration of the learning sub-systems of cognition, content, pedagogy and assessments.

Take-home Messages: 1. The epistemic framework of Systems thinking provides deeper understanding of all interacting systems and subsystems within undifferentiated and complex settings. 2. This flexible, yet action-oriented approach can be used in developing health professional education curriculum for contemporary clinical environments.

People are the Corner Pieces of the Reformation Puzzle: Contributing to Egyptian Medical Education Reform Through Professional Development Training

AUTHOR(S):

- **Samantha Miles, Knowledge E, United Arab Emirates (Presenter)**
- Ahmed Tawdy, Military Medical Academy, Egypt
- David Taylor, Gulf Medical University, United Arab Emirates
- Nadia Badrawi, Supreme Council of Universities, Egypt

ABSTRACT

Background: In response to the national vision for improved healthcare and education across Egypt, the Egyptian Knowledge Bank, an initiative of the Ministry of Education, commissioned a project for capacity-building training to promote 'Teaching Excellence in Medical Education'. After successful delivery of pilot program in 2017, the initiative evolved into a national project of professional development fostering collaboration between the multiple government entities, all government sponsored medical schools, and a private service provider. The project, delivered in 2018, aimed to build the critical mass of professors with the necessary skills and mindset to drive curriculum reform and implement teaching excellence practice to move towards a fully integrated, competency-based 5+2 structured medical education curriculum.

Summary of Work: The program delivered 4 modules across 30 days of training, supported by 5 international experts: 1. Theory Guided Teaching and Learning (Hossam Hamdy); 2. Applied Curriculum and Course Design (David Taylor); 3. Assessment Design (Adrian Freeman, Maryellen Gusic); 4. Practical Application of Teaching Excellence Skills (Michelle McLean). It conveyed core-competencies determined based on governmental mandates, Egyptian stakeholder feedback, and international expert consultation. The interactive workshops combined content delivery with hands-on exercises and practical exercises to maximize retention and empower learners.

Summary of Results: 83 participants represented 26 medical schools across Egypt. Every school represented in the project was supported to develop and submit a revised curriculum map moving towards a competency-based integrated delivery. More than ½ of the participants went on to lead training sessions to spread the knowledge they obtained.

Discussion and Conclusions: This has been a significant undertaking involving the facilitated collaboration between governmental entities, a private service provider, and medical schools, moving towards a shared vision, aligned with the government policy and international standards. It has been received very positively by the participants and has already had significant impact within their institutions.

Take-home Messages: Significant and rapid changes are possible when there is a shared vision, facilitated by stakeholders and supported by a team of international experts. One of the outcomes of the project has been the renewal of the project to meet the greater demand for training and support to facilitate further radical development of medical education in Egypt.

Accelerating Change in Medical Education: Outcomes from a Community of Innovation

AUTHOR(S):

- **Kimberly Lomis, American Medical Association, USA (Presenter)**
- Sally Santen, Virginia Commonwealth School of Medicine, USA
- Judee Richardson, American Medical Association, USA
- Michael Dekhtyar, American Medical Association, USA
- Susan Skochelak, American Medical Association, USA

ABSTRACT

Background: The American Medical Association's Accelerating Change in Medical Education (ACE) initiative established a community of innovation to propagate creative education models. Objectives included: (1) Developing new methods for teaching and/or assessing key competencies for medical students and fostering methods to create more flexible, individualized learning plans; (2) Promoting exemplary methods to achieve patient safety, performance improvement, and patient-centered team-based care; (3) Improving medical students' understanding of the health care system and health care financing; (4) Optimizing the learning environment. Grants were awarded to eleven US medical schools in 2013 plus 21 in 2016, concluding in 2018.

Summary of Work: Common curricular enhancements included: systems thinking, quality improvement, patient safety, value-based care, health care economics/policy, teamwork, interprofessional care, leadership, change agency, health information technology. Programmatic changes supported active learning, competency-based education, individualized learning plans, assessing readiness for internship, optimizing the learning environment, coaching and wellness programs. Collaborative work articulated the concept of health systems science as the third pillar of medical education, complementing basic sciences and clinical skills. Additionally, ACE collectives promoted the Master Adaptive Learner, competency-based methods, coaching, educational informatics, and wellbeing.

Summary of Results: ACE propagated innovations across the US, with multiple stakeholder benefits: students - training in new topics and individualized pathways to support competency; faculty members - new skills, funded roles, scholarship, academic advancement; medical schools - enhanced reputations driving recruitment and external funding; health systems - faculty and students trained in quality improvement, patient safety, systems thinking. ACE has produced 168 academic publications, cited over 1000 times. Over 600 consultations involving 250 institutions accelerated innovations across the US and internationally.

Discussion and Conclusions: The ACE initiative fostered a community of innovation in medical education. Institutions striving to implement bold changes shared strategies and struggles to create the medical schools of the future and promote rapid dissemination. ACE has impacted 19,000 students, caring for 33 million patients annually. Study of student cohorts transitioning to GME will include graduate and program director surveys and ACGME milestones.

Take-home Messages: Cross-institutional collaboration provides support for the challenging work of transformative change in medical education and enables rapid propagation of ideas.

Mapping and Reviewing the Medical Curriculum using Artificial Intelligence

AUTHOR(S):

- Paul Gagnon, LKCMedicine, Nanyang Technological University, Singapore (Presenter)
- Red Mendoza, LKCMedicine, Nanyang Technological University, Singapore
- Sneha Mondal, IBM India, India
- Swarnadeep Saha, IBM India, India
- Malolan Chetlur, IBM India, India
- Nabil Zary, Mohammed Bin Rashid University of Medicine and Health Sciences, UAE

ABSTRACT

Background: “The curriculum in medical education is a sophisticated blend of educational strategies, course content, learning outcomes, educational experiences, assessment, the educational environment and the individual students’ learning style, personal timetable and programme of work” (Harden 2011). Curriculum mapping can provide an overview of the learning outcomes, learning resources, learning activities and assessment. Since mapping and reviewing a curriculum is a human resource intensive exercise, the aim of this study was, therefore, to explore if Artificial Intelligence (AI) could be employed to understand a medical curriculum.

Summary of Work: The context of the study was the Lee Kong Chian School of Medicine (Singapore) with a comprehensive curriculum map covering the whole MBBS program, consisting of thousands of Learning Outcomes (LOs) (more than 5000 LOs across five years) aligned to a variety of competency frameworks. Using Content Experts, we trained an AI curriculum mapping system to determine which LOs of similar nature and description are most applicable to a specific domain across the systems in question. As well, this AI curriculum mapping system was employed to align the LOs to targeted Learning Resources (LRs) within curriculum teaching blocks and associated MCQs.

Summary of Results: We have developed a framework that enables AI to understand the relationship between learning outcomes and also align the learning outcomes to relevant learning resources within curriculum teaching blocks, as well as associated MCQs.

Discussion and Conclusions: The ability of the AI curriculum mapping system to identify relationships between LOs was very encouraging and indicates a potential for AI to support medical schools in their curriculum tracing, mapping and reviewing processes. Furthermore, such a capability can be employed by learners as an LO centric resource recommender system.

Take-home Messages: Artificial Intelligence may be employed to support increased efficiency in curriculum mapping efforts, leading to decreased efforts by content experts, and the opportunity for more frequent targeted curriculum reviews in the context of a continuous quality improvement process.

Focussing intrinsic roles integration - a strategic multi-site mapping approach in German medical undergraduate curricula

AUTHOR(S):

- Jan Griewatz, Competence Centre for University Teaching in Medicine Baden-Wuerttemberg, Germany (Presenter)
- Miriam Rothdiener, Competence Centre for University Teaching in Medicine Baden-Wuerttemberg, Germany
- Maria Lammerding-Koeppel, Competence Centre for University Teaching in Medicine Baden-Wuerttemberg, Germany

ABSTRACT

Background: Internationally, competency-based frameworks with structuring role concepts are increasingly implemented as basis in undergraduate medical education (UME). Intrinsic roles incorporate relevant competencies complementing medical expertise. However, clarification and implementation of these intrinsic roles in existing structures remain difficult, due to complexity and non-transparency of grown curricula. The aim of this cross-institutional mapping study was to analyse: (1) to what extent German UME programs explicitly meet newly given standards after five years of study and (2) which further information can be drawn from multisite mapping data for evidence-based reflection on curricula and framework.

Summary of Work: In a joint project 8 German medical faculties mapped their curricula (80-100% of courses) against given national standards, using a common mapping tool and consented procedures. Roles representation was characterized by the curricular weighting of roles objectives (percentage of citations) and referred to the average weighting of intrinsic roles. Weightings and program agreement were interlinked in role-specific Matrix Maps to document the roles' overall developmental status.

Summary of Results: Data shows that, especially (sub-)competencies of the Health Advocate are consistently well-integrated in curricula with generally high curricular weightings. The Scholar ranks as the role with the most progression at some faculties, showing several high weighted objectives with a wider range of curricular representation. The Collaborator displays average curricular representation, but also signs of curricular development in relevant parts. Although the Professional is partly well adopted, most of its objectives reveal low explicit curricular weightings. The Leader/Manager is characterized by consistently lowest curricular weightings with several substantial deficiencies in curricular representation. The 4-Field-Matrices provide insight in overall risk-and-value-potential of roles, based on the localization of objectives in a quadrant (Disregard, Potential, Progress, Emphasis). Thus, quadrant-specific lead strategies and measures are enabled.

Discussion and Conclusions: The process-oriented, non-normative benchmarking approach provides a differentiated snapshot to compare programs in the field of others, revealing emphases and shortcomings in role implementation. The outline of multisite data may serve as external reference for program self-assessment, fostering informed discussions and strategic curriculum development. Thus, it enhances transparency and resource-efficiency. It may also provide data from practice for framework review.

The discriminatory power of examiners' OSCE global ratings with other areas of a paediatric assessment program

AUTHOR(S):

- **Hasantha Gunasekera, University of Sydney, Discipline of Child and Adolescent Health, Australia (Presenter)**
- Jennifer Anderson, University of Sydney, Australia
- Deborah O'Mara, University of Sydney, Australia

ABSTRACT

Background: Tests with high statistical reliability may not assess critical clinical skills well, whereas, clinical assessments may not have high reliability statistics. The Sydney Medical Program's Child and Adolescent Health (CAH) teaching block's assessment includes an integrated score across a knowledge test, a short answer clinical skills paper and a three station OSCE. A global rating scale was introduced for the OSCE where examiners (senior clinicians) make an overall judgement of each student's performance on each station incorporating communication and inter-personal skills. In this study, we analysed the association between the global ratings and student performance in terms of the integrated block score excluding the global ratings.

Summary of Work: Global rating scores and the in-block CAH integrated assessment results, exclusive of the global rating score, were de-identified for 462 students across 18 months (6 rotations) to December 2018. We categorised students into 4 groups by the number of OSCE stations for which a student was given a satisfactory global rating, and compared their integrated CAH score using Analysis of Variance (ANOVA).

Summary of Results: The number of students who were categorised satisfactory in all 3 OSCEs was 265 (57% of students); in 2 OSCEs was 136 (29%); in 1 OSCEs was 52 (11%); and there were 9 students (2%) who were not satisfactory in any OSCE station. As expected, there was an association between the number of satisfactory global ratings and the overall OSCE score ($F=132.18$, df 3,461, $p<0.001$, eta squared 0.465). However, the ANOVA also showed a significant difference between students' integrated CAH assessment mark for these 4 groups, increasing consistently according to the number of satisfactory global ratings ($F=46.14$, df 3,461, $p<0.001$, eta squared 0.232).

Discussion and Conclusions: Experienced paediatric examiners' global ratings in an OSCE station are significantly associated with that student's final integrated assessment mark. The generalisability of a global score by experts should be acknowledged by being part of the summative assessment calculation. Further research is required on how best to use expert judgements in medical education assessment.

Take-home Messages: Examiners global ratings should be used for a range of assessments and feedback.

Linear OSCE progression in a Physician Associate Programme

AUTHOR(S):

- Sharon Hartwell, Swansea University, UK (Presenter)
- Jayne Dawkins, Swansea University, UK
- Steve Capey, Swansea University, UK

ABSTRACT

Background: Swansea University set up a Physician Associate (PA) programme starting in September 2016. We ensured our final OSCE was at a similar/higher standard than the national OSCE and used OSCE blueprint produced by the Faculty of Physician Associates.

Summary of Work: In Year One the 16 station OSCE was split into two parts containing eight stations each. The first part was sat after 19 weeks of the programme and focused on the process of undertaking skills on 'normal' patients. After this OSCE the students are given their percentages for each station and written feedback from examiners on their performance. The second part was sat at the end of Year 1 and assessed both process and differential diagnoses. The two parts of the OSCE are standard set and the results are combined for all 16 stations.

In Year 2, there was a 16 station OSCE held at the end of the year and the Angoff calculated across all stations.

The aim of the OSCEs was to ensure a progressive increase in competency and complexity.

Summary of Results: All students who passed our OSCEs, passed the national OSCE, achieving the fourth highest score of all schools at that sitting. Qualitative feedback from PA graduates stated unanimously that the OSCEs and teaching prepared them well for the national OSCE and clinical work. When comparing the performance rank order between all three OSCEs, there is minimal change between students.

Discussion and Conclusions: We feel that the increase in complexity of the OSCEs across Year 1 and Year 2 OSCE prepared the students for both the national OSCE and the work of a PA. We believe our OSCE standards ensure a steady increase in expected skills, rather than a step-wise increase.

Take-home Messages: A two stage OSCE, with increasing complexity across a year of study, can ensure an increase in expected knowledge and skills between the first and second parts of the OSCE and can ensure that students meet expected standards early in the two year course.

Impact of external quality assurance on quality improvement to Objective Structured Clinical Exams (OSCEs) at Australian medical schools

AUTHOR(S):

- Shannon Saad, The University of Notre Dame, Australia (Presenter)
- Cassandra Richmond, The University of Notre Dame, Australia
- Karina Jones, James Cook University, Australia
- Karen D'Souza, Deakin University, Australia
- Clare Heal, James Cook University, Australia
- Bunmi Malau-Aduli, James Cook University, Australia

ABSTRACT

Background: Australian Collaboration for Clinical Assessment in Medicine (ACCLAiM) is a collaborative venture between medical schools that focuses on benchmarking student outcomes in the clinical domain. This is achieved by the collective development and use of Objective Structured Clinical Exam (OSCE) stations with benchmarking of student performances between de-identified institutions. In addition, ACCLAiM members partake in a quality assurance (QA) arrangement, whereby a QA visitor from one institution observes the OSCE at another institution, and then completes a structured feedback report spanning the broad range of processes that contribute to an OSCE. The QA report is submitted to ACCLAiM and the host medical school. Schools involved in the collaboration have access to reports that have been conducted by their member academics, or relating to their own OSCE.

Summary of Work: Perceptions of how the QA process informs practice were obtained by online survey of ACCLAiM-participating schools. Invited participants have roles in medical education and /or assessment, with experience in the QA process. Survey questions addressed issues relating to the use of the QA report, including informing future OSCE practice at each school.

Summary of Results: All respondents reported usefulness of the QA report, primarily citing the ability to use the feedback to drive changes and/or improvements in OSCE processes at their School. It was noted that feedback frequently instigated improvements to OSCE case content, the structure of marking sheets, the processes for standardising SP performances, and examiner training and calibration processes. Improvement of OSCE stations was ranked as the most important outcome consequence. Most respondents (83.3%) indicated additional benefits of having a QA examiner, including the establishment of collegial networks and strengthening of collaborations.

Discussion and Conclusions: Consistent with the aims of ACCLAiM, feedback reports serve to drive QA improvement processes in Australian medical schools. Incidental benefits include establishing a medical education community of practice between member schools.

Take-home Messages: 1. The ACCLAiM QA process has informed quality improvement both within and between schools. 2. Improvement of OSCE station quality is the most valued resulting outcome. 3. Quality assurance of clinical assessment has facilitated a community of practice in medical schools within Australia.

Does Confidence about Competence Decisions Increase as Assessment Data Accumulate? It depends on the OSCE Domain

AUTHOR(S):

- Jorie Colbert-Getz, University of Utah School of Medicine, USA (Presenter)
- Katie Lappe, University of Utah School of Medicine, USA
- Tiffany Weber, University of Utah School of Medicine, USA
- Danielle Roussel, University of Utah School of Medicine, USA

ABSTRACT

Background: Student assessment has traditionally been course-based with assessment scores combined to determine a final grade. Students are motivated to pass a course, but it is unclear if they achieve program competencies. Alternatively, a programmatic assessment model captures performance by competency across courses, which enables identification of students' strengths and weaknesses, with opportunities for growth in all areas. Few studies have measured the impact of switching from a course-based to a programmatic assessment model and no studies have investigated if there is more confidence in competence decisions as assessment data accumulate.

Summary of Work: In AY2017-2018, the University of Utah SOM moved from a course-based to a programmatic assessment model for medical students' year 3 Objective Structured Clinical Exams (OSCEs). Students completed 2-station OSCEs at end of 7 clerkships and received cumulative OSCE domain reports 3 times during year 3 in the areas of history taking, physical examination, clinical reasoning, testing, and documentation. Students also completed a must pass 7-station OSCE at the end of year 3 (EOY3OSCE), but could opt-out if their cumulative OSCE performance met a threshold. Cumulative clerkship OSCE domain scores at times 1 and 3 were correlated with EOY3OSCE scores for 110 students to see if the strength of relationships increased as assessment data accumulated.

Summary of Results: Correlations between clerkship OSCE and EOY3OSCE scores were small (< 0.30) for all domains at time 1. Correlations were moderate for history taking (0.43), physical examination (0.35), and documentation (0.43) and small for clinical reasoning and testing at time 3.

Discussion and Conclusions: As OSCE data accumulate we can be moderately confident in our ability to make competence decisions about students' history taking, physical exam and documentation skills. More data points or additional types of assessment are needed for students' clinical reasoning and ability to interpret tests.

Take-home Messages: As medical schools move to programmatic assessment, it is important to understand how many data points are needed to determine competence. The results of this study suggest the number of assessment data points needed to determine competence may vary depending on the OSCE domain.

Video-based examiner score comparison and adjustment (VESCA): measuring the influence of different examiner-cohorts in fully-nested OSCEs

AUTHOR(S):

- Peter Yeates, Keele University, UK (Presenter)
- Alice Moulton, Keele University, UK
- Natalie Cope, Keele University, UK
- Gareth McCray, Keele University, UK
- Bob McKinley, Keele University, UK
- Richard Fuller, University of Leeds, UK

ABSTRACT

Background: Whilst ensuring equivalence of examiners' judgements in Objective Structured Clinical Exams (OSCE) is critical to assessment validity and fairness, most OSCEs involve multiple different groups of examiners, either in parallel circuits or distributed locations. Despite prior research suggesting different 'examiner-cohorts' may importantly influence OSCE outcomes, the potential for these effects are rarely considered chiefly due to the limitations imposed by fully 'nested' designs (no crossover between student performances seen by different examiner-cohorts). As these effects could importantly bias distributed or national exams we report the development of an intervention to measure and adjust for examiner-cohort effects in fully nested OSCEs.

Summary of Work: Across two studies we developed 'Video-based Examiner Score Comparison and Adjustment' (VESCA): 1. Volunteer students were unobtrusively filmed on most stations during their year 3 OSCE. 2. Additionally to live examining, all examiners (8 cohorts of 12 examiners in each study) were invited to score 2-4 station-specific, comparator videos of students' performances. This produced partial crossing. 3. Global scores and total percentage scores were respectively analysed using Many Facet Rasch Modelling (MFRM) and linear mixed modelling (LMM) to estimate the influence of examiner-cohorts on students' scores. Adjusted 'fair scores' were calculated for each student, and influence on students' categorisation examined.

Summary of Results: Live and video scores were equivalent. Student ability varied by 29%, $sd=5.4\%$. Examiner-cohorts varied in their scoring of the same ability of students by up to 5.7% (Cohen's $d=1.06$) suggesting a substantial effect. Adjustment of scores around an artificial pass mark produced a change in classification for 6% of students (fail to pass or vice versa), whilst 9.5% of students' scores changed by at least 0.5 standard deviations of student ability.

Discussion and Conclusions: Larger effects could potentially be seen between sites in distributed OSCEs, challenging the assumption of equivalence of assessments. Further research should determine: sampling requirements; the influence of other potential biases (contrast effects, rater-drift, idiosyncrasy); and the accuracy of estimates.

Take-home Messages: VESCA offers a promising method to measure and adjust for examiner cohort effects. Once validated, VESCA could potentially enhance the equivalence of high-stakes judgements in distributed or even national exams.

Inter-rater agreement between direct examiners and examiners viewing video recordings in veterinary medicine OSCEs

AUTHOR(S):

- Jean-Yin Tan, University of Calgary Faculty of Veterinary Medicine, Canada (Presenter)
- Irene Ma, University of Calgary Cumming School of Medicine, Canada
- Grace Kwong, University of Calgary Faculty of Veterinary Medicine, Canada
- Emma Read, The Ohio State University College of Veterinary Medicine, USA

ABSTRACT

Background: Assessments of video recordings of student performances may improve efficiency and inter-rater consistency in Objective Structured Clinical Examinations (OSCEs) compared to live assessments. However, how live assessments compare to video-based assessments is unknown. The study seeks to compare scores from live examiners with those from video examiners in a Doctor of Veterinary Medicine program OSCE. The hypothesis is that there is no significant difference in scoring between the two formats.

Summary of Work: Students (n=33) were assessed by live (n=9) examiners in a three-station OSCE. Performances were video-recorded and assessed by video examiners (n=5). The 3 stations assessed the following skills: inverting suturing, elbow arthrocentesis, and thoracocentesis. Binary checklists were used to determine pass/fail results.

Summary of Results: Based on modified Fleiss' Kappa, overall examiner agreement for pass/fail grading was 0.82 for suturing, 0.56 for arthrocentesis, and 0.76 for thoracocentesis. Overall reliability of the stations was moderate for suturing and arthrocentesis (Cronbach's alpha 0.45 and 0.51 respectively) and fair for thoracocentesis (0.34). Using a Chi-squared test, overall there was no significant correlation between pass/fail outcome and live vs video examiners (p=0.55). Using a generalized linear mixed effects model adjusting for stations, stations (p<0.001) and interaction between station and type of examiner (p=0.03) had statistically significant effects on pass/fail outcomes. The odds of passing a given station did not differ between live vs video examiners (p>0.16) on pair-wise comparison. However, amongst video examiners, candidates had increased odds of passing suturing as compared to both arthrocentesis (odds ratio OR=4.87, p=0.01) and thoracocentesis (OR=6.01, p<0.01).

Discussion and Conclusions: Overall examiner agreement varied by station, from moderate to almost perfect agreement. Live assessments did not differ significantly from video-based assessments. However, stations and the interaction with live vs video examiner had statistically significant effects on pass/fail outcomes, with increased odds of passing the suturing station within video-based assessments.

Take-home Messages: The study concludes that there were no significant differences in the scoring between live and video examiners, although there were statistically significant station-specific differences among video examiner scores in veterinary OSCEs. Reasons for these differences need to be further explored.

Sharing the presentation before lecture increases students' interest

AUTHOR(S):

- Süleyman Yıldız, Dicle University Faculty of Medicine, Turkey (Presenter)
- Abdullah Yıldız, Istanbul Saitik Bilimleri Üniversitesi Umraniye Eğitim ve Araştırma Hastanesi, Turkey
- Emine İenkal, Maastricht University, The Netherlands
- Ece Nur Çinar, Yeditepe University, Turkey

ABSTRACT

Background: According to studies, computer-generated presentations affect learning positively when students access a copy of lecture slides before they enter the class. However, some teachers may be concerned that if slides are made available to students, they will use them as a substitute for attending class.

Summary of Work: The aim of this study was to determine whether teachers are right in their fears. A cohort study was conducted between 298 medical students in the term 2018-2019.

Summary of Results: Analysis per discipline revealed a positive correlation between average slides availability before lectures and average attendance ($p < 0.05$). Mean attendance at lectures with slides available before class lectures was twice the mean attendance at lectures without slides available before (69% vs 31%, $p < 0.001$).

Discussion and Conclusions: Making lecture slides available for students before the lecture can actually increase student attendance and participation, especially for first and second year courses. Improved attendance, better participation because of the reduced notetaking effort, and slightly better exam performance are also likely if slides are provided before class.

Take-home Messages: Whether slides are available before or after the lecture makes a difference.

#5J Short Communications - Teaching and Learning - Lecture/Flipped Classroom

Creating Context To A Neonatal Placement With Flipped Online Resources

AUTHOR(S):

- Hannah Massey, Norfolk and Norwich University Hospital, UK (Presenter)

ABSTRACT

Background: 4th year undergraduate medical students at our institution spend one week on the neonatal unit as part of their paediatric attachment. During this placement they attend deliveries with the neonatal team. The expectation is during this placement students understand how to care for a neonate at birth and why the approach to resuscitation is so different. However, despite good exposure to new-born resuscitation, students were struggling to learn. We decided to curate a set of online resources to improve learning while not adding to an already full timetable.

Summary of Work: 50 fourth year students participated in an attachment on the neonatal unit. The first rotation of 25 students undertook the standard placement. The second 25 students spend 10 minutes engaging with targeted online material prior to their attachment. Evaluation of both rotations was undertaken 4 weeks post placement using Kirkpatrick's framework. Students undertook multiple choice questions (not directly linked to pre-attachment material), a skills test and rated their enjoyment of the placement.

Summary of Results: 22 students undertook the evaluation in rotation 1 and 23 in rotation two. Students rated enjoyability on a Likert scale where 1 was least enjoyable and 5 most enjoyable. In the second rotation 60% of students gave the placement 5 compared with 17% in the preintervention group. Mean MCQ score was 45% pre-intervention and 60% post-intervention. Evaluation of airway skills is shown below

Discussion and Conclusions: The students who spent 10 minutes engaging with pre-course material prior to the weeklong placement had higher MCQ scores, better airway skills and enjoyed the placement more. The pre-course material gives the students context to what they are seeing in the delivery room. This transforms passive observation into engaged observation. Engagement with the task allows the students to become legitimate peripheral participants within the team and stimulates learning. Perhaps we need to think more closely about how we create context prior to clinical encounters. Is a block of lectures followed by a hospital placement the base way to do this? Perhaps we need to create context temporally to the ward learning events.

Take-home Messages: Ward placements as well as classroom based lectures can be supported with flipped materials.

Flipped classroom is significantly effective for medical students to learn medical interview

AUTHOR(S):

- Eiji Kaneko, Tokyo Medical and Dental University, Japan (Presenter)
- Yasuko Abe, Tokyo Medical and Dental University, Japan

ABSTRACT

Background: The medical interview is one of the most important techniques for medical students. In flipped classroom (FC), students watch video materials before class as homework and spend more time in discussion or practical training in the classroom. In our previous study, we made a new FC program of medical interview and compared the effectiveness of the program with the traditional program (T) in randomized small group of students (n=14). The result showed FC students performed better but it was not significant due to the limited number of students. In this study, we introduced a new FC program for fourth-year students and evaluated its effectiveness compared to that of the fourth-year students in the previous year.

Summary of Work: Fourth-year medical students (n=105) performed medical interviews of simulated patients in the new FC program in November. Students attended a half-hour lecture and watched an 18-minute video, which showed every step of the medical interview, before class. In the previous year, fourth-year students attended one-hour lecture and read the syllabus before class. Students practiced medical interviews in turn and discussed about their performances, which were video-recorded and evaluated using checklists later. Students also answered the questionnaire. T-test was used for statistics. This study was approved by ethical committee of the university and supported by grant from JSPS.

Summary of Results: According to the questionnaire survey, 63% of the students watched the video carefully, 30% watched through the video, 2% skipped through the video, while 5% did not answer. For 84% of the students, the video program was easy or very easy to understand. The scores of the medical interview (n=48) were significantly higher in FC (24.3±2.9 in FC vs 21.0±4.1 in T, p=0.003).

Discussion and Conclusions: Since the previous study showed better results in FC, we decided to introduce FC for fourth-year students. The scores of the medical interview improved significantly in FC group. Results of CBT and OSCE in February will show if the two classes are similar in general, and if educational benefit in FC last for three months. These issues will be discussed in the presentation.

Take-home Messages: The new FC program showed significantly better educational effect for medical interview.

Twitc'h'ing medical education - the potential of live stream lectures

AUTHOR(S):

- Thomas Shiozawa, Institute of Clinical Anatomy and Cell Analysis, University of Tuebingen, Germany (Presenter)
- Martina Bientzle, Leibniz Institut für Wissensmedien, Germany
- Johannes Grosser, Leibniz Institut für Wissensmedien, Germany
- Joachim Kimmerle, Leibniz Institut für Wissensmedien, Germany
- Bernhard Hirt, Institute of Clinical Anatomy and Cell Analysis, University of Tuebingen, Germany

ABSTRACT

Background: Digitalization of teaching starts with new formats. The internet platform Twitch and its rapid development demonstrates the possibilities of live-streaming, and how entertainment works for the next generation. In 2014 Twitch had already become the fourth biggest source for internet traffic in the U.S. [1], in 2018 Twitch hosted 2m broadcasters monthly and about 15m viewers per day [2]. Is there potential in using this format for teaching purposes?

Summary of Work: With the webpage www.sectio-chirurgica.de the Institute of Clinical Anatomy and Cell Analysis Tuebingen hosts a live streaming platform for interdisciplinary, interactive teaching that has been online for 10 years so far. The OpenTeach project investigates the potential of this innovative online teaching format. One of the research questions is, whether the key factors for successful live streaming - consistency, know-how, entertainment, interaction - can also be applied to a teaching format.

Summary of Results: Live streams at regular intervals lead to a consistent number of viewers. The audience can be actively involved in live formats. A live chat that can be accessed by everybody using their own device is more accessible than sitting in a lecture hall with 200 students. Chat activity can be influenced positively by the moderator's/lecturer's interaction.

Discussion and Conclusions: There is great potential in the use of live streaming for teaching. On Twitch learning and information are also motivational factors for viewers [3]. Streaming is perceived as an educational format [4].

Take-home Messages: The new generation is raised on new entertainment formats that can be utilized for teaching and even further.

Student moderators' use in lecture capture programs in multiple first semester courses increase student response rates and knowledge retention

AUTHOR(S):

- Phillip Pearson, American University of the Caribbean, Sint Maarten (Presenter)
- Douglas Burns, American University of the Caribbean, Sint Maarten
- Mark Quirk, American University of the Caribbean, Sint Maarten

ABSTRACT

Background: Previous research by the authors demonstrated that in one course, use by students and course director of a question and answer (Q&A) function of a lecture-capture video platform increased quiz scores and comprehension of subject material compared to controls. Subsequent research showed that student moderators who led online discussion using the Q&A function increased student dialog and exam scores and knowledge retention. The present paper examines the effectiveness of these teaching/learning interventions across a diverse set of basic science courses in a semester.

Summary of Work: Students (n=134) in anatomy, embryology, histology, and molecular cell biology courses participated in the study. Students were first incentivized to participate in the Echo 360 Q&A function by lecturer demonstrating its ability to increase exam scores and comprehension. Six student moderators responded to questions on the Q&A function in all courses. To better understand the relationship between the intervention and performance, MCQ exam items were mapped to the quantity and quality of Q&A activity by students. Overall performance on the exam items in the courses with moderators was compared to performance on similar items in a cohort that did not have student moderators or used the Q&A function.

Summary of Results: After extensive incentivization, Q&A use increased and continued at that elevated level in all courses. Students responded to question threads by asking additional questions and not just responding to questions or reading what other students had asked. Interdisciplinary questions that spanned all three courses were evident. Perceived quality of Q&A questions dramatically increased and correlated with the frequency of responses in all three classes.

Discussion and Conclusions: The act of self-questioning has been linked to deep vs. surface learning. Student moderators increased its adaption by all three classes and correlated with increased student use.

Take-home Messages: The use of Q&A function was considered to be of great value and was used significantly by students.

Development of a Medical Education Scholarship Track Within A Residency Career Enrichment Program

AUTHOR(S):

- Holly Caretta-Weyer, Stanford University School of Medicine, USA (Presenter)

ABSTRACT

Background: Many emergency medicine (EM) residents identify an interest in teaching and medical education during residency. Several residency programs have developed concentrations or elective tracks to address these interests. However, medical education is becoming increasingly challenging secondary to the growing complexity of practice and the growing roles within medical education ranging from clinical teacher, to educational administrator, to clinician educator, or even education researcher.

Summary of Work: We sought to design and implement an education scholarship track within our residency career enrichment program spanning all four years of training to address the full range of roles and allow our residents the opportunity to develop a scholarly niche within medical education. Following Kern's model for curriculum development, we performed a literature review and utilized published models for education scholarship fellowships as a guide. We additionally performed a targeted needs assessment of our residents regarding their interests within medical education scholarship. As part of the needs assessment, residents also wanted to ensure that there was room for individualization within the curriculum such that they could tailor the track to their individual interests.

Summary of Results: The needs assessments provided the following topics for inclusion in the medical education scholarship track: resident as teacher, education theory, presentation skills, small group facilitation, team-based and problem-based learning, curriculum development, assessment, competency-based medical education, program evaluation, education research methods, survey development, study design, manuscript writing, grant writing, and peer review. Goals and objectives were developed for each topic course.

Discussion and Conclusions: Eight residents have joined the education scholarship track since the beginning of this academic year. Each of them has chosen a different route depending upon his or her interests. Several have focused on clinical teaching while others have focused on areas within the clinician educator niche such as curriculum development and assessment. Two residents have pursued education research projects, one focusing on qualitative methods to investigate psychological safety in feedback and the other focusing on resident communication with patients. Both of these projects will be submitted to education research journals upon completion.

Take-home Messages: An education scholarship track within a residency enrichment program provides opportunities for residents professional development across the continuum of medical education.

Longitudinal workshops of residents-as-teachers based on teaching EPAs had a high satisfaction for residents

AUTHOR(S):

- Tadayuki Hashimoto, Hashimoto Municipal Hospital, Japan (Presenter)
- Makoto Kikukawa, Kyushu University, Japan
- Junji Otaki, Hokkaido University, Japan
- Junichi Taniguchi, Kumamoto University, Japan
- Synsuke Kosugi, Iizuka Hospital, Japan
- Takashi Kanazawa, Kyushu University, Japan

ABSTRACT

Background: Residents play a pivotal role in clinical education. However, no teaching competencies for residents existed. The authors reported teaching competencies for residents using the Delphi method at AMEE 2016, and its entrustable professional activities (EPAs) at AMEE 2018. We have held longitudinal workshops over a year to establish those competencies.

Summary of Work: We arranged eight workshops in total. Participants included nine medical residents and one young attending physician from a Japanese teaching hospital. At the end of each workshop, questionnaires about the quality of workshops were collected. They also answered another questionnaire about the adequacy of the topics after the final workshop.

Summary of Results: The overall response rate of each workshops was 85.3%. The answer of 'Was this workshop helpful for you?' was 4.64 (Likert scale 1-5). The response rate of the questionnaires about the topics was 70.0%. The answer of 'Do you think this topic is adequate for you as residents?' was 4.77.

Discussion and Conclusions: The participants were satisfied with these longitudinal workshops and regarded topics as adequate for them. We believed the reason is that these workshops were constructed using the competencies summarized by stakeholders using the Delphi method, which are likely to have strong needs.

Take-home Messages: To establish the teaching competencies of residents, a longitudinal workshop can be an important method.

Senior residents as role models: A phenomenographic study

AUTHOR(S):

- Kuo-Chen Liao, Chang Gung Memorial Hospital, Taiwan (Presenter)
- Chang-Hsuan Peng, Chang Gung Medical Education Research Center, Taiwan
- Chien-Da Huang, Chang Gung Memorial Hospital, Taiwan
- Chang-Chyi Jenq, Chang Gung Memorial Hospital, Taiwan

ABSTRACT

Background: Senior residents are entrusted to teach and serve as role models within the clinical workplace. Research on role models has centered on personal attributes and strategies to enhance role-modeling skills. This study aims to fill the gap by investigating medical trainees' different conceptions of senior residents as role models.

Summary of Work: This qualitative study adopted a phenomenographic approach. Data were gathered through individual interviews with twelve participants (three senior residents, five PGY trainees, two 5th-year and two 7th-year medical students) and field notes taken by a researcher-observer documenting clinical practice and teaching interactions between these participants in an internal medicine context.

Summary of Results: Participants described senior residents' role modeling through their teaching as a 'ward guardian', taking major responsibility for the supervision of junior trainees' clinical practice, ensuring patient care quality and ward operation. Within this main category, four interrelated positions were described: problem solver, interpersonal communicator, learning facilitator and life story narrator.

Discussion and Conclusions: Our findings presented various conceptions of the positions embodied in senior residents as role models in clinical teaching practice. Upon fulfilling these positions, senior residents can enhance trainees' professional development: including their clinical reasoning skills, medical problem solving, teamwork communication, and support trainees' identity formation in the clinical learning environment.

Take-home Messages: By adopting phenomenography, a better understanding about the phenomenon of how senior residents influence the learning of medical trainees through role modeling can be provided. The results can be useful to enable and support change in curricular design of residents-as-teachers programs and, furthermore, inform senior residents' practice as role models.

From amateur to Osler: Teaching residents the fundamentals of clinical instruction using humour and game-based learning

AUTHOR(S):

- Fawzia Huq, University of Sydney, Australia (Presenter)
- Sarah Aitken, University of Sydney, Australia

ABSTRACT

Background: As senior clinician responsibilities increase, training junior doctors (residents) to be effective clinical teachers becomes imperative. The near-peer literature suggests that residents not only impart knowledge and skills to medical students, but vitally model professional values and behavior. We have pioneered an innovative, evidence-based, clinically oriented resident-as-teacher program using humour and interactive games. The aim of the program is to develop teaching expertise using resources that are readily available in most hospitals; with the long term goal of preparing novice clinicians for formal medical student instruction.

Summary of Work: The teaching course is designed with an emphasis on humour and games. Two facilitators run the course over four weeks. The only resources required are a room with basic audiovisual facilities. The bi-annual course is delivered locally, and has also been presented internationally to medical faculty and students at the University of Copenhagen. Course efficacy is assessed using Irby's clinical teaching effectiveness scale to measure pre/post changes in self-rated teaching ability; and focus groups to ascertain course strengths and weaknesses. Four domains of clinical teaching are emphasized: 1. Understanding how adults learn 2. Setting realistic learning objectives 3. Teaching clinical reasoning 4. Giving effective feedback

Summary of Results: After completing the course, residents report a significant improvement in the domains of instructional clarity and organization, instructor knowledge, instructional skill and clinical supervision. Over 90% of residents agree / strongly agree that the program stimulates interest in teaching, improves confidence, is well organized, has clear learning goals, and should be delivered to other residents.

Discussion and Conclusions: Our 3-year experience suggests that humour and games are valuable tools when designing a resident teaching program. The clinical reasoning module which is taught using games is particularly effective, as residents report an improved understanding of their own reasoning strategies. Greater teaching confidence and the ability to identify and address gaps in students' reasoning are reported positive outcomes of the course.

Take-home Messages: A low-resource, short, effective, resident training program delivered using humour and games greatly enhances resident teaching confidence and skill.

Near peer teachers GP Specialty Trainees (GPSTs) as Teachers and career path finders

AUTHOR(S):

- Melvyn Jones, UCL, UK (Presenter)
- Liza Kirtchuk, Kings College London, UK
- Joe Rosenthal, UCL, UK

ABSTRACT

Background: Junior doctors are key providers of medical student teaching in hospital settings, yet rarely do so in primary care as part of their GP specialty training. There is evidence that the reduced distance between teacher & learner in such near-peer teaching (NPT) fosters learning (Ten Cate & Durning). However, postgraduate (PG) medical training is situated in an 'externally regulated learning' environment where self-regulated and externally regulated learning interact to influence students' learning. (de la Fuente) GP training schemes in N. London offer 6 month Innovative Training Posts (ITP) for GP specialist trainees (GPSTs) combining their clinical training with regular student teaching.

Summary of Work: We evaluated this educational innovation to explore the impact on GPSTs & their students. We carried out focus groups and semi-structured interviews with the GPSTs, their students & stakeholders in GP education (education leads), to explore the perspective of GPSTs as UG teachers. Interviews were transcribed & data thematically analysed; deductively from Ten Cate & inductively from our novel data.

Summary of Results: Data were obtained from 26 individual stakeholders. We identified elements of role modelling and socialization into the discipline, and identified the role of external regulated learning. All stakeholders perceived tangible benefits to students from NPTs; they adopted more student centred approaches and were more likely to take on board students' immediate goals, contrasting with senior doctors (social congruence). Students valued GPSTs' generalist clinical expertise, who could make explicit their knowledge of medicine. GPSTs expressed benefits to their own development, forming their identity as learners & teachers. GPSTs & educational stakeholders explored this acquisition of 'expertise'. The role of education; both teaching & learning for GPSTs was key; articulated as 'to teach something well is to understand it well'. GPSTs also provided students with sign posting for GP careers.

Discussion and Conclusions: Formalised near peer teaching in GP for students is relatively novel (Rushforth). There are strong educational benefits to learners & teachers, while not disrupting GPSTs own training.

Take-home Messages: Near peer learning provided by GPSTs to students aids their learning and role modelling and is accepted (and encouraged) by senior educators.

Does qualification as PAL (peer-assisted learning) student tutor enhance CanMEDS role acquisition? A survey analysis on why medical students should learn how to teach

AUTHOR(S):

- Daisy Rotzoll, Skills and Simulation Centre LernKlinik Leipzig, University of Leipzig, Medical Faculty, Germany (Presenter)
- Maike Brathuhn, Department of Paediatrics, Leipzig University Hospital, Germany

ABSTRACT

Background: CanMEDS is a widely accepted framework identifying and describing the abilities physicians require to effectively meet health care needs of the people they serve. The aim of undergraduate medical curricula is conveying these roles (medical expert, communicator, collaborator, leader, health advocate, scholar and professional) to nurture future competent physicians. We hypothesized that the implementation of peer-assisted learning (PAL) modules for undergraduate medical student tutors may be supportive for internalizing these roles in future doctors. In our study, we therefore investigated if former peer student tutors working at the Skills and Simulation Centre who underwent a structured student-as-teacher (SAT) training program and had prolonged experience in giving PAL sessions retrospectively saw their peer-student-tutor career as helpful in developing CanMEDS competencies, as compared to the impact of their general undergraduate medical curriculum.

Summary of Work: A questionnaire was developed and n=31 former peer student tutors meeting the defined inclusion criteria were contacted. N=14 questionnaires were turned in and analyzed. Questions focused on former PAL student tutor experience and possible impact on the development of the seven CanMEDS roles, as compared to the impact of their undergraduate medical curriculum in general.

Summary of Results: When regarding all seven CanMEDS roles, former peer student tutors answered that the role of collaborator, followed by the role of communicator were the two roles most positively influenced by their activities at the Skills and Simulation Centre, followed by the roles of professional, medical expert and manager. Least influence on roles of health advocate and scholar were determined. When regarding the overall undergraduate medical curriculum, peer student tutors felt that the development of CanMEDS roles were less well conveyed, with the exception of the medical expert role.

Discussion and Conclusions: The reported study suggests that experience as a PAL student tutor at a Skills and Simulation Centre during medical undergraduate studies supports the development of CanMEDS roles required for work in postgraduate residency programs. All former PAL tutors valued their experience as being important for their future personal and professional development.

Take-home Messages: This study suggests that teaching experiences as a PAL student tutor can enhance competency development of CanMEDS roles in future physicians.

Peer-led mock Objective Structured Clinical Examination (OSCE): an efficacious tool in supporting students through a transition curriculum

AUTHOR(S):

- Wesley Channell, School of Medicine, University of Leicester, UK (Presenter)
- Arjun Nehra, School of Medicine, University of Leicester, UK
- Neil Thakrar, School of Medicine, University of Leicester, UK
- Rachel Westacott, Department of Medical Education, University of Leicester, UK

ABSTRACT

Background: Leicester Medical School is currently undergoing curriculum reform. This has resulted in a unique cohort who have undergone a new but truncated third year, relative to subsequent cohorts. Fourth year medical students led the development of a mock OSCE, in collaboration with medical school faculty, to help this cohort practise competences expected in clinical examinations.

Summary of Work: A 12-station mock OSCE, endorsed and financially supported by the medical school, was run over one weekend in the university examination setting. The OSCE was entirely designed by fourth year medical students, including station content, which was reviewed by the medical school. Stations mirrored those within the summative examination, and examiners received a briefing about exam conduct. Questionnaires were given out immediately after the mock OSCE. The impact of each station on students' preparedness was evaluated with paired sample t-tests and qualitative responses were organised into recurring themes. A second survey looking at student-perceived utility on summative exam performance is currently being undertaken and results will be added to this presentation.

Summary of Results: Of 127 attendees, 112 returned completed feedback (88%). All logistical components of the OSCE were ranked as greater than 4.5/5 on a Likert scale. A statistically significant improvement in student-perceived preparedness was demonstrated in all OSCE stations ($p < 0.001$), with stations where students felt least prepared, such as fluid management, exerting the greatest positive impact. Event organisation ($n=40$) and level of examiner knowledge ($n=26$) were the most frequently praised attributes. Extended feedback time ($n=9$) and additional stations ($n=9$) were the most frequently cited areas for improvement.

Discussion and Conclusions: Peer-led assessment of practical examinations improves students' confidence in the context of a new assessment structure. Endorsement by the medical school assures the development of reliable content and enriches the preparation of student examiners, whose knowledge and experience is highly esteemed by their peers.

Take-home Messages: Although dealing with a mid-course curriculum change is challenging for students, collaboration between faculty and student groups can result in well organised peer-led assessment practice and increased candidate confidence entering summative examinations.

Near peer mentoring on allied health placements: a systematic review

AUTHOR(S):

- Joanna Tai, Deakin University, Australia (Presenter)
- Merrolee Penman, University of Sydney, Australia
- Gretel Evans, Westmead Hospital, Australia
- Jennie Brentnall, University of Sydney, Australia
- Belinda Judd, University of Sydney, Australia

ABSTRACT

Background: Near-peer mentoring (NPM) during allied health clinical placements may afford benefits, including improving placement experiences, improving learners' clinical capabilities, altering the workload of clinical supervisors, and importantly, preparing allied health students for future clinical educator roles after graduation. There is likely also benefit to educators, in terms of enjoyment, workload alteration, and additional information on student performance. Service users may benefit where students can contribute to caseload management. However, benefits to allied health students, supervisors and service users are currently unclear, as studies providing evidence for near-peer mentoring have primarily occurred in medicine and nursing.

Summary of Work: A narrative systematic literature review was conducted to identify benefits of NPM for allied health students, their educators, and service users. Keyword searches across CINAHL, ERIC, EMBASE, Scopus, Proquest Education, Medline and PsycInfo identified 2738 articles, which were screened for relevance and quality by two researchers. 9 papers were included in the final analysis.

Summary of Results: Included studies were in the fields of physiotherapy, occupational therapy, pharmacy and psychology. Some contained cross-discipline mentoring; others focussed on senior and junior students within the same or similar professions. Studies were largely exploratory or evaluative, with a focus on student satisfaction and perceived learning outcomes, from student and supervisor perspectives. No paper directly focussed on service user outcomes, or assessed students' subsequent performance. Students perceived that learning opportunities were maximised, and that NPM developed knowledge, communication skills, and education skills, while providing a supportive environment.

Discussion and Conclusions: The small number of relevant studies across allied health suggest this is an emerging area of interest, with studies exploring proof of concept rather than impacts on short and longer-term learning. While the evidence to date is promising, additional empirical work should ascertain learning benefits.

Take-home Messages: NPM is a feasible pedagogical strategy for clinical placements, which results in student satisfaction. Future studies could focus on both positive and negative outcomes, and include objective performance measures to provide stronger evidence for NPM.

Peer Assisted Learning: Exploring A Vertical Approach

AUTHOR(S):

- Elaine Koh, Monash University, Australia (Presenter)
- Michael Wang, Monash University, Australia
- Vivien Lai, Monash University, Australia
- Linly Liu, Monash University, Australia
- Kit Ming Foo, Monash University, Australia
- Joanna Tai, Monash University, Australia

ABSTRACT

Background: Vertically Enhanced Study Program Approach (VESPA) Case Nights is a student-led peer assisted learning (PAL) program at Monash University, Australia. Four near-peer PAL events (Case Nights) per year are hosted for all students enrolled in the Bachelor of Medicine/Bachelor of Surgery (MBBS). Each event centres on a student-written clinical case which integrates theoretical and clinical knowledge, as well as clinical skills across year levels. Final and penultimate year students were provided with training to assume the role of peer tutors.

Summary of Work: A prospective cross-sectional study used a 30 question instrument with Likert and open ended questions, distributed at the conclusion of three Case Nights in 2018. 21 statements addressed general benefits and potential improvements to VESPA Case Nights, with five to seven statements targeting pre-clinical students, clinical students and peer tutors separately.

Summary of Results: A total of 425 questionnaires were collected, with 173 preclinical student, 156 clinical student and 96 peer tutor questionnaires returned. Overall, the majority of participants had overwhelmingly positive views of VESPA. In particular, 85% of peer tutors strongly agreed or agreed that VESPA has provided a rewarding opportunity to 'pay it forward' through medical education while 83% reported that participation increased their likelihood of engaging in medical teaching in the future.

Discussion and Conclusions: Senior medical students' responses highlighted their inclination to return the goodwill they have received from the medical community. This desire to 'pay it forward' might be harnessed to further enhance medical education. Participation in PAL may have long-lasting impacts on peer tutors, particularly on attitudes towards and motivation to be involved with, the education of their colleagues and juniors.

Take-home Messages: VESPA Case Nights' vertically integrated approach across multiple year levels results in benefits for preclinical and clinical participants beyond a basic peer-to-peer learning model. This study also indicates a need for further inquiry to better understand the attitude of peer tutors and the long-term impacts of PAL involvement.

Being a tutor, experience and skills of second-year students of health studies. A qualitative study at the health faculty of Angers, France

AUTHOR(S):

- Alexis Racine, Department of General Medicine, Health Faculty, France (Presenter)
- Anne-Victoire Fayolle, Department of General Medicine, Health Faculty, France
- Clément Guineberteau, Department of General Medicine, Health Faculty, France
- Catherine Passirani, Department of PluriPASS, Health Faculty, France

ABSTRACT

Background: There is an increasing interest in Peer Assisted Learning (PAL) in health studies and abundant literature about PAL during the second cycle of medical studies. However, the literature is weak when it comes to the first years and moreover when it is tutors and not tutees that are the object of study. The main objective of this work was to study the tutors' experience gained during PAL at the faculty of Angers, France. The secondary objective was to describe the skills developed by tutors.

Summary of Work: A qualitative study using focus group. Sampling in maximum variation of tutors of the 2017-2018. Maximum variation was obtained via socio-demographic and school criteria. Tutors were recruited at the end of their school year by email. Focus group was facilitated by an evolutionary interview guide, approaching the following themes: experience with PAL; tutor's motivations; tutor's role; limits and difficulties encountered; and skills development.

Summary of Results: Data saturation was achieved after three focus groups involving 19 tutors. They have had a positive experience as tutees, motivating them, in turn, to become tutors. Their experience as tutors led them consider themselves as health professionals, teachers and as 'social cohesion' elements. This experience enabled the development of pedagogical skills such as able to transmit their knowledge and their experiences; improve their docimological skills. The tutor's role also enabled the development of expected health professional skills such as a social and relational know-how. Tutors thought they would not have had the opportunity to develop these skills in the regular university curriculum. Tutors coped with their own limits especially concerning their knowledge and a feeling of educational responsibility that was not anticipated by the tutors.

Discussion and Conclusions: PAL seemed to have a positive effect on tutors during the first years of health studies. The reciprocity of educational exchanges allowed students to develop their relational and pedagogical skills. However, prior training seemed necessary. It appeared interesting to leave the tutors a constructive space of speech and action with the aim of improving and innovating teaching paths.

Take-home Messages: The skills developed by tutors were linked to those expected of a health professional.

Students in the Medical Faculty: Associations between social support, social isolation, perceived stress, functional ability and quality of life

AUTHOR(S):

- Taina Hintsa, Department of Educational Sciences and Psychology, University of Eastern Finland, Finland (Presenter)
- Anne Monni, University of Eastern Finland/University of Helsinki
- Eeva Pyörälä, Center for University Teaching and Learning, University of Helsinki, Finland
- Marko Elovainio, Department of Psychology and SleepWell Research Program, University of Helsinki, Finland
- Saara Repo, Center for University Teaching and Learning, University of Helsinki, Finland
- Tiina Paunio, Department of Psychiatry and SleepWell Research Program, University of Helsinki, Finland

ABSTRACT

Background: Medical and dental studies have been asserted to be demanding and stressful. When facing difficulties in studies and exams, social support may alleviate stress and enhance performance. In the present study, we examined whether there were gender differences in experienced social support and social isolation and whether social support and isolation were related to perceived stress, functional ability and quality of life.

Summary of Work: A survey instrument for studying students' wellbeing, performance and stress was developed in the Medical Faculty, University of Helsinki in a pilot-study conducted in 2017 among the students of Medicine, Dentistry and Psychology. Data collection continued in 2018 when 825 students responded, also the students of Logopedics and Translational Medicine. Ethical approval was granted by the Research Ethic Board of the Faculty of Medicine.

Summary of Results: Women reported higher social support (9.38 vs. 7.84, $p=0.003$) and higher perceived stress (3.53 vs 3.22, $p=0.008$) than men. Men reported higher social isolation than women (0.19 vs. 0.51, $p=0.006$). There was no difference in the level of functional ability or quality of life between the genders (p -values > 0.05). Social support was related to higher functional ability (women: $r=0.21$, p -value $<.001$; men: $r=0.22$, p -value 0.001) and quality of life (women: $r=0.26$, p -value $<.001$; men: $r=0.28$, p -value $<.001$). Social isolation was linked to higher perceived stress, lower functional ability and lower quality of life among both genders.

Discussion and Conclusions: We observed that social support was an important resource factor for students' wellbeing in the Faculty of Medicine. Enhancing the students' social support and preventing their social isolation are relevant in improving students' wellbeing and performance. Furthermore, the teaching programs need to seek solutions to diminish and prevent the students' social isolation by improving the social support by teachers and peer students and fostering a collaborative culture of learning.

Take-home Messages: Lack of social support was related to students' distress. Understanding the connection between social support and students' wellbeing is important in targeting appropriate support for students and in the development of the curricula. Further studies about how to enhance social support are needed.

Medical Student Mistreatment and Reporting: A Journey

AUTHOR(S):

- **Amanda Bell, Niagara Regional Campus, Michael G DeGroote School of Medicine, McMaster University, Canada (Presenter)**
- Catherine Connelly, DeGroote School of Business, McMaster University, Canada
- Allyn Walsh, Department of Family Medicine, McMaster University, Canada
- Meredith Vanstone, Department of Family Medicine, McMaster University, Canada

ABSTRACT

Background: Over 50% of Canadian medical students report experiencing mistreatment, yet only a small proportion of students report these concerns to school administration. It is unknown how medical students make sense of their experiences of mistreatment and come to decide whether to formally report these experiences. A better understanding of this phenomenon will facilitate changes by the medical school to better support students.

Summary of Work: This Constructivist Grounded Theory study interviewed 19 current and former medical students from one institution about their experiences with mistreatment and reporting. Anonymized transcripts were reviewed, coded and theory was developed.

Summary of Results: Students undergo a journey surrounding experiences of mistreatment in five phases: Situating, Experiencing and Appraising, Reacting, Deciding, and Moving Forward. Students move through these phases as they come to understand their position as medical learners and their ability to trust and be safe within this institution. Each experience of mistreatment causes students to react to what has happened to them, and then decide if they will share their experiences and reach out for support. They choose if they are going to report the mistreatment, at what cost and for what outcomes. Students continue through their training while incorporating their experiences into their understanding of the culture in which they are learning and continually resituating themselves within the institution.

Discussion and Conclusions: This study revealed institutional mistrust from students especially as it related to reporting mistreatment. Interventions designed to support students and decrease exposure to mistreatment may be best focused on increasing organizational trust between students and medical school leadership. Students volunteered mechanisms to support them. Medical school administration should consider how they can increase trust with their learners while identifying areas of concern and procedures for intervening and providing more transparent resolutions.

Take-home Messages: Medical students do not always trust that their school is responsive to concerns of student mistreatment. Medical students form informal support networks to deal with mistreatment and their peers play an important role in dealing with the experience. Support for medical students experiencing mistreatment may be best focused on strategies to increase trust that the institution will act on student concerns rather than modifying the existing reporting structures.

“Hierarchies are marked” ... : Medical students’ mistreatment at a medical school in Mexico City

AUTHOR(S):

- **Luz María Angela Moreno-Tetlacuilo, Universidad Nacional Autonoma de Mexico, Facultad de Medicina, Departamento de Salud Pública, Mexico (Presenter)**
- Nelly Yared Alvarado, Universidad Nacional Autonoma de Mexico, Facultad de Medicina, Departamento de Salud Pública, Mexico
- Nora Ibarra Araujo, Universidad Intercultural del Estado de Mexico, Mexico
- Laura Najera Nava, Universidad Autonoma del Estado de Mexico, Mexico
- Harumi Quezada-Yamamoto, Universidad Nacional Autonoma de Mexico, Facultad de Medicina, Departamento de Salud Pública, Mexico
- Antonio Rafael Villa-Romero, Universidad Nacional Autonoma de Mexico, Facultad de Medicina, Departamento de Salud Pública, Mexico

ABSTRACT

Background: Medical students’ (MS) mistreatment has been informally reported by MS as a pervasive problem at our medical school, mainly in clerkships. This report is part of a wider study we made on gender mistreatment; other types of mistreatment were mention.

Summary of Work: Our aim was to describe student's mistreatment not related to gender and fair treatment mentioned in the interviews. This study was authorized by Faculty's Research and Ethical Board.

Methodology: We carry on an exploratory qualitative research based on symbolic interactionism and gender perspective. We did four focus group and three in depth interviews among male and women MS after written inform consent. Each interview lasted around 90 minutes; all of them were videotaped, recorded and transcribed, codified by grounded theory and analyzed through a feminist education perspective.

Summary of Results: We found other types of mistreatment not related to gender. Good treatment was narrated too. Mistreatment: hierarchy was pointed out as the main cause of inequality and mistreatment, mainly in the surgery clerk ship and emergency room; residents become perpetrators along the residency years. MS narrated: constant disqualification and disparaging remarks, verbal mistreatment, bad manners, not being allowed to sit, not to get their meals on time or go to the toilet, public humiliation in front of patients, not being taken into account. Department's chiefs tolerated this conduct. MS don't get support by Faculty, they endure mistreatment alone. Depression, isolation, weight loss were among health affections. MS mention companionship among interns to protect each other from punishment (being held in hospital for several days). Fair treatment: Support from some attending (younger ones) and hospital's head in favor of some female Medical Students (FMS) who bear sexism and gender-sexual harassment was mention as well as acknowledgment to FMS' skills and competence. Younger attending were cited as accessible, less hierarchical

Discussion and Conclusions: Institutional structure violence was observed. Students assessed violence as a personality feature and not as a socially structured problem. Mistreatment has negative consequences in medical students well being including their health.

Take-home Messages: Violence against MS is an educational and social problem that most be attended.

A qualitative exploration of medical students' experiences of shame

AUTHOR(S):

- **Tony Artino, Uniformed Services University of the Health Sciences, USA (Presenter)**
- William Bynum, Duke University School of Medicine, USA
- Lara Varpio, Uniformed Services University of the Health Sciences, USA
- Pim Teunissen, Maastricht University School of Health Professions Education, Netherlands

ABSTRACT

Background: Shame is a powerful emotion that occurs in response to negative events such as medical error or failure to achieve a personal expectation. Medical school poses a unique set of challenges for students, such as complex team dynamics, perceived inadequacy in clinical knowledge, and frequent transition periods. Each of these challenges can contribute to feelings of shame; however, little is known about how medical students experience this emotion. We cannot assume that interventions aimed at supporting other populations (e.g., residents) will be effective with these learners too. Instead, we must first answer a foundational question: How do medical students experience shame within the context of the medical learning environment?

Summary of Work: We used hermeneutic phenomenology to explore the shame experiences of 16 medical students at a large teaching hospital in the United States. Data collection included a written reflection and a one-hour, semi-structured hermeneutic interview “informed by Tracy and Robins's theory of self-conscious emotions” that explored participants' shame experience(s). We iteratively analyzed the data according to the hermeneutic method, which yielded rich descriptions of participants' shame experiences.

Summary of Results: Participants' shame experiences were triggered by specific events (e.g., below average academic performance, struggling publicly with clinical tasks, exclusion from patient care responsibilities, etc.). We identified five contributing factors to participants' shame experiences: perfectionism; competition with and comparisons to others; underrepresentation (e.g. minority race, education background); focus on objective measures of performance; and treatment by supervisors/institutional leaders. The effects of students' shame experiences included emotional distress, impaired physical wellness, social isolation, and impacts on professional and personal identity formation.

Discussion and Conclusions: Our data suggests that shame is a powerful emotion in medical students that can lead to significant negative effects. Potential implications that deserve further study include the emotional impact of grades and licensing exams, the relationship between underrepresentation and shame, and how students' expectations influence their self-evaluations.

Take-home Messages: This study adds to a growing understanding of how medical learners experience shame within the context of the medical learning environment. This understanding can be used to inform targeted resource development and future research to address and mitigate the negative effects of shame in medical education.

Equity And Diversity: Ways to prevent violence among health professions undergraduate students

AUTHOR(S):

- **Maria Paula Panúncio-Pinto, Ribeirão Preto Medical School, Brazil (Presenter)**
- Giovanna Singh Gasperini, Ribeirão Preto Medical School, Brazil
- Grazielle Keile Xavier, Ribeirão Preto Medical School, Brazil

ABSTRACT

Background: Interpersonal violence IPV among health professions - HP undergraduate students takes various forms and it has become increasingly challenging to face it and develop strategies to prevent its occurrence, through awareness and education, aiming at tolerance, respect for diversity, in search of real equity.

Summary of Work: In order to (1) discuss aspects of IPV at academic environment from the day-to-day experience and (2) propose actions to raise awareness and educate community as well as to prevent and fix up IPV situations that have already occurred we have proposed workshops for students, teachers, officials, managers. Program involves mini-classes on the topics of university violence, restorative justice, mediation of conflicts and moments of participatory activities using and art (music and video), small group activities for discussion and presentation of strategy suggestions to deal with violence in academic everyday life.

Summary of Results: Six workshops were held in the period from August to December 2018, with an average of 120 participants, of which 70% were undergraduates, 20% were postgraduates and 10% were teachers. The record of material produced in workshops allowed us to identify: (1) types of violence (against women - sexism, harassment; veteran-freshman relationship, teacher-student relationship, motivated by sexual orientation; by academic performance; (2) prevention / avoidance strategies and strategies to remedy: foster dialogue, sensitize the issue through its approach, fully welcome victims, increase the exchange of information between different actors in the community, involve teachers, managers and leaders in tackling the problem; face situations in a diligent and objective way.

Discussion and Conclusions: Through dialogue and experiences exchange, from different points of view, it was possible to bring up issues related to naturalization of IPV, prejudice and unconscious intolerance, demonstrating the relevance of talk about how we are relating to each other. The proposals built in each workshop will be presented to the Campus Units.

Take-home Messages: Spaces must be created to discuss interpersonal relationships, violence, prejudice, intolerance and thus act to educate, raise awareness for the achievement of equity.

Depression, academic stress and substance use among medical students in Romania

AUTHOR(S):

- Codruta Alina Popescu, "Iuliu Hatieganu" University of Medicine and Pharmacy, Romania (Presenter)
- Alexandru Sirbu, Iuliu Hatieganu University of Medicine and Pharmacy, Romania
- Sebastian Mihai Armean, Iuliu Hatieganu University of Medicine and Pharmacy, Romania
- Anca Dana Buzoianu, Iuliu Hatieganu University of Medicine and Pharmacy, Romania

ABSTRACT

Background: Research consistently indicates that medical students report high levels of depression and suicidal ideation. Medical students with depressive symptomatology face escalated risk for alcohol-related negative consequences. The academic stress of medical training is also widely acknowledged, with an intensive and time-consuming workload, and large intellectual and emotional demands. The aim of the study was evaluate the level of academic stress and to examine the prevalence of depression and substance use, including marijuana, alcohol and other illicit substances in a sample of medical students in Romania.

Summary of Work: A sample of 781 students from all medical schools in Romania completed an anonymous, web-based survey including questions about illegal substance used, the AUDIT questionnaire for alcohol abuse, Beck Depression Inventory and The Medical Student Stressor Questionnaire.

Summary of Results: The results showed a 29.7% prevalence of mild depression, 18.3% of moderate depression and 8.5% of severe depression based on a Beck Depression Inventory. Nearly 5% of the sample was on antidepressant medication, and 2% had suicidal ideation. Nearly 25% of the sample was experiencing clinically significant depressive symptoms 65.2% of the students reported having never used any illegal substance and 35% reported marijuana use at least once in their lifetime and 9.5 in the last week (the study was done during the exam session). 45.3% of the students didn't consume alcohol and 10% had an AUDIT score for alcohol addiction.

Discussion and Conclusions: The findings represent initial data on the prevalence of substance use and depression among Romanian medical students. Nationwide studies are needed further investigating the prevalence, the motivation and the impact of this risky behavior among this population.

Take-home Messages: The high rates of depression among currently enrolled medical students call for the promotion of mental health, with a special emphasis on vulnerable groups. To reduce medical students' academic stress, a learning environment to foster their self-esteem and positive prospect for academic achievement is needed.

Accreditation as Quality Assurance: Measures of Effectiveness

AUTHOR(S):

- Danielle Blouin, Queen's University, Canada (Presenter)

ABSTRACT

Background: Accreditation of undergraduate medical education (UME) programs serves as a significant quality assurance (QA) mechanism to ensure the quality of education offered by programs. Accreditation effectiveness has been studied mainly by looking at students' performances on national examinations. However direct linkages between accreditation and the graduates' performances are difficult to establish.

Summary of Work: This qualitative study sought to identify novel markers of accreditation effectiveness. In 2016, Canadian medical education leaders (deans, UME deans, accreditation leaders, curricular leaders) participated in individual interviews and focus group discussions to share their perceptions of useful indicators of accreditation effectiveness. The constant comparative method of analysis associated with the grounded theory approach was used for data analysis. There are 17 medical schools in Canada; all are public. 16 were invited to participate; one school was excluded as the study would have interfered with ongoing accreditation activities.

Summary of Results: 63 individuals from 13 (81%) programs participated in interviews or focus groups. Proposed indicators were grouped under seven themes. Effectiveness of accreditation could be evidenced by looking at: 1. Process: quality of the processes and systems in place at UME programs; 2. Program: quality of curriculum, learning environment, assessment systems; 3. Expectations: whether programs' social accountability mandate is met, e.g., primary vs. specialist care ratio, geographic distribution; 4. Student/graduate performance: on national examinations, in postgraduate training, etc.; 5. Stakeholders' satisfaction: whether the public, government, faculty members, etc., are satisfied with programs' graduates; 6. Research productivity: by students and faculty members; 7. Faculty engagement: within UME programs and in activities aiming at enhancing teaching skills; 8. QA: whether programs demonstrate commitment to QA and to program evaluation.

Discussion and Conclusions: Several new potential indicators of accreditation effectiveness were identified that would help substantiate the value of accreditation as QA mechanism in ensuring the quality of UME. Next steps involve an analysis of the feasibility and of the specific data required in each category.

Take-home Messages: 1. UME accreditation aims at ensuring the quality of medical education programs; 2. Current markers on accreditation effectiveness focus on learners' performance; 3. This study proposes several novel markers of accreditation effectiveness based on interviews and focus groups with Canadian education leaders.

Medical Students' Perceived Readiness for Clerkship - 5 years of Survey data

AUTHOR(S):

- Simon Field, Dalhousie University, Canada (Presenter)
- Darrell Kyte, Dalhousie University, Canada

ABSTRACT

Background: Dalhousie University conducts an annual survey of medical students to evaluate their perceived readiness to begin clerkship. We have reviewed the past 5 years' worth of data to assess areas where students feel well-prepared and evaluated differences based on a number of variables.

Summary of Work: Our Clerkship Readiness Survey is administered shortly after commencing clerkship, and allows students to self-evaluate their comfort in dealing with various aspects of clinical practice. It has been administered annually for the past 5 years.

Summary of Results: Survey results show consistency in the skills with which students are most and least comfortable. For example, students consistently report more comfort with communications skills and less comfort with proposing a management plan for their patient's problems. Results are also consistent across Dalhousie's two campuses; however, differences were evident between male and female students with respect to a number of skills. Open-ended feedback showed students felt well-prepared in communication skills but suggested additional emphasis was needed in pharmacology and in particular prescribing.

Discussion and Conclusions: Students showed comfort with their communication skills, and less comfort with creating management plans. Male students showed higher confidence levels with domains directly related to acute patient care and communicating bad news, while female students had greater comfort in the domains of demonstrating compassion and communicating with colleagues. While our survey data did not show significant differences across a number of variables, there were domains in which male and female students differed in their levels of comfort in working within a clinical environment. We plan to cross-reference these results with student performance on OSCEs.

Take-home Messages: Student surveys over 5 years have shown consistency with top- and bottom-ranked skills across campuses and ages, and across some skill sets, but male and female students showed differences in their perceived abilities in selected physician activities.

- Joy Checa, American University of The Caribbean School of Medicine, USA
- Kimberly Kirkland, American University of The Caribbean School of Medicine, USA
- Julie Taylor, American University of The Caribbean School of Medicine, USA

ABSTRACT

Background: American University of the Caribbean School of Medicine (AUC) is an international medical school with a medical sciences campus in Sint Maarten and clinical sites at seventeen US and seven UK hospitals with vastly different structures, patient populations and environments. AUC has systematically developed a robust tracking strategy to ensure a comparable educational experience for all required clerkship students across 24 clinical settings.

Summary of Work: AUC has created multiple mechanisms for tracking clinical sites including 1) program evaluation and 2) student experiences and academic outcomes. Detailed clerkship evaluations provide significant quantitative and qualitative feedback from students after each clinical rotation. The annual site visit process produces comprehensive reports and action items. Clinical site caseloads are compared utilizing student-entered electronic case logs. Region-specific student government representatives liaise directly with deans. Students' academic performance, including clerkship grades, National Board of Medical Examiners (NBME) Subject Examination performance, United States Medical Licensing Examination (USMLE) Step 2 performance and National Residency Match Program residency attainment rates are also documented for each site and compared to mean data from US clinical sites, UK clinical sites and all clinical sites in the same specialties. Data are shared with site leaders and faculty at annual in-person clinical sites by AUC Clinical Deans. These tracking mechanisms facilitate data comparison by clinical site and by clerkship within each clinical site.

Summary of Results: The team will present the student clerkship evaluation tool, the site visit process and a templated site visit report. Two clinical dashboards, one for internal use and the other for external reporting, track both program and student outcomes iteratively.

Discussion and Conclusions: Vastly different clinical sites can provide variable student educational experiences and academic outcomes. AUC employs a broad array of quantitative and qualitative measures to ensure comparable clinical clerkship educational experiences across diverse clinical sites. This information is used to 1) drive program improvements and identify best practices and 2) to identify outliers in student experiences and academic outcomes.

Take-home Messages: Detailed tracking and analysis of clerkship, site, and student outcomes can demonstrate comparability of the educational experience at diverse clinical sites.

Students Making a Change (SMAC) - Using an innovative education platform to collect medical undergraduate feedback for real-time improvement

AUTHOR(S):

- **Shabina Yasmin Rahman, University Hospitals of Leicester NHS Trust, UK (Presenter)**
- Chiraag Thakrar Karia, University Hospitals of Leicester NHS Trust, UK
- Shelina Sachedina, University Hospitals of Leicester NHS Trust, UK
- Stephen Williams, University Hospitals of Leicester NHS Trust, UK
- Sue Carr, University Hospitals of Leicester NHS Trust, UK

ABSTRACT

Background: Student feedback is an important aspect of curriculum development . Currently, feedback is collected retrospectively by the local Medical School at regular intervals using a mixture of Likert scale and open-ended questions. Generally, response rates are low and there is no opportunity for real-time improvements in response to feedback.

Summary of Work: In total, fifteen focus groups were conducted over 17 months (September 2017 to February 2019) midway through 3rd and 4th year clinical placements. These sessions utilised TopHat, an innovative education platform to collect real-time feedback. Four questions were asked to allow students to contribute meaningful, structured feedback: 1) What works well? 2) What requires improvement? 3) What would you change? 4) How would you change it? Students were asked to rank preferred areas of improvement and provide constructive suggestions for improvement.

Summary of Results: An average of 12 students attended each focus group with several common themes emerging, including positive tutor exemplars, timetabling issues, clarification of student expectations and bedside teaching opportunities. Feedback and the students' suggestions for improvement were communicated to clinical placement block leads for implementation in real-time. Changes made were disseminated to students through a quarterly newsletter.

Discussion and Conclusions: The use of TopHat to collect real time feedback has allowed the rapid implementation of improvements during a clinical placement experience. This has also improved student engagement with the process of giving feedback by promoting discussion and empowering them to create meaningful change. In addition, students are developing an awareness of quality improvement which is a skill listed in the General Medical Council's 'Outcomes for Graduates'.

Take-home Messages: Using an innovative, online education platform to collect feedback can help to engage and empower medical students and lead to real-time improvements in their clinical placements.

How can we build active learning communities for healthcare professionals online? A narrative synthesis of what works and when

AUTHOR(S):

- Amy Manley, University of Bristol, UK (Presenter)
- Catherine Trimble, Avon and Wiltshire Partnership NHS Trust, UK
- Louisa Wilson, Avon and Wiltshire Partnership NHS Trust, UK

ABSTRACT

Background: Online communities between healthcare professionals intend to promote learning, foster collaboration, aid problem solving, and reduce professional isolation. However many strategies to create them are unsuccessful (Sandars 2006). Case studies describe online communities, but common themes which could direct developers and future research are unclear.

Summary of Work: This narrative review systematically reviews qualitative and quantitative studies evaluating the use of asynchronous communication to support learning and collaboration between healthcare professionals, published since 2012. Medline, PsycInfo, CINAHL, ERIC and the British Education Index databases were searched. Abstracts and full text articles were screened by two reviewers. Data were extracted from 25 papers using a piloted proforma which included MERSQI and BEME research quality measures. Findings were synthesised and emerging themes independently identified and agreed.

Summary of Results: Asynchronous communication can support online learning, from creating international networks, to supporting local journal clubs and delivering accredited programmes. Meaningful interaction takes time to emerge, often months to years. A tension exists between the benefits of asynchronous discussion (convenience, collaboration, relevant peer-learning, support, reflection) and associated downsides (work-life balance, conflict, reliability of information, avoidance of disagreement, data protection). Intrinsic and extrinsic motivators influenced participation differently. There were more active participants when extrinsic motivators were used, however less meaningful discussion emerged. Although extrinsic barriers were often cited as prohibitive to engagement, qualitative evidence suggested that a fear of appearing incompetent was an important, but little researched, barrier to posting. This, as well as differing objectives, may explain the, somewhat unexpected, association between years of experience and posting activity.

Discussion and Conclusions: Techniques to enhance discussion include facilitation and moderation, task definition, rewards, combining communication and content and advertising strategies. However their value will depend on the aim of the individual community. Studies were limited by cross-sectional evaluation and small sample sizes.

Take-home Messages: 1. Extrinsic motivation to participate is associated with more active participants, but poorer quality of interaction 2. Individuals report extrinsic barriers to communication, but also avoid posting due to a fear of their posts being perceived negatively 3. Facilitation, task definition, taught content and advertising encourage community engagement and growth

Designing MOOCs for medicine and healthcare curricula

AUTHOR(S):

- **Luke Woodham, St George's, University of London, UK (Presenter)**
- Katrina Tatton-Brown, St George's, University of London, UK
- Katherine Joeques, St George's, University of London, UK
- Fiona Howat, St George's, University of London, UK
- Sheetal Kavia, St George's, University of London, UK

ABSTRACT

Background: Massive open online courses (MOOCs) have become increasingly well established in medicine and healthcare education. There has been a widespread recognition of their value in continuing professional development (CPD) amongst the clinical workforce, with some courses having formal CPD accreditation from relevant Royal Colleges in the UK. However, there is currently a lack of understanding and shared knowledge about how such courses can be designed to additionally cater to the needs of students on taught programmes.

Summary of Work: St George's, University of London have developed a series of MOOCs which are closely aligned with the curricula of undergraduate and postgraduate taught programmes, while also being relevant to the CPD needs of the clinical workforce. Through targeted discussions these courses aim to provide all learners with an enriched formative learning experience and exposure to a geographically diverse, inter-professional learning cohort, with participants from different disciplines and stages of training.

Summary of Results: To date six MOOCs that are directly used within taught programmes have been created, with further courses in development. Comments within the courses indicate that they have been well-received, and keen advocates and champions amongst academic staff have formed a working group to share experiences and good-practice. However, there is some initial evidence that learners on taught programmes demonstrate lower engagement with the online discussions than those joining from the wider workforce.

Discussion and Conclusions: MOOCs can be high quality educational resources which provide learning opportunities unavailable through other means of teaching. However, further work is required to understand patterns of learner engagement amongst those enrolled on taught programmes, and to develop strategies that provide an optimal experience across diverse participant groups.

Take-home Messages: MOOCs offer a rich range of opportunities to both learners and teachers, but to fully utilise these it is crucial to target the resources to the needs of your learner audience. Having academic champions is crucial to gaining widespread acceptance of these resources.

Identifying Instructional Design Principles in MOOCs to Inform Integration

AUTHOR(S):

- **Marlies Reinders, Department of Internal Medicine (Nephrology), Leiden University Medical Center, the Netherlands (Presenter)**
- Renée Hendriks, Center for Innovation in Medical Education, Leiden University Medical Center, The Netherlands
- Peter de Jong, Center for Innovation in Medical Education, Leiden University Medical Center, The Netherlands
- Wilfried Admiraal, ICLON Leiden University Graduate School of Teaching, The Netherlands

ABSTRACT

Background: Massive Open Online Courses (MOOCs) are well structured free online resources. With growing interest in integrating MOOCs into formal medical education, their quality must be ensured. Earlier research showed that MOOCs in general score high on organization and presentation but low on instructional design quality. However, information about instructional design in specifically medical MOOCs is limited. Therefore, our research question was: How well do medical MOOCs meet the instructional design principles: problem-centeredness, activation, demonstration, application, integration, collective knowledge, collaboration, differentiation, authentic resources, feedback and goal-setting?

Summary of Work: An overview of medical MOOCs was compiled. Inclusion criteria were: medical condition in title; language English; course available between Sept'17 and Feb'18; no course fees; target group not excluding students. Course Scan, a tool based on the first ten principles was extended with six items based on Goal-Setting Theory, then validated, and implemented. The first author registered as a learner in the selected MOOCs, and scored all items after studying all course pages.

Summary of Results: Through selection 33 out of 410 medical MOOCs were included. Quality scores ranged from 12 to 36 points out of 78 (mean:21, stdev.:6.8). Application, authentic resources and feedback were present in 97% of the MOOCs. Course goals were present in 82% and 61% of the courses included relevant workplace problems. Prior knowledge was activated in 48% of the MOOCs. MOOCs incorporated collective knowledge in 39%, differentiation in 39%, and demonstration in 33%. Integration of new knowledge into daily life was required in 6% of the MOOCs and 3% required collaboration.

Discussion and Conclusions: The principles application, authentic resources, and some items of problem-centeredness and goal-setting are well represented, while integration and collaboration are scarcely present. Some principles may be difficult to implement in the MOOC concept, which might explain several low scores. Overall the medical MOOCs in this study score better on design quality than MOOCs on various non-medical topics in previous research.

Take-home Messages: MOOC quality should be considered before integrating. Medical MOOCs meet the instructional design principles in varying degree. For integration purposes certain principles might better be incorporated in linked classroom activities.

The Learning Outcome of Interactive E-Teaching System Using E-curricula and Instant Messaging in Post-Graduate Training in Laboratory Medicine

AUTHOR(S):

- Pin-Fei Wei, National Taiwan University Hospital, Taiwan (Presenter)
- Chin-Yu Cheng, National Taiwan University Hospital, Taiwan
- Shwu-Ing Meng, National Taiwan University Hospital, Taiwan
- Shiao-Ni Yan, National Taiwan University Hospital, Taiwan
- Chun-Ming Wang, National Taiwan University Hospital, Taiwan
- Yu-Chun Chiu, National Taiwan University Hospital, Taiwan

ABSTRACT

Background: E-curricula break time and space restriction of education. Instant messaging is increasingly popular and shortens the distance between people. We aimed to analyze the learning effectiveness after adding interactive E-teaching system in the post-graduate year(PGY) training in Laboratory Medicine.

Summary of Work: Traditional lecturing and paper assessments were used for conventional course before 2016. Interactive E-teaching system, set-up since 2016 using E-curricula for unrestricted learning, Line groups for connection and discussion, and Google Forms for assessment of learning/teaching effectiveness and student feedback, was added into PGY training and defined as interventional course. Hands-on tutoring, which is important for clinical training, remains in both course. Comparison of variables in this historical controlled study were analyzed by statistics.

Summary of Results: There were 19 students in the conventional course(PGY training in 2012-2015) and 12 students in the interventional course(PGY training in 2016-2017) and. The median pre-course assessment scores on common laboratory knowledges/skills, basic clinical hematology and basic clinical microscopy had no significant difference in conventional versus interventional group($p=0.45$; $p=0.87$; $p=0.76$). Students in both groups got score improvements in 3 categories without significant differences(30.98 vs 37.86, $p=0.20$; 52.40 vs 54.75, $p=0.82$; 25.0 vs 22.73, $p=0.63$). However, student feedback rates increased from 24.3% to 92.1% after Google Forms being paralleled to assessment. Average conference or journal article published by PGY trainees increased from 0.89/trainee in 2012-2015 to 1.52/trainee in 2016-2017 after interactive E-teaching system being integrated in PGY training.

Discussion and Conclusions: Google Forms make student feedback more convenient thus increase the response rate. Interactive E-teaching system motivates students to explore and discuss problems in an unrestricted environment thus is associated with learning benefits and even active learning after training.

Take-home Messages: Interactive E-teaching system complements the shortcomings of traditional course in immediacy and interaction therefore improves the feedback rate and motivates active learning.

Integration of extended Learning Analytics into the virtual patient system CASUS

AUTHOR(S):

- **Martin Adler, Instruct, Germany (Presenter)**
- Inga Hege, Universität Augsburg, Germany

ABSTRACT

Background: E-learning portals, such as the virtual patient system CASUS, collect a wide range of usage data, for example timestamps for actions, given answers and success scores. Such data can provide information about potential problems of participants and support the quality management. Thus, learning analytics on such data provides excellent opportunities for education, but offering straight forward reports for educators and students while not oversimplifying results still is a challenge.

Summary of Work: Building on the already available reporting in CASUS, we analyzed the usage of these reports in close cooperation with educators. The main area for improvement we identified was that the presentation and accessibility of reports, educators often did not interpret the data or look into the detailed level due to limited time. Thus, potential problems of participants or quality issues in their courses were rarely identified. Following this analysis, we restructured the data visualization in cooperation with the educators.

Summary of Results: Data is re-structured summarized anonymous data in 3 levels: (1) course overview level, (2) module level, visualizing data on pages of the modules, (3) detail level showing fine granular information about interactions. Depending on time educators can get an overview about activities in courses or dig into details if necessary. For faster interpretation the system now provides explicit hints about potential issues including links where the educator can access the details on which this issue was identified. During the implementation phase, which was completed in January 2019, we regularly asked educators to test the usability and provide feedback. Additionally, educators can now access detailed information, such as responses to questions, directly in the content creation area.

Discussion and Conclusions: The new learning analytics tools are available for all educators in CASUS since the beginning of 2019. First results show an increased usage of the reports than before and feedback of the educators is promising.

Take-home Messages: Visualizing e-learning usage data is critical for a high-quality implementation of e-learning activities into the curriculum. Easy-to-use visualization without oversimplification is needed, since educators have limited time to access an interpret the data.

Building a Medical Education Outcomes Center

AUTHOR(S):

- **Mark Rosenberg, University of Minnesota, USA (Presenter)**
- Jacqueline Gauer, University of Minnesota, USA
- Emily Melcher, University of Minnesota, USA

ABSTRACT

Background: The quantity of data available across the medical education continuum continues to expand, but these data often languish in siloed databases' unaccessed and underutilized. This exponential data expansion provides not only an opportunity to drive innovation and scholarship in medical education, but also a challenge, in the context of growing concerns over data privacy and the question of how to apply ethical stewardship to student data.

Summary of Work: The Medical Education Outcomes Center (MEOC; <https://outcomes.med.umn.edu>) was developed to connect educators and researchers to data sets, data experts, and innovative analyses. MEOC was designed to curate, manage, and integrate a large number of data elements and sources. A comprehensive request governance framework was created to standardize the intake and processing of requests through a multi-step workflow, and to ensure compliance with ethical best practices.

Summary of Results: A comprehensive inventory of over 100 data sources owned or utilized by the medical school was conducted, and nearly two dozen of these data sources have been vetted and integrated to-date. Upon consultation with subject matter experts, key definitions were translated into database terms to establish accurate, shared data definitions. Since fall 2017, MEOC has fulfilled 127 data requests, with another 50 requests currently in the pipeline. This work has culminated in a wide range of outcomes analyses, including peer-reviewed publications, and support of accreditation and quality improvement work.

Discussion and Conclusions: We have developed a framework to facilitate requests for data in a way that makes data easily accessible, documents each request to track where data are going and reduce duplication of effort, and ensures compliance with regulatory standards and ethical considerations. A limitation is that the process is resource intensive. While the framework is easily scalable, the process of vetting and fulfilling requests is not. The framework developed by MEOC could be applied to any context where a large amount of learner data is collected.

Take-home Messages: MEOC provides a flexible model for the development of an education outcomes center that can be adapted to other institutions.

Anatomy dissection improves the initially lower levels of spatial ability of medical undergraduates

AUTHOR(S):

- **Katerina Bogomolova, Leiden University Medical Center, The Netherlands (Presenter)**
- Beerend P. Hierck, Leiden University Medical Center, The Netherlands
- Jos A. van der Hage, Leiden University Medical Center, The Netherlands
- Steven E.R. Hovius, Erasmus University Medical Center, The Netherlands

ABSTRACT

Background: Spatial ability is considered a successful predictor in anatomy learning and acquisition of technical skills. Previous research suggest that spatial ability can be trained by practice and education. However, high interest in anatomy and personal preference for a surgical specialty does necessarily implies a higher spatial ability among residents. The relationship between spatial ability and high interest in anatomy in the very early stages of a medical career has not been evaluated yet. The aim of this study was to evaluate whether the choice for an extracurricular anatomy dissection course is related to spatial abilities of medical undergraduates, and whether spatial ability improves after participation.

Summary of Work: In a prospective case-control study, course participants (cases) were first and second-year medical students admitted to the extracurricular anatomy dissection course of ten weeks (n=45). Controls were their counterparts who did not apply and therefore did not participate in the course (n=65). Spatial ability was measured by the validated 24-item Mental Rotation Test prior to and ten weeks after the course. The differences in spatial ability scores at baseline were analysed with independent t-test. A one-way ANCOVA analysis was performed to compare the mean improvement in spatial ability scores, while adjusting for spatial ability scores at baseline.

Summary of Results: At baseline, there was no significant difference in spatial ability scores between course participants and controls (first-year: 14.6 vs 13.8; p=0.411; second-year: 11.8 vs 11.5; p=0.856). At the end of the course, participants achieved significantly higher scores as compared to controls: 20.6 vs 18.6, ANCOVA, F=4.9, p=0.030 (for the first-years) and 18.3 vs 17.6, ANCOVA, F=5.07, p=0.030 (for the second-years). In a sub-analysis, the significant improvement in spatial ability scores was present only in students with initially lower spatial abilities.

Discussion and Conclusions: The choice for an extracurricular anatomy dissection course does not imply a higher spatial ability among medical undergraduates and only students with initially lower spatial abilities did benefit from the dissection course. Further research is needed to investigate which specific activities within anatomy dissection improve spatial ability.

Take-home Messages: These findings indicate that spatial ability can be enhanced by repeated practice of anatomy dissection among students with lower spatial abilities.

From cut-and-see to preoperative planning - a new concept for dissection course

AUTHOR(S):

- Jörg Goldhahn, ETH Zurich, Switzerland (Presenter)
- Natascha Lier, Institute of Anatomy of the University Zurich, Switzerland
- Oliver Ullrich, Institute of Anatomy of the University Zurich, Switzerland
- Michael Thali, Institute for Forensic Medicine of the University of Zurich, Switzerland
- Johannes Loffing, Institut of Anatomy of the University of Zurich, Switzerland

ABSTRACT

Background: Dissection courses play an essential role in medical curricula - not only in understanding interindividual differences in anatomy but also in achieving manual dissection skills. So far, step-by-step preparation served as an approach to learn these skills. However, new imaging modalities enable preoperative planning of dissection compared to surgical planning within a clinical environment..

Summary of Work: In collaboration with the Institute for Forensic Medicine we could provide CT scans for all cadavers in our dissection course. The scans were available on tablets next to the situs. Small planning exercises were handed out to the students, which triggered planning of next dissection steps. Students had to measure structures and to identify and measure them after subsequent preparation. These Tasks were also part of the final exam.

Summary of Results: The entire cohort of 90 students mastered the course content. Initial feedback indicates that the preoperative planning helps to make the link between imaging (virtuality) and real structures (reality). An additional imaging software with annotations helped to understand anatomical landmarks and structures. Student feedback was very positive and the final exam indicated an improved ability to localize anatomical structures in the specific situs.

Discussion and Conclusions: The preliminary experience with preoperative planning in the dissection course was very positive but need further systematic investigation to quantify the potential effect on medical education.

Take-home Messages: Dissection courses still play an essential role in medical education. The combination with imaging helps to turn them into preoperative planning and make them more valuable.

Student-Led Tutoring and Gross Anatomy Sessions: Meeting a Medical Student Curriculum Redesign with a Near-Peer Tutoring Framework

AUTHOR(S):

- Christopher Barnes, Rush Medical College, USA (Presenter)
- Adam Payne, Rush Medical College, USA
- Benino Navarro, Rush Medical College, USA

ABSTRACT

Background: When our medical school recently implemented a new curriculum, we as medical students recognized the need for a tutoring system to support this change. We met this by creating a tutoring service that supplemented underclassmen learning, while simultaneously fostering the teaching skills of upperclassmen who wish to become medical educators. We utilized Near-Peer Tutoring (NPT), a system involving current medical students teaching other current medical students, which has been shown to positively impact tutors, tutees, and faculty.

Summary of Work: Our NPT program is completely student-organized and led. We implemented 'office hours' where 1-2 tutors held sessions for underclassmen to come and go freely and ask any questions. We also implemented gross anatomy peer tutoring with similar sessions in the gross anatomy lab, where upperclassmen tutors would identify and explain pertinent structures, adding any clinical correlations to further student understanding.

Summary of Results: Per survey results, 100% of students reported feeling more prepared for exams due to NPT, with an average preparedness rating of 4.57 and 4.90 for office hours and anatomy tutoring, respectively (scale of 1-5). 70% reported learning about new resources and study techniques, 61% appreciated the comfortable and consistent spaces for questions, and 54% emphasized the usefulness of learning from a near-peer's perspective.

Discussion and Conclusions: Our NPT model is an effective system of supplementing medical student learning, which can ease the transition of a curriculum change. NPT benefits students beyond content, as our system offers assistance on how to learn by presenting a variety of resources and study techniques to medical students, each having individual learning needs. Beyond benefits to students our tutoring service also benefits faculty as it is largely student-led, minimizing the amount of resources needed to run the program and avoiding additional workload for faculty and administrative staff.

Take-home Messages: Our NPT service taught new medical students how to learn content effectively. Students felt more prepared for exams, while tutors gained new skills as educators. This teaching method proved invaluable even with a changing curriculum. This service being student-led allows it to be readily applied to other schools.

The Modernization of Anatomy Teaching: The Integration of Web-based Augmented reality (WebAR) and Three-Dimensional (3D) Printing Technology

AUTHOR(S):

- Mei Kuen Florence Tang, The Chinese University of Hong Kong, Hong Kong (Presenter)
- Lik Hang Taylor Tang, The Chinese University of Hong Kong, Hong Kong
- Miu Yung Olivia Ngan, The Chinese University of Hong Kong, Hong Kong
- Wai Ho Kwok, The Chinese University of Hong Kong, Hong Kong

ABSTRACT

Background: The fundamental learning of anatomy for health professions in Faculty of medicine depends on the plastinated specimen of human cadaveric material which is related to the health hazard, ethical and moral concerns. At present, students examine the plastinated specimen, they need to go through the details through the atlas. The WebAR in the education is a good resource, as the information dynamically overlaid with the real-world static object is stored in the web pages. The learners can access the virtual valuable additions without the geographical barrier and time restriction. Recently, the prototyping via the 3D printing technology is easily and quickly built up from the digital data. Medical applications have widely used this technology, especially for tissue engineering.

Summary of Work: By applying the WebAR with the 3D printing assisted with the plastinated organ of the kidney, we would like to study if they enrich the students' experiential learning and examine their effectiveness as a medical educational intervention in Anatomy teaching to the health professions.

Summary of Results: Our team developed courseware entitled as Virtual eLearning Tool (VeT) using WebAR with 3D printing technology, providing an excellent sight stimulation to study the gross anatomy of the kidney. Through the VeT platform, students can use their smartphones to screen the 3D printed kidney model; and all the information of the internal anatomical structures is pop out in details via the position marker. Students acquire the knowledge from the interactive multi-media material in positive experiential learning.

Discussion and Conclusions: From our pilot study, the VeT provides several educational implications that our team has designed the novel AR-based experiential learning environment for studying Anatomy; it relieves the ethical issue concerning the usage of cadaveric material; it bridges the interactive learning gap between the factual knowledge with text content type in the book and the 3D model and it facilitates students learning in acquiring anatomical knowledge for understanding the spatial relationship of organs.

Take-home Messages: The potential and affordance of the WebAR and 3D printing technology are being valued and extended to the strategic pedagogy in the future health professional education.

Exploring the application of ultrasound in teaching anatomy: a mixed method study

AUTHOR(S):

- Te Fa Chiu, Department of Education, China Medical University Hospital, Taiwan (Presenter)
- Chia-Hsin Yang, China Medical University Hospital, Taiwan
- Yuan-Chun Tsai, China Medical University Hospital, Taiwan
- Wei-Jun Lin, China Medical University Hospital, Taiwan
- Fremen Chihchen Chou, China Medical University Hospital, Taiwan

ABSTRACT

Background: Manipulating (operating) ultrasound, instead of learning from only picture and text, may be an efficient way to help students approach anatomy, by introducing hand-on practice and building concept of continuous two-dimensional structure. In addition, peer-assisted learning also has excellent effect on learning anatomy, it can increase the feasibility of small-group teaching, encourage knowledge sharing and reduce tuition cost.

Summary of Work: We trained 27 senior medical students to serve as teaching assistants (TAs), and integrated ultrasound into anatomy curriculum for 201 junior medical students. The course consisted of didactic lecture, ultrasound demonstration by medical staff with large group, and mainly of practical lab training with small groups (a TA instructing 6-7 medical students). Each medical student received 12 hours of lab training in divided 3 sections. We conducted a mixed method study with explanatory design to explore the feasibility and the reason behind.

Summary of Results: The quantitative part showed: Students are happy to that ultrasound was integrated in learning anatomy(97.0%), feel more interesting(97.3%), agree that ultrasound can help anatomy learning(95.4%), and hope to integrate ultrasound into more anatomy courses(95.3%). Satisfaction to medical staff and TA is 97.4% and 97.8% respectively. The qualitative part revealed: Clarifying the anatomy knowledge on the actual human body, improving the concept of relative position in three-dimensional space, and actual operation help understanding anatomy in-depth and memorization. TAs improve the accessibility and interaction through using 'the same language' as students.

Discussion and Conclusions: Teaching and learning anatomy has been considered as one of the most challenging tasks in medical education in terms of the huge need of resources and the difficulty to comprehension. Most students found that the vivid experience of learning anatomy on a living human body through operating ultrasound is a unique way and beneficial for promoting in-depth comprehension. The application of ultrasound in teaching anatomy with peer-assisted learning strategy is supported by both the quantitative and qualitative data. TAs themselves benefited most, both quantitatively and qualitatively.

Take-home Messages: Integration of ultrasound into anatomy curriculum is helpful in increasing learning motivation and comprehension. Application of peer-assisted learning is cost-effective in ultrasound teaching.

Using Global Burden of Disease measures to guide case-selection and emphasis in an international medical curriculum

AUTHOR(S):

- Samuel McConkey, RCSI, Ireland (Presenter)
- Mary Cafferkey, RCSI, Ireland
- John Jenkins, RCSI, Ireland
- Martina Crehan, RCSI, Ireland
- Wayne Cunningham, RCSI, Bahrain
- Teresa Pawlikowska, RCSI, Ireland

ABSTRACT

Background: In transforming its undergraduate medicine curriculum, RCSI is developing a series of clinical cases, through which students will learn about behavioural and social determinants of health, health care systems, biological sciences, clinical and quantitative skills and knowledge, as well as clinical medicine. The curriculum will be delivered at three international sites hence it must prepare mobile students for practice in many international settings, and equip them with knowledge of the wide range of major health issues they will encounter, and the skills they will need to lead and work effectively in multi-professional, multi-cultural and multilingual health services. To address this we have developed a process based on the work on Global Burden of Disease (GBD) collaboration.

Summary of Work: The global contribution of every disease, disability or category, measured in disability-adjusted-life-years (DALYs), was ranked in descending order using GBD. The annual rate of change was noted. The slice of DALYs lost from each condition in Ireland, Bahrain, Malaysia and USA were compared to the global ranking. A cut-off was chosen below which inclusion of conditions would necessitate other justification. The list was mapped against RCSI's current topics, diagnostic codes for family doctors, and conditions included at two other medical schools. The conditions were grouped by physiological system and presented to the faculty for discussion and critique as a suitable approach to globalise this core element of the curriculum.

Summary of Results: The findings are surprising and non-intuitive. Neonatal disorders cause most loss of DALYs globally and rank in the top 10 in Bahrain and Malaysia. Ischaemic heart disease ranks 2nd globally, (1st in Ireland, Malaysia, USA). Stroke ranks third globally (2nd in Malaysia) whilst diabetes mellitus ranked 8th globally is 1st in Bahrain. This may be a useful tool to select clinical conditions for case-based teaching and to guide their relative emphasis.

Discussion and Conclusions: The GBD can help guide selection and emphasis of cases included in a medical curriculum.

Take-home Messages: GBD data can help provide a framework for selection of diseases and conditions that medical students should learn about in an increasingly interconnected world.

Samoan, New Zealand and Nepalese medical student perspectives and ideas regarding global health within medical curricula

AUTHOR(S):

- **Hannah Sim, University of Otago, Christchurch, New Zealand (Presenter)**
- Andrew Miller, University of Otago, New Zealand
- Roshit Bothara, University of Otago, New Zealand
- Tim Wilkinson, University of Otago, New Zealand
- Susan Jack, University of Otago, New Zealand
- Jen Desrosiers, University of Otago, New Zealand

ABSTRACT

Background: There is consensus that medical students need more opportunities to learn about global health during their undergraduate training. However, few studies have explored why, how and what medical students would like to learn about global health.

Summary of Work: This mixed-method study involved medical students in Nepal, Samoa and New Zealand (NZ) participating in the Global Health Classroom, a collaborative, virtual global health learning activity, which was awarded the AMEE 2018 Patil Innovation Award. Pre-GHCR questionnaires were sent to all participants in the three countries. Semi-structured interviews were carried out with randomly selected participants; 5 in Samoa and 14 in NZ. The questionnaires and interviews explored participants' motivations for learning about global health, and what and how they wanted to learn about global health in the medical curricula. The quantitative and qualitative data was analysed using a triangulation approach.

Summary of Results: 120/161 (75%) of participants across the three countries completed the questionnaire, of which 73% reported interest in learning about global health. Participants reported the importance of being global citizens and their recognition of doctors' roles in addressing health equity as key motivators for learning about global health. Of the global health learning concepts recommended by Johnson et al., students expressed most interest in learning about cultural diversity and impact on health (60%) and global burden of disease (59%). Students rated active learning methods higher than didactic methods.

Discussion and Conclusions: Medical students are motivated to learn about global health because they identify themselves as global citizens and future doctors with the duty of addressing health inequity. The medical curricula needs to capitalise on this by incorporating active learning methods of global health concepts, such as culture diversity and health, and global burden of disease. Global health educators should recognise these motivations and aspirations in developing the global health curricula.

Take-home Messages: 1. Students are motivated to learn about global health because they identify themselves as global citizens and aspire to see equitable health care globally. 2. Global health curricula needs to align their content and learning methods with these motivations to produce effective global health practitioners.

Health Professional education and practice in preventing and controlling infections amidst escalating global antimicrobial resistance

AUTHOR(S):

- Linda Gulliver, Otago Medical School, University of Otago, New Zealand (Presenter)
- Heather Brooks, Department of Pathology, University of Otago, New Zealand
- Linda Kinniburgh, Otago Polytechnic School of Nursing, New Zealand
- Joanne Stodart, Southern District Health Board, New Zealand
- Joy Rudland, Otago Medical School, University of Otago, New Zealand

ABSTRACT

Background: This study aimed to find out how well New Zealand doctors and nurses are trained, assessed and monitored in Infection Prevention and Control (IPC). Peer assessment of clinical practice and patient feedback were also piloted as quality assurance tools aimed at reducing infections, a key objective of the World Health Organisation's global action plan targeting burgeoning rates of antimicrobial resistance.

Summary of Work: Medical and nursing curricula were mapped for IPC teaching and assessment alongside IPC monitoring methods used in clinical practice. Doctor and nurse clinician cohorts (undergraduates to >10 years postgraduate) were evaluated by peer experts while completing clinical procedures involving hand hygiene, aseptic technique and patient isolation. Self-evaluation, followed by patient and expert peer feedback, occurred post-procedure.

Summary of Results: Although medical students received twice the IPC-related theory compared to nursing students, nurses obtained more formal IPC-specific practical tuition and assessment. For medical students IPC-specific practical tuition was opportunistic, rotation specific or formed part of an orientation (e.g. to operating theatre). Despite less formal IPC practical teaching and assessment, medical students in practice were expected to be IPC-competent when demonstrating mastery of a skill. Doctors and nurses generally self-reported competency in IPC regardless of experience, however many admitted adjusting their technique to save time. All agreed that introducing regular peer review of IPC practice was desirable. Peer expert and patient feedback was generally positive, however some patients questioned whether they felt empowered enough to challenge perceived poor clinician practice.

Discussion and Conclusions: Although clinician cohorts mostly performed IPC procedures adequately, this study shows areas for improvement and suggests a need for a greater IPC-specific formal practical component in medical training. Regular peer review of IPC practice would be well received by staff and patients, especially since not all patients feel sufficiently empowered to speak up. Results from this study can be used to inform positive change in medical and nursing curricula and IPC in clinical practice.

Take-home Messages: Rigorous IPC education and monitoring is required to curb reliance on antibiotics and reduce global antibiotic resistance. Moreover, safe IPC practice should be viewed as a basic patient/consumer right.

Climate Change in Medical Curriculum 2020

AUTHOR(S):

- Alaa Dafallah, University of Khartoum, Sudan (Presenter)
- Tarek Ezzine, International Federation of Medical Students Associations, Tunisia
- Katja Čič, International Federation of Medical Students Associations, Slovenia
- Omnia El Omrani, International Federation of Medical Students Associations, Egypt

ABSTRACT

Background: There is a remarkable gap between the impacts of climate change on health and the inclusion of the topic into medical curricula, leaving future healthcare professionals with insufficient knowledge and competency to address the issue. The International Federation of Medical Students' Associations (IFMSA) aims to integrate climate-health in medical curricula worldwide by 2020. This advocacy campaign is happening through the engaging network of 1.3 million medical students coming from 125 countries and with the support of other organisations working on Environmental Health, Climate Change & Medical Education.

Summary of Work: A survey was launched via our communication channels of the IFMSA. Every National Member Organisation reported on the status of climate-health integration in their medical curriculum. The IFMSA Public Health in Medical Curriculum Toolkit was created last year and will represent the basis for our call to action and advocacy to integrate climate health into curricula in the target countries.

Summary of Results: The results of the survey reflects the inclusion of Climate Change in Medical Curriculum from 125 countries. It will be analysed and translated into a World Climate-Health Map on IFMSA website in which we can view the status of inclusion of Climate-Health in Medical Curriculum. The aim is to launch the World Climate-Health Map at the AMEE conference.

Discussion and Conclusions: The outcomes of the Report Cards will be combined and analyzed in a yearly synthesis report that aims to be presented at the AMEE conference. The results will also be published on our website in the form of a map where anyone can search for the University of their interest and learn about the aspects of each climate-health curriculum.

Take-home Messages: There's an urgent need for a climate change curriculum based on emerging scientific evidence and reviews on the health impacts of climate change. This significant association calls for medical education to train future healthcare professionals on health sector mitigation and adaptation to climate change. Medical students should be equipped with the knowledge and skills to manage climate-related illnesses, engage in eco-health promotion, and disease prevention, hence paving the way for a climate-resilient society.

Global health: Can essays demonstrate transformative learning?

AUTHOR(S):

- Ann Wylie, King's College London, UK (Presenter)
- Eleanor Bowen- Jones, Kings College London, UK

ABSTRACT

Background: Reflective writing offers ways in which transformative learning (TL) can be expressed. Global health (GH) learning and experiences provide ideal opportunities for students to have their worldviews positively challenged and for the insight development. Reflective writing could provide evidence of this, hence the study. The core values associated with GH themes and the imperative to see GH as mainstream in medical education teaching offer significant opportunities for integration in core clinical teaching and medical curricula. Core teaching requires assessment and the modality used in one large UK medical school is essays. These essays were mandatory and submitted before elective placements of final year students.

Summary of Work: Students were provided with webinars, reading lists and symposium as part of their GH module and subsequently were expected to submit a 2000 word GH essay with a focus and title of their choice. This happened concurrently whilst they planned and prepared for elective placements taking place after their final exams. A team of 20 experienced academics were recruited to mark the 420 essays. A purposive sample, where consent was obtained, (N=40) of essays were anonymised and thematically analysed with no regard to the grade. Data were collected from the markers regarding the views of depth of learning and insights into GH concepts demonstrable in the essays.

Summary of Results: Early findings suggest the range of focus and topics the students selected enabled them to produce good-quality scholarly writing and draw on years of learning. A minority of students merely described a case study or their forthcoming elective placement, whilst the majority were able to integrate GH concepts, present arguments and conclude with an informed discussion. Some essays gave indications that transformative learning had occurred. The markers commented on the high standards of writing and the range of topics as well as the insights the students articulated.

Discussion and Conclusions: The argument for GH in core curricula is appropriate. Essays as the assessment tool, not only provide evidence of learning but can demonstrate, for some students, transformative learning.

Take-home Messages: Essays are a valuable assessment modality for TL and GH.

Universal professionals or global physicians? A multi-centre study of international medical programme design

AUTHOR(S):

- **Emmaline Brouwer, Maastricht University, the Netherlands (Presenter)**
- Erik Driessen, Maastricht University, the Netherlands
- Norul Hidayah, International Medical University, Malaysia
- Vishna Nadarajah, International Medical University, Malaysia
- Klara Somodi, Pécs University, Hungary
- Janneke Frambach, Maastricht University, the Netherlands

ABSTRACT

Background: Increasing numbers of medical schools offer curricula that specifically target international students, and aim to prepare them for a medical career abroad. To design such a curriculum that adequately prepares these students for global practice is challenging as well as controversial: designers must seek to reconcile specific local healthcare requirements with the global health competencies doctors need in our globalised world. By investigating how international medical programme designers experience this balancing act, this study aims to contribute insights to the debate on global and local health education.

Summary of Work: We conducted a multi-centre instrumental case study across three universities with international medical programmes in Hungary, Malaysia and the Netherlands. The study involved 26 semi-structured interviews and a curriculum document analysis of all programmes. Key curriculum designers were recruited through purposive sampling. Data were thematically analysed within an international and multidisciplinary team and then integrated to find the main parallels and dissimilarities across settings.

Summary of Results: Participants described two different profiles of international medical programme graduates: 'a global physician', who is equipped with specific competencies for international practice, and 'a universal professional', who as an overall high-level graduate is fit for future practice anywhere. These perspectives presented different curriculum design challenges, including how to define global relevance and strike a balance between the global and the various potential future local work contexts. Curriculum design strategies varied from adding a global health flavour to teaching material, to standardisation and ensuring alignment with global educational developments.

Discussion and Conclusions: International medical programmes teach us how we can rethink graduate profiles of international education. Yet, curriculum choices that aim to prepare a universal professional involve risks inherent in standardisation, while adding specific global health competencies to prepare a global physician requires careful consideration of the definition of global health.

Take-home Messages: - Curriculum designers define two different graduate profiles of international medical education: a high-level universal professional and a distinct global physician.

- It remains challenging to prepare students for the requirements of a specific yet unknown future local healthcare context.

Priorities and Insights: A Professionalism Curriculum for Postgraduate Psychiatry Learners

AUTHOR(S):

- Tanis Adey, Memorial University of Newfoundland, Canada (Presenter)

ABSTRACT

Background: A physician's professional identity is central to the physician-patient relationship. Lapses of professionalism by physicians are now commonplace and professionalism training must be included in curricula to meet accreditation standards. An effective curriculum focused on humanism can impact student professionalism attitudes and behaviours and is associated with enhanced patient satisfaction, treatment compliance and decreased medicolegal complaints.

Summary of Work: A modified Delphi technique was used to develop a questionnaire to determine key professionalism topics for a psychiatry training program at a Canadian University. Two pilot professionalism modules on top priority topics were delivered and evaluated. Descriptive and qualitative analysis was performed.

Summary of Results: Of the 137 potential participants, 30% responded. Of 42 respondents 26/42 (62%) were female and 17/42 (41%) were learners. Ten topics were felt to be very important to include in a professionalism curriculum by at least two thirds of respondents. Six topics were endorsed significantly more often by psychiatrists when compared to residents as being 'very important' to include in a professionalism curriculum: Boundary violations; Communication; Patient handover; Respectful behavior toward patients and families; Process improvement; and Social accountability. Evaluation of two pilot modules on top priority topics, Boundary violations and Managing professionalism with challenging patients, suggested that professionalism training was well received (4.6/5 for both modules). Qualitative evaluation deemed it to be important and relevant.

Discussion and Conclusions: While there is some agreement on professionalism topics that are very important to include in a psychiatry professionalism curriculum, there is some disagreement between learners and psychiatrists regarding priority topics.

Take-home Messages: More professionalism curriculum is needed in psychiatry training. Current education trends involve learners identifying their own learning needs. This study illustrates that learners may not always be able to identify their knowledge gaps. Curriculum guidance may be necessary.

What do Pre-clinical Students Learn about Professionalism from Observation Learning in Patient and Family Advisory Councils in China?

AUTHOR(S):

- **Shaoting Feng, The First Affiliated Hospital, Sun Yat-sen University, China (Presenter)**
- Ming Kuang, The First Affiliated Hospital of Sun Yat-sen University, China
- Suqing Yang, The First Affiliated Hospital of Sun Yat-sen University, China
- Jingsong Wang, The First Affiliated Hospital of Sun Yat-sen University, China
- Haipeng Xiao, The First Affiliated Hospital of Sun Yat-sen University, China
- Tinghuai Wang, The First Affiliated Hospital of Sun Yat-sen University, China

ABSTRACT

Background: Observation Learning in pre-clinical years is an important part of early involvement in clinical practice for medical students in China. Initiated by Sun Yat-sen University, it has been widely accepted and playing a significant role in medical professionalism education in many medical colleges after 20 years development. Increasingly, healthcare organizations are adopting patient and family advisory councils (PFACs) as a key strategy to improve patients' healthcare experience. To develop a method for better professionalism education, we set an observation learning session in PFACs for pre-clinical medical students.

Summary of Work: The project consisted of pre-clinical students taking the program of 'early involvement in clinical practice' in the First Affiliated Hospital of Sun Yat-sen University, who were from Grade 1 to Grade 3 of medical college. In 2018, 268 students participated in this program, were arranged to observe the PFACs in their elective departments of our hospital during their winter/summer vacations. 257 Narratives based on their observations were collected and each student offered his or her reflections on their own narrative. The content of the narratives and reflections were analyzed.

Summary of Results: Students' responses were overwhelmingly positive in both written and oral feedback. The majority (95%) were deeply impressed by the observation learning in PFACs. It not only illustrated them how doctors communicating with patients, but also offered them opportunities hearing voices of the patients, exerting an imperceptible influence on their mind of essential principles of medical professionalism, such as humanism, responsibility, altruism and excellence. Reinforcement on medical professionalism were shown in students' narratives and reflections.

Discussion and Conclusions: Observation learning in PFACs for pre-clinical students is a positive way for shaping professionalism in pre-clinical years of medical education. It can help developing students' empathy with patients, communication skills, as well as better understandings for the doctor-patient relationships. Narratives and reflections written by students could deepen their understandings of the values and principles of professionalism in pre-clinical years.

Professionalism Breakfast

AUTHOR(S):

- Ellen M. Friedman, Baylor College of Medicine, USA (Presenter)

ABSTRACT

Background: Many studies reveal that professionalism issues, rather than cognitive knowledge or technical skills are the leading causes behind medical errors. In addition, in the United States, professionalism is a mandated core competency in all residencies. In order to provide training in this area, we created sessions to encourage discussion and reflection on practical professionalism issues. An unique aspect of these sessions is the emphasis on peer to peer learning with minimal faculty support. Earlier surveys revealed that the majority of participants have witnessed lapses in professionalism.

Summary of Work: This project engages residents and fellows in discussion of realistic vignettes focused on professionalism issues in order to increase their comfort and willingness to address similar situations when they arise. Incorporating the exercise into a one-hour breakfast meeting maximizes participation by minimizing conflict with clinical schedules and also helps to maintain an informal atmosphere for open, peer-to-peer discussion. Professionalism breakfasts have now been conducted with numerous medical and surgical residencies.

Summary of Results: On post-activity evaluation surveys, the majority of participants indicated that: 1. The professionalism scenarios were realistic (75.6%-76.8%). 2. They learned something new about professionalism (62.4%) 3. They planned to put the concepts learned into practice (63.5%) 4. They felt better prepared to handle lapses in professionalism (70%) 5. They enjoyed the format and would recommend it to a friend/colleague (69.6%-71.0%)

Discussion and Conclusions: Based on these preliminary results, we feel that the Professionalism Breakfasts have met our original goals to create a positive and enjoyable learning experience that highlights professionalism in the GME curriculum and help participants deal with professionalism conflicts that they will encounter. This demonstrates a potential avenue for teaching professionalism not only to meet ACGME requirements but also to ultimately improve patient care. We plan to broaden participation in this program to additional departments.

Take-home Messages: 1. This program facilitated peer to peer discussions on sensitive and practical topics. 2. One hour sessions which include refreshments attract excellent participation. 3. This format is low cost, requires minimal faculty burden and enjoyable for the participants 4. Participants felt better prepared to handle lapses in professionalism.

Professionalism across the professions

AUTHOR(S):

- Erica Smyth, RCSI, Ireland (Presenter)
- Heinz Lechleiter, Dublin City University, Ireland
- A Jamie Saris, Maynooth University, Ireland
- Rachael Hession, Law Society of Ireland, Ireland
- Marié T O'Shea, RCSI, Ireland
- Teresa Pawlikowska, RCSI, Ireland

ABSTRACT

Background: One of the objectives of medical education is to develop a sense of professional identity in learners. Professional identity can be developed in many ways, for example as an individual or as part of a larger group. We believe that important information about the development of professional identity and underpinning teaching strategies can be learnt by looking at professionalism in different contexts. The aim of this study is to explore the experiences, values and behaviors that contribute to the development of professionalism and professional identity in different professional groups.

Summary of Work: A qualitative research approach was employed and conducted from a constructivist perspective. Data was collected in digitally recorded focus groups comprising of heterogeneous groups of stakeholders in the areas of medicine, law and academic teaching. Focus group discussions were fully transcribed and analysed using inductive thematic analysis to identify emergent themes.

Summary of Results: 20 subjects participated in 4 focus groups. There was a consensus between the professions that professionalism is a difficult subject to teach explicitly and that most individuals learnt through observation of peers and seniors, role modelling and following a code of conduct or professional guidelines. Differences between the professions existed with regards to the power balances between the professionals and their service recipients, and the role of practitioner context and influence of institutional professional culture.

Discussion and Conclusions: There are similarities and differences between how professionalism is perceived across the professions and each profession has its own challenges to professional behavior. Similarities existed between the strategies to teach professionalism, whereas differences were present in the influence of practitioner context and power relationships. The journey to professional identity is unique for individuals both within and between professions.

Take-home Messages: By examining professionalism between different profession groups, factors which may not have previously been considered are highlighted as potentially important for the development of professional identity in the medical context. Observing professionalism from different perspectives allows the medical educational community to harness ideas which can be used to develop new progressive teaching strategies for instilling professionalism in medical students.

Pill Counter, business person or health care provider? A discourse analysis of professional identity in pharmacy education

AUTHOR(S):

- **Jamie Kellar, Leslie Dan Faculty of Pharmacy, University of Toronto, Canada (Presenter)**
- Cees van der Vleuten, School of Health Professions Education, Maastricht University, Netherlands
- Mirjam oude Egbrink, School of Health Professions Education, Maastricht University, Netherlands
- Elise Paradis, Leslie Dan Faculty of Pharmacy, University of Toronto, Canada
- Zubin Austin, Leslie Dan Faculty of Pharmacy, University of Toronto, Canada

ABSTRACT

Background: Professional identity formation - the development of professional values, actions, and aspirations “ is gaining momentum as a movement for educational reform in health professions education. Currently, and historically, pharmacist identity has been contested: are they merchants or health care professionals? This unformed professional identity may have significant effects on recruitment, retention, acceptance by other healthcare professionals, and approval by society.

Summary of Work: The objectives of this study were to explore (1) what have been the professional identities in pharmacy education over the last century in North America and (2) which one(s) currently dominate the curricula. A Foucauldian informed historical discourse analysis was undertaken to uncover the educational assumptions underpinning pharmacist identity over time. This analysis, allowed for the questioning of the roles of the pharmacist that are taken for granted and assumed as rational and inevitable.

Summary of Results: This study identified five prominent discourses in the literature related to the professional roles of pharmacists over the last century. The identities are the 'apothecary', 'druggist', 'merchandise', 'expert advisor' and 'health care provider'. Each of these discourses constructs the pharmacist's professional role in different ways and as such makes possible certain language, subjects, and objects. An unexpected finding of this research was that over the years there were no clear discursive shifts in the education literature, but rather discursive 'pile-ups' of all identities.

Discussion and Conclusions: Each identified discourse remained present throughout the entire archive. These 'discursive pile-ups' suggest that each discourse continues to have relevance to pharmacy educators, and as such competes for space in the curriculum. Although each discourse is not dominant at the same time, each holds some place in the education and practice arena and fights to remain pertinent. This likely contributes to the identity challenges pharmacists currently face.

Take-home Messages: This critical discourse analysis reveals that pharmacist identity constructs are not straightforward, self-evident, or progressive. Pharmacy educators must determine the ultimate goal of pharmacy education and begin a formal process of inculcating the ideal identity discourse in pharmacy curricula.

Faculty's reflective narratives and the residents' professional identity formation: A thematic analysis

AUTHOR(S):

- See Meng Khoo, Alexandra Hospital, Singapore (Presenter)
- Serene Wong, Alexandra Hospital, Singapore

ABSTRACT

Background: One of the most important objectives of medical education, beyond equipping the trainees with knowledge and skills essential for competent clinical practice, is to transform the trainees from lay people to professionals. Faculty's reflective narratives may help shift the training paradigm from the narrow focus of the explicit teaching of professionalism to a more comprehensive strategy of supporting the professional identity formation of their trainees.

Summary of Work: Semi-structured focus group discussions were conducted with 20 residents from an Internal Medicine program to explore their perspectives on how the faculty's reflective narratives, through an online forum named 'letters to residents' that periodically featured letters from the program director (PD) and faculty members, had impacted the development of their professional identity. A thematic analysis approach, informed by sensitising concepts drawn from the professional identity formation and socialisation framework, was used to identify the themes iteratively.

Summary of Results: Four themes were identified: Faculty's reflective narratives (1) in the right context, triggered deep reflection which led to effective socialisation and formation of professional identity; (2) were effective in supporting the reflection and socialisation process if the authors were recognised by the residents as role models; (3) were effective in provoking deep reflection if they resonated with the experiences of the residents; (4) in triggering residents' reflections, influenced the culture of the microsystem that the residents worked and trained in, which in turn impacted their daily experiences and led to socialisation and development of their professional identity.

Discussion and Conclusions: To our knowledge, this is the first qualitative study that explores the in-depth relationship between faculty reflective narratives and the professional identity formation of the residents. The findings from this study has helped advance our understanding in this area by uncovering the detailed relationships and interactions between faculty's reflective narratives, factors that influence residents' reflection, the process of socialisation and development of professional identity.

Take-home Messages: Faculty's reflective narratives, if appropriately shared by credible role models, inspired deep reflection which led to effective socialisation and development of professional identity.

The effectiveness, implementation and evaluation of quality improvement training programmes in surgery: a BEME systematic review

AUTHOR(S):

- Elena Pallari, King's College London, UK (Presenter)
- Zarnie Khadjesari, University of East Anglia, UK
- David Aceituno, King's College London, UK
- Catherine Anyango Odhiambo, King's College London, UK
- Ross Warner, Northampton General Hospital, UK
- Christopher Bastianpillai, Royal Stoke University Hospital, UK
- James Green, Bart's NHS Trust, UK
- Nick Sevdalis, King's College London, UK

ABSTRACT

Background: Quality improvement is defined as a systematic, scientific effort to make changes that improve healthcare delivery and subsequently patient outcomes, system performance and professional development. Surgical training curricula have recommended training in QI- however there are currently no specifications regarding the optimal content or delivery of such training.

Summary of Work: We evaluated the effectiveness, implementation, evaluation of surgical QI training interventions. We reviewed interventions based on their design, influence on knowledge and skills learning and organisational impact – including any reported benefit for patient care. There were 20,590 hits across the 10 databases, of which 11,563 studies were screened based on title and abstract following de-duplication, and 73 studies which were full text reviewed. The primary outcomes were the teaching/training programme evaluation, teaching material, pedagogical methods, while secondary outcomes focused on how the programmes were implemented. We also carried out formal quality appraisal of the evidence.

Summary of Results: A total of n=19 studies were included in the final synthesis, with 95% from the US and 89% in general surgery. Most studies had unclear underpinning framework (58%), setting description (63%), content (53%) and conclusions (47%), while all scored low on psychometrics reporting and were at high risk of bias (> 60% of studies). All studies used lectures, workshops, QI project either alone or in combination as pedagogical methods to teach improvement models e.g. plan-do-study-act (PDSA) cycles, system-based learning or awareness of medical errors. Finally, implementation constraints or mentorship initiatives for example were identified as a barrier or driver, respectively.

Discussion and Conclusions: This review highlights how QI is taught to surgeons and surgical trainees globally. Surgeons, researchers and educators can use these findings to inform the design and evaluation of surgical QI curricula. While some consistency was found in the materials taught and educational methods used, there is lack of homogeneity in educational and other outcomes. Future research should improve assessment of effectiveness of surgical QI training programs.

Take-home Messages:

- Heterogeneous design of evaluation studies in surgical QI training
- Lack of a coherent educational theoretical framework for the reported outcomes

BEME Review - How does medical education affect empathy and compassion in medical students? A meta-ethnography

AUTHOR(S):

- **May Eng Loo, Health Outcomes & Medical Education Research (HOMER), NHG Education, National Healthcare Group, Singapore (Presenter)**
- Charmaine Krishnasamy, Health Outcomes and Medical Education Research (HOMER), NHG Education, National Healthcare Group, Si, Singapore
- Sik Yin Ong, Health Outcomes and Medical Education Research (HOMER), NHG Education, National Healthcare Group, Si, Singapore
- Jill Thistlethwaite, NPS, MedicineWise; University of Technology Sydney, Australia

ABSTRACT

Background: Empathy and compassion are important in healthcare delivery, and necessary qualities for medical students to possess and demonstrate. The aims of this meta-ethnography were to explore medical students', patients' and educators' perceptions of what affects empathy and the expression of compassion; and address gaps in knowledge, attitudes and skills on how education affects empathy and the expression of compassion in medical students.

Summary of Work: We used the seven steps by Noblit and Hare (1988) for this meta-ethnography. CINAHL, EMBASE, ERIC, PsycINFO and PubMed databases were searched for studies in English, published from 2007-2017 with outcomes of empathy and compassion. Extracted data were coded for concepts, similarities and differences, and relationships between and across studies were explored. Key themes and concepts were identified and accounts from the studies were used to build interpretations.

Summary of Results: 33 qualitative studies were included. Four main themes were derived: Seeing the patient as a person; appreciating the elements of empathy and compassion; navigating in the training environment; and being guided by ideals. Interactions between the patient, the medical student and training environment which affect the development of empathy and compassion were illustrated in a conceptual model.

Discussion and Conclusions: Empathy and compassion arise from the unique interaction between a medical student and a care recipient. Medical students can demonstrate empathy and compassion through active listening, understanding the patient's perspective, providing relief for discomfort, and offering kind gestures to patients. The results extend our understanding of how medical education affects the expression of empathy and compassion in medical students, and lend support to and provide important considerations for medical educators and faculty developers in further developing and improving medical curricula.

Take-home Messages: Empathy and compassion are interpersonal, and authentic learning contexts are ideal for medical students' expression of empathy and compassion.

Learning from patients about patient-centredness: A realist review

AUTHOR(S):

- **Esther de Groot, University Medical Center Utrecht, the Netherlands (Presenter)**
- Johanna Schonrock-Adema, Centre for Education Development and Research in Health Professions (CEDAR), University of Groningen, the Netherlands
- Agnes Diemers, Department of General Practice and Elderly Care, and Center for Education Development and Research,, the Netherlands
- Kristin van den Bogerd, Department of Primary and Interdisciplinary Care, Skills Lab, University of Antwerp, Belgium
- Katrien Bombeke, Department of Primary and Interdisciplinary Care, Skills Lab, University of Antwerp, Belgium
- Saskia Mol, Julius Center for Health Sciences and Primary Care, University Medical Center Utrecht, the Netherlands

ABSTRACT

Background: Patient-centred work is an essential part of contemporary medicine. Literature shows that educational interventions contribute to developing patient-centredness, but there is a lack of insight into the associated learning processes. Through reviewing articles about educational interventions involving patients, we aspired to develop a program theory that describes the processes through which the educational interventions expectedly result in change.

Summary of Work: An initial, rough program theory was generated during the scoping phase. In our realist review, we searched for relevant articles in PubMed, PsycINFO, ERIC, CINAHL and Embase for all years before and through 2016. We included diverse studies in which the participants were students, residents, doctors, nurses or dentists. The relevance and rigour of the studies was taken into account during analysis. With deductive as well as inductive coding, we extended the rough program theory.

Summary of Results: We classified five different contextual aspects which affect how upcoming professionals learn patient-centredness. These aspects are influenced through components in the intervention(s) related to the learner, the patient and faculty. We placed the mechanisms together in four clusters: (1) Comparing and combining “as well as broadening “ perspectives; (2) Developing narratives and engagement with patients; (3) Self-actualisation, and (4) Socialisation. Four partial-program-theories were developed, which show how different components of interventions evoke, within certain contexts, mechanisms that contribute to patient-centredness.

Discussion and Conclusions: These theories help us to better understand how the roles of patients, learners and teachers interact with context elements such as the kind of knowledge that is considered legitimate or insight in the whole illness trajectory. Our program theories open up potential areas for future research and interventions that may benefit teachers, learners and patients

Take-home Messages: When developing an intervention aimed at learning patient-centredness, educators could benefit by explicitly taking the context into account. Our review will potentially provide valuable points for discussion and reflection, but not a simple ‘to do’ list. For researchers, one of our main recommendations would be to be more explicit about the sociocultural aspects of the context in which they plan to implement their intervention.

Multi-level learning in general practice

AUTHOR(S):

- Marie-Louise Dick, The University of Queensland, Australia (Presenter)
- Margaret Henderson, The University of Queensland, Australia
- Yi Wei, The University of Queensland, Australia
- David King, The University of Queensland, Australia
- Katrina Anderson, Australian National University, Australia
- Jill Thistlethwaite, University of Technology, Australia

ABSTRACT

Background: Increasing educational and supervisory demands on already-busy general practitioners (GPs), resulting from increasing numbers of medical students and graduates undertaking training in community-based settings, has become a concern in recent years. Multi-level learning (MLL), or teaching and learning that is shared across different levels of learners, is one strategy proposed to assist in addressing these demands.

Summary of Work: We undertook a BEME (Best Evidence Medical Education) systematic review of the literature to identify the benefits, challenges and facilitators of MLL initiatives in community-based general practice. We used a realist synthesis approach to explore mechanisms and contexts to explain the outcomes.

Summary of Results: We found 15 papers providing primary research evidence relevant to our research questions. Benefits of MLL were reported across all learner levels including: learning from colleagues closer in age and experience to themselves (cognitive and social congruence) for medical students; clinical and personal benefits for general practice registrars; and time and financial efficiencies for some GPs and practices. Several key mechanisms thought to support our hypotheses about successful MLL outcomes were identified. Of these 'a strong teaching culture' was widely represented, and was considered a context for most other key mechanisms.

Discussion and Conclusions: The identified findings demonstrate that MLL can be successful in the general practice setting given the appropriate contexts. Compared with non-MLL teaching initiatives, MLL has the potential to provide a broader range of teaching methods and experiences for learners, as well as time and financial efficiencies for some practices. We believe that the findings of this review can help to inform educators and practices considering the use of MLL approaches in general practice, and potentially other community-based settings.

Take-home Messages: MLL approaches in the general practice setting can provide benefits to all levels of learners, however it is important to adopt flexible teaching and learning methods that best suit the participating learners and practices.

Developing collaborative healthcare education programmes for staff in low and middle income countries

AUTHOR(S):

- Elaine Hill, University of Central Lancashire (UCLan), UK (Presenter)

ABSTRACT

Background: As recent Ebola outbreaks have demonstrated, health problems and their solutions transcend national boundaries. Large discrepancies exist between standards of healthcare provision in developed and developing countries. The root cause is often financial, resulting in poor infrastructure and under-resourced educational and healthcare systems¹. Continuing professional education (CPE) programmes improve staff knowledge, skills, retention and practice, but remain costly and rare in the developing world. One potential solution involves healthcare education collaborations between institutions in developed and developing countries to provide culturally-appropriate CPE in low/middle income countries².

Summary of Work: A focussed systematic review was undertaken to ascertain how frequently such collaborations occur, how they are undertaken and their impact on healthcare education and practices in developing countries.

Summary of Results: From 36 citations, 6 potential studies were fully screened. Most focussed on distance learning for doctors, nurses or midwives, with outcomes at level 1 on Kirkpatrick's hierarchy³. Educational partnerships involved a variety of developed and developing countries and educational settings.

Discussion and Conclusions: Despite their acknowledged importance, such collaborations appear uncommon. When they occur their effectiveness may be hampered by developed nations failing to fully appreciate the practical challenges and cultural differences between themselves and their developing country partners. Published literature regarding international collaboration for healthcare CPE is rare, with no consensus on the most effective partnership-working or educational approaches to use.

Take-home Messages: In an increasingly connected world, collaborations which aid healthcare education in developing countries are both practically and ethically significant but further research is required to determine the best approach. A BEME review is in progress to try and address this.

A BEME Review on the Utility of Mini-CEX in Undergraduate and Postgraduate Medical Education

AUTHOR(S):

- Sara Mortaz Hejri, Tehran University of Medical Sciences, Iran (Presenter)
- Mohammad Jalili, Tehran University of Medical Sciences, Iran
- Rasoul Masoomi, Tehran University of Medical Sciences, Iran
- Mandana Shirazi, Tehran University of Medical Sciences, Iran

ABSTRACT

Background: The Mini-Clinical Evaluation Exercise (Mini-CEX) is used for assessing performance of undergraduate and postgraduate medical trainees in workplace. This systematic review aimed at exploring and synthesizing the evidence considering utility (validity, reliability, educational impact, acceptability, feasibility and cost) of the mini-CEX.

Summary of Work: Followed by the published BEME-approved protocol, eight electronic databases were searched. No study was excluded on the grounds of design, location, or language. Data extraction and quality assessment were done by two authors. Discrepancies were resolved by a third reviewer. Descriptive synthesis was used to address the review questions.

Summary of Results: Out of 2259 citations, 58 papers were included. Number of participants ranged between 8 and 1149; and 16 to 7808 mini-CEXs forms were completed in different studies. Reliability: Chronbach's alpha ranged from 0.58 to 0.97. The number of encounters needed for a desirable G coefficient varied greatly. Validity: Most studies showed that with the increasing levels of competence, the scores of mini-CEX increased significantly. Factor analyses proved a single factor solution. Moderate to high correlations between mini-CEX scores and other clinical exams were reported. Acceptability: Satisfaction was high among both trainees and assessors. Yet, some found mini-CEX to be anxiety provoking, or hard to determine the necessary standard. Educational impact: Respondents were generally positive. Participants found this tool as a valuable educational tool which helped them identify their strength and weaknesses, which provide insight into their clinical competence. Many studies found that a kind of feedback had been provided in the majority of mini-CEX encounters, but the accuracy and usefulness of the feedback provided was questioned by many studies. Cost and feasibility: Only one paper estimated cost as \$A 80,000 per year. Mean observation time and feedback time ranged from 12.3 to 46.5 minutes, and from 5.7 to 20.1 minutes, respectively.

Discussion and Conclusions: The mini-CEX is widely used as a formative and summative assessment tool and appears to have reasonable validity and reliability. The reported acceptability and feasibility should be interpreted in the light of required number of encounters. By providing a framework for structured observation and feedback, the mini-CEX bears a favorable educational impact.

Revealing the hidden curriculum and professional culture in the clinical workplace: a practical tool for trainees and faculty

PRESENTER(S):

- Hanneke Mulder, University Medical Center Utrecht, School of Medical Sciences, The Netherlands
- Jacqueline van Wijngaarden, University Medical Center Utrecht, The Netherlands
- H. Carrie Chen, Georgetown University School of Medicine, USA
- Olle ten Cate, University Medical Center Utrecht, The Netherlands

ABSTRACT

Background: The ‘hidden curriculum’ refers to the set of implicit messages about values, norms, and attitudes that trainees infer from the behaviour of individual role models as well as from group dynamics, processes, rituals and structures. The hidden curriculum is considered highly influential in medical education, especially in the clinical workplace, and is known to affect patient safety and wellbeing of faculty and trainees. It is often described solely from the trainee perspective and in negative terms. This workshop analyses the hidden curriculum of the clinical workplace, includes multiple perspectives, and addresses both its positive and negative effects. We will introduce a practical and non-judgmental approach using the tool REVIEW (Reflecting & Evaluating Values Implicit in Education in the Workplace), to facilitate reflection, discussion and action on the hidden curriculum and professional culture. REVIEW, based on Q-sort methodology, has been used successfully by individuals and teams, including faculty members and trainees, to elucidate and constructively address the hidden curriculum within training programs and clinical units/departments.

Who Should Attend? Educators interested in the implicit aspects of learning, especially in workplace learning, and educational leaders and administrators with responsibility for improving the workplace learning environment for any level of medical education.

Structure of Workshop: A brief didactic presentation will introduce the concepts of ‘hidden curriculum’ and ‘culture’, describe the REVIEW tool and procedures, and provide an overview of our experiences using REVIEW in graduate and postgraduate medical education. We will then engage participants in an exercise using REVIEW, providing them with the opportunity to experience the tool themselves. A final discussion will focus on possible applications of REVIEW in participants’ own settings.

Intended Outcomes: Participants will leave the workshop with

- Increased awareness of the hidden curriculum as a reflection of the professional micro culture of a clinical team and of its relevance for workplace learning
- Practical experience using the REVIEW tool to elucidate the hidden curriculum
- Insight into the strategies, best practices, and challenges for using REVIEW in undergraduate and postgraduate medical education
- Exploration of ways to apply REVIEW in participants’ own setting

Level: Introductory

#5U Conference Workshop

Refugees' and Migrants' Health in Medical Curricula

PRESENTER(S):

- Evangelos Papageorgiou, EMSA - European Medical Students' Association, Greece
- Aikaterini Dima, IFMSA - International Federation of Medical Students' Associations, Greece
- Janusz Janczukowicz, AMEE, Poland
- Petra Verdonk, Amsterdam UMC, VUmc, The Netherlands
- Veronica Selleger, Amsterdam UMC, VUmc, The Netherlands
- Hiba Ghandour, IFMSA - International Federation of Medical Students' Associations

ABSTRACT

Background: Following the recent refugee crisis, there has been an ongoing discussion in AMEE on what should be done in support of refugee medical students in Europe. In the AMEE Conference 2018 in Basel, members from AMEE, IFMSA and EMSA decided to organize a workshop on the topic of "Student Refugees in Europe: Barriers & Solutions to University Enrollment and Retention", which gained a lot of attention from participants. Two Syrian refugee students joined us and shared their experience with continuing their medical studies in European Universities. Moving forward, it is important to shift our focus towards Refugees and Migrants Health in Medical Curricula and to evaluate if it is addressed enough, and most importantly, if it is addressed appropriately. Our times are unpredictable and there are many conflict zones in the world and multiple populations in danger; this is a reality that doctors will have to face in their work. With that thought in mind, it is of utmost importance to prepare the future medical and health professionals to be able to deal with these very vulnerable patient groups, protect their right to health and treat them appropriately.

Who Should Attend? The workshop could be of interest to academic staff, curriculum developers, policy makers in education and students.

Structure of Workshop: The workshop will consist of the following parts:

- Review of AMEE, IFMSA and EMSA involvement in the refugee crisis
- Presentation of last year's workshop outcomes and the link between the two workshops
- Sharing of best practices in refugees' and migrants' health education from experts
- Small working group discussion on the challenges that present while trying to include refugees' and migrants' health in medical curricula

Level: Introductory

#5V Conference Workshop

Problem Students or Problem Teaching? Exploring approaches to engaging students in their learning

PRESENTER(S):

- Ian Hall, Advance HE, UK
- Kathy Wright, Advance HE, UK

ABSTRACT

Background: Many university teachers experience “problem students” in their classes. The underlying causes of these problems may be many and varied, but working with successful learners is the aim of all university level teachers. University academics are experts in their disciplines but are they also aware of the literature on effective learning and teaching? According to a study by Bok (2009) only 8% of professors reported taking ‘any account of research into teaching and learning in preparing their classes’. In this session we ask whether this could be a contributory factor in the problem of students who are disengaged in their studies. A 2010 OECD report on learning sciences research identified the role of emotions and motivation in successful and unsuccessful learning experiences. In this workshop we will explore the ways in which students learn and how we can best support their learning, through effective learning design and outcome-led teaching. This workshop will also consider the sector work on high impact pedagogies, including the findings of our HEA 2015 report, ‘Engaged student learning: high impact strategies to enhance student achievement’ to help us to consider designing learning opportunities which can lead to student success.

Who Should Attend? Staff with an interest in teaching and learning in higher education, either as a teacher/lecturer or those with leadership or management responsibilities for teaching.

Structure of Workshop:

- Welcome/Introductions
- Lessons from learning sciences
- Designing learning for student success
- Approaches to engaging students in partnership
- Action planning and next steps

Intended Outcomes: By the end of the workshop, participants will be able to:

- Understand the importance of positive learning environments in learning
- Be equipped to use teaching strategies to engage students

Level: Introductory/Intermediate

#5W Conference Workshop

5W (2777)

Date of Workshop: Monday, 26 August 2019

What is Your Shape: Understanding the Roles of Types of Expertise in Health Professional Education

PRESENTER(S):

- Elizabeth Wooster, OISE/University of Toronto, Canada
- Douglas Wooster, University of Toronto, Canada

ABSTRACT

Background: Currently there is a developing discussion within other professions regarding the “shape” of practitioners who will be successful in the future. This discussion revolves mainly around the difference between the “T” and the “pi” practitioner. A “T” practitioner is someone who has knowledge over a number of different areas with deep knowledge in one specific area. A “pi” practitioner is someone who has deep knowledge in two specific areas in addition to general knowledge covering multiple areas. The facilitators posit that there are, in fact, five different “shapes” of practitioners and that practitioners may move from one shape to another throughout their practice. Garnering a deeper understanding of the different shapes and how they can be used to maximize health professional education to impact patient care and development of educational strategies is necessary to be a successful practitioner.

Who Should Attend? Anyone who plays a role in developing curriculum or has responsibility for mentoring or training current and future practitioners.

Structure of Workshop: The workshop will combine a series of short didactic lectures interspersed with interactive sessions. The interactive sessions will include the following types of exercises to encourage participants to share their experiences and learn from each other: think, pair, share; popcorn; visual Likert scales; small group and large group discussions.

Intended Outcomes: At the end of this workshop, participants will be able to:

- 1) Describe the five different “shapes” and how they relate to the expertise development
- 2) Explain how each different shape may influence and facilitate the development of practitioners
- 3) Delineate how the use of these shapes to develop practitioners may improve patient care
- 4) Assess the current environment of their home institution
- 5) Develop a strategy for instituting the “shape” framework.

Level: All levels are welcome. Familiarity with overarching skill development across the continuum would be a benefit but is not essential.

#5X Conference Workshop

5X (2500)

Date of Workshop: Monday, 26 August 2019

Location of Workshop: Room 0.96-97, Level 0

Bringing the lay voice into medical education: the use of 'patient and public' representatives in Specialty Recruitment and Medical Education in the UK

PRESENTER(S):

- Jonathan Howes, Health Education England, UK
- Sheona MacLeod, Health Education England, UK
- Clare Wright, Health Education England, UK

ABSTRACT

Background: There has been significant medical and educational resource invested in the development of sophisticated methods to support the selection of doctors into postgraduate medical training and their progression through training. Yet, although the role of a doctor is centred around the care of patients, the input of lay representatives, patients and the public into doctors' recruitment and selection and their subsequent assessment, is very variable. The UK Medical and Dental Recruitment and Selection Quality and Standards committee was created to improve standards and equity across all UK medical recruitment and selection processes. The committee has reviewed the role of lay representatives in recruitment processes, identified best practice and developed guidance to support its adoption and spread. The review of the progression of doctors in training in England also provided insights into best practice in this area

Who Should Attend? Anyone interested in or involved with recruitment to or delivery of specialty training programmes

Structure of Workshop: In this workshop we will share our experience of embedding the lay voice in our recruitment, selection and progression processes, and what we have learnt from incorporating this different perspective.

Intended Outcomes: It will provide an opportunity for others to share their initiatives and ideas and will open the debate around whether we are delivering doctors with the knowledge, skills and attitudes that patients want, rather than those with attributes valued by the medical profession

Level: All levels of knowledge

#5Y Conference Workshop

5Y (384)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1600-1730

Vibrate to Communicate

PRESENTER(S):

- Linda McCrorie, University of Nicosia Medical School, Cyprus
- Peter McCrorie, University of Nicosia Medical School, Cyprus

ABSTRACT

Background: Students often experience communication difficulties in a number of situations, e.g. while working in groups which require their active participation, during consultations with patients, in an OSCE situation or presenting in front of their peers and professors. Faculty also experience communication difficulties when lecturing or speaking in public. Many of these issues arise from lack of confidence, caused by insufficient preparation, nervousness, shyness, poor voice production and tight body language. In this workshop, we will offer ideas on how to work with students and faculty to help them become more confident when communicating, by working on their breathing technique, voice production and spoken language skills, body language and PowerPoint presentation skills.

Who Should Attend? Students; Faculty, especially those involved in student support and/or faculty development; Faculty involved in delivering lectures

Structure of Workshop:

Plenary: Overview of presenters' experience in helping students and faculty build their confidence when speaking in public.

Group activities: - simple Pilates movements - breathing exercises - voice projection exercises - group reading.

Interactive Plenary: PowerPoint presentation guidelines.

Questions.

Intended Outcomes: By the end of the workshop, participants will:

- use their voices more confidently
- understand the benefits of breathing exercises
- have a method for approaching any presentation with less nervousness
- be able to give a visually and orally improved presentation

Level: Basic - no prior knowledge required

#5Z Conference Workshop

5Z (2694)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1600-1730

Location of Workshop: Room 2.44, Level 2

Integrating the Arts and Humanities into Medical Education: Lessons From Across the Globe

PRESENTER(S):

- Alison Whelan, AAMC, USA
- Elizabeth Gaufberg, Harvard Medical School, USA
- Quentin Eichbaum, Vanderbilt University, USA
- Pablo González Blasco, SOBRAMFA, Brazil

ABSTRACT

Background: The Association of American Medical Colleges (AAMC) has launched a major initiative to advance the integration of the arts and humanities across the continuum of medical education. A growing evidence base suggests that learning experiences that integrate arts and humanities within curricula may lead to a variety of important learning outcomes. These include skills-based outcomes such as honing observation and interpretation skills, relational outcomes such as empathy, communication, and teamwork, and transformational outcomes at the level of professional identity formation and advocacy. In this session, the foundational importance of the arts and humanities to medical education will be highlighted and lessons from international colleagues will be shared. Linkages to key medical education learning outcomes will be made, and the educational research to support these practices will be shared.

Who Should Attend? (1) Medical and health professional educators across the continuum of education (2) Educators, learners and administrators who are considering integrating arts and humanities into curricula at their institution and are seeking guidance on which approach may be most appropriate and feasible. (3) Educators, learners and administrators with a general interest in the arts and humanities and wishing to hear alternate perspectives and approaches.

Structure of Workshop: Dr Whelan will begin by briefly describing the strategic efforts by the AAMC to integrate arts and humanities in medical education. Three educators from diverse institutions will describe their efforts to integrate the arts and humanities. Following these mini presentations, the attendees will be invited to consider opportunities for integration within their local institutions and the needs to support these efforts. The speakers will also serve as a panel to engage the audience in discussion about the current and future opportunities for advancing healthcare and clinical wellbeing through the integration of arts and humanities in education.

Intended Outcomes:

1. A deeper appreciation of the value of integrating the arts and humanities into health professional development and education.
2. An understanding of the medical education learning outcomes that can be advanced using the arts and humanities.
3. Assessment of the needs at the local and broader levels for further integrating the arts and humanities into curricula.

Level: Varied

#5AA Conference Workshop

5AA (1722)

Date of Workshop: Monday, 26 August 2019

Clinical Reasoning Assessment in the Workplace: What Tools are in your Toolbox?

PRESENTER(S):

- Michelle Daniel, University of Michigan Medical School, USA
- Steven Durning, Uniformed Services University of the Health Sciences, USA
- Temple Ratcliffe, University of Texas Health San Antonio, USA
- Larry Gruppen, University of Michigan, USA
- Eric Holmboe, Accreditation Council for Graduate Medical Education, USA
- Stuart Lubarsky, McGill University Faculty of Medicine, Canada

ABSTRACT

Background: Clinical reasoning entails conscious and unconscious cognitive operations in which clinicians observe, collect and analyze information to diagnose and treat patients (Eva, 2007; Durning et al, 2011). Clinical reasoning has been identified as a core competency, essential for safe and effective patient care. Ensuring the development of clinical reasoning competence requires robust programs of assessment. Workplace-based assessments (WBAs) are essential components of any comprehensive clinical reasoning assessment strategy. A recent scoping review by the authors (Daniel et al, 2018) identified 7 different WBA methods. Educators will recognize some of these methods, including direct observation (e.g., mini-CEX) and global assessments (e.g., end-of-clerkship evaluations). Other methods may be less familiar, including chart stimulated recall, think aloud, and self-regulated learning microanalysis. Each method differs in its potential validity, reliability, feasibility, and components of the clinical reasoning construct it measures. This workshop will provide an overview of the different types of workplace-based assessments, as well as their strengths and weaknesses. We will discuss challenges associated with implementing different types of WBAs (e.g., the non-systematic nature of clinical practice, content specificity, rater variations, time and resource utilization) and strategies to overcome them. Participants will leave better equipped to implement programs of clinical reasoning assessment at their home institutions.

Who Should Attend? Faculty and administrators with interest in clinical reasoning assessment across the continuum.

Structure of Workshop:

- Introductory didactic (overview of WBAs of clinical reasoning and validity primer)
- Table top discussions (Which WBAs do participants currently use? What are their strengths and weaknesses?)
- Panel of experts (discuss different WBAs, their common uses, validity, and feasibility concerns)
- Table top discussions (Given X level learner, what additional methods might you want to use to ensure a robust program of clinical reasoning assessment? What are issues of feasibility? What are strengths and limitations in regards to validity? How can you best manage the threats to validity?)

Intended Outcomes:

- Describe the strengths of different WBAs
- Identify threats to validity for different WBAs
- Outline a program of WBA that balances strengths and limitations of validity, while addressing feasibility

Level: Intermediate - Advanced

#5BB Conference Workshop

5BB (2313)

Date of Workshop: Monday, 26 August 2019

Time of Workshop: 1600-1730

Location of Workshop: Room 2.83, Level 2

Followership - The Forgotten Key to Leadership

PRESENTER(S):

- Benjamin Berg, Simtiki Simulation Center, John A Burns School of Medicine, USA
- Yoko Akamine, Osaka City General Hospital, Japan
- Nobuyasu Komasa, Osaka Medical College, Japan
- Gen Ouchi, University of Ryukyus, ChuraSim Simulation Center, Japan

ABSTRACT

Background: Workshop focus is on definitions, skills, and assessment of Followership concepts for Interprofessional, Healthcare, Teamwork and Leadership training. Followership constructs play a key role in team dynamics. Leadership functions and skills in teamwork training are increasingly incorporated in healthcare training from organizational management to bedside team care. Leadership is identified as a team element, without explicit recognition of followership constructs. Teamwork training paradigms incorporate followership skills such as situational awareness and non-hierarchical behavior. Followership studies in non-healthcare domains yielding mature definitions of “followership style”. Followership is the role of supporting leadership functions. Followership is a process whereby followers apply specific interactive skills and attitudes and engage in constructive critical thinking to support Leadership functions in teamwork. Exemplary followers are accountable, and effectively influence leadership decisions and actions. Defined leadership styles include : Alienated, Exemplary, Passive ,and Conformist. Individual Followers may exhibit mixed Followership styles. To understand and apply Followership constructs training should allow followers and leaders both to understand and reflect on their own Followership style.

Who Should Attend? Healthcare educators interested in facilitating experiential learning focused on teamwork, leadership, or faculty development for simulation instructional skills. Attendees from varying disciplines, experience, and educational settings are welcome. Simulation based teaching experience is not required.

Structure of Workshop:

15 min: Welcome/Introduction - PowerPoint/ Audience Response System (ARS) Followership core concepts and definitions. Kelly and Challef terminology/ARS

20 min: Key Followership skills - Facilitated breakout groups -Discuss and list followership skills, characterize “styles”, share examples -Facilitated group Summaries

10 min: Integrating Followership Concepts - Powerpoint/ARS

35 min: -Followership video assessment exercise -Video review by small groups, each with an assigned focus -Facilitated discussion and review of small group observations

10 min: Q/A and Course evaluation

Intended Outcomes:

Understand concepts of Followership for curriculum integration in teamwork and leadership training programs. Workshop facilitated small group discussions support an opportunity to assess and reflect on Followership using a defined rubric.

Objectives:

- List two definitions of Followership
- Describe four followership styles for integration in scenario design/learner assessment
- Assess and Identify followership styles in video vignettes

Level: Novice, intermediate, and advanced level facilitators and education designers.

#5CC Conference Workshop

5CC (1898)

Date of Workshop: Monday, 26 August 2019

Using activity theory to maximise the effectiveness of reflective ePortfolios

PRESENTER(S):

- Uzma Tufail-Hanif, University of Edinburgh, UK
- Morkos Iskander, University of Lancaster, UK

ABSTRACT

Background: In the UK, in common with many other countries, regular reflective practice is mandated and evidence required for continued accreditation. A common method of fulfilling this requirement has been through the use of an ePortfolio, encouraging healthcare professionals to record experiences relating to standards of practice. Critical reflection should lead to improvements in clinical care by 1) developing the healthcare professional's awareness of their own practice within the wider context of medicine as a whole and 2) enabling an effective response to feedback. Reflection therefore has the potential to generate change in practice, but this is an inconsistent outcome when ePortfolio entries are restricted to factual descriptions of events with little or no reflection. Activity theory has been used to derive a framework for critical reflection that can be used to assess one's own and current practice to allow areas for improvement to be identified. This workshop will examine frameworks for structuring reflective writing and introduces an activity theory derived framework which promotes goal-directed learning.

Who Should Attend? 1) Healthcare professionals interested in the use of Reflective ePortfolios as a tool to support lifelong learning. 2) Participants who wish to use reflective writing to stimulate personal and professional development.

Structure of Workshop: The workshop will begin with an introduction to the use of reflective ePortfolios and the practice of reflection. A number of frameworks that can be used to structure reflections will then be outlined. During the workshop participants will be given opportunities to practise reflective writing. Participants will also receive a Getting Started handout summarising key aspects of the workshop.

Intended Outcomes: At the end of the workshop, participants should

- 1) be able to realise the potential of technology enhanced reflective ePortfolios to facilitate active lifelong learning
- 2) be able to utilise a variety of frameworks for reflection
- 3) know how to exploit complex or adverse situations so that each event becomes an opportunity for concrete learning and self-development

Level: All

Demographics and career interest of students in a novel high school STEM academy designed to increase diversity in the health professions

AUTHOR(S):

- Reamer Bushardt, George Washington University School of Medicine & Health Sciences, USA (Presenter)
- Catherine Golden, George Washington University School of Medicine & Health Sciences, USA
- Linda Zanin, George Washington University School of Medicine & Health Sciences, USA
- Maranda Ward, George Washington University School of Medicine & Health Sciences, USA
- Robert Turner, George Washington University School of Medicine & Health Sciences, USA
- Marcia Firmani, George Washington University School of Medicine & Health Sciences, USA

ABSTRACT

Background: Despite scientific and technological advancements in U.S. healthcare, health inequity and workforce diversity are major problems. Health inequities by income, race/ethnicity, education, insurance status, and English-competency persist. An urban private academic medical center and public high school partnered in 2018 to implement a novel secondary education STEM academy to increase workforce/trainee diversity.

Summary of Work: During the last four years of secondary education, students complete secondary and dual-enrollment courses in a healthcare-focused academy. At graduation, students earn healthcare certifications, college credit and advantage for admission into healthcare programs. The inaugural cohort of students (ages 14-15 years) self-reported various measures via voluntary electronic survey (e.g. demographics, academic/career interests, knowledge of health professions, academic/career plans). The survey was piloted prior to administration.

Summary of Results: Respondents (N=77 of 104, RR=74%) were 81.8% female and 60% non-white/multiracial. Demographics were 40% white, 18.2% black, 10% Asian, and 18% Hispanic/Latino. Around 30% spoke English as a second language, of which 32.5% spoke ≥2 languages fluently. About half were from neighborhoods with household incomes \$60,000-80,000 USD/year and most had parent(s) with bachelor's degree or higher (57.1%). Some had relatives working in healthcare (24.7%). Motivations for participation included interest in working with patients (90.9%), personal interest in medicine (92.2%) or health sciences (58.4%) and feeling the program would help successful career attainment (26%). Students reported anticipated challenges with academic difficulty, heavy workloads, and time management. Few could independently describe key aspects of common health professions (e.g. skill/education requirements, salary) except for nursing. Most (62.3%) intend to pursue a 4-year degree with highest interest in nursing (44.2%) and surgery (37.7%).

Discussion and Conclusions: These students are more ethnically diverse than the US workforce they are designed to enter. Language competencies were advantageous considerate of regional population needs. Students lacked sufficient breadth and depth of understanding of health careers for optimal academic/career planning and require individualized mentoring/advisement. Longitudinal qualitative/quantitative measures will be collected to assess performance, attitudes, perceptions, and career outcomes.

Take-home Messages: Diversity in the US healthcare workforce and student pipeline, including individuals from disadvantaged backgrounds, is inadequate. Innovative approaches to improve workforce and trainee diversity, lower costs/time of education, and increase health equity are needed.

The preliminary result of motivational drive chart to Japanese female medical doctors

AUTHOR(S):

- Fukuko Moriya, Kurume University School of Medicine, Department of Pathology, Japan (Presenter)
- Tatsuyuki Kakuma, Kurume University, Biological Analyzing Center, Japan
- Hitoshi Obara, Kurume University Hospital, Clinical Research Supportive Center, Japan
- Mizuho Kido A., Anatomy & Physiology, Faculty of Medicine, Saga University, Japan
- Hirohisa Yano, Kurume University School of Medicine, Department Of Pathology, Japan
- Takuji Torimura, Kurume University School of Medicine, Gastroenterology, Japan

ABSTRACT

Background: Japanese society has had long-held stereotype division between the social roles of men and women. Some female medical doctors pursue their career after childbirth, but others are compelled to stop working due to childbirth or childcare. There are few formal studies for qualifying or quantifying the motivational changes of Japanese female medical doctors. Analyzing how their working motivation is driven by life-time events is very effective to encourage them to pursue their career.

Summary of Work: The university hospitals of Kurume and Saga designed a questionnaire to study working motivation focusing on female medical doctors with childcare experience. We charted our findings and came up with our original 'Motivational drive chart'. This chart reflected the change of working motivation. It requires to note the age, the motivational value, and the life-time event when the value moves. We randomly chose 39 female medical doctors, which is equivalent to about 7.5 percentage of female doctors' population in these areas. We analyzed their motivational charts by STATA 15(Stata Corp).

Summary of Results: The range of age of those interviewed is 30 to 46. The motivational value drops in 25-30 years old significantly ($P < 0.001$), but gradually increases in 30-35 years old significantly ($P < 0.05$). Childbirth, childcare or anxiety on career development and unbalance of work and childcare is significantly relevant to the drop of working motivation in 25-30 years old. Otherwise getting a medical specialist license is significantly relevant to the increase of motivation in 30-35 years old. In 35-40 years old, their motivational value significantly decreases by childbirth and childcare or family to get sick.

Discussion and Conclusions: Japanese female medical doctors can work just like male doctors can. However once they give birth, they can no longer work in the same way as before because housekeeping and taking childcare are Japanese female's role. We guess that the drop of working motivation by childcare might have a relationship to Japanese social roles. We should find the reason why Japanese female medical doctors lose their motivation by childbirth or childcare.

Take-home Messages: Japanese female medical doctors drop their motivation after childbirth and during childcare. We want participates from other countries to know the plight of them.

How to use entrustable professional activities (EPAs) to teach cultural competence and diversity issues to undergraduate medical students

AUTHOR(S):

- Jeanine Suurmond, Amsterdam UMC, The Netherlands (Presenter)
- Ines Rupp, Amsterdam UMC, The Netherlands

ABSTRACT

Background: EPAs are core units of professional practice that can be fully entrusted to a trainee as soon as he or she has demonstrated the necessary competence to execute the activity unsupervised, and thus reflect the objectives of postgraduate training, but because EPAs are composed of different CANMED roles and are executable, observable, and measurable in process and outcomes, they are increasingly being used in undergraduate training as well. For this purpose, the Utrecht Framework defines five core EPAs and 31 small nested EPAs. For example, one core EPA is: informing, advising and guiding patients and families and consists of 3 nested EPAs: (1) Discussing diagnostic options and obtaining informed consent: (2) Discussing test results, prognosis, and a management plan and (3) Discharge conversation. While medical schools need to prepare students to deliver care to diverse patient populations, the question is: Can EPA's be used for observing and assessing tasks and responsibilities related to diversity responsive care?

Summary of Work: We used the framework of cultural competence to describe knowledge, attitudes and skills to deliver diversity responsive care, eg the skill to use interpreters in case of language barriers or the skill to communicate in case of cultural conflicts. Using this framework, we analyzed whether the core EPAs described these specific knowledge, attitudes and skills or whether adaptations are needed.

Summary of Results: There are (at least) two ways to make the above mentioned EPA diversity sensitive: 1. The skill 'to use interpreters when needed' can be added as a fourth nested EPA. 2. EPA's may be rewritten, e.g., the second nested EPA can be rewritten into: 'Discussing test results, prognosis, and a management plan taking into account socio-cultural factors' so that cultural conflict is managed.

Discussion and Conclusions: It is relatively easy to map the concept of cultural competence to EPAs. As a next step we would recommend to obtain consensus, for example in a Delphi study with experts, on what EPAs are most relevant for cultural competence training and when they can be entrusted.

Take-home Messages: The framework of cultural competence can be used to refine EPAs. The refined EPAs can be used to better assess cultural competences of students.

Lack of representation in clinical skills manikins: Is this contributing to differential attainment in undergraduate medical education?

AUTHOR(S):

- Peter Tamony, St George's, University of London, UK (Presenter)

ABSTRACT

Background: Addressing the ethnicity attainment gap is a key goal for medical schools. Data shows that Black, Asian, and minority ethnic students (BAME) have poorer educational outcomes than their White colleagues. There are several hypotheses for this, including BAME students feeling isolated and institutional bias. There is a paucity of literature on how this can be addressed in clinical skills teaching during medical school and whether using manikins with non-white skin colour increases inclusivity of BAME students.

Summary of Work: St George's, University of London (SGUL) uses 4 main suppliers for clinical skills models. During the early years of the medical degree (MBBS) programme the following models are used: venepuncture/cannulation, peripheral arterial blood gas sampling, digital rectal examination, male pelvic examination, female pelvic examination, urinary catheterisation, obstetric examination, breast examination, intramuscular injection, airway management, and otoscopy. Academic staff are not directly involved in the procurement process. The authors set out to document what number of darker skin models the department currently has, and what models are offered by their suppliers.

Summary of Results: SGUL has 223 models used for teaching 11 different clinical skills during the MBBS programme. All 223 models have pale skin colouring. Dark skin models are available for 3 of the procedures SGUL teach (venepuncture/cannulation, intramuscular injections, and otoscopy).

Discussion and Conclusions: Although darker skinned models are available for certain skills, the university does not stock any. Our BAME students may feel excluded or isolated during teaching of clinical skills because of this. Extensive further study is needed in this area. We need to explore: student perceptions of skin colour on clinical skills models and teaching of skin signs; whether introducing darker skin models has a positive impact on BAME students' feelings of inclusiveness and confidence in performing skills; and whether other medical schools have a more inclusive approach. Awareness must be spread and good practice should be shared. If this leads to increased demand, equipment suppliers will need to increase their range of models available with dark skin.

Take-home Messages: Current practice is suggestive of institutional bias. This could be contributing towards the BAME attainment gap.

Evaluation of the present situation of bilingual teaching in eight-year M.D. program in China and a vista for possible reformative schemes

AUTHOR(S):

- Hongyu Jin, West China Hospital, Sichuan University, China (Presenter)
- Chi Yuan, West China School of Medicine, Sichuan University, China
- Ping Qing, West China School of Medicine, Sichuan University, China
- Rui Zeng, West China Hospital, Sichuan University, China

ABSTRACT

Background: Bilingual teaching is a necessary product in the field of professional courses teaching induced directly by a purpose to catch up with international education level during the educational reforms in China. In medical colleges, courses applying this teaching mode is conducted in English mainly, together with a necessary fraction of Chinese to confirm students' comprehension. Our research aims to explore underlying deficiencies of bilingual teaching system from brand-new aspects along with possible reformatory solutions.

Summary of Work: This survey reflects the current status of bilingual teaching in eight-year M.D. program from the perspectives of both the teachers and students via questionnaire analysis and face to face interviews. A total of 19 teachers, doctors and 66 students from West China School of Medicine, Sichuan University and other colleges were included.

Summary of Results: 60.61% (40/66) of the students surveyed believed that bilingual teaching was necessary for eight-year M.D. program students. However, 50% (20/40) of them attributed the benefits of bilingual teaching to vocabulary improvement only and 30% attributed it to better understanding of medical theory system. From the teachers' prospective, most of them call on increased proportion of English in bilingual teaching and 73.7% (14/19) were not satisfied with the current status of bilingual teaching.

Discussion and Conclusions: Compared with a survey conducted in 2011, the proportion of students and teachers who are not satisfied with the bilingual teaching has increased, so as the proportion of students who want diverse types and more bilingual class hours. The survey reflects the contradiction between what students and teachers expect in bilingual courses quality and class hours and the resources school can provide. Meanwhile, another contradiction between English level of students and requirements of bilingual teaching also exists. Therefore, solving problems caused by these two contradictions is the key point to improve the efficiency of bilingual teaching and learning.

Take-home Messages: There is a great disparity between reality and expectation of bilingual teaching in eight-year M.D. program in China. The current teaching model satisfies neither teachers nor medical students. It is of great importance to launch out more reformatory policies to comprehensively improve its efficiency.

Public health education for medical students: interaction with multicultural students to learn diversity in health promotion

AUTHOR(S):

- Chi-Feng Hsieh, I-Shou University, Taiwan (Presenter)
- Shu-Wen Wan, I-Shou University, Taiwan
- Hsing-yen Hsieh, I-Shou University, Taiwan
- Yun-Ju Chen, I-Shou University, Taiwan

ABSTRACT

Background: The School of Medicine for International Students of I-Shou University in Taiwan is a newly established four-year M.D. program (taught in English for Bachelors degree) that aims to cultivate passionate and devoted international medical professionals for home countries. For nurturing internationally accredited doctors dedicated to humanitarian service and global healthcare, public health competencies, especially as they relate to the management of chronic disease, will be of increasing importance to the global health-care workforce.

Summary of Work: The students need to be able to use their understanding of public health to benefit patients. Nineteen third grade medical students from 10 countries who selected the class Healthcare in developing countries were divided into 4 groups for cases study and health promotion making. For the local and international media play a vital role as the link between health workers and the larger public at present, the designed curriculum considered the interaction with multicultural students to learn diversity from each other in health promotion. Interdisciplinary teaching was performed by teachers with different expertise.

Summary of Results: Students mostly responded positively to the class with a significant focus on interacting with the multicultural and multidisciplinary learning. Students realized the significance and barriers of healthcare in developing countries and reflected deeply on their discussion with the multicultural patients. Students learned the successful and challengeable factors in health promotion and policies well during cases study and discussion. Finally, four great health promotion videos for specific health need of home countries were created and shared with public.

Discussion and Conclusions: The aim of the class was achieved. Medical students' interaction with multicultural group members may promote the students' understanding and reflection in health care and promotion. To strengthen teaching of public health in undergraduate medical schools, we could : (1) Review the curriculum for public health teaching. (2) Explore and include innovative teaching methods like social media communication. (3) Harmony between national health needs, health programs and public needs for multinational students in medical schools.

Take-home Messages: Medical students' interaction with multicultural group members may promote the students' understanding and reflection in health care and promotion.

Graduates' ratings on acquired gender perspectives and gender medicine-related knowledge and competencies: A comparison between the traditional and new modular curriculum of medicine at Charité Berlin

AUTHOR(S):

- Sabine Ludwig, Charité - Universitätsmedizin Berlin, Germany (Presenter)
- Harm Peters, Charité - Universitätsmedizin Berlin, Germany
- Vera Regitz-Zagrosek, Charité - Universitätsmedizin Berlin, Germany
- Ute Seeland, Charité - Universitätsmedizin Berlin, Germany

ABSTRACT

Background: With the introduction of the new modular curriculum of medicine, gender medicine knowledge and sex/gender differences in the prevention, diagnosis and therapy of diseases were systematically integrated into the curriculum and are part of the assessment. A gender change agent supported the integration. Here, the aim was to evaluate how graduates of both medical programs rate their gender medicine-related knowledge and competencies.

Summary of Work: A questionnaire was developed and sent to the first graduates of the new curriculum (N=83) and to 221 graduates of the traditional curriculum in 2017, half a year after their graduation. Students were asked to rate their knowledge in gender medicine and their ability to apply sex and gender-specific skills in different medical domains, e.g. diagnosis, medical decision-making and prevention.

Summary of Results: The response rate was 17% for the new curriculum and 15% for the traditional curriculum. Among the graduates of the new curriculum, 31% rated their knowledge in gender medicine as 'very good' or 'good', whereas 52% of the graduates of the traditional curriculum rated their knowledge as 'poor' or 'very poor'. 50% of the graduates of the traditional curriculum feel capable to apply sex- and gender-specific aspects in the diagnosis of diseases, 47% in medical decision-making and 45% in prevention, compared to 77% of the graduates of the new curriculum for all three medical domains.

Discussion and Conclusions: Graduates of the new curriculum rate their knowledge in gender medicine better than those from the traditional curriculum. This translates in higher skills in the application of gender-related aspects in the diagnosis, medical decision-making and disease prevention in their clinical work. Although, the self-ratings of the graduates of the new curriculum are better, the survey shows that gender medicine content should still be reinforced within the curriculum. For this, the GenderMed Database (<http://gendermeddb.charite.de/>) and the eGender Module (<http://egender.charite.de/>) can be used.

Take-home Messages: A systematic integration of gender perspectives and gender medicine-related aspects in medical curricula translates in better self-ratings of medical graduates on their ability to apply gender-related aspects in their clinical work.

Applied Virtual Medical Educational System with Cross-Cultural Case Scenarios in Building Better Patient Care - A Pilot Study from Taiwan International Scholarship Program

AUTHOR(S):

- Ruyi Huang, E-DA Hospital & I-SHOU University, Taiwan (Presenter)
- San-nan Yang, E-DA Hospital & I-SHOU University, Taiwan
- Hsing-Yen Hsieh, I-Shou University, Taiwan
- Tsuen-Chiuan Tsai, Kaohsiung Medical University, Taiwan
- Chyi-Her Lin, E-DA Hospital & I-SHOU University, Taiwan
- Chi-Wei Lin, E-DA Hospital & I-SHOU University, Taiwan

ABSTRACT

Background: The paramount importance of cross-cultural education in international medication education is self-evident. However, international students often had the language barrier and were unfamiliar with social norms that impede the development of their patient-centeredness skill. Virtual medical education could take advantage of inventing different colors of skin, language and social settings in the scenarios. Therefore, we aim to investigate if different language scenarios would affect students' learning outcome on whole-person care.

Summary of Work: We designed a pilot feasibility study of cross-cultural patient scenarios with both English and Chinese version. 18 groups (each group has 3-5 students) were included. The sessions began with 10 minutes of introduction on whole person approach, followed by role assignments and 90-120 minutes of group discussion. The teachers guided the session with a bio-psycho-social approach. The virtual educational system scores separately in history taking, physical examination, laboratory testing, and final diagnosis. The differences between the two groups of means were compared using independent-tests. The satisfaction questionnaire was applied to discover students feedback.

Summary of Results: Overall, the testing of mean scores did not show significant differences between the English group and the Chinese group. Nonetheless, the students reported gaining a better understanding of the needs of patients, being exposed to new languages and issues of cultural competency, and knowing more of the social and behavioral context of patients through the virtual educational system.

Discussion and Conclusions: Combining carefully designed case scenarios with virtual education training helps international students to learn skills of whole-person approach despite language differences. Surprisingly, our students could show empathy to specific emotional cues, and obtain prompt diagnosis despite the language barrier in virtual training. The translators and group dynamics were vital in facilitating these learning outcomes. Future effort could be extended to designing diverse age, gender, skin-color scenarios, in training whole person care, and to examine, if it affects the real-cultural OSCE scores.

Take-home Messages: Understand the impact of language barrier of the international program could be mitigated through introducing virtual educational training, in which students could cultivate whole-person approach while gaining exposure to diversity early.

Addressing Gaps in the Attitudes and Beliefs of Workplace Sexual Harassment for Nurses and Trainee doctors in a Singaporean Academic Hospital

AUTHOR(S):

- **Nichollette Goh, National Health Group, Singapore (Presenter)**
- Kaushal A. Sanghvi, National Health Group, Singapore
- Sarah Lu, National Health Group, Singapore
- Cheong Wei Huey, National Health Group, Singapore

ABSTRACT

Background: Sexual harassment (SH) can be defined as any unwelcomed conduct of a sexual nature, which has the effect of creating an intimidating, hostile and degrading environment for the victim. There are few predisposing factors for medical and nursing training unlike other workplaces. The nature of work is often in small groups, requiring physical examination and discussions of marital infidelity, sexual abuse, and similar topics rarely discussed in other professional settings. This may contribute to the breakdown of social barriers that would otherwise preclude unwelcomed sexual overtures.

Summary of Work: A literature search was conducted on the topic of workplace SH in a Singapore academic hospital pertaining to nurses and trainee doctors. Relevant medical, empirical and theoretical research literature were identified through a multitude of medical education, social science and media search engines.

Summary of Results: The review showed a public opinion campaign done in Singapore in 2008 and this poll showed that half the population had experienced some form of SH. There was also a paper describing that different ethnic groups in Singapore perceived cues to SH differently - Singaporeans use English as a high context language, which complicates the victim's coping response. There were multiple other articles reflecting trends of SH in medical trainees and nurses from other western countries.

Discussion and Conclusions: The literature review demonstrated that amongst Singaporean general population, there was a difference of attitude to SH in different ethnicities. It also reflected the public opinion wherein a high percentage of the responders have experienced some form of SH. We also discovered academic articles reflecting high trends of SH in hospitals in developed countries.

Take-home Messages: This study is lacking a previous precedent in Singapore. A Singaporean academic hospital is a multi-ethnic and multi-racial workplace. It can be postulated that the attitudes and beliefs towards SH would be different when comparing the general population of Singapore and other developed countries. We will be embarking on a mixed-methods study to further explore SH in our local context.

#5EE ePosters - Assessment

The Application of Milestones and Entrustable Professional Activity in Standardized Patient Training - the Results of Pilot Study

AUTHOR(S):

- Chia-chang Huang, Taipei Veterans General Hospital, Taiwan (Presenter)
- Chin-Chou Huang, Taipei Veterans General Hospital, Taiwan
- Ying-Ying Yang, Taipei Veterans General Hospital, Taiwan
- Ling-Yu Yang, Taipei Veterans General Hospital, Taiwan
- Fa-Yauh Lee, Taipei Veterans General Hospital, Taiwan
- Shou-Yen Kao, Taipei Veterans General Hospital, Taiwan

ABSTRACT

Background: Standardized patients (SP) can simulate clinical cases. The reliability of Objective Structured Clinical Examination (OSCE) was affected by the many factors. Milestones and entrustable professional activity (EPA) are competency-based training and assessment models. In the standardized patient training, we could also use the concept for their training program.

Summary of Work: This project was conducted since Aug 2016. The first year, we developed 4 EPAs, include scenario of history taking, physical examination, communication & patient education, and reports interpretation & disease management. Total 67 SPs, 21 SP trainers and 17 raters were enrolled in the OSCE for pilot study during Feb to May 2017. The response rate of questionnaire was 94.3% (99/105) after pilot study.

Summary of Results: The professional content validity of this version were history taking 4.62 (0-5), physical examination 4.70 (0-5), communication & patient education 4.69 (0-5), and reports interpretation & disease management 4.68 (0-5). The mode of SPs performance were seven (1-9) in history taking (level 4), eight (1-9) in physical examination (level 4-5), seven (1-9) in communication & patient education (level 4) and seven (1-9) in reports interpretation & disease management (level 4). The Cronbachs Alpha of students' OSCE scores was 0.571 in the 8 SP stations of Feb. 2017. About the application of milestones and EPAs in SP training, there were 65.7% understood, 17.2% general known and 16.2% unknown among SPs, SP trainers and raters. Seventy seven percent SPs (48/62) indicated that they had achieved the desired goals.

Discussion and Conclusions: Through this pilot study, the application of milestones and EPAs could defined the competence of SP in these 4 EPAs with level 4 to 5 after 90 minutes SP training program in OSCE. The concepts and formats of EPA and milestones were so complex that they need time to understand and application. Brief explanation and sufficient time for SP training could be effectively using and promoting milestones and EPAs.

Take-home Messages: 1. The concepts and formats of milestones and EPAs could be applied in the SP training as an competency-based training and assessment model. 2. Brief explanation and sufficient SP training could be effectively using and promoting milestones and EPAs.

Written Assessment and The Cognition Levels Addressed: A Review of Published Studies in Health Sciences

AUTHOR(S):

- Mei Yee Ng, Trinity College Dublin, Ireland (Presenter)
- Richard Deane, Trinity College Dublin, Ireland

ABSTRACT

Background: Variety of written assessment formats are used in the field of undergraduate and postgraduate medical education namely those requiring knowledge-generation particularly essays and short-answer questions. These have largely been replaced by formats requiring knowledge-recognition particularly multiple-choice questions, single best answer questions, extended-matching questions. Rising concerns exist regarding the impact of widespread and exclusive use of the popular SBAQ format in assessment of medical professionals, specifically, knowledge overestimation and encouragement of surface learning. Computerised grading of SAQs now exist to enhance their feasibility as an assessment format.

Summary of Work: This review aimed to find out how cognitive levels are addressed by various types of written assessment format in health sciences and to ascertain the type of written assessment format that can achieve higher-order cognitive levels. Bibliographic databases were used to perform the literature search using a predetermined phrases list. Additional articles were identified from obtained articles references. Original studies from tertiary-level institutions offering health science programs addressing cognitive level measurement in written assessments were accepted. Full-text were obtained for articles meeting the inclusion criteria. Thematic analysis was done according to type of health science programs and basic science and clinical subjects.

Summary of Results: Limited research exist addressing these questions especially for clinical subjects in undergraduate and postgraduate medicine level. Most studies found that using Bloom's taxonomy to develop questions can produce questions aimed at higher-order cognitive levels as most written assessments were targeting lower-order cognitive levels. There is consensus that well-designed knowledge-recognition assessment formats are an effective replacement to test higher-order cognitive levels and could satisfactorily replace or be superior to knowledge-generation assessment formats even though they are difficult to produce and training is required.

Discussion and Conclusions: Further evaluation of these research questions is warranted given the significant role played by written assessment in medical education at both undergraduate and postgraduate levels and the limited research that address these questions especially for clinical medicine subjects.

Take-home Messages: It is possible to use written assessments to test at higher-order cognitive levels. Questions testing higher-order cognitive levels are difficult to produce and training in question development using Bloom's taxonomy is needed. Collapsing Bloom's taxonomy into 3 categories improves its usage.

Developing an Online Structured Professional Reasoning Exercise (e-OSPRES) to test case assessment, diagnosis and Treatment Planning in orthodontics

AUTHOR(S):

- Richard Cure, University of Warwick, UK (Presenter)
- Elizabeth Hopkins, University of Warwick, UK

ABSTRACT

Background: Case assessment, diagnosis and treatment-planning of unseen cases is an integral part of Masters level/specialty training in Orthodontics, assessing the clinical reasoning construct. Historically, hard-copy photographs, radiographs and study-models have been used, for a structured viva between examiners and candidates, testing case-assessment, diagnosis and treatment-planning skills. Oral vivas, even with marking criteria, are open to criticism for potential examiner bias, stringency variation and subjective standards for passing, resulting in poor reliability; they are also time consuming and 'people-dependant.'

Summary of Work: Digital artefacts for unseen cases: photographs, radiographs and 3D images of teeth were used. Structuring of the overall assessment included: setting questions and potential answers in a 'drop-down' format, thus alleviating the need for 'free-text' answers, which were generic for a wide-range of clinical cases, and developing protocols for computerised marking. An e-platform which enabled 3D imagery manipulation and compatible across e-platforms was developed, trialled on specialty trainees and then used for a cohort of Masters students.

Summary of Results: e-OSPRES provide more structure, clarity, validity and reliability for assessment, facilitate computerised marking, allow greater flexibility in delivering case-based assessments, reduce the examiners required at centres and enhance marking consistency. Candidate performance mirrored performance in other areas of assessment and feedback was favourable on the process.

Discussion and Conclusions: Unseen cases assess candidates clinical reasoning and problem-solving capabilities, together with aspects of continuing case-management, traditionally assessed by a viva-voce. An e-format, which assesses the same abilities, yet is able to deliver the same assessment across multiple candidates, without a viva, was required and developed. An e-OSPRES to test case assessment, diagnosis and treatment-planning in orthodontics is a viable alternative to traditional hard copy material and vivas for unseen cases. The model allows delivery of the assessment in any environment with an IT thus facilitating flexibility in both venue and timing of delivery and allow allows any number of candidates to sit the assessment simultaneously. The format has potential for use in the wider dental and medical field.

Take-home Messages: e-OSPRES are a viable alternative to traditional vivas IT systems facilitate flexibility in assessment venues Computer marking viable with 'drop-down' format answers Variety of clinical-cases fit into generic format

More than Just Numbers - Mean ABEM-ITE Percentile Score Helps Predict Resident Success in Final Exam in a Singapore Emergency Medicine Program

AUTHOR(S):

- Dong Haur Phua, Tan Tock Seng Hospital, Singapore (Presenter)

ABSTRACT

Background: All Emergency Medicine (EM) residents in Singapore are required to take the American Board of Emergency Medicine In-Training Examination (ABEM-ITE) once a year. They are subsequently provided with their percentile score in relation to other EM residents who have taken the examination. Upon completion of residency, residents have to successfully complete a final qualification examination (FQE) consisting of written, clinical viva, appraisal of literature, teaching and administration components to receive specialist accreditation as an Emergency Physician with the Specialists Accreditation Board in Singapore. This study aims to examine the relationship between ABEM-ITE percentile scores and success in the FQE in a single nascent EM program.

Summary of Work: Yearly ABEM-ITE percentile scores of all residents in our residency program who attempted the FQE were collected. Data from residents who were attempting the FQE for the first time were analysed.

Summary of Results: Data from 17 residents who attempted the FQE between 2011 and 2014 were analysed. The individual resident's mean ABEM-ITE percentile score across their residency years was 72.26 (S.D. 7.01) in those who succeeded in the FQE, compared to 67.15 (S.D. 6.37) in those who did not succeed. The last ABEM-ITE percentile score just before the FQE of residents who succeeded was 74.64 (S.D. 7.02), that of those who did not succeed was 72.33 (S.D. 7.39). Independent-samples t-test did not reach statistical significance.

Discussion and Conclusions: There was no statistical difference between the mean ABEM-ITE percentile score of residents who succeeded in the FQE and those residents who were unsuccessful, this could be due to small data set. Nevertheless the mean ABEM-ITE percentile scores were markedly different. That of residents who succeeded on at the FQE was distinctly higher than those who did not.

Take-home Messages: Performance in ABEM-ITE helps this residency program to identify EM residents who are at risk of not succeeding in the FQE and alert the program to possible need for early educational intervention.

Balint Group as Facilitator Instrument of Medical Internship Students Training

AUTHOR(S):

- Edmea Oliva-Costa, Universidade Federal de Sergipe, Brazil (Presenter)
- Rayssa Didou, Universidade Federal de Sergipe, Brazil
- Damaris Calcides, Universidade Federal de Sergipe, Brazil
- Enaldo Melo, Universidade Federal de Sergipe, Brazil

ABSTRACT

Background: Medical training is quite complex, since factors related to the student's personality, daily dealing with pain and death can contribute to mental health problems not always investigated during the medical undergraduate. Medical students suffer more stress in the last two years of their undergraduate (Medical Internship) and Balint Group (BG) participants develop skills to better protect themselves from these stressors. Objectives: To investigate about the BG repercussion in medical internship students from a Northeastern Brazilian public University.

Summary of Work: Qualitative study performed through BG from September/2017 to April/2018. Weekly sessions of BG were held for one hour and a half each, comprising a maximum of 12 students during 10 weeks each group, totaling 68 students. Annotations were made on the field research notebook regarding the most reoccurring testimonies every session. There were also another data collecting tool: a report made by each participant after the last sessions, about the BGs contributions to their own medical education process and mental health.

Summary of Results: Feelings of dissatisfaction, fear and insecurity were part of the general picture brought by most students, which ratifies the high levels of stress of the medical school. Recurrent themes during the groups: 1-Difficulty dealing with death; 2-Difficulties in transmitting bad news; 3-Difficulty dealing with patients in mental suffering - fear of madness; 4-Fears about the professional market and the choices of medical residency; 5-Reports of physical, emotional and mental exhaustion; 6-Difficulties about interpersonal relationships within the medical undergraduate.

Discussion and Conclusions: The Balint Group promoted a positive reinforcement in the medical education process, due to being one of the rare available spaces during undergraduate studies when students could express their dissatisfactions, wishes and expectations. The participants showed a reduction in the anxiety referred to during the first sessions of BG, which demonstrates to be a good preventive strategy to the deteriorating mental health of undergraduate students during their medical education.

Take-home Messages: The results reinforce that BG is a good strategy to enable a less stressful academic experience for medical students. In the present study, BG contributed to decrease psychic distress and increased the students communication skills. Thus BG can be a useful tool in medical training.

The role of question banks and the implications for medical schools: a systematic review

AUTHOR(S):

- **Afra Jiwa, King's College London, UK (Presenter)**
- Edward Fenby, Kings College London, UK
- Eugene Ace McDermott, Kings College London, UK
- Mariam Koronfel, Kings College London, UK

ABSTRACT

Background: Recently, medical schools in the UK have chosen multiple choice question (MCQ) examinations to test knowledge as recommended by the General Medical Council (GMC). In response, the Medical Schools Council Assessment Alliance (MSCAA) established a question-bank in 2013 supplying universities with questions for their examinations. A number of private companies have developed question-banks, to familiarise users with MCQs and to encourage spaced repetition. Three key providers supply this at costs ranging from £25-63 per annum. Though the utility of question-banks is recognised, this work seeks to better understand the role of question-banks and address the implications for medical schools.

Summary of Work: Comprehensive searches of relevant databases were completed in January 2019 using the following keywords and associated terms; MCQ, Single best answer (SBA), answer-bank and question-bank. The reference lists were manually searched for relevant studies. Of 192 articles, 17 were deemed relevant and included for analysis.

Summary of Results: Several studies confirmed the correlation between use of question-banks and test scores but identified differences in effectiveness poststratification. Two studies showed increased effectiveness in low performing students. Three studies highlighted the benefit of question-banks which were adapted to course and assessment format, alongside cultural and racial differences; specifically, those underrepresented in questions found less benefit from the resource. Two studies reviewed student-authored question-banks. One deemed a pay-by-play model effective - students could access the question-bank if they provided questions. In both models, question writing frequency correlated with summative performance and results suggested student-authored questions were of sufficient quality, despite concerns. Participants from several studies suggested schools should implement a spaced repetition tool or similar.

Discussion and Conclusions: Low achieving students would benefit most from curriculum-specific question-banks which account for cultural differences. As generic question-banks cannot provide this, medical schools should consider offering students access to contextualised question-banks. Discrepancies in income limit equal access to question-banks and provide further justification for internal question-banks.

Take-home Messages: Universities should consider implementing context-specific question-banks to enable fair access to resources for students. Student-authored question-banks may be a suitable alternative; further research is necessary to consolidate findings.

A tool to identify and support medical students who are high achievers in basic science written assessments but lower performers in OSCEs

AUTHOR(S):

- Alexia Papageorgiou, University of Nicosia Medical School, Cyprus (Presenter)
- Nicoletta Nicolaou, University of Nicosia Medical School, Cyprus
- Constantina Constantinou, University of Nicosia Medical School, Cyprus
- Ourania Kolokotroni, University of Nicosia Medical School, Cyprus
- Stelios Georgiades, University of Nicosia Medical School, Cyprus
- Adonis Ioannides, University of Nicosia Medical School, Cyprus

ABSTRACT

Background: Clinical and communication skills are part of the curriculum of medical degrees and are commonly assessed by OSCEs. Performance in OSCEs requires the application of skills that are different to those applied in written assessments for the basic sciences. This work aims at providing a tool (a) to identify students that perform well in the basic sciences but not in their OSCEs and (b) to be used by the clinical and communication skills team to identify the causes behind low performance and provide additional support.

Summary of Work: 101 medical students (from years 2 and 3 of the MD programme) were included in the study. To investigate the association between performance in basic sciences and OSCE performance, the students were ranked based on their mean performance in the basic sciences and their performance in the OSCE in the corresponding semester. A scatterplot was created (OSCE rank on the y-axis, basic science rank on the x-axis) and the 25th and 75th rank percentiles were estimated.

Summary of Results: Overall, there was a significant correlation between mean performance in the basic sciences and OSCE performance. However, the scatterplot allowed easy identification of students who performed well in the basic sciences (i.e. basic science rank within the 25th percentile) but did not perform well in their OSCE (i.e. OSCE rank within the 75th percentile).

Discussion and Conclusions: The proposed method could be used to provide feedback to students with regards to their ranking in the basic sciences and OSCEs and alert students performing well in their basic sciences to the need for working on their communication and clinical skills. In addition, the clinical and communication skills team could offer appropriate support mechanisms based on the underlying cause behind low performance in OSCEs, such as anxiety and reticence, rather than lack of basic scientific understanding.

Take-home Messages: We propose a method for identifying students who, despite their high performance in basic sciences, may require additional help with their clinical and communication skills. This tool could also be used for longitudinal monitoring of individual student performance and assessing the effectiveness of the support mechanisms.

Medical students' peer to peer assessment reliability in clinical case simulations training

AUTHOR(S):

- **Laura Malakauskiene, Lithuanian University of Health Sciences, Lithuania (Presenter)**
- Jonas Ulevicius, Lithuanian University of Health Sciences, Lithuania
- Brigita Mazenyte, Lithuanian University of Health Sciences, Lithuania
- Ruta Jolanta Nadisauskiene, Lithuanian University of Health Sciences, Lithuania
- Ausrele Kudreviciene, Lithuanian University of Health Sciences, Lithuania

ABSTRACT

Background: Progressive teaching trends strive to combine traditional learning techniques and modern technologies, either focused on student centered approach. Students self-learning, peer-to-peer learning and assessment, as well as adequate feedback by peer and teacher support successful learning. Aim of the study was to evaluate the reliability of undergraduate medical student's peer-to-peer assessment of clinical case simulations in the module of Obstetrics and Gynecology.

Summary of Work: Subjects of the study were undergraduate fifth-year students of the Lithuanian University of Health Sciences (LSMU) Medical Academy who were studying Obstetrics and Gynecology module during the period from 2017 September to 2018 November. Students were using HybridLab® training technique for improvement of gynecological, obstetrical and neonate patient investigation skills. A retrospective analysis was done, comparing peer-to-peer student's and teacher's evaluation of clinical case simulation performance. Simulations were evaluated using a standardized checklist, which afterwards was converted to a score from 0 to 100. Scores were compared using Wilcoxon signed rank test and results are given in the following manner: median (min-max; mean).

Summary of Results: During the selected period 466 students have participated in 1668 clinical case simulations. While comparing peer-to-peer and teachers' evaluations, 55,5% (n=926) of simulations were evaluated identically, in 36,5% (n=608) of cases evaluation scores, given by peers were higher and in 8,0% (n=133) were lower, comparing to teachers' evaluations. Median scores given by peers and teachers were 100 (39-100; 98,6) and 100 (26-100; 95,2) respectively (p<0.001). In 27,8% (n=206) of cases with unequal evaluations, score difference was more than 10.

Discussion and Conclusions: Almost half of student's peer-to-peer evaluations diverged from teachers' evaluations, which were considered as a standard. Moreover, the difference was significant. This data raises doubts about the reliability of students' peer-to-peer assessment of clinical case simulations. Incorrect assessment can fail expected and adequate feedback, as well as successful learning.

Take-home Messages: Students' peer-to-peer evaluation is an important part of medical training and teamwork skills. However the use of peer-to-peer assessments for professional development in healthcare professional curriculum shouldn't be a key standard.

Exploring and Analyzing Clinical Examination and Lateral Thinking (EXCEL) Program applies script theory as the pedagogue in enhancing learning for early year clinical students

AUTHOR(S):

- Zong Jie Koh, National University Hospital Singapore, Singapore (Presenter)
- Choon Seng Chong, National University Hospital Singapore
- Benjamin Goh, National University Hospital Singapore
- Celene Ng, National University Hospital Singapore

ABSTRACT

Background: Medical students transitioning into their clinical years struggle in developing effective clinical approaches based on theoretical knowledge. Evidence supports that experienced clinicians are distinguished by the organization of their knowledge rather than their abilities in problem-solving or memorization. This process of clinical reasoning has been attributed to the use of 'illness scripts' (IS) which are refined through practice and experience. The aim of the EXCEL program is to mentor early clinical year students through the stepwise process of developing their own IS in order to establish the foundation for their clinical years.

Summary of Work: Between January - December 2018, third-year students from Yong Loo Lin School of Medicine, Singapore, were enrolled into the EXCEL program. In groups, they participated in a half-day workshop with simulated patients. Students took turns in history taking (HT) and physical examination (PE). Discussion with tutors focused on the following in order to establish differential diagnoses: a) Applying knowledge nodes in evaluating findings b) Forming neural networks for correlation c) Encapsulating thoughts into diagnoses d) Developing an IS that can be reproduced and refined Pre and post-course surveys were conducted which were to be filled after an actual patient encounter. Survey questions were focused on evaluating participant perceived comfort, efficiency and dynamicity in HT and PE and were graded on a Likert scale of 1-5. Score percentages were analyzed and reported.

Summary of Results: A total of 117 participants were enrolled. As compared to before the workshop, a greater proportion of participants were more comfortable with HT (74.3% vs 57.3%) and PE (63.6% vs 41.0%). A greater proportion were able to complete HT (62.2% vs 40.9%) and PE (62.5% vs 42.1%) in the stipulated time. A greater proportion were constantly thinking about possible differentials during their HT (56.2% vs 46.5%) and PE (50.0% vs 36.0%). 47.7% of participants after the course felt that they were able to determine the most likely diagnosis as compared to 29.2% before the course.

Discussion and Conclusions: Structured workshops utilizing IS guides learning for clinical year students.

Take-home Messages: Recognize and use IS to establish foundational skills for clinical year students.

Evaluating Student Competence in the Shared Discovery Curriculum

AUTHOR(S):

- Robert Malinowski, Michigan State University College of Human Medicine, USA (Presenter)

ABSTRACT

Background: The College of Human Medicine launched the new competency-based Shared Discovery Curriculum in 2016. Basic and clinical sciences are integrated throughout the semester and content is presented by 'chief complaint and concern'. A custom platform, Just in Time Medicine (JIT), was developed to both deliver instructional content and track assessment data. JIT collects, organizes and displays the assessments that a student completes each semester according to the SCRIPT taxonomy. This includes standardized progress exams, peer evaluations, self-reflections and individualized learning plans. The Student Competence Committee (SCC) serves as a 'checkpoint' for students to progress through the curriculum. At the end of each semester, every SDC student is reviewed. The SCC utilizes the JIT platform exclusively to review student assessment data. In addition to the SCRIPT taxonomy, attendance data and qualitative comments for each student are also reviewed.

Summary of Work: To evaluate the effectiveness of the JIT system, online surveys were administered and focus groups were conducted with SCC members for the researcher's Lilly Teaching Fellowship project (<https://aan.msu.edu/teaching-learning/lilly-fellowship/>). The main areas of discussion included: Process: How are members using JIT? What improvements can be made? Confidence: How confident are the committee members in their ability to make summative judgments? Holism: Does JIT give a multi-dimensional view of each student? Training: How can physician-faculty improve their appraisal of student competence?

Summary of Results: Overall, the participants were very satisfied and felt that JIT gave them an accurate illustration of each student's performance. All felt that JIT had improved over time, both in functionality and ease of use. There was a high level of trust in most of the data presented in JIT. Attendance data was viewed as inaccurate, due to the varying methods by which it was collected and measured.

Discussion and Conclusions: JIT has become a vital system for the SDC. Most SCC participants are very satisfied and are able to complete their evaluations quickly and accurately. Most are very pleased with the responsiveness of the Assessment and Programming teams and the continuous improvement of processes.

Take-home Messages: JIT is a robust, evolving platform that has become an essential tool for the evaluation of students in a competency-based medical curriculum.

Baseline knowledge assessments are an effective tool for retrieval practice in student pharmacists

AUTHOR(S):

- Sarah Anderson, University of North Carolina at Chapel Hill Eshelman School of Pharmacy, USA (Presenter)
- Amanda Corbett, University of North Carolina at Chapel Hill Eshelman School of Pharmacy, USA
- Kathryn Morbitzer, University of North Carolina at Chapel Hill Eshelman School of Pharmacy, USA
- Denise Rhoney, University of North Carolina at Chapel Hill Eshelman School of Pharmacy, USA

ABSTRACT

Background: Retrieval practice is a learning strategy where recalling information from long-term memory enhances learning by placing information in the working memory. Study techniques that incorporate retrieval practice are more effective for long-term memory retention. Additionally, metacognition and self-regulated learning aim to make students self-aware and allow them to plan and implement strategies to improve upon their knowledge. The Accreditation Council for Pharmacy Education (ACPE) 2016 Standards emphasize learning pedagogy and knowledge acquisition prior to practice experiences, but little data exists regarding baseline testing of student pharmacists. The objective of this study is to assess the impact of retrieval practice on students' knowledge acquisition in integrated pharmacotherapy courses.

Summary of Work: This is a retrospective review of student baseline knowledge assessments, given at course commencement, from January 2017-December 2018. Baseline assessments were administered on ExamSoft® to second- and third-year student pharmacists participating in a sequence of three integrated pharmacotherapy courses. Items were tagged to key knowledge domains from the accreditation standards [Biomedical Sciences (BS), Clinical Sciences (CS), Pharmaceutical Sciences (PS)] and Bloom's taxonomy [Knowledge/Comprehension (KC), Application/Analysis (AA), Synthesis/Evaluation (SE)]. Students are provided individualized knowledge gap reports, as identified by the assessment in ExamSoft®, which can be used as a mechanism for retrieval practice. Microsoft Excel and SPSS Statistics Software (IBM) was used for any statistical analysis. Descriptive statistics was utilized to describe the data.

Summary of Results: Two cohorts of students participated in the study. The first cohort of students (n=144; 3 baseline assessment) showed increased retention across the baseline assessments: CS (+13.01%), PS (+8.26%), KC(+2.51%), AA (+8.98%), SE (+12.52%), with the exception of BS (-27.44%). The second cohort of students (n=142, 2 baseline assessments) showed increased retention: BS (+14.93%), CS (+0.65%), PS (+3.78%), KC(+4.8%), AA (+4.03%), SE (+0.05%).

Discussion and Conclusions: Overall, students showed increased retention. Providing students with a gap analysis allows students to incorporate retrieval practice as the series progresses. Additionally, this provides course developers opportunities to increase moments of retrieval practice as indicated in the gap analyses.

Take-home Messages: Baseline assessments provide the opportunity for students to recognize knowledge gaps and enforces metacognition and self-regulated learning.

Fifteen Seconds Matters - Evaluate Under Graduated Year Medical Students' Ability in Echocardiography

AUTHOR(S):

- Yen-Yu Liu, Mackay Memorial Hospital, Taiwan (Presenter)
- Ching-Chung Lin, Mackay Memorial Hospital, Taiwan
- Chung-Lieh Hung, Mackay Memorial Hospital, Taiwan
- Charles Jia-Yin Hou, Mackay Memorial Hospital, Taiwan
- Yih-Jer Wu, Mackay Memorial Hospital, Taiwan
- Hung-I Yeh, Mackay Memorial Hospital, Taiwan

ABSTRACT

Background: As medical device advanced, sonography becomes an essential tool in post-graduated-year residents and medical physicians worldwide. However, the ability to perform echocardiography is still unknown in under-graduate-year (UGY) in Taiwan.

Summary of Work: We organized a workshop combined with flipped classroom and manipulation. Each student was asked to read the materials before participation. Pre-curriculum written test evaluates the ability of 'know how' in echocardiography. Before pre-training hands-on test, we arbitrarily separated the students into two groups. In group A, each of them had two periods of 30 seconds to perform parasternal long axis view and apical four chamber view. Meanwhile, in group B, each of them only had two 15-second to operate the same views. Then, both groups received 25 minutes hands-on operating by help of faculties. Similarly, post-training hands-on test was conducted in group A and B (show how). Finally, post-curriculum written tests were provided.

Summary of Results: There were 23 UGY medical students (male=16) in group A and 21 UGY (male=14) in group B. Pre-curriculum written test was 49.0 ± 35.5 in group A and 43.1 ± 20.3 in group B ($p=NS$). Pre-training hands-on test showed 1.3 ± 0.5 in group A and 1.2 ± 0.4 in group B (by Likert scale, excellent (5), very good (4), good (3), fair (2), poor (1))($p=NS$). The records of pre-curriculum written test and pre-training hands-on test were no significant difference in both group. Post-training hands-on test reported 2.2 ± 0.7 in group A and 1.8 ± 0.6 in group B ($p=0.03$). Post-training written test were 87.0 ± 15.3 in group A and 91.1 ± 7.9 in group B ($p=NS$). Post-training hands-on test were significant improved comparing with pre-training test in both groups (both $p<0.001$). However, the group A got higher score than the group B in post-training hands-on test.

Discussion and Conclusions: Before training, UGY medical students showed poor ability in manipulating echocardiography, but got fair degree after training. However, a 15-second period made different performance in post-training hands-on test between group A and group B. We suggested there should be fulfilled with enough time for UGY medical students in post-training hands-on test.

Take-home Messages: The workshop facilitates UGYs performance in echocardiography.

Using simulation to practise inter- and intraprofessional communication skills in undergraduate medical education

AUTHOR(S):

- Mascha Berk, UMC Utrecht, the Netherlands (Presenter)
- Marielle Jambroes, UMC Utrecht, the Netherlands
- Anna Kersten, University Medical Centre Utrecht, the Netherlands
- Rianne Poot, Utrecht University, the Netherlands
- Marjo Wijnen-Meijer, TUM Medical Education Center, TUM School of Medicine, Technical University of Munich, Germany

ABSTRACT

Background: Rising numbers of patients with multi-morbidity and substitution of hospital care to primary care underline the importance of inter- and intraprofessional communication for high quality and patient centred care. However, mastering these skills is insufficiently addressed in undergraduate medical education.

Summary of Work: As part of the new curriculum, a four-day simulation was developed for all fifth year medical students to practice inter- and intraprofessional communication skills. In different rotating roles; clinician, general practitioner or public health physician students run an outpatient clinic. Every ten minutes a written patient casus appears online. In order to solve the casus students have to perform different communication tasks; writing referral letters, consulting other physicians, calling patients to explain results or composing discharge letters. Physicians and standardized patients participate in the simulation and provide the students with feedback. In the afternoon students prepare and conduct a multi-disciplinary meeting (MDM) within the physician role they had in the morning. To assess students' learning feedback and self-reflection are used.

Summary of Results: In 2017 the simulation was conducted 8 times with an average of 27 students per run. The overall evaluation score for the outpatient clinic was 4.3 and for the MDM 3.3 on a 5 point scale. Students highly appreciate the safe environment and the authenticity of the communication tasks and they feel better prepared to perform these tasks during their clerkships. Physicians, standardized patients and teachers like to contribute to the simulation.

Discussion and Conclusions: In response to patients' needs, patient centered and integrated healthcare practice is required. With increasing professional and societal emphasis on patient centered care and safety, simulation to train inter- and intraprofessional communication and collaboration skills can be a valuable addition to every curriculum.

Take-home Messages: Simulation to train inter- and intraprofessional communication skills is a valuable addition to medical curricula.

Effective Interprofessional Education as a Strategy for Quality Improvement

AUTHOR(S):

- Yan Qin, Singhealth, Singapore (Presenter)
- Josephine Zhenmei Wang, Singapore General Hospital, Singapore
- Joy Meiling Tan, Singapore General Hospital, Singapore
- Lok Lin Wong, Singapore General Hospital, Singapore
- Kah Lai Chia, Singapore General Hospital, Singapore
- Yucui Yee, Singhealth, Singapore

ABSTRACT

Background: With the ageing population and chronic disease burden, allied health professional such as physiotherapist has been playing an important and integral role in holistic patient care. However, inappropriate referral to physiotherapy is not uncommon in our institution. Internal Medicine department used to hold a one-hour allied health educational session once a year but the attendance by junior doctors had been suboptimal. We postulate that effective interprofessional education would reduce such inappropriate referral.

Summary of Work: There were three phases of this interprofessional education program. In phase 1, Internal Medicine doctors joined an interactive education session with a group of physiotherapists. In phase 2, a workgroup consists of both doctors and physiotherapists was formed to seek area of improvement through collaboration. Reducing inappropriate referral to physiotherapy was identified as a quality improvement project. After multiple discussions of both parties and cause analysis, a three-question tick box tool to aid the referral to physiotherapy was created. In phase 3, quarterly 10-minute briefing to Internal Medicine doctors by the workgroup members has been conducted to cater the learning needs due to frequent rotation of junior doctors. Posters of the three-question tick box were put up in the ward subsequently.

Summary of Results: A seven-month data collection prior to phase 3 interventions showed average 26 inappropriate referrals received each month. Given that the physiotherapist takes about 15 minutes to screen each case, there was a loss of 6.5 hours therapy time each month to screen patients who did not require physiotherapy services. After introduction of the three-question tick box tool and quarterly briefing, continuous monthly data monitoring showed average 2.5 inappropriate referrals received per month. Our team was able to reduce the inappropriate referrals to physiotherapy services from Internal Medicine doctors by 90.4% (from 26 to 2.5 inappropriate referrals received per month), which would have saved 5.9 hours therapy time per month.

Discussion and Conclusions: Compared with the previous once yearly one-hour allied health educational session, we found that the current quarterly briefing with concise and customized content is more effective to change doctors' practice behaviour.

Take-home Messages: Effective and customized interprofessional education can be a useful strategy to boost quality improvement.

Using simulation to train interprofessional collaboration for healthcare students in primary care

AUTHOR(S):

- Lene Lunde, University of Oslo, Norway (Presenter)
- Anne Moen, University of Oslo, Norway
- Rune Bruhn Jakobsen, University of Oslo, Norway
- Elin Olaug Rosvold, University of Oslo, Norway

ABSTRACT

Background: Healthcare professionals must work in interprofessional teams in primary care to meet new, more complex challenges in patient care. Increased complexity in healthcare has led to the introduction of interprofessional collaboration in healthcare curricula. Simulation-based learning is a powerful facilitator for active and safe learning and simulation studies show improvement of the delivery of care in acute clinical situations, but we have found few studies on primary healthcare simulation.

Summary of Work: The purpose of the PhD-project is to study simulation as a strategy for training students in typical clinical situations in primary healthcare. We will prepare scenarios where students solve practical, semi-acute, primary healthcare situations to explore the students' experience of participating in simulation, assessments of the scenarios, and experiences with simulation as a method for active learning and team collaboration. We recruited five healthcare students (medical students, and master and bachelor students in nursing) to pilot test the first two scenarios in December 2018. We elicited their assessments of the learning experience, and specifically explored how to improve the scenarios before data collection starts. Interprofessional collaboration between health professionals are crucial for patient safety and optimal results. We will present preliminary results from the simulation in April 2019 at AMEE.

Summary of Results: The pilot test supported that the scenarios were relevant and highly useful for the participants' learning. Especially, the fidelity of the scenarios with realistic and recognisable patient situations from primary care enhanced their experience. The students suggested minor adjustments to strengthen the scenarios' potential for learning interprofessional teamwork.

Discussion and Conclusions: Based on feedback from the pilot test, we adjusted the scenarios. Data collection will take place in April 2019 with approximately 30 participants conducting simulation and focus group interviews. The project will provide research-based knowledge about simulation as a strategy for teaching and active learning that prepare students for the increasing complexity they will meet in primary care.

Take-home Messages: Using simulation to train interprofessional collaboration for healthcare students in primary care has the potential to improve clinical practice and prepare students for the increasing complexity they will meet in primary care.

Investigation of changes of empathy levels in clinical psychology and medical students of Japanese Medical School before and after interprofessional education

AUTHOR(S):

- Hiroki Okada, Department of Medical Education, Faculty of Medicine, Kagawa University, Japan (Presenter)
- Shuji Bandoh, Department of Medical Education, Faculty of Medicine, Kagawa University, Japan
- Naohiro Kurotaki, Department of Clinical Psychology, Faculty of Medicine, Kagawa University, Japan
- Kenji Kanbara, Department of Clinical Psychology, Faculty of Medicine, Kagawa University, Japan
- Shuji Noguchi, Department of Clinical Psychology, Faculty of Medicine, Kagawa University, Japan
- Junko Kawahito, Department of Clinical Psychology, Faculty of Medicine, Kagawa University, Japan

ABSTRACT

Background: In 2018, Kagawa University established the Department of Clinical Psychology in the Faculty of Medicine. We conducted an interprofessional education (IPE) for medical students (MS) and clinical psychology students (PS) immediately after their admission and then evaluated the difference of empathy between MS and PS before and after IPE.

Summary of Work: IPE program includes outline of medicine, group works concerning about medical ethics and privacy protection and experiences in medical institutes and elderly care facilities. Jefferson Scale of Empathy-medical students (JES-S) (Japanese version: Kataoka 2009) was used. Participants included 87 MS (47 men and 40 women) and 16 PS (5 men and 11 women).

Summary of Results: The JSE score of MS was 113.2 before IPE and 111.5 after IPE. The JSE score of PS was 111.1 before IPE and 111.1 after IPE. There was no significant difference in JSE scores between MS and PS. But among 10 perspective taking tasks, PS have found a significant decrease in items 13 (non-verbal cues and body language in understanding patients), 16 (understanding emotion in patients-clinician relationship) and 20 (empathy as a therapeutic factor), where MS have shown a decrease in item 16. MS have shown a significant decrease in item 11 (patient-physician emotional ties in medical treatment) of compassionate care, whereas PS had no differences in any of the items. In contrast, PS have found an increase in items 3 (viewing patients' perspective), 5 (sense of humor and clinical outcomes) and 10 (understanding of therapeutic relationship to patients), where MS have found an increase only item 5.

Discussion and Conclusions: The decrease in some elements of perspective taking by PS indicates a lack of understanding of patient's feelings. PS felt much interest in seeing the patients with medical illness and learned more about medical problems than psychological problems after IPE. Because the therapeutic outcomes are stronger in the medical treatment than psychological treatment. Moreover, PS likely appreciate the importance of deeper understanding of medicine than clinical psychology.

Take-home Messages: Early introduction of medical teaching to PS reduces likelihood of some levels of empathy.

Introduction of Clinical Exchange Training for Medical and Dental Students

AUTHOR(S):

- **Mina Nakagawa, Institute of Education, Tokyo Medical and Dental University, Japan (Presenter)**
- Kanako Noritake, Institution of Education, Japan
- Kumiko Yamaguchi, Institution of Education, TMDU, Japan
- Janelle Moross, TMDU, Japan
- Jun Tsuruta, Institution of Education, TMDU, Japan
- Keiichi Akita, Institution of Education, TMDU, Japan

ABSTRACT

Background: In aging societies, tighter coordination and collaboration between medical and dental professionals are needed to deal with the number of comorbid systemic condition which endanger the oral health. Tokyo Medical and Dental University (TMDU) started a new undergraduate medical and dental integrated curriculum in 2012 to improve collaboration between medical and dental professionals.

Summary of Work: Under our integrated curriculum, students of both schools learn together for common competencies such as relevant basic and clinical sciences, and social medicine. To develop and add a new component in clinical years to the integrated curriculum, we interviewed faculty staff of two schools in an attempt to accurately grasp barriers for coordination and collaboration between medical and dental professionals.

Summary of Results: Interview revealed that the lack of interest and insufficient understanding of the practice of other profession were identified as barriers. In order to overcome this, we developed and added a new component, the Clinical Exchange Training (CET), to the integrated curriculum which brings students of both schools during their clinical years to attend rounds in Palliative Care Unit and Outpatient Dental Clinics and teach each other after rounds with the help of supervising faculty staff.

Discussion and Conclusions: Analysis of the feedback from students who participated in CET revealed that CET was effective in helping students understand the roles and responsibilities of both professions, broadening ones perspectives in patient care, and cultivating self-affirmation. The addition of CET to our medical and dental integrated curriculum may help students acquire the needed competencies and better prepare students for future interprofessional work.

Take-home Messages: Recent advancements in medical and dental sciences have blurred the boundaries between medical and dental care. Undergraduate medical and dental integrated curriculum may better prepare medical and dental students for coordination and collaboration which are needed in aging societies.

Evaluation of Team-Based Learning in Respiratory System II Course in Two Academic Years

AUTHOR(S):

- Napat Chatteeraphat, Faculty of Medicine, Chulalongkorn University, Thailand (Presenter)
- Ornjira Trithiphen, Faculty of Medicine, Chulalongkorn University, Thailand
- Danai Wangsaturaka, Faculty of Medicine, Chulalongkorn University, Thailand

ABSTRACT

Background: Team-based learning (TBL) has been widely used in medical education. The Faculty of Medicine, Chulalongkorn University piloted TBL in Year 3 pharmacology course in 2015. Since then, more courses have utilised TBL. This study aims to evaluate students' perception towards TBL in Respiratory System II courses in 2017 and 2018 academic year.

Summary of Work: Twenty-one items, specifically designed to evaluate various aspects of TBL including students' learning behaviour in TBL, were included in the course evaluation questionnaires. Comparison between opinions of students with high GPAX (3.75 - 4.00) and low GPAX (< 3.00) was performed using either Pearson Chi-square or Fisher's exact test.

Summary of Results: The response rate was 86% (522/607). The overall satisfaction towards TBL was 3.7/5. Most respondents were satisfied with the number of students per group (91%); self-study time for advance assignment (81%); time for iRAT (87%); time for clarification and appeal (80%); and the mix of students with various GPAX in each group (80%). However, only 46% enjoyed TBL and only 33% preferred more TBL in other courses. The characteristics of TBL which students liked most were: learning as a team (41%) and the use of test in learning (29%). There was statistically significant difference between students with high and low GPAX ($p = .028$) in their most preferred characteristics of TBL. Of the 5 steps of TBL, 65% felt they learned most from advance assignment. Students with high GPAX perceived this statistically significantly differently from students with low GPAX ($p = .003$).

Discussion and Conclusions: Despite its advantage in promoting active learning, adult learning and collaborative learning, student satisfaction towards team-based learning was not as great as expected. This could be due to: unfamiliarity/adjustment to a new teaching method; inadequate preparation of students, teachers and educational resources; a wide range of students' learning styles and expectation; or an underlying problem of overcrowded content in this course. Student consultation is essential to improve TBL.

Take-home Messages: The success of implementing an innovative teaching method depends not only on an innovation itself, but also teachers and students in your own context.

Does Multi-Disciplinary Debriefing Improve Clinical Knowledge, Human Factors and Confidence in Interprofessional Simulation?

AUTHOR(S):

- Ryan Phillips, Royal Cornwall Hospitals Trust, UK (Presenter)
- Sanjeev Sahota, Royal Cornwall Hospitals Trust, UK
- Johannes Driessen, Royal Cornwall Hospitals Trust, UK

ABSTRACT

Background: Simulation is known to improve technical knowledge and performance. Currently, no research suggests that improvement in clinical knowledge or human factors is dependent on who facilitates debriefing. We conducted a pilot study to investigate whether debriefing with nurses and doctors, compared with doctors alone, improved students' knowledge and confidence in clinical simulation of acutely unwell patients.

Summary of Work: A faculty of doctors and nurses facilitated a six-session course for nursing and medical students (n=10) focussing on the 'Airway-to-Exposure' approach when assessing deteriorating patients. Sessions involved brief teaching sessions, followed by high-fidelity simulated scenarios with debriefs. Students were split into two cohorts: one with debriefing facilitated by nurses and doctors (multidisciplinary (MDT) group), and the other group debriefed by only doctors (non-MDT group). Data was collected using a multiple-choice knowledge test and a questionnaire using Likert scales to rate human factors such as communication and prioritisation. These were administered before and after the course with scores analysed using paired t-tests.

Summary of Results: 100% of participants rated the course 5/5 for being challenging, relevant and would recommend to their peers. On the human factors questionnaire, there was a mean increase of 40% (p = 0.0043) across all domains in both cohorts. When questions were categorised into themes, understanding and confidence showed the greatest improvement, 56% (p < 0.001) and 55% (p = 0.04). Both MDT and non-MDT cohorts improved knowledge scores (23% (p = 0.039) and 17% (p = 0.15), respectively).

Discussion and Conclusions: Interprofessional simulation is a valuable teaching modality, whereby clinical concepts can be reinforced by scaffolding, and effective communication between disciplines can be learned safely. Our study demonstrated that simulation in interprofessional education is a useful learning experience, improving scores across knowledge, non-technical skills and confidence. Interestingly, the data trended toward an increase in knowledge in the multi-disciplinary debrief group. Further research using a larger sample size will be required to investigate this further.

Take-home Messages: Simulation improved all participants' knowledge, non-technical skills and confidence. MDT debriefing trended toward improvement over non-MDT debriefing however further study using a larger sample will be required to investigate this further.

Improving patient safety by integrating team resource management program into staff training: 9-year experience in a tertiary hospital

AUTHOR(S):

- Hsiang-Chun Tsai, Dalin Tzu Chi Hospital, Buddhist Tzu Chi Medical Foundation, Taiwan (Presenter)
- Wen-Lin Fan, Center for Quality Management, Buddhist Dalin Tzu Chi Hospital, Taiwan
- Hsin-Ju Lu, Center for Quality Management, Buddhist Dalin Tzu Chi Hospital, Taiwan
- Jui-Teng Chien, Vice Superintendent, Buddhist Dalin Tzu Chi Hospital, Taiwan

ABSTRACT

Background: Team approach is necessary to facilitate multidisciplinary cooperation in the hospital. It can effectively improve medical quality and enhance patient safety by decreasing medical errors which stem mostly from poor communication.

Summary of Work: In 2009, we adopted TRM (team resource management) after benchmarking other institutes, and launched workshops in our hospital in 2010. From 2011 to 2018, we conducted 55 courses and workshops with 4,342 participations from 11 specialties, including physicians, nurses, pharmacists, medical technologists, physical therapists, radiologists, dieticians, ect. The education program focused on subgroup discussion and case presentation in addition to lecture by instructors. A total of 17 teaching video demonstrations was edited from medical errors, near-miss/sentinel incidents, or from safety-related news events. Overall, the average satisfaction score was 90%.

Summary of Results: Since 2014, regular audit on how TRM was implemented in 25 units or clinical specialties was performed every 3 months. The annual completion rate for 55 indicators improved from 62% to 75% in 2017. In the national Survey on Patient Safety Culture, the positivity rate of 'teamwork within units' improved from 46.0% (before TRM implementation) to 58.9% in 2018. The dimension of 'safety climate' also improved from 41.4% to 55.3%.

Discussion and Conclusions: The results showed that implementation of TRM program is a very promising method to enhance teamwork culture and patient safety across all fields in our hospital. During the 9-year intervention period, our staff were successfully provided with higher perception of patient safety and more useful skills in teamwork that can be applied to their daily practice. Improving teamwork and communication through TRM training helps clinical units and healthcare professionals solve complex problems cooperatively and systematically.

Take-home Messages: The climate of safety and perception of teamwork culture are greatly improved by continuous TRM training, practice, and auditing.

“Two is a crowd” - a qualitative analysis of dyad training in clinical clerkships

AUTHOR(S):

- Laerke Marijke Noerholk, CAMES Rigshospitalet, Denmark (Presenter)
- Anne Mette Morcke, CAMES Rigshospitalet, Denmark
- Martin G. Tolsgaard, CAMES Rigshospitalet, Denmark

ABSTRACT

Background: Globally, medical schools are responding to the need for more doctors by admitting a greater number of students. Consequently, clinical departments receive an increasing number of clerkship students resulting in numerous calls for more cost-effective methods of training than the traditional one-to-one apprenticeship model. Collaborative learning has shown positive results in the simulated setting and could be a solution to the volume problem. However, what works in the controlled simulated setting may not work in the clinical setting, where various stakeholders' support is key to success.

Summary of Work: We explored stakeholders' reactions to shifting from a one-to-one apprenticeship model to training students in dyads during clerkships. Each day two students were paired and assigned to different clinical functions with a supervising doctor. We conducted semi-structured interviews with ten students, five nurses, twelve doctors and ten patients. The interviews were transcribed and analyzed inductively for emerging themes. Afterwards we used stakeholder value theory as the lens, through which we analyzed and interpreted data.

Summary of Results: The support from senior doctors and nurses often lacked and strong resistance against dyad training was displayed in several clinical settings. The main concern was that having two students present disrupted patient trust and increased time spent on supervision. These participants had the highest stakeholder power. Junior doctors and nurses, patients and students often displayed higher support than senior staff, but had lower stakeholder power. The patients did not oppose having two students present during their consultation and found that they contributed to the students' education. The students' support was mainly determined by the attitude from the supervising health professionals.

Discussion and Conclusions: Senior health professionals had the highest stakeholder power and found that dyad training disrupted focus on patient-centeredness. This consequently fostered resistance towards dyad training and made implementation impossible. However, the patients did not share this reservation, suggesting that they were instrumental in a value statement rather than the object of concern.

Take-home Messages: Dyad training in the clinical clerkships has learning potential, but to senior health professionals “two is a crowd”.

Norwegian health care students' experiences from interprofessional education on complex patients in nursing homes

AUTHOR(S):

- **Birgitte Kalleberg, Faculty of Medicine, University of Oslo, Norway (Presenter)**
- Karin Svensberg, School of Pharmacy, Faculty of Mathematics and Natural Sciences, University of Oslo, Norway
- Ragnhild Hellesø, Department of Nursing Science, Institute of Health and Society, Faculty of Medicine, University of Oslo, Norway
- Liv Mathiesen, School of Pharmacy, Faculty of Mathematics and Natural Sciences, University of Oslo, Norway
- Lene Hystad Hove, Institute of Clinical Dentistry, Faculty of Dentistry, University of Oslo, Norway
- Elin Olaug Rosvold, Faculty of Medicine, University of Oslo, Norway

ABSTRACT

Background: An increasing ageing population may lead to a higher prevalence of multi-morbidity. To address this complex situation in nursing homes there will be a need of an augmented interprofessional approach. Our study aimed to explore graduate students' experiences of interprofessional education (IPE) on patients with complex care needs in nursing homes.

Summary of Work: In spring 2018 students from six educations at the University of Oslo, Norway (advanced geriatric nursing, clinical nutrition, dentistry, medicine and pharmacy) were organized into interdisciplinary groups. The groups examined and developed a care plan for a nursing home patient. The students were then interviewed in focus groups. Data were analyzed according to Malterud's Systematic Text Condensation.

Summary of Results: 21 graduate students participated in four focus groups. The results indicated that IPE was a structural facilitator for new collective knowledge and it facilitated a cobweb of relations between students, patients, nursing home staff and educators. IPE was also an eye-opener for future interprofessional collaboration. The students reported that they became more confident about their own role and gained a better understanding of the importance of a multi-professional approach.

Discussion and Conclusions: The results indicate that nursing homes with complex patients are adequate learning arenas for IPE. The interprofessional education worked as an eye-opener for future collaboration and provided important experiences for all participating professions. The students reported to see the value of interprofessional collaboration when providing health care for complex patients. During the training, most students went from a unidisciplinary task distribution to an interprofessional work organizing.

Take-home Messages: One way to meet an ageing population with multi-morbidity in nursing homes, could be providing a comprehensive care by interprofessional teams. Our study indicates that graduate students experience interprofessional education as meaningful, and that interprofessional education might open a window for future interprofessional collaboration.

Interprofessional Large-Group Simulation of Sudden Infant Death Syndrome - Experiences of Students and Professionals

AUTHOR(S):

- **Kirsimarja Metsävainio, Kuopio University Hospital, Finland (Presenter)**
- Terhi Saaranen, University of Eastern Finland, Department of Nursing Science, Finland
- Marja Silén-Lipponen, Savonia University of Applied Sciences, School of Health Care, Finland
- Maria Palkolahti, University of Eastern Finland, Department of Nursing Science, Finland
- Marjorita Sormunen, University of Eastern Finland, Department of Nursing Science, Finland

ABSTRACT

Background: Simulation education is widely used in teaching interprofessional collaboration. While simulations are usually carried out in small groups, this study used a large-group simulation with 427 participants. A working group of our universities designed and implemented a scenario of a sudden infant death syndrome (SIDS). A team of professionals from pre-hospital care, police force, social care and church preformed the scenario. 301 students and 126 professionals followed the simulation scenario and the debriefing. Participation was possible either in a large lecture hall (n=337) or at distant locations (n=90).

Summary of Work: The purpose of this study was to describe the students and professionals' (n = 350) experiences of the interprofessional large-group simulation. The data was collected using a questionnaire with 5-step Likert-scale and open questions. Quantitative data was analyzed by descriptive statistical methods and open questions with inductive content analysis.

Summary of Results: Almost all participants were satisfied with the large-group simulation and considered it useful for their work or studies. The participants learned communication, respect towards the family and other professionals and handling of the crisis situation. The different roles of the professionals and the quality and requirements of the collaboration were highlighted. The areas of development were to improve the arrangements and implementation of the event.

Discussion and Conclusions: The learning experience from large-group simulation described by the participants was similar to the previous studies of small group simulations. This encourages us to continue these large-group simulations, as their implementation will allow even hundreds of learners to participate in the simulation event simultaneously, resulting in cost efficiency in teaching.

Take-home Messages: Large-group simulation proved out to be an innovative and useful method to be used in teaching within social and health care.

Simulation Based Education: Demonstrating effective multidisciplinary teamwork to undergraduate nursing and medical students

AUTHOR(S):

- Harriet Welch, Walsall Healthcare Trust, UK (Presenter)
- Thomas Wallbridge, Walsall Healthcare Trust, UK
- Priya Jalota, Walsall Healthcare Trust, UK
- Jonathan Pepper, Walsall Healthcare Trust, UK

ABSTRACT

Background: Successful multidisciplinary team working is an essential part of safe and effective clinical practice. Yet UK undergraduate nursing and medical students have little experience of formal multidisciplinary education. Therefore, upon graduating, many healthcare professionals are unsure of the roles and responsibilities of their newly qualified counterparts. Simulation training offers a controlled and supportive environment in which these misconceptions could be challenged and positive multidisciplinary working experienced. Moreover, the importance of good clinical communication, teamwork and leadership can be demonstrated in readiness for everyday clinical practice.

Summary of Work: Led by a multidisciplinary faculty, final year medical and nursing students participated in a simulation workshop comprised of two high-fidelity simulation scenarios, post-scenario debriefings and a tutorial introducing key non-technical skills. Within the scenarios, students were expected to assess acutely unwell patients whilst managing difficult colleagues, relatives and a multitude of distractions. Anonymised questionnaires focusing on the students understanding of non-technical skills was completed before and after the workshop.

Summary of Results: All 21 students (n=21) agreed that the workshop was useful and relevant to their undergraduate curriculum. Qualitative data showed a greater understanding of the roles and abilities of newly qualified nurses and doctors. Moreover, enthusiasm for interprofessional education was seen with many commenting that multidisciplinary participants increased the fidelity and realism of the simulation scenarios. Confidence in handing over information to colleagues rose from 71.4% to 95.2% following training. 100% of students were confident in raising concerns and in their understanding of non-technical skills as a result of the workshop.

Discussion and Conclusions: As medical educators, we are responsible for preparing students for clinical practice and thus ensuring that they have the skills necessary to work as effective members of the multidisciplinary team. Our results confirm that simulation training can be used to provide students with positive examples of multidisciplinary collaboration and successful clinical communication.

Take-home Messages: Simulation training is an effective way of incorporating multidisciplinary education into undergraduate studies of healthcare professionals in readiness for real-life clinical practice.

Interprofessional Education in the Real World: Creating a Foundation for Success in a Patient's Medical Home

AUTHOR(S):

- Amanda Condon, University of Manitoba, Canada (Presenter)
- Dana Turcotte, University of Manitoba, Canada

ABSTRACT

Background: Clinical care models, including the Patient's Medical Home (PMH), identify interprofessional teams as integral to optimal patient-centered care. These environments can provide authentic clinical learning opportunities for health professional learners. It is recognized that interprofessional education must ensure training in the context of the work environment so learners can develop the collaborative skills necessary to adapt to the clinical setting. Literature in this area is often focused on evaluation of select interventions or activities, with less emphasis on foundational structures and team culture that need to be in place within a clinical setting to optimize authentic learning experiences.

Summary of Work: An interprofessional primary care team in Winnipeg, Manitoba, Canada, provides comprehensive team-based care, in keeping with the PMH model, and regularly includes interprofessional learners. This poster describes the foundational structures and clinical activities within this team that support interprofessional learning and role modeling for health professional learners, as well as highlighting opportunities for ongoing optimization.

Summary of Results: Establishment of regular opportunities for primary care team members to meet, learn and collaborate together builds a foundation for students when they arrive on the team. Within this team, physical space and co-location, frequent team meetings, regular case discussion, shared learning opportunities, quality improvement activities and patient-focused referral/case management have authentically incorporated learners. These existing activities can be tailored to ensure appropriate inclusion of learners (and professionals) who may be present at any given time.

Discussion and Conclusions: Community-based primary care is well situated to provide authentic clinical interprofessional learning experiences for students across health professions. Existing foundational culture and workflow are key to optimal collaborative experiences in this environment. This foundation provides seamless incorporation of students into the existing team and thus, meaningful and authentic clinical experiences. Future work includes assessing how and what learners take away from these collaborative opportunities. What benefits do these experiences provide for students and team members? How can learners and teams be assessed on collaboration skills? What are other sites doing to address this health professional competency?

Take-home Messages: Strong foundations within a Patients Medical Home contribute to authentic interprofessional learning experiences in primary care.

Exploring the challenges of implementing CBME across stages and specialties: a qualitative study

AUTHOR(S):

- Yi-Da Sie, China Medical University Hospital, Taiwan (Presenter)
- Fremien Chihchen Chou, Center for Faculty Development, China Medical University Hospital, Taiwan

ABSTRACT

Background: Competency Based Medical Education (CBME), which was developed under the background of Northern American medical education culture, has been practiced in many countries around the world nowadays. But few have been discussed systemically about what challenges are engaged along CBME implementation, especially to a non-Northern American healthcare system. This study aimed to reveal those challenges which are faced across different stages and specialties under CBME's three dimensions including the development of competency framework and progression of competencies, teaching and learning tailored to competency, and systemic assessment with the decision of trainee's progression.

Summary of Work: Participants were representative faculties from different specialties across Taiwan, including pediatricians, emergency physicians, internal physicians, ENT, GYN and anesthesiologists. They joined to explore their challenges faced onto three dimensions of CBME by means of World Café Method. Divergent idea and discussions from different perspectives were recorded through dictation and key idea were shared by cards during the conference. Qualitative content analysis with conventional approach was applied to let the themes emerging through coding and categorization.

Summary of Results: Here was summary of some key themes: Fragmented curriculum and the lack of consensus across intra- and inter-specialty. The lack of affordance of current healthcare system and environment toward CBME. The prevalence of existing educational system and learning culture among teachers and students. The paradoxical effect of assessments development in CBME. The more details and differences among specialties will be discussed in the conference.

Discussion and Conclusions: It is harder to achieve consensus across the more specialties and sub-specialties, and the faculties may get lost in fragmented contexts and different foci of duty. The existence of parallel system under current culture of teaching and learning allows teachers and students to postpone the change. We need both stakeholders and authorities to increase the affordance of working environment toward education to let CBME break the threshold.

Take-home Messages: It's time to challenge ourselves about the beliefs of workplace education and how much we want to and afford to pay for it.

Could milestone evaluation be an effective instructional scaffolding for residency training?

AUTHOR(S):

- Chien-yu Chen, Taipei Medical University Hospital, Taiwan (Presenter)
- Yi-No Kang, Taipei Medical University Hospital, Taiwan
- Kung-Pei Tang, Taipei Medical University, Taiwan
- Jeng-Cheng Wu, Taipei Medical University Hospital, Taiwan
- Chun-Chao Chang, Taipei Medical University Hospital, Taiwan

ABSTRACT

Background: The pedagogical principle of instructional scaffolding is to establish a shared goal, to break the learning objectives into manageable steps, and to provide support to tailor the needs of the learners throughout the learning process. The Anesthesiology milestone was adopted in Taipei Medical University Hospital since 2016. Residents' level of competence was evaluated once a week as shift cards and every six months as a formal progress report. This study aims at examining whether the implementation of milestone evaluations could facilitate residents' progress as an effective scaffolding teaching strategy.

Summary of Work: We retrospectively analyzed the data collected from 9 residents and 11 faculties who have engaged in the globalization process of the Anesthesiology milestone. We used multiple regression adjustment analysis to explore the influence of the number of milestone evaluation a resident experienced with his/her milestone score. Four major confounding factors (i.e., rater's gender, resident's gender, year of training, and self-assessment) were identified and adjusted accordingly.

Summary of Results: We analyzed 2125 milestone assessments within the period of June 2016 and December 2018. The results showed that after controlling several confounding factors, the number of milestone assessment itself could still positively predict a resident's overall rating score, whose regression coefficient Beta was .331 ($p < .001$). Similar results were also noted in all domains of milestone, whose regression coefficients Beta were .403 (PC), .443 (MK), .310 (SBP), .411 (PBLI), .196 (PROF), and .194 (IPCS), respectively.

Discussion and Conclusions: Three essential elements make milestone evaluation in our institute an effective scaffolding pedagogy. Firstly, we treated evaluation as the collaborative interaction between the learner and the expert and offered sufficient support and guidance from the instructors. Secondly, we believed that learning could take place only in the resident's zone of proximal development, which means that assessors should be aware of the learners current level of knowledge and then work to a certain extent beyond that level. Thirdly, we regarded milestones as adjustable and temporal support for professional development just like scaffolds for building construction, which should be weaned gradually once independence is achieved.

Take-home Messages: Regular milestone assessments under tailored support is an effective instructional scaffolding for competency development during residency training.

Critical competencies in specialist physician training in occupational medicine (OM) and ways to assess these - trainers' perspective

AUTHOR(S):

- Marianne Rytkönen, University of Eastern Finland, Occupational Health and Medicine, Finland (Presenter)
- Kari Reijula, Helsinki University, Department of Public Health - Occupational Health, Finland
- Asta Toivonen, University of Helsinki, Department of Public Health - Occupational Health, Finland
- Leena Ala-Mursula, University of Oulu, Center for Life Course Health Research, Finland

ABSTRACT

Background: The specialist physician training is under reform in Finland. Current changes include the building of competency based curriculum. In specialist physician training in occupational medicine (OM), provided by five universities, there were 907 trainees and 358 trainers in 2017 nationwide. The curriculum aligns the training in the workplace. The reform requires re-evaluation of the target competencies and development of feasible assessment practices. We aimed to explore the trainers' views on these.

Summary of Work: In 2018, we carried out an online survey among trainers in the specialty of OM at the University of Helsinki. We used both multiple choice and open-ended questions to explore trainers' views of the critical competencies and assessment of these. Furthermore, we scrutinized their experiences and beliefs of the purposes of the assessment. We used descriptive statistics in the quantitative data. We analysed the qualitative data thematically.

Summary of Results: 45/123 (37%) actively training trainers answered the survey. Knowledge management and communication competencies were emphasized (mean 4,9 in 5-point Likert scale). The three most often described competencies were communication, medical and work ability related expertise. Trainers were engaged in the assessment in the beginning, in weekly tutorial sessions and every six months during the training. They valued the possibilities for consultations, collaboration and discussing challenging situations to follow the trainees' development.

Discussion and Conclusions: Trainers in OM specialist training are active and engaged in coaching. They have the key role in assessing the development of the trainees. They consider this role essential. This is important since the training mostly takes place at work under their guidance. For the universities, it is crucial to involve the trainers in the curriculum development and explore their views of the competencies needed in everyday practices.

Take-home Messages: Training in the specialty of OM is university led, learning at work and supervised by the trainers. Trainers describe communication, medical and work ability related expertise as the most critical competencies. Trainers are engaged in following the development of their trainees and thus important for the trainees' learning process. They are in a grandstand view to the changes in the practice of the specialty.

Designing a Hybrid Faculty Development Program for Competency-Based Medical Education Implementation

AUTHOR(S):

- Jason Jiunshiou Lee, Taipei City Hospital, Taiwan (Presenter)
- Ting-Fang Chiu, Taipei City Hospital, Taiwan
- Jung-Chieh Du, Taipei City Hospital, Taiwan
- Yi-Ning Liu, Taipei City Hospital, Taiwan
- Dachen Chu, Taipei City Hospital, Taiwan
- Li-Lin Kuo, Taipei City Hospital, Taiwan

ABSTRACT

Background: Competency-based medical education(CBME) is an outcome-based approach that involves teachers identifying the abilities required of residents or younger healthcare professionals. Taipei city hospital will be launching CBME in 2019 so faculty must understand the theory behind and learn to coach trainees how to meet the entrustable professional activities(EPAs)/milestones and assess the achievements.

Summary of Work: The center for faculty development(CFD) has held a hybrid faculty development program(HFDP) for CBME last December. The CFD emailed four related articles to clinical teachers who signed up for the HFDP three days earlier. On the program day, the CFD gave two 30-minute-interactive lectures, two 45-minute-workshops, and 30-minute panel discussions. During the workshop, each healthcare professional group built the EPAs and shared their thoughts as well. A total of 44 clinical teachers participated and finished ten multiple choice questions(MCQs) before and after the HFDP. All of the MCQs tested for the important CBME concepts(total score: 10). We also asked participants "Have you read the related articles before the HFDP?"

Summary of Results: Seven participants have read the related articles before the HFDP(group1) while thirty-seven participants have not(group2). The difference-in-difference method and analysis of covariance were used to compare the changes in pre- and post-HFDP MCQs across the two groups. The average pre- and post-HFDP scores were 4.29(± 2.14) and 8.00(± 2.58) of the group1 and 3.68(± 2.16) and 8.38(± 1.52) of the group2, respectively. The accuracy percentage of post-HFDP scores among the two groups were 8.00 and 8.38($p=0.57$) while the changes(difference-in-difference) among the two groups showed statistically significantly($p=0.0077$).

Discussion and Conclusions: Although only 16% of participants read the related articles before the HFDP, the hybrid program including interactive lectures, workshops, and panel discussions helped all the participants learn the concepts well by participating in the CBME activities and brainstorming for the EPAs with peers. The HFDP helped all participants have a high level(80%) of having important CBME concepts.

Take-home Messages: Although emailed articles might not be a good way for hospital staffs for pre-class preparation due to heavy work loading, a hybrid faculty development program for CBME could help clinical teachers gain a greater understanding of CBME and know how to implement CBME in their curriculum designs.

The Development of the Brazilian Competencies Framework in Gynecology and Obstetrics: An innovative experience

AUTHOR(S):

- **Gustavo Salata Romao, University of Ribeirao Preto, Brazil (Presenter)**
- Raquel Autran Coelho, Federal University of Ceara, Brazil
- Ricardo de Carvalho Cavalli, Ribeirao Preto Medical School University of Sao Paulo, Brazil
- Sheyla Ribeiro Rocha, Federal University of SAo Carlos, Brazil
- Francisco José Cândido dos Reis, Ribeirao Preto Medical School University of Sao Paulo, Brazil
- Marcos Felipe Silva de Sá, Ribeirao Preto Medical School University of Sao Paulo, Brazil

ABSTRACT

Background: The development of competencies by the medical resident is required for the professional performance. The competencies framework is a set of essential knowledge, skills and attitudes and a guide for the training, evaluation and certification. We identified the need to elaborate the Brazilian Competencies Framework in Gynecology and Obstetrics (BCF-GO).

Summary of Work: Based on international experiences and aligned with the current Brazilian residency guidelines, the Brazilian Gynecology and Obstetrics Society (Febrasgo) developed the initial version of BCF-GO. The content validity was obtained through a panel of specialists composed of 360 experts of 25 Febrasgo Specialized Commissions who evaluated the relevance and adequacy of 21 competencies axes in different areas of activity. The consultants suggestions were incorporated into the BCF-GO final version. In order to make it useful to the residency programs, Febrasgo implemented a competency-oriented training course for resident supervisors.

Summary of Results: BCF-GO consists of 21 competencies axes including professionalism and patient safety, distributed in three levels of milestones. Each level of milestones is based on the expected performance in each step of the training program. This document was approved by the National Medical Residency Commission of the Ministry of Education, thus becoming the official guide for training, evaluation and certification of specialists in Gynecology and Obstetrics in Brazil. Since BCF-GO was published many programs are adhering to these new benchmarks and other medical specialties such as pediatrics and family medicine are developing competencies frameworks. More than 200 resident supervisors from all over the country are applying the Febrasgo training course.

Discussion and Conclusions: BCF-GO was developed through a valid and reliable method. The participation of the supervisors in the training course and the development of competency frameworks in other medical specialties reflects the great acceptance of this work by the academic community. The approval of the BCF-GO in the Ministry of Education is an evidence of its recognition by the Brazilian political authorities.

Take-home Messages: The competency framework is a great reference for the training, evaluation and certification of medical residents and its development should be performed through valid and reliable methods.

An A-S-K competency model for medical graduates in China

AUTHOR(S):

- **Gang Xin, Shantou University Medical College, China (Presenter)**
- Shaoyan Zheng, Shantou University Medical College, China
- Pi Guo, Shantou University Medical College, China
- Zihua Li, Shantou University Medical College, China
- Xiaoqing Huang, Shantou University Medical College, China

ABSTRACT

Background: The aim of this study is to build an attitude-skill-knowledge (A-S-K) competency model in China and to identify core and development of competencies for Chinese medical graduates.

Summary of Work: This is a cross-sectional study carried out among Chinese medical graduates who graduated this year (graduates), 3 years ago (residents) and 5 or 6 years ago (senior doctors) from medical schools in China. Data were collected using self-assessment questionnaire and behavioral event interview (BEI). The questionnaire was designed based on 36 competency items of medical graduates on 5-point Likert scales where 1 is “beginner” and 5 is “expert”. The reliability and validity of the questionnaire system were analyzed. Then BEI was conducted to confirm the characteristics of the model and identify the core and development of competencies.

Summary of Results: The number of graduates, residents and senior doctors who responded to the questionnaire is 226, 193, and 186 respectively. Three dimensions of the 36 items were identified by exploratory factor analysis and confirmatory factor analysis. The A-S-K competency model was emerged to be composed by 8 attitude items, 10 skill items and 18 knowledge items. Then 15 graduates, 15 residents and 13 senior doctors were interviewed. By analyzing the highest competencies mentioned by the participants, five core competencies were identified as communication and cooperation with patients, teamwork, principle of patient-centered care, making treatment plan and application of clinical knowledge. The development of competencies was identified by comparing the BEI data of residents with graduates, and senior doctors with residents. Competencies as communication and teamwork were developed significantly during medical practice.

Discussion and Conclusions: The five core competencies of Chinese medical graduates identified by this study were similar with previous core competencies models such as ACGME and CanMEDS. The development of competencies was also identified. The model could be used as a tool for the Chinese medical graduates to assess their competencies.

Take-home Messages: An A-S-K competency model in China was built and five core competencies were identified. The competencies such as communication and teamwork could be developed with the medical practice.

Exploring the “Essential” Competencies Acquired by Japanese Midwives Graduating from a One-Year Post-Nursing Program

AUTHOR(S):

- Akiko Uehara, Seisen Jogakuin College, Faculty of Nursing-Science, Japan (Presenter)
- Yoshikazu Asada, Jichi Medical University, Japan
- Atsuko Yumoto, Saku University, Japan
- Mariko Shibata, Saku University, Japan
- Yoshimi Takeuchi, Saku University, Japan
- Satoko Nakata, Saku University, Japan

ABSTRACT

Background: Competency-based medical education has been gaining prominence, and in 2009, the Japanese Midwives Association introduced 45 “essential” competencies based on those of the International Confederation of Midwives. After a decade, however, there are no evaluations of Japanese midwives’ competencies. This study aims to assess the level of acquired by midwives in Japan.

Summary of Work: Self-report questionnaires were issued to 56 graduates of the one-year post-nursing program between December 2018 and January 2019. These students rated themselves against 45 competencies at the time of both their graduation and the survey, using 4 levels: level 0, either no experience of or failing to demonstrate the competence; level 1, able to demonstrate the competence with the support of others; level 2, able to demonstrate the competence independently; level 3, able to demonstrate the competence and support the performance of others. The responses were scored from 0 (level 0) to 3 (level 3) and the data then analyzed using Wilcoxon signed-ranks test. The Institutional Review Boards (IRB) at Saku University approved this study protocol.

Summary of Results: A total of 24 graduates participated in the survey. Their mean age was 27.3 (5.5SD) with a mean of 2.0 (1.1SD) years’ experience as a midwife. The mode of 2 competencies reached level 2 at graduation, but except for 2 more at level 1, others were level 0. When surveyed, the mode of 1 competency reached level 3, with 26 at level 2, but 17 competencies remained at level 1 and 1 at level 0; however, the mean value of 42 competencies had risen significantly ($p < 0.05$).

Discussion and Conclusions: These results raise the issue of validating of the competencies for midwives and the one-year post-nursing curriculum in Japan. In future, it essential that the level of the competencies acquired is evaluated by others, such as managers and peers.

Take-home Messages: Japanese midwives had not acquired 43 out of 45 “essential” competencies at graduation and 17 competencies remained at minimum level 1 at the time of the survey.

Evaluation of Simulated Training Scenarios and Debriefing Quality Using a Competence-Based Behavioral Checklist

AUTHOR(S):

- Yoshitaka Maeda, Jichi Medical University, Japan (Presenter)
- Yoshikazu Asada, Jichi Medical University, Japan
- Yoshitaka Kikkawa, Jichi Medical University, Japan
- Chiaki Takahashi, Jichi Medical University, Japan
- Michiko Kameda, Jichi Medical University, Japan
- Megumi Watai, Jichi Medical University, Japan

ABSTRACT

Background: In Japan, scenario-based simulated training allows novice nurses to experience multitasking. Scenarios are based on clinical events so that novices can encounter the seven competencies of multitasking as nurses, including fall risk management, communication, and prioritization of tasks. In our training, all novice nurses experience all competencies through three scenarios. For example, the patient has coughing fits when the nurse leaves for toileting assistance with another patient. Immediately after each scenario, debriefing by nurses is conducted. Although training success depends on the scenario and debriefing quality, it is difficult to evaluate effectiveness of these two factors; thus, we developed a competence-based behavioral checklist and proposed a method to evaluate the effectiveness of scenarios and debriefing.

Summary of Work: First, we developed a list of 25 ideal observable behaviors expected of nurses after acquiring seven competences through each scenario. We evaluated nurses' behavior in each scenario using this list, and whether behaviors listed were sufficiently reviewed during debriefing. In this training, 124 nurses were divided into groups of 6-8. Summarizing the list clarified scenario and debriefing effectiveness.

Summary of Results: All listed behaviors were discussed by all groups in debriefing. In the final scenario after debriefing twice (roundup scenario), approximately 80% nurses could perform 19 of the 25 listed behaviors. Further, comparing before and after debriefing, the implementation rate of behaviors related to competence in drip infusion management greatly increased; it is possible that nurses sufficiently acquired the seven competencies through scenarios and debriefing. However, 49% nurses did not auscultate the patient with coughing fits, a weak point in that scenario.

Discussion and Conclusions: Using this checklist, scenario and debriefing advantages and weaknesses can be analyzed based on nurses' behavioral tendencies. Moreover, the list can clarify how debriefing changes nurses' behavior. With each item of the checklist being linked to the seven competencies, identifying each nurse's achievement of competence is possible.

Take-home Messages: Evaluating nurses in scenarios using a competence-based behavioral checklist enables assessment of the effectiveness of training scenarios and debriefing. Additionally, using a behavior-focused list enables clarification of specific points for scenario improvement and emphasis in debriefing.

Construction and Analysis of a First Aid Competence Index for Nurses in the Two-Year Nursing Postgraduate Training Program

AUTHOR(S):

- Shih-Ying Yen, MacKay Memorial Hospital, Taiwan (Presenter)

ABSTRACT

Background: In-hospital cardiac arrest is a patient safety issue which also attracts extensive attention worldwide. Nursing staffs are often the first line members to initiate rescue process when discovering unstable hemodynamics of the patients. Although new nursing staffs had training courses in the Two-Year Postgraduate Training Program for Nurses (NPGY2) provided by the Ministry of Health and Welfare-in which basic concepts of first aid are acquired, technical courses are taken, and basic life support certification is obtained-NPGY2 nurses were still incapable of identifying emergency condition and solving patient's problems immediately. Their incompetence in first-aid skills may influence the rescue efficacy and also lead to increase in-hospital morbidity and mortality. For patient safety, it is crucial to evaluate the first aid competence of NPGY2 nurses.

Summary of Work: The main purpose of this study was to construct NPGY2 nurses' first aid capability scale. We test reliability and validity of the scale in order to know the applicability of the verification scale in clinical practice and research, and construct a useful tool to assess the NPGY2 nurses' first aid capability. We first developed a scale focusing on the first aid ability by Defi method and confirmatory factor analysis.

Summary of Results: The confirmatory factor analysis consisted of five facets with a total of 15 questions; critical thinking ability, emergency response ability, first aid related technical operation ability, medical team cooperation ability, medical team Communication ability, the construction reliability of each facet is .812, .744, .833, .887, .874. The Cronbach's α coefficient of the overall scale is 0.920, and the alpha coefficients of each facet are .808, .748, .830, .880, .866.

Discussion and Conclusions: Adding training courses such as first-aid case analysis, post-emergency case discussions, can improve the overall first-aid ability of nursing staffs. Our study showed that this scale has good reliability and validity. The scale may be used as an objective indicator for assessing the effectiveness of first aid in the NPGY2 nurses.

Take-home Messages: The future research scale design can be based on the students seniority and combined with the Entrustable Professional Activities (EPAs) to develop a first aid capability scale.

Multiple Transitions of Undergraduate First-Year Students in the MBChB Programme: Expectations, Experiences and Emotions

AUTHOR(S):

- Nokuthula Tlalajoe, University of the Free State, South Africa (Presenter)
- Mpho Jama, University of the Free State, South Africa

ABSTRACT

Background: The transition from school to tertiary study can be daunting and overwhelming. Many students who have potential are underprepared for this transition. However, institutions are equally as underprepared. Studies on transition into medical programmes have only focused on the “state of being a first-year medical student” rather than the “transition process” itself. The focus of this paper will not only be on the transition process, however, on the multiple transition phases within the first year of the MBChB programme at the University of the Free State (UFS), South Africa. The aim was to determine the first-year undergraduate medical students’ perception of their multiple transitions within the first year.

Summary of Work: Two focused group discussions were held in 2017 with 19 first-year undergraduate medical students who went through multiple transitions within their first year of the MBChB programme. Three transitional phases were investigated; (i) the beginning of the first year (phase 1), (ii) six months later (phase 2), (iii) back into the beginning of the first year for the second time (phase 3). The focus during the discussions was on their perceptions of the multiple transition phases. Three main themes were identified namely the expectations and experiences, emotions and recommendations during analysis of data.

Summary of Results: According to the results, most students stated that during the initial transition, lecturers and senior students did not provide them with a “big picture” regarding expectations in the MBChB programme. Instead, expectations shared did not match their “real” experiences in the programme. Eventually, they experience different forms of emotions. The main recommendation from the students was the importance of social integration and relationships in the faculty and with lecturers.

Discussion and Conclusions: Medical schools such as the UFS should consider the multiple transitions that students go through within their first year, and design strategies that will ease these transitions.

Take-home Messages: The lack of social integration during transition should be prioritized among undergraduate first-year medical students.

Medical students' learning strategies during transition to clinical training are strongly associated with their levels of burnout and wellbeing

AUTHOR(S):

- Denisse Zuniga, Pontificia Universidad Catolica de Chile, Chile (Presenter)
- Guadalupe Echeverría, Pontificia Universidad Catolica de Chile, Chile
- Oslando Padilla, Pontificia Universidad Catolica de Chile, Chile
- Maribel Calderon, Pontificia Universidad Catolica de Chile, Chile
- Marcela Bitran, Pontificia Universidad Catolica de Chile, Chile

ABSTRACT

Background: Transition to clinical training involves numerous learning and personal challenges for medical students. Not surprisingly, this period is associated with significant erosion in students' wellbeing, with one in two students developing burnout, a syndrome characterized by emotional exhaustion, depersonalization and diminished personal accomplishment. The objective of this study was to characterize the learning strategies used by medical students in this transition and study its association with burnout, wellbeing and academic performance.

Summary of Work: 1,394 medical students (44.4% females) from eleven Chilean universities enrolled in years 4 and 5 of a 7-year curriculum participated in this cross-sectional study. They answered validated questionnaires of burnout (Maslach Burnout Inventory, MBI), psychosocial wellbeing (Mental Health Continuum, MHC-SF) and clinical learning strategies (Clinical Learning Strategies Questionnaire, CEACLIN). CEACLIN is a 48-item scale rated with a 4-point frequency scale and comprised of four dimensions: Academic Engagement (AE), Study Techniques (ST), Emotion Regulation (ER) and Stress Management (SM).

Summary of Results: Women reported using more frequently the learning strategies associated with AE, ST and ER, compared to men. The pattern of strategies used by students also varied across universities. The prevalence of Burnout among the participants reached 53.8%. Burnt-out students reported lower use of strategies associated with AE, ST and ER as well as higher levels of SM use. Inversely, flourishing students reported higher levels of AE, ST and ER use and lower levels of SM. Grades were directly associated with the level of AE-related learning strategies and inversely associated with ER and SM, after controlling for sex, university, burnout and wellbeing status.

Discussion and Conclusions: The frequent use of clinical learning strategies associated to AE, ST and ER dimensions is strongly associated with lower levels of burnout and higher wellbeing. SM is inversely associated. AE, ER and SM, but not ST, were associated with grades.

Take-home Messages: Learning strategies such as academic engagement, study techniques and emotion regulation in clinical training could help students to deal better with the inherent distress of medical studies. Academic engagement appears as a key learning strategy to achieve better grades. SM seem to be a response to burnout. Funding provided by FONDECYT 1150340.

Facilitating a successful transition from academic to clinical education for medical students

AUTHOR(S):

- **Brooke Short, University of Newcastle, Australia (Presenter)**
- Upuli Pahalawatta, University of Newcastle, Australia
- Carol Hood, University of Newcastle, Australia
- Louise Lambeth, University of Newcastle, Australia
- Mary-Ann Ryall, University of Newcastle, Australia
- Michael David, University of Newcastle, Australia
- Amanda Dawson, University of Newcastle, Australia

ABSTRACT

Background: The transition from the academic phase of medical school to the full-time clinical environment can often be difficult and stressful. Beginning Education At Central Coast Hospitals (BEACCHES) was developed as an experiential wilderness experience to assist this transition and increase student awareness of the resources available for their support.

Summary of Work: Aims This project has two aims, to provide students with first responder education and to introduce students to the Central Coast, their fellow students and their support staff. Sessions on first responder training specific to coastal and remote locations included: First aid and Surf safety with the Ocean Beach Surf-Life saving club, antivenin education with the Australian Reptile Park. The second aspect to this program was management of changing expectations in the new environment. A mental health forum with representatives from junior medical staff who were previous students, senior clinicians and academic support officers was held. In addition, a presentation on managing work-life balance and awareness of mental health issues was run. Method A two-day workshop was held on the Central Coast. Pre and post workshop surveys were conducted with a combination of matrix questions, Likert response scales and long answer questions. Ethics was obtained. Both quantitative and qualitative responses were analyzed.

Summary of Results: Excellent feedback regarding this program was received all students reporting an increase in knowledge in all three domains of critical medicine and evacuation issues, student health and workload management, and Central Coast Community and environment. The areas of greatest knowledge in each of these domains were management of surf incidents, signs and symptoms of PTSD and central coast marine and ocean environment. An increase in confidence was seen in responding effectively to an emergency situation, particularly in response to improvisation in the field. All findings were statistically significant with all P-values <0.01. In the following 6 months one student has self-reported for assistance with stress management as a result of this forum

Discussion and Conclusions: The addition of BEACCHES to the orientation of medical students at the Central Coast Medical School has demonstrated itself to be an effective program for allowing students to adjust more quickly to full time clinical education.

Easing the Transition of Medical Student to Professional Practitioner: The Implementation of a Near-Peer Led Teaching Session in Induction Week across East of England Region

AUTHOR(S):

- **Katie Wood, Mid Essex Hospital NHS Trust, UK (Presenter)**
- Emily Farrow, East and North Hertfordshire NHS Trust, UK
- Titilopemi Oladosu, Norfolk and Norwich University Hospitals NHS Trust, UK
- Bina Patel, Cambridge University Hospitals NHS Trust, UK
- Isabelle Goldrick, Barts Health NHS Trust, UK

ABSTRACT

Background: The UK General Medical Council emphasize the importance of preparation for clinical practice, however, transitioning from medical student to professional practitioner as a foundation year 1 (FY1) doctor can be challenging for newly qualified doctors.

Summary of Work: We implemented a near-peer led teaching session titled 'Asked to See Patient' (ATSP) which was taught across 19 hospitals in the East of England region of the UK. We trained 57 current FY1 doctors via two half day 'teach the teacher' courses in Cambridge, to design and deliver the ATSP session during induction week to the incoming FY1 doctors at their local hospitals. They could choose from a variety of scenarios, and were encouraged to incorporate role-play into teaching.

Summary of Results: After the 'Teach the teachers' course, 100% of current FY1 doctors agreed or strongly agreed that they now felt confident in designing, organising and delivering the ATSP teaching session. After the local sessions, incoming FY1s: 92% felt the session was relevant to their learning needs, 83% were more confident about assessing and escalating patients during on-call shifts, 74% were more confident about accessing and utilising hospital guidelines during on-call shifts, 81% were more confident about receiving and providing a structured clinical handover during on-call shifts.

Discussion and Conclusions: Overall, the data shows that incoming FY1 doctors felt more confident in many areas pertinent to clinical practice after having the ATSP session compared to before. Furthermore, it suggests that after the 'teach the teachers' course, the current FY1s felt empowered to design, organise and deliver the sessions, which aides their further development also.

Take-home Messages: Near-peer led local teaching of a regionally implemented session entitled 'Asked to See Patient', delivered in induction week, can help improve the confidence of newly qualified doctors entering into professional practice in the UK.

A Scoping Review of Interventions to Support the Transition from Medical Student to Doctor

AUTHOR(S):

- Niamh Coakley, University College Cork, Ireland (Presenter)
- Anel Weise, University College Cork, Ireland
- Aislinn Joy, University College Cork, Ireland
- Helen Hynes, University College Cork, Ireland
- Paula OLeary, University College Cork, Ireland
- Deirdre Bennett, University College Cork, Ireland

ABSTRACT

Background: The transition to clinical practice is a challenging one for the newly graduated doctor. Graduates report feeling unprepared for some aspects of practice which can intensify the difficult nature of the transition. Supervisors and program directors similarly express concerns regarding deficiencies in certain competencies expected of new graduates. In addition to affecting the confidence and competence of medical graduates, lack of preparedness may also have patient safety implications, as evidenced by reports of the ‘July effect’ when new graduates commence practice. In response to this issue, focused interventions have been designed and implemented in an attempt to improve work readiness and ease the transition. We conducted a scoping review of the literature to determine the extent, range and nature of these interventions.

Summary of Work: Our review was informed by Arksey and O’Malley, and Levac’s methodological framework. Using relevant terms we searched Medline, CINAHL, Embase, PsycINFO, SocINDEX and ERIC databases, handsearched key journals: Medical Education, Academic Medicine and Medical Teacher, and tracked citations, to identify empirical papers, in the English language, describing the implementation and/or evaluation of interventions explicitly designed to address preparedness for practice. Papers were screened by abstract and title, and then by full text using inclusion and exclusion criteria. Data was extracted to address the focus of the review.

Summary of Results: Using PRISMA guidelines, 5076 articles were identified following database searching, with an additional 93 articles by journal handsearching and citation tracking. This yielded 3648 articles when duplicates were removed. These articles were subject to title and abstract screening yielding 204 articles that were subject to full text review. 180 articles were finally selected for data extraction. Results will be presented to provide an overview of the breadth of the literature on discrete interventions that facilitate preparedness for clinical practice.

Discussion and Conclusions: This review will inform future research, practice and policy in the preparedness for practice and ease of transition of medical graduates commencing their first postgraduate year.

Take-home Messages: A ‘preparedness gap’ exists: this review will describe the breadth of current interventions in the literature that address this issue, informing future practice.

Bridging the Gap: Transition from Medical Student to Junior Doctor

AUTHOR(S):

- Ujjwal Prakash Khanal, Institute of Medicine, Tribhuvan University, Nepal (Presenter)
- Preeti Shakya, Chitwan Medical College Teaching Hospital, Nepal

ABSTRACT

Background: The transition from medical student to junior doctor- from supported learning to independent practice- is quite challenging with fresh graduates lacking both clinical skills and confidence. The extraordinary nature of the job in terms of clinical responsibilities, horrendous workloads and complexity all add to the challenge. This study sought to evaluate the main concerns and challenges of junior doctors during the transition from their role of students to that of a practicing doctor and what could be done to facilitate this transition.

Summary of Work: The junior doctors from Chitwan Medical College Teaching Hospital in Nepal were surveyed using a semi-structured questionnaire. The questionnaire contained items pertaining to their experiences, concerns during clinical practice and best approaches that they think would enhance the transition.

Summary of Results: A total of 62 junior doctors participated in the survey. The findings suggest that despite radical changes in the curriculum, most newly qualified doctors (65%) still found the transition challenging. Three key themes emerged from the analysis; the amount of clinical exposure during medical school, training prior commencing clinical practice and support during clinical tasks.

Discussion and Conclusions: This study has provided interesting insights into the experiences of newly qualified doctors and a lot can be learned by exploring their experiences. The predominant concern expressed by the participants was the management of critical cases (86%). While graduates felt prepared for basic clinical tasks such as history taking and physical examination, they reported a drop in self-confidence while prescribing medications and deducing differential diagnoses. A lack of adequate clinical exposure during medical school and poor support from the faculty during clinical work were sought to be the key contributing factors for this difficult transition.

Take-home Messages: Proper and adequate training prior to clinical work is highly valued during the demanding transition period. Workplace support and supervision, especially from senior colleagues, should be made available to junior doctors in especially situations where they are dealing with critical and complex cases. Medical schools need to ensure that students are provided with early exposure to clinical environments which allow meaningful contact with patients and increasing opportunities to act up as a role of junior doctor, even as students.

Final Year Examinations Versus Job Preparation: Introducing a Series of Sessions to Bridge the Gap

AUTHOR(S):

- Ariella Midgen, Watford General Hospital, UK (Presenter)

ABSTRACT

Background: The final year of medical school feels like a year of conflicting priorities: revising for examinations versus preparing to start work. It leaves students sacrificing important parts of their studies to focus on different assessments in turn. This is less efficient than a holistic approach and impacts how students engage with educational opportunities. In particular, students perceived their clinical placements as more useful for job preparation than for examinations ($p=0.0114$) and reported being less likely to engage with their placements as examinations loomed closer.

Summary of Work: A series of classroom-based teaching sessions were devised and introduced to University College London medical students on their final year undergraduate placements at Watford General Hospital. Each session covered key theoretical knowledge within common hospital scenarios. The aim was to assess the course's efficacy at shifting participants' attitudes towards their clinical placements and at encouraging students to view their final examinations as part of job preparation rather than draining time away from it. This was assessed using pre- and post-course questionnaires.

Summary of Results: The sessions were positively received, and students reported feeling more prepared for their written examinations ($p=0.0487$), OSCEs ($p=0.0622$), and for beginning work ($p=0.0504$). More importantly, following the sessions students were more likely to believe that revision and their future careers overlapped ($p=0.0443$), and less likely to believe that their clinical placements were irrelevant until their examinations ended ($p=0.1371$).

Discussion and Conclusions: The final year of medical school can feel like a tick-box exercise. It is tempting for students to focus on the most pressing priority at the time, rather than viewing educational opportunities and exams as tools to equip them for the future. However, preparing for examinations and preparing to start work are not mutually exclusive. Following this programme students shifted their perspectives on clinical opportunities and reported being more likely to engage with them as a result.

Take-home Messages: Bridging sessions could be a useful supplement to realign the aims of the final undergraduate year. There is no need for educational opportunities, examinations, and clinical experiences to be at odds with each other.

The effectiveness of orientation training for new nursing staff by flipped classroom teaching mode

AUTHOR(S):

- Jen-Yu Chi, National Cheng Kung University Hospital, Taiwan (Presenter)
- Wei-Fang Wang, National Cheng Kung University Hospital, Taiwan
- Yu-Ting Tien, National Cheng Kung University Hospital, Taiwan
- Chia-Jung Chen, National Cheng Kung University Hospital, Taiwan
- Yen-Ning Hsu, National Cheng Kung University Hospital, Taiwan

ABSTRACT

Background: The purpose of orientation training program is to serve new staffs to acquire the working skills and be familiar with the environment. However, the traditional method is based on one-way teaching which lacks of the feedback and the validation of the training results. Therefore, we have introduced the “flipped classroom teaching mode”, FCTM, in medical system to attract new nursing staff to learn actively and improve learning efficiency for their orientation training.

Summary of Work: To testify the FCTM. One group of new staff were trained by FCTM ; Others are by traditional method, as a control group. The course, common examinations for nursing, for FCTM group is separated into three steps: 1. Preview the courses including viewing the standard videos for nursing such as CT, MRI scan etc. 2. Group discussions during the courses at the classroom. 3. Group reports after the lessons. Interactive discussions between lecturers and learners. Nurses in the FCTM and control group will be examined at pre and post training program. Satisfaction of the both mode will be evaluated by the learners. The performance of both group will be evaluated after 3 month .

Summary of Results: The average grades of pre-test of the FCTM group is 80(\pm 9.68), total is 100 points; the control group is 77.2(\pm 12.62), $p=0.216$, no significant difference. After the training, the grades of the control group is 82.6(\pm 13.37); the FCTM group is 95.2(\pm 7.62), $p< 0.001$. The grades of FCTM group is better than the control group. The satisfaction for teaching method of the FCTM and control group is 4.28(\pm 0.52) and 4.91(\pm 0.22), $p< 0.001$. total is 5 points. Satisfaction of the clinical teachers to judge the performance of FCTM group is 4.07(\pm 0.62) which is higher than the control group, 3.48(\pm 0.57).

Discussion and Conclusions: Implementation of FCTM to the orientation training for the new staff has dramatic influence on their working performance and with better satisfaction from their mentors. FCTM training can achieve Kirkpatrick's Learning Evaluation Level 3; the knowledge are being used the workplace.

Take-home Messages: The FCTM method is considerable a good orientation training method.

A multi-support approach: The role transition of newly graduated nurses during the first three months of preceptorship in Taiwan

AUTHOR(S):

- Hui-Ying Chiang, Chi Mei Medical Center/Southern Taiwan University of Technology, College of Humanities and Social Sciences, Taiwan (Presenter)
- Kai-Fang Chang, Chi Mei Medical Center, Taiwan
- Su-Ya Huang, Chi Mei Medical Center, Taiwan
- Ling Yeh, Chi Mei Medical Center, Taiwan

ABSTRACT

Background: Role transition is a challenging and stressful process for newly graduated nurses (NGNs). Between 20-30% of NGNs leave their jobs within the first 3 months of their nursing careers because of difficulties during role transition. Knowing that, the success of role transition is determined by an effective and supportive preceptorship resulting in high satisfaction from continued learning and smooth job adaptation among NGNs.

Summary of Work: A project of multiple support approaches was applied to NGNs who were new nurses during their first 3 months of employment in 2018. Supportive strategies included open-space-technology (OST) meetings with NGNs and their preceptors respectively, mentor-like consultations regarding interpersonal relationships, on-line E-portfolio networks and a skill-based orientation program. Through OST meetings, the preceptors learned to manage their stress in teaching such as handling role conflicts, and calming the fear of the NGNs' failures at work. In addition, the NGNs had opportunities for self-reflection, inner-strength exploration and peer-group support, which assisted their role adaptations. Second, the mentor-like visits facilitated interpersonal relationships and helped monitor the NGN's competence progress. Third, the NGNs could review their E-portfolios and preceptors' feedback on their mobile phones. Last, the orientation was programmed based on skill-based practices.

Summary of Results: In total, 109 new nurses and their preceptors participated in this project. By the end of 2018, 17 new nurses left their jobs. The turnover rate of 15.6% (2018) decreased from 24.1% in 2017. Moreover, the NGNs stated that their interpersonal communication, preceptor-preceptee relationships and role adaptation were satisfactory.

Discussion and Conclusions: This project contributes to the understanding of NGNs' role transition and job retention at the novice stage. Through a bundle of supportive activities including peer-group discussions, mentor-like visits, on-line portfolios and skill-based orientation programs, NGNs are encouraged to continue learning and succeed in their role transitions.

Take-home Messages: For hospitals to pursue successful nurse retention, using multiple supports can assist new nurses to acclimate to their new roles. For nurse educators and administrators to facilitate role adaptation, developing effective strategies such as OST meetings, one-on-one preceptorships, competence-based orientations, mentorships of preceptors and preceptees, and on-line portfolios is recommended.

A study on the Learning Attitudes, Learning Difficulties and Coping Strategies of New Nurses

AUTHOR(S):

- Su-Chen Kuo, Chi Mei Medical Center, Liouying, Taiwan (Presenter)

ABSTRACT

Background: When newly graduated nurses become nurses, they must learn much to adapt themselves to the complicated environment in this transition period. How to help them to learn better is our major concern. The purpose of this study is to comprehend the new nurses' learning attitudes, the difficulties they encounter, and coping strategies.

Summary of Work: We performed a cross-sectional. This study was conducted through a questionnaire survey according to a 5-point Likert scale in December of 2018. The data was collected from new nurses that were trained in the Two-Year Post Graduate Training Program of the Regional Teaching Hospital in Taiwan. A total of 145 of the 146 new nurses (99.3%) completed the survey. The measurement tools were adapted from relevant previous studies to meet the needs of the research and also interviews with five new nurses with an open question guide, including three sub-questionnaires, "attitude toward learning," "learning difficulties," and "coping strategies for learning."

Summary of Results: The conclusions of the study are as follows:

1. The attitudes toward learning for new nurses shows medium-high status, the dimension of teachers' teaching shows the highest one, but the dimension of learning habit shows the lowest one.
2. The learning difficulties of new nurses shows a medium-low status, how to learn to care about critical patients and emergency treatment shows the highest one.
3. The coping strategy adopted by new nurses shows positive behaviors, implying that positive coping strategies are used most, but negative ones are used less.
4. The relationship between learning attitudes, learning difficulties and coping strategies is close. Learning attitudes and learning difficulties have a negative correlation and positive correlation with learning strategy.

Discussion and Conclusions: When we plan new nursing training programs, how to improve their intensive care ability and increase their confidence is important. Preceptors must help new nurses create their positive learning attitudes, and then they will learn better.

Take-home Messages: If new nurses have a good attitude towards learning, they will adapt themselves well to the complicated clinical environment.

Developing a tailored induction programme for International Medical Graduates

AUTHOR(S):

- Justin Poisson, Great Ormond Street Hospital for Children, UK (Presenter)
- Craig Knott, Great Ormond Street Hospital for Children, UK
- Emma Parish, Great Ormond Street Hospital for Children, UK
- Holly Boyd, Great Ormond Street Hospital for Children, UK
- Cheryl Hemingway, Great Ormond Street Hospital for Children, UK
- Sanjiv Sharma, Great Ormond Street Hospital for Children, UK

ABSTRACT

Background: International Medical Graduates (IMGs) are defined as any doctor that has obtained their primary medical qualification outside of the UK. Over 50% of junior doctors at Great Ormond Street Hospital for Children (GOSH) fall into the IMG category. The Postgraduate Medical Education (PGME) Department at GOSH collected data to develop strategies to assist with the integrations of IMGs into the organisation. One of these strategies was to expand the induction programme; tailoring it toward the specific needs of IMGs.

Summary of Work: PGME designed an additional mandatory half-day induction programme aimed at IMG doctors that have not previously worked or lived in the UK. We used survey data to design a relevant programme of content, which includes: • Common abbreviations and nuanced language used in the clinical environment • An introduction to the NHS Structure and Funding • The role of the GMC in clinical practice and education • UK training pathways and equivalence • Organisational support for IMGs • Simulation training using the scenario of difficult venepuncture and phlebotomy with challenging conversations with families and staff around this procedure

Summary of Results: The number of attendees fluctuated on a monthly basis, in line with recruitment variation, ranging from 3-11. Attendees were given a pre and post induction survey to identify the country of initial medical training, assess their confidence in starting their placement and identify the difficulties of moving to the UK. Confidence to start the placement was scored out of 10, which rose from an average score of 6.0 prior to the programme to an average score of 8.0.

Discussion and Conclusions: Attendees felt that the session provided them with a useful introduction to the NHS and GOSH, and felt they were more confident to start their first placement in the UK as a result. They found the abbreviations and practical discussion of common problems and pitfalls most valuable.

Take-home Messages: Using data from surveys of IMG doctors to develop a tailored induction helps IMGs transition into the NHS.

Transition to Foundation Year 2 - how can we better support trainees?

AUTHOR(S):

- Kirsty Brownlie, NHS (Severn Deanery), UK (Presenter)
- Clare Van Hamel, NHS (Severn Deanery), UK
- Katy Stevenson, Severn Deanery, UK

ABSTRACT

Background: In recent years, there has been a focus on supporting doctors transitioning to foundation year 1 (F1). However, our hypothesis was that there are other stressful stages during training; with the transition from F1 to F2 being one example of a significant step-up in responsibility. We wanted to understand whether this causes anxiety and stress for trainees, whether they feel that patient safety is affected, and what measures could be introduced to help improve the transition and improve patient safety.

Summary of Work: A detailed survey was distributed to all F2 doctors within Severn Deanery. It addressed how trainees felt during transition, the support provided to them before, during and afterwards, and what areas they felt could be improved in order for them to feel better supported. The data was analysed and discussed with deanery management, and several areas for improvement in support have been identified.

Summary of Results: Nearly 40% of F2 doctors reported feeling stressed by the transition from F1-F2, and 1 in 3 did not feel confident moving up to F2. Nearly 50% indicated that they plan to take time out of training after F2 due to stress, burnout or lack of work/life balance. Whilst many factors contribute to stress for trainees, our survey suggests that one area which could be improved is the transition from F1-2, which has perhaps previously been underestimated in terms of its role in trainee wellbeing. The survey flagged an important connection between trainee wellbeing and patient safety with 61% of respondents stating that patient care was affected during the transition.

Discussion and Conclusions: Ways of improving the transition process were identified, many of which are now being addressed by the deanery: 1. shadowing days 2. educational sessions about the roles of F2 doctors 3. greater appreciation for the difference between F2s and more experienced doctors on SHO rotas 4. avoidance of on-call shifts during the transition week 5. mentoring for foundation doctors.

Take-home Messages: The survey showed that the step-up to F2 is significant, and without appropriate support, trainees can experience stress and anxiety. Considering the possible impact on patient safety and retention of doctors, new ways to support trainees are critical.

Impacts of contextual game-based learning on Nurse Practitioners learning performances in health assessment courses

AUTHOR(S):

- Chin-Sheng Lin, School of Medicine, National Defense Medical Center, Taiwan (Presenter)
- Hui-Chen Lin, Tri-service General Hospital National Defense Medical Center, Taiwan
- Gwo-Jen Hwang, Graduate Institute of Digital Learning and Education, National Taiwan University of Science and Tech, Taiwan
- Yaw-Don Hsu, Tri- Service General Hospital National Defense Medical Center, Taiwan
- Jiunn-Tay Lee, Tri- Service General Hospital National Defense Medical Center, Taipei, Taiwan

ABSTRACT

Background: It is important to foster nurse practitioners (NPs) health assessment and differential diagnosis competences. Previous studies indicated that the lack of could be the main reason affecting NPs' learning outcomes, which further affects their confidence of facing patients. The use of simulated contextual learning system could be an answer to this problem.

Summary of Work: In this study, a contextual game-based learning system for health assessment is developed for providing clinical practicing environment in gaming contexts by taking into account several learning objectives, such as medical history collection, physical assessment and differential diagnosis. In order to verify the effect of the proposed approach, a quasi-experiment was conducted. The experimental group learned with the contextual game, while the control group learned with the traditional instruction.

Summary of Results: The results showed that the experimental group significantly improved learning achievement, motivation, attitude and self-efficacy. Moreover, the satisfaction of the learning approach of the experimental group was significantly higher than the control group.

Discussion and Conclusions: In this study, we successfully used a contextual game-based learning approach in the health assessment course for nurse practitioners. The findings could be a good reference for researchers and teachers in medical and nursing education.

Take-home Messages: Situating learners in the context of practicing enables them to master the problem-solving procedure, which could help them improve the confidence to serve patients. Moreover, situating them in a game-based learning storyline, could decrease their learning anxiety and enhance their learning motivation. Thus, it is worth investigating the use of digital game-based approach in medical and nursing education.

Neurophysiology Games in the Process of Education and Learning in Psychology: Perception of Students in the Living of Construction

AUTHOR(S):

- Carla Waldeck Santos, Faculdades Pequeno Príncipe, Brazil (Presenter)
- Rogério Saad Vaz, Faculdades Pequeno Príncipe, Brazil

ABSTRACT

Background: Neurophysiology games related to the teaching-learning process; describes the process of students neurolearning in game construction. The perspective of cognitive neuroscience and its contribution to education was used as a theoretical reference, reaching the principles of brain-based learning and the constructivist theories based on the authors Piaget, Vigostky and Ausubel.

Summary of Work: The purpose of this study was to analyze Psychology undergraduates in relation to perception and construction of Neurophysiology in the teaching-learning process; and support the strategy of building games for students as an active methodology strategy and to describe the students neurolearning process in the construction of games. The methodology chosen was a qualitative, with an exploratory and descriptive approach combined. The data were obtained through a semistructured interview with students of the 3rd and 7th period of Psychology that carried out this activity. For the analysis of the data, we used the Content Analysis proposed by Minayo. The students report on the strategy of teaching games construction is to be a different methodology, since it provides a way out of the routine of lectures, abstracts, theaters, seminars they are accustomed to develop; challenging; which assists in the understanding and application of the knowledge of Neurophysiology, since they need to review and deepen the knowledge and to relate the theory with the practice; enables the development of metacognition; personal valuation; the integration among students and the improvement of the interpersonal relationship.

Summary of Results: The results observed showed that this strategy allowed students to be active players throughout the game construction process, characterizing it as an active methodology, as well as contemplating the principles of brain-based learning. The students evoked executive functions for the elaboration of the games, essential functions in their professional life.

Discussion and Conclusions: This analysis clarified an intimate relationship between active methodologies and the principles of brain-based learning, as well as studies of cognitive neuroscience contribute to better targeting of the educational act.

Take-home Messages: The construction of games allows to work with different forms of learning and demonstrates to be an efficient methodology.

Spreading Happiness for Medical Students with TV Game Shows Teaching Style: Facilitating Learning-by-Learner

AUTHOR(S):

- Sahattaya Niyamosot, Suranaree University of Technology, Thailand (Presenter)
- Kitirat Rattanathawornkiti, Suranaree University of Technology, Thailand

ABSTRACT

Background: For decades, the learning method was based on conventional lecture which was passive and teacher-centered process. Nowadays, new generation students have difference than previous generations. This study aims to introduce unconventional teaching style that inspired by popular Thai TV Game Shows was held for medical students to reduce academic stress and creative way to facilitate learning.

Summary of Work: Clinical radiology is taught as a pre-clinical class for 3rd year medical students at faculty of medicine, Suranaree University of Technology (SUT). All 91 students participated in this class “Basic of radiology in the reproductive system”. All students were divided into 5 groups (about 18 each). Each got selected Thai TV Game Show concepts from teacher were designed their own different show in the studio classroom, acting as 1-2 moderators (per group). In the class session, each group presented both game quizzes and academic questions, then answered. After that, the teacher summarized the core topic and made the feedback. All students did individual pre-and post-test and following completed the online questionnaires.

Summary of Results: 89 (97.8%) students completed the questionnaires. The majority of students thought that this class activity promote interests and engagement (excellent 43.8%, very good 37.1%), boost thinking creatively (excellent 46.1%, very good 34.8%), enjoy learning (excellent 56.2%, very good 28.1%) and enhanced knowledge after study (excellent 46.1%, very good 33.7%). Level of satisfaction revealed very satisfied (66.3%), satisfied (33.7%) and dissatisfied (0%). The average total score of individual pre-and post-test from all 91 students was significantly increased from 56.43 ±13.11 to 94.12 ±5.66 (p-value <0.001*).

Discussion and Conclusions: Engage students in creating their own learning environments, then give them in establishing learning goals. By transferring classroom management to medical students for their direction, teacher and co-teachers become facilitators of learning. Group activity, interactive game show-based teaching style motivated students with active learning, to gain both happiness and knowledge.

Take-home Messages: Medical students are not only learner, sometimes they can be co-teachers. Encouraging alternative form of self expression in the new generation students is one of the strategy for effective learning in the classroom.

Team-Game-Tournament in new nurses' medication training program

AUTHOR(S):

- Pei-Hsuan Li, Chi Mei Medical Center, Liouying, Taiwan (Presenter)
- Yueh-Mei Wang, Chi Mei Medical Center, Liouying, Taiwan
- Su-Chen Kuo, Chi Mei Medical Center, Liouying, Taiwan

ABSTRACT

Background: Administering medicine to patients is a high priority, most demanding, stressful and responsible part of nursing work. How to training new nurses is important and challenging. We used traditional didactic teaching and skill demonstrated by teacher in the past. But we found out new nurses still confuse and wrong performance through this one way teaching process. When new nurses were nurse student, they practiced many times in clinical. We think don't repeat some content they learned before. Check backs their concept and skill correctly is more important. So we designed Team-Game-Tournament training program to teach new nurses.

Summary of Work: The training program use Team-Game-Tournament strategies. It were be implemented two times. There were 28 new nurses participate this program during July 2017 to August 2017. Four steps in this training program. 1. Give medication Standard Operating Procedure paper to new nurses before learning. 2. "What was wrong". New nurses were assigned to two groups. Then teacher played video which nurses give general and high risk medication to patients. New nurses discussed what was wrong in the video and wrote down on the board. 3. "Grab right." There were 6 IV bags in the desk. New nurses must grab right IV bag to teacher. 4. New nurses from two groups demonstrated medication skill and teacher clarify. Then, teacher checked everyone's skill with checklist. Finally, gave small gifts to the group won the game.

Summary of Results: We measure the effectiveness of training program. The cognitive test average score were improved 20.7 (72.5→93.6). This is higher than traditional teaching average scored 8.7(72.7→81.3). They all pass medication skill test by teacher with checklist. New Nurses felt high learning satisfaction (100%) and had much positive feedback. They pointed out that this training program use Team-Game-Tournament strategies was better than others before. They said "Through Team-Game-Tournament, we have more positive interaction and improve medication knowledge and skill. We get more confident in this lesson before take care patients. We love this lively discussion.

Discussion and Conclusions: Team-Game-Tournament strategy may elevate new nurses' motivation and learning effectiveness. Teacher felt a sense of achievement and agree this change is worthy.

Take-home Messages: How to train our new nurses' effectiveness.

Mixing Innovations: Incorporating educational technology into game-based learning

AUTHOR(S):

- Douglas Bovell, Weill Cornell Medicine in Qatar, Qatar (Presenter)
- Sean Holroyd, Weill Cornell Medicine in Qatar, Qatar
- Syed Latifi, Weill Cornell Medicine in Qatar, Qatar
- Mark Healy, Weill Cornell Medicine in Qatar, Qatar
- Jamie Gray, Weill Cornell Medicine in Qatar, Qatar

ABSTRACT

Background: Advocacy for the flipped classroom has been gaining momentum in the medical literature. Research shows that incorporating active learning techniques, such as gaming and educational technology, can improve student motivation and engagement. Both of which are key components to lifelong learning.

Summary of Work: We reported at AMEE 2018 on using a gamified review quiz during an undergraduate medical program Flipped Classroom event. This year we adapted the group review quiz, by incorporating online gaming technology. Quiz questions were loaded into an online quiz program that awarded points for correct answers. As a bonus, teams gained additional points by answering quickly. 'Team captains' of randomly assigned student groups, once logged-in online, via tablet etc, selected their teams answer choice by pressing the appropriate option. After each question, the correct answer and score for each group was published and totaled. This created a league table of points obtained for each team, with the winning team gathering the most points. As before, students were asked to complete an anonymous survey on the effectiveness of the activity to their learning and to rank other learning activities they found beneficial.

Summary of Results: About 90% of students (n=63) found quiz-gamification effective for delivering review-content and enhancing their engagement. Furthermore, it was found that the 2019-cohort (gaming technology-based) had a richer experience than the 2018-cohort (no gaming technology) as confirmed by the Mann-Whitney U tests ($p < 0.05$). In addition, the 2019-cohort felt they most benefited from Gamification activities, while the 2018-cohort preferred Problem-based learning.

Discussion and Conclusions: The incorporation of gaming technology was reported by the students to be highly effective in enhancing their engagement and learning. In addition, many students commented that it was fun and very enjoyable. A comparison with the data from the previous year, demonstrates that the addition of technology brought about an overall increase in the level of engagement of the students and enhanced their learning. However, it should be noted that some students became disinterested in the activity when their team was not winning, leading reduced participation. Clearly, this is an important consideration for future activities.

Take-home Messages: Gaming technology can enhance the learning experience in a variety of different modalities.

StudzyBuddy: a novel game to facilitate Dermatology revision for final year Medical students

AUTHOR(S):

- David Cripps, South Warwickshire NHS Foundation Trust/The University of Warwick, UK (Presenter)
- Rachel Ventre, South Warwickshire NHS Foundation Trust/The University of Warwick, UK
- Cleone Pardoe, South Warwickshire NHS Foundation Trust/The University of Warwick, UK
- Josie Hough, South Warwickshire NHS Foundation Trust/The University of Warwick, UK
- Shabnam Singhal, South Warwickshire NHS Foundation Trust/The University of Warwick, UK

ABSTRACT

Background: Game-based learning is emerging as a rapidly developing area in medical education and this poster aims to demonstrate that game-based learning can be applied to dermatology. A board game, created by the authors, is presented as a novel approach to enhance learning in this challenging subject area. “StudzyBuddy: Define, Describe, Draw and Decide your way through Dermatology” is an interactive resource designed for final year medical students to improve confidence in dermatology, focusing on diagnosis, investigation, management, recognition and description of lesions with correct medical terminology.

Summary of Work: Initially, learning outcomes for the game were blueprinted against a British University Medical School Curriculum and content was developed by doctors with an interest in dermatology and education. A prototype of the game was then trialled with junior and senior medical educators for quality assurance and fine tuning. The focus of this poster is a trial of the aforementioned game with final year medical students. The students (n=66) attended a facilitated revision workshop featuring the StudzyBuddy board game. Quantitative and qualitative data on students confidence in various aspects of dermatology was collected before and after the session using Likert response questionnaires and open-ended questions.

Summary of Results: Likert responses showed an increase in mean confidence levels from pre-session to post-session across various aspects of dermatology: Diagnosis 3.26 ± 0.70 to 3.88 ± 0.57 ($p < 0.001$), Investigation 3.02 ± 0.72 to 3.47 ± 0.64 ($p < 0.001$), management 3.25 ± 0.72 to 3.52 ± 0.61 ($p = 0.016$), recognition of dermatological lesions 3.07 ± 0.74 to 3.97 ± 0.55 ($p < 0.001$), description of describing dermatological lesions 2.98 ± 0.86 to 3.82 ± 0.58 ($p < 0.001$). Students agreed that game play achieved learning goals (80%), and was less stressful than traditional methods of teaching (89%). Qualitative themes included variation of topics and learning styles, knowledge application and enjoyment.

Discussion and Conclusions: This poster demonstrates how game based learning improved perceived confidence in dermatology in a group of final year medical students.

Take-home Messages: This poster presents a novel approach to learning dermatology and demonstrates how game based learning improved perceived confidence in dermatology in a group of final year medical students.

Combination of Game-based learning and Team-based learning for Improving Medical Knowledge and Self-Confidence in Patient Management

AUTHOR(S):

- Noosara Klumsombut, Ratchaburi Hospital Medical Education Center, Thailand (Presenter)

ABSTRACT

Background: Game-based learning are used in many spectrums. Game-based learning in medical education builds adaptive expertise through medical problem-solving, interaction and enthusiasm. We used mobile device application (Kahoot!) for our game platform and combined with team-based learning(TBL) for the 6th year medical students in pediatric nephrology clinic for improving in pediatric nephrology knowledge and self-confidence in patient management.

Summary of Work: We used TBL in pediatric nephrology clinic in 2014-2016 and changed to use this method in 2017-2018. Two weeks before class, all students had learned the objective of pediatric nephrology diseases by self-study. In class, groups of 2-3 students played Game of Pediatric Nephrology (Game of PeN) on their own mobile devices by using Kahoot! application. This game contained a series of multiple choice questions about common pediatric nephrology diseases. Students got immediate feedback on their answers by the teacher to assure their knowledge. Then they got an assignment to apply their knowledge to manage the patients in pediatric nephrology clinic under the teacher's supervision. Post-class questionnaires about self-confidence in pediatric nephrology knowledge and patient management were analyzed.

Summary of Results: Post-class questionnaires showed improvement in students' self-confidence in their pediatric nephrology knowledge from an average of 78% in post self-study to an average of 95% in post playing-game. Their confidences in management of pediatric nephrology patient were an average of 96%. Thus, all students appreciated this learning strategy and the group discussion.

Discussion and Conclusions: Game-based learning provided good attraction and enjoyable problem-solving game for students. In addition, they benefited from TBL through interactive group discussion for competent knowledge. Not only they improved in pediatric nephrology knowledge but also in self-confidence in patient management.

Take-home Messages: Combination of game-based learning and TBL obviously improves medical knowledge and students' self-confidence in patient management through their interactive discussion in problem-solving game.

The Building Blocks of Haematology: an observation-based research project exploring the use of LEGO® SERIOUS PLAY® within undergraduate medical education

AUTHOR(S):

- Isaac Chung, Weston Area Health Trust, UK (Presenter)
- Emily Booth, Weston Area Health Trust, UK
- Alexandra Martin, Weston Area Health Trust, UK

ABSTRACT

Background: LEGO® SERIOUS PLAY® methodology has been used and adopted within the business industry over the past decade, proving itself as an effective tool in motivating and improving performance. More recently, use of similar pedagogical concepts within medical education has shown to be effective in addressing the topics of professionalism and reflective practice in medical students (Thomson, 2018). The following project proposes that similar methodology can be incorporated into teaching important aspects of basic medical science and physiology. To highlight this, we have demonstrated the practical application of this through the use of LEGO® SERIOUS PLAY® in teaching undergraduate medical students about the coagulation cascade.

Summary of Work: Two groups of third-year medical students from the University of Bristol received a seminar on the coagulation cascade. Both groups were taught using conventional, lecture-based methods, whilst one group received additional teaching using LEGO® SERIOUS PLAY® to create a physical model of the cascade. Quantitative data was collected using pre- and post-test scores as part of their assessment of learning. This data was analysed to determine whether there was any difference in test scores. Those who received teaching using LEGO® also completed a questionnaire to evaluate the added value of the teaching method.

Summary of Results: The project is within its primary stages and full results will be available upon completion and presentation in August 2019.

Discussion and Conclusions: By not relying on conventional ‘teacher-led’ methods, the use of interactive and practical activities such as LEGO® allows all learners to participate actively. By creating physical models, complex and difficult concepts can be broken down into ‘building blocks’ that are more easily understood by students, drawing upon constructivist theories. Use of these activities also promotes creativity, problem-solving skills and encourages teamwork within learners.

Take-home Messages: LEGO® SERIOUS PLAY® methodology may have a role within undergraduate medical education. The use of LEGO® in teaching aspects of basic sciences and physiology enables all learners to participate actively, promotes problem-solving and team working skills, and may enable difficult concepts to be understood more easily. Further research must be done to consider its long-term impact on learning.

Using game based learning as a formative assessment tool in microbiology class

AUTHOR(S):

- Anirut Limtrakul, Faculty of Medicine, Srinakharinwirot University, Thailand (Presenter)
- Benjamas Wongsatayanon, Faculty of Medicine, Srinakharinwirot University, Thailand
- Chantana Mekseepralard, Faculty of Medicine, Srinakharinwirot University, Thailand
- Wanna Pumeechockchai, Faculty of Medicine Srinakharinwirot University, Thailand
- Kruawan Chotelersak, Faculty of Medicine, Srinakharinwirot University, Thailand
- Srisombat Puttikamonkul, Faculty of Medicine, Srinakharinwirot University, Thailand

ABSTRACT

Background: Studying microbiology is a tedious task for medical students as there are a lot of contents to be read and memorized. To ease students through this mind-numbing study, and also encouraging students to review the learning contents on the important pathogenic microorganisms, a game called “compose me” was developed to complement the learning experiences as a flipped-classroom activity and a formative assessment tool.

Summary of Work: The game was settled in a card game fashion, and was designed for 180 students to play together in each round. The students were assigned and advised to review all the class contents about the pathogenic microorganisms in intervals before the game day. In-classroom activities, all the students played the game in rounds. Each round began with each student blindly drew a characteristic card. The instructors stood to post the pathogen name cards. Once every student obtained the card, one had to seek the correct pathogen name matching to characteristic on the card and then gather around that pathogen name post. This was a time limited activity; the students who gathered in time at the pathogen name post with the most correct characteristic cards won double stars. At the end of each round, instructors summarized the correct characteristics of the pathogens. At the end of the class activity, student could freely combined their stars to match the numbers needed for prizes.

Summary of Results: Formative activity using the game on a whole class with almost 180 students was manageable. Most students loved the game and responded that they could recollect the important characteristics of the pathogens. The activities provided students the opportunity to joyfully rehearse recalling the class contents. However, some processes have to be improved to bring the students’ engagement through the end.

Discussion and Conclusions: The game engaged most of the students, and was quite formative, allowing the review of class contents more enjoyable. Although, big class game activity can be arranged, nevertheless small class activity would be easier to manage both in time and content summarisation efficiency.

Take-home Messages: A class loaded with tremendous knowledge contents can become enjoyable with the complementary game based learning.

The Efficiency of BMB gamification for the 2nd Year Medical students of Phramongkutklao College of Medicine (PCM)

AUTHOR(S):

- **Montalee Theeraapisakkun, Phramongkutklao College of Medicine, Thailand (Presenter)**
- Thanakrit Vichasilp, Phramongkutklao College of Medicine
- Prakarn Rudeekulthamrong, Phramongkutklao College of Medicine
- Nattaprapa Suriyamontol, Phramongkutklao College of Medicine
- Unchalee Visawapoka, Phramongkutklao College of Medicine
- Alisa Sanamontre, Phramongkutklao College of Medicine

ABSTRACT

Background: The application of game elements and game techniques were successfully developed in the e-Learning using a Modular Object - Oriented Dynamic Learning Environment (Moodle) software in the Biochemistry and Molecular biology (BMB) course. It, as an innovative tool in medical education, was firstly used in PCM last academic year. This was found to improve medical student e-learning participation and engagement. Thus, the purposes of this research were to determine the efficiency of the BMB gamification, the effectiveness on achievement and the attitudes towards learning by BMB gamification.

Summary of Work: The BMB gamification was improved and studied by all 99 of the second year PCM medical students of academic year 2018. The BMB contents were comprised of biomolecules, metabolism and molecular genetics. The achievement test was used before and after the learning experience. Besides, the students should also do 3 tests during studying. The attitude towards the learning by BMB gamification was done. The data were collected and statistically analyzed by SPSS.

Summary of Results: The efficiency of the BMB gamification E1/E2 was 85.19/80.77 which was above set criterion 80/80. The students' learning achievement at posttest was significantly higher than at pretest at 0.001 level. The attitude towards the learning by BMB gamification was at the good to excellent level. The students pleased to collect eXperience Point (XP) during studying and the formative assessments were very incentive.

Discussion and Conclusions: The BMB gamification moodle was very effective and could develop the student's learning achievement. Most of the students strongly agreed that it was very suitable technology for teaching in modern time. They could learn at any time, any place and felt no stress. It made them eagerly learn further contents and tried to get the best score.

Take-home Messages: Gamification in e-learning can indirectly help learners improve their learning outcome by making them more participation in learning activity.

Fostering faculty engagement in a community of practice by means of collaborative gamification

AUTHOR(S):

- **Cristina Kroeff Schmitz Gibk, Universidade do Vale do Rio dos Sinos/UNISINOS, Brazil (Presenter)**
- Cristiane Maria Schnack, Universidade do Vale do Rio dos Sinos, Brazil
- Agnes D. Diemers, University Medical Center Groningen, Netherlands
- Marco Antonio de Carvalho-Filho, University Medical Center Groningen, the Netherlands/State University Campinas, Brazil

ABSTRACT

Background: Engagement is a basic requirement for the existence of a community of practice; collaboration, on its turn, is a basic skill for competent medical professionals in the 21st century. We hypothesized that collaborative gamification can be a strategy to reach both goals.

Summary of Work: We designed and implemented a blended faculty development course (VirtualVivo) in the Medical School of a Southern Brazilian private University. Collaborative gamification was used as a strategy to promote participants' engagement and foster identity development. The gamification strategy involved twenty-seven faculty members divided into three teams. The scoring system was developed to value collaboration. Teams scored points for accomplishing tasks such as exam item reviews, lesson plan sharing, or socializing in academic activities; however, a team could only win if scores were equalized. Hence, to keep scores balanced, participants had to engage "opponent" team peers in tasks by inviting them personally and posting the tasks in special forums online.

Summary of Results: The collaborative gamification strategy yielded identity strengthening and engagement, which was noticeable by observing participants online activities. The activity called "Challenge in pills", a forum which stimulated participants to socialize in academic events, registered twenty-six entries by twelve participants, who also invited peers to join in. The forum called "Refer to a GP" was an efficient tool to foster knowledge sharing: twenty-three team members produced fifty-two posts on exam item reviews. Finally, the forum called "Knowledge goes viral", focusing on the sharing of tested classroom activities, had a less significant but still existing participation.

Discussion and Conclusions: Collaborative gamification seems to enhance both engagement and collaboration. The devised strategy broke barriers amongst faculty and encouraged more judgment-free exchange of knowledge and experiences; it also rendered light-hearted moments of community identity building. Collaborative gamification is therefore a strategy to be further explored and more widely implemented for the potentially fruitful results it encompasses.

Take-home Messages: Collaborative gamification is a promising alternative to engage faculty with each other so as to strengthen community bonds and propel the community into constant development.

A comparison of learning outcome and student satisfactions in game based learning and lecture based learning

AUTHOR(S):

- Piyarat Rojsanga, Udonthani Medical Education Center, Udonthani Hospital, Thailand (Presenter)

ABSTRACT

Background: Current learning focuses on the active learning activities that allow students to use the thought process to make their own knowledge. This study was conducted to evaluate the learning outcome and student's satisfaction in game-based learning (GBL) and lecture-based learning (LBL).

Summary of Work: GBL and LBL were used in teaching one topic for 4th and 5th-year medical students. About 2 weeks before attended, all students had pretest and then were assigned to self-study from website. At the class session of GBL group, the learning process was constructed with: 1st game; quiz: all the students answered the quiz in program "Kahoot" to find the highest score, 2nd game; matching game: the students were received the group of answers and then tried to match with proper situations, 3rd game; mysterious cases: the students were divided into 3-4 per group and received the mysterious case study to solve the problems and raced to answer the question to find the winning team. At the end of each game, the teacher summarized the core concept and made the feedback. Finally, all students had posttest and completed the questionnaires to evaluate the satisfaction. The learning outcome was evaluated by the difference between posttest and pretest scores.

Summary of Results: Fifty-nine students participated: 30 students in GBL and 29 students in LBL group. The learning outcomes were significantly improved in both groups. The posttest scores were not significantly different between both groups. The levels of satisfaction were significantly higher in the GBL group included encourage self-learning before attending class, increase student engagement, promote teamwork, improve problem-solving skill and retain knowledge.

Discussion and Conclusions: game-based learning encourages students to be active participants. The activities allow the students to put their knowledge to solve the problems and can gain a better understanding by making the discussion

Take-home Messages: Game-based learning is one of the effective active learning tools to improve knowledge gain, promote student engagement, develop critical thinking, and promote problem-solving skill.

Improving the learning outcomes and teaching satisfaction of nutrition interns through Game-Based Learning

AUTHOR(S):

- Ying-Ru Chen, Department of Nutrition, Chung Shan Medical University Hospital, Taiwan (Presenter)
- Hsing-Chun Lin, Department of Nutrition, Chung Shan Medical University Hospital, Taiwan

ABSTRACT

Background: The professional knowledge courses of the nutrition interns were mostly traditional lectures in the past. It made the interns become passive learning which led them to feel hard to pay attention in the class, and also make it difficult to memorize. Therefore, through Game-Based Learning (GBL), the course is more diversified and lively. By this way, interns could acquire knowledge and develop problem-solving skills. Our training of nutrition interns in all of the curriculums, the teaching and application of Enteral nutrition were the biggest gap between the school and the clinical, and interns were also lacking of comprehension. Hence, I re-planned the course of Introduction and application of Tube feeding and combined it with the operation of practical skills.

Summary of Work: Original process: Traditional lecture. New process: Planning three games linked with learning includes: Tube feeding skills and precautions instructions, Introduction and application of commercial formulas and Common tube feeding complications and solutions.

Summary of Results: 1. The teaching satisfaction of the course "Introduction and application of Tube feeding" was 98.9%. 2. The pre- and post-test average scores of practice test increased from 48.8 points to 86.4 points.

Discussion and Conclusions: After the curriculum innovation, nutrition interns were more interested in the content of the course, promoted learning effect and enhanced teacher-student interaction to enhance teaching satisfaction.

Take-home Messages: Introduction of GBL can increase interaction, effectiveness and fun, it should be extended to all curriculums.

Comparison of Performance among Graduating Doctors Trained in Traditional & Integrated Curriculum

AUTHOR(S):

- Seyyedha Abbas, Foundation University Medical College, Islamabad, Pakistan (Presenter)

ABSTRACT

Background: Foundation University Medical College (FUMC) is among the few universities of Pakistan where Integrated Modular Teaching Program has been implemented. The study compared the performance of graduating doctors trained in traditional & integrated curriculum.

Summary of Work: We compared the final professional examination scores of Group A students with the Group B. The pattern, subjects, examiners & duration of the final examinations were same for both groups. Central tendency, mean and standard deviation were calculated, comparisons were made between the entry & final examination scores. In the end, theory and practical scores were compared using 't' test. A p value less than 0.05 were considered significant. The reliability and validity of the scores were also ensured.

Summary of Results: The overall performance of students who had undergone integrated curriculum (97.0%) was better compared to students who had undergone traditional curriculum (84.2%). Comparison between the different components of the exams using ANOVA test also showed improved performance of the same group of students with the p value less than 0.05. By using reliability analysis the Cronbach's alpha is 0.744 for the overall performance & 0.691 and 0.746 respectively for the theory and practical examination.

Discussion and Conclusions: This study provides the evidence that integrated curriculum has been proven to provide better and improved performances of students as compared to traditional curriculum. Results of this study may be used as guidelines for other national institutes and encourage them to move towards curricular reforms. The results of such studies must be disseminated to enhance the awareness and to facilitate the implementation of such programmes which can bring the positive change in the healthcare system.

Take-home Messages: To attain a standard, it is highly recommended that quality assurance cell be functioning at every medical school and policy makers should focus on quality assurance programs. It is also recommended that multicenter study be conducted involving the institutions where the integrated system is implemented to build an evidence base from which important medical school and workforce decisions can be made. As a future direction of the study the performance of these graduates in clinical settings/hospital settings can be evaluated to see the outcome of the programs.

Implications for the design of an integrated pharmacy curriculum from a scoping review of integrated health professions curricula

AUTHOR(S):

- Aisling Kerr, RCSI Dublin, Ireland (Presenter)
- Hannah O'Connor, RCSI Dublin, Ireland
- Paul Gallagher, National University of Singapore, Singapore
- Teresa Pawlikowska, RCSI Dublin, Ireland
- Judith Strawbridge, RCSI Dublin, Ireland

ABSTRACT

Background: Integrated undergraduate health professions curricula aim to produce graduates who are prepared to meet current and future healthcare needs. Integration is advocated by pharmacy regulators as the perceived optimum way of preparing students for first registration as pharmacists. Integration can be described by model of integration; horizontal, vertical or spiral, themes for integration or by integrative teaching and learning approaches. Harden's integration ladder has been operationalised by The General Pharmaceutical Council as three levels: "fully", "partially" and "not integrated" curricula.

Summary of Work: This scoping review aimed to explore health professions education literature to inform the design of integrated pharmacy curricula. This review asks: what is meant by integration in health professions curricula? The Arksey and O'Malley scoping review framework was utilised. Ovid MEDLINE, EMBASE, Scopus, Web of Science and ERIC were searched for studies published up to May 2018. Research papers were eligible for inclusion if they described curriculum integration in undergraduate health professions curricula. Models of integration, themes for integration, teaching and learning approaches and level of integration were defined to support data extraction.

Summary of Results: 9345 studies were identified and 136 were included. 12.5% of included studies included a definition of integration. The majority of studies described horizontal integration (n=87). Various teaching and learning approaches were described, including experiential (n=43), case-based (n=42) and problem-based (n=38) learning. Systems-based teaching (n=56) was the most common theme reported. The majority of curricula were classified as "partially integrated" i.e. levels 5-7 on Harden's ladder (n=101). 81 studies reported perception outcomes. Only three studies reported outcomes beyond perception. Reported outcomes were mostly positive and included knowledge gains, increased appreciation of relevance, increased motivation and improved communication. Increased stress, difficulty understanding basic concepts and time constraints were also reported.

Discussion and Conclusions: Various themes for integration and integrative teaching and learning approaches are used. A lack of evidence for integration remains due to reliance on perception data.

Take-home Messages: There is a need for integration to be explicitly defined by curriculum developers and researchers. Attention should be given to model, theme, teaching and learning approach, level of integration and outcomes.

Microanalysis framework on learning effectiveness and satisfaction of organ system-based integrated curriculum in undergraduate medical education

AUTHOR(S):

- **Bor-Ching Sheu, Center of Faculty Development, College of Medicine, National Taiwan University, Taiwan (Presenter)**
- Yen-Hsuan Ni, Center of Faculty Development, National Taiwan University College of Medicine, Taiwan
- Yu-Jung Lin, Center of Faculty Development, National Taiwan University College of Medicine, Taiwan
- Wang-Huei Sheng, Center of Faculty Development, National Taiwan University College of Medicine, Taiwan
- Shan-Chwen Chang, National Taiwan University College of Medicine, Taiwan

ABSTRACT

Background: The curriculum integration group of National Taiwan University College of Medicine (NTUCM) have constructed organ system-based integrated curriculum (OSB-IC) of the undergraduate medical program since 1992. The aim of this study was to construct a micro-analysis framework for assessing the learning effectiveness and satisfaction of OSB-IC in an undergraduate medical curriculum.

Summary of Work: The NTUCM implements the integration of basic and clinical disciplines into a unitary unit that allows courses in the same organ system to be completed within a structured time framework of teaching coordination. A structured questionnaire of Likert-type statements for scaling was utilized to evaluate students' perceptions of the OSB-IC. Students were surveyed immediately after the session on their opinions about OSB-IC. Scores were analyzed to assess the curriculum reform in basic and pre-clinical teaching classes. The distinct Likert elements of each lecture are micro-analyzed as interval-level summative scales data scales and then sorted out to individual basic and clinical disciplines.

Summary of Results: The mean questionnaire responding rate adjusted from each class number of students are all >90% in 2 semesters. The micro-analyzed data of structured questionnaire for rational assessment learning effectiveness and satisfaction are all preferably >4.2 in the mean in sorted basic and pre-clinical teaching classes of the categorized OSB-IC.

Discussion and Conclusions: Integration throughout the whole organ and functional system-based curriculum is time-consuming and hard work is required for planning, organization and execution. Organ-functional-based curriculum integration is a distinguished educational aim, which entails achieving cognitive, conceptual, and practical connections among the complex categories of unified basic and preclinical knowledge. The micro-analysis revealed that the OSB-IC curriculum was well accepted by the students as an effective enhancement to lecture-centered teaching programs. Our report applied a framework for monitoring the learning effectiveness of OSB-IC in an undergraduate medical curriculum.

Take-home Messages: The present study was an innovative trial that applied a microanalysis framework for assessing the learning effectiveness and satisfaction of OSB-IC in an undergraduate medical curriculum. The framework improved OSB-IC to the specific discipline of undergraduate medical education.

Integrating Engineering into the Medical Curriculum

AUTHOR(S):

- Judith Rowen, Carle Illinois College of Medicine, USA (Presenter)
- William Pluta, Carle Illinois College of Medicine, USA
- Jenny Amos, Carle Illinois College of Medicine, USA
- Brian Aldridge, University of Illinois College of Veterinary Medicine, USA

ABSTRACT

Background: The Carle Illinois College of Medicine is a new US, 4-year school which aims to produce physician innovators who will impact health through systems thinking and applied design. To this end, engineering concepts and practice are integrated throughout the curriculum in a trans-disciplinary manner (Harden, 2000). We believe our experience provides guidance and best practices for integrating “theme” topics into curricula.

Summary of Work: Our integration of engineering is guided by ten principles: 1. Articulate a clear mission. Ours is: “We educate exceptional physician-innovators to deliver high-value, compassionate health care through transformative solutions developed at the intersection of engineering, science and medicine.” 2. Articulate clear design principles. Ours include “engineering is integrated, not spackled.” 3. Specify competencies. Engineering competencies appear alongside basic science and clinical. 4. Select instructional approaches that foster effective integration. We chose problem-based learning for our preclinical pedagogy; facilitator guides include engineering prompts. 5. Integration should extend across the curriculum. Engineering activities span all four years. 6. Thematic objectives should be assessed throughout. 7. Content experts need to be engaged early and often. Engineering faculty are integrated throughout our structure. 8. Provide adequate resources, from curricular time to personnel. 9. Adapt recruitment methods to the curriculum. 10. Do not neglect the rest.

Summary of Results: Our first class of 32 entered in 2018; they are acquiring basic science and clinical knowledge as expected; performance on quizzes and progress tests has been on par with national results; scores on engineering assessments mirror performance on the medicine content. Students are demonstrating clinical skills development through OSCEs and preceptor feedback.

Discussion and Conclusions: We have identified two challenges. First, difficulty delivering the engineering content at the appropriate level for all learners. We are trying new approaches, and will offer some targeted “boot camp” orientation experiences. Second, recognition that our engineering competencies are too broad; we are detailing this framework more carefully in an iterative approach to curricular development.

Take-home Messages: Our successful integration of engineering into a medical school curriculum provides useful lessons learned for other schools planning to enhance curricula with engineering or other “theme” topics important to their mission.

A Review of International Nursing-related Vocational and Educational Training on the Issue of Integrated Teaching

AUTHOR(S):

- Maria Christidis, The Swedish Red Cross University College, Sweden (Presenter)

ABSTRACT

Background: The review focus was to systematize, describe and critically analyze previous international research on school-based integrated teaching for vocational knowing in nursing-related education in upper secondary and higher-level education. The review questions were: a) What kind of integration was conducted within a school context in nursing-related education? b) What in terms of vocational knowing was highlighted as a result in the studies through integrated teaching? c) What was the relation between study aim and analytical method for the vocational knowing that was highlighted?

Summary of Work: Searches were conducted in two databases, EbscoHost, and ProQuest Social Sciences. Search terms 'integrated teaching', 'vocational knowing' and 'nursing', retrieved from the databases, were combined with "AND". Search area was expanded by terms 'education', 'curriculum', 'vocational', and specified with 'thematical integration'. Delimitations comprised admitted approaches of integration (Case Method, Problem-based Learning), and were set to scholarly, peer-reviewed articles. The first sorting comprised assessment of abstracts, while the second sorting comprised whole articles. Reference-lists of included studies were assessed for inclusion. Altogether, 14 studies were included and assessed for quality and coherence with Grade CerQual.

Summary of Results: The results showed three types of integrated teaching, integration through embeddedness or streaks, problem-based learning, and between school and workplace; vocational knowing related to a professional and academic context; and there was a methodological significance for the type of vocational knowing highlighted in the studies.

Discussion and Conclusions: Integrated teaching with professional connection was stressed as significant for vocational knowing, because of authenticity and meaningfulness. Vocational knowing of academic character required a professional contextualization for meaningfulness. The primary studies highlighted quantitative methodology as quality measure and bypassed epistemological (constructivism and positivism) aspects. A quantitative method of approach was shown as the quality measure in primary studies. The notion of quality requires expansion with more qualitative studies, that focus on minor student groups and specific didactic situations for an in-depth understanding of integrated teaching and vocational knowing in nursing.

Take-home Messages: Integrated teaching is an admitted didactical approach but highly significant for vocational knowing.

Reimagining electives in the clerkship year - a focus on career exploration and integration

AUTHOR(S):

- Patricia Cornett, University of California, San Francisco, USA (Presenter)
- Sarah Goglin, University of California, San Francisco, USA
- Leslie Sheu, University of California, San Francisco, USA
- Sara Clemons, University of California, San Francisco, USA

ABSTRACT

Background: Medical students traditionally explore different specialties through core clerkships and electives. Electives usually occur in the fourth year and thus have a limited role in helping students make decisions about specialties as they often occur after the residency application deadline in the USA. Elective career exploration in the clerkship year allows medical students to have more opportunities to explore specialties at earlier time points.

Summary of Work: In the context of major curricular redesign at the University of California San Francisco (UCSF), faculty designed 65 clinical electives across departments during the clerkship year called Clinical Immersive Experiences (CIExes). CIExes were categorized into 4 groups: apprenticeship, clinical skills building, integrative, or subspecialty. All students enrolled in three 2-week CIExes over the course of the year.

Summary of Results: Students completed 426 CIExes in the first year (January to December 2018). Enrollment reflected the distribution of the types of CIExes offered. The majority of students (69%) chose to enroll in a mix of different CIEx types. They made their decisions about CIEx choice to explore a specific career (75%), to acquire new skills or knowledge (22%), to learn about a specialty they had limited exposure to (18%), and/or to prepare for an upcoming clerkship (6%). Students rated their CIExes highly (4.48/5, SD 0.7). In open-ended comments students valued the opportunities for career exploration, particularly in specialties in which they had limited clinical exposure, and opportunities to acquire skills and knowledge, regardless of CIEx type.

Discussion and Conclusions: Students found CIExes in the clerkship year to be valuable to their learning and career exploration. They appreciated the diversity of options and the flexibility within each CIEx to focus on their learning goals. Next steps include understanding the impact CIExes have on students' fourth year elective choices, residency decisions, and overall professional identity formation.

Take-home Messages: Electives in the clerkship year provide career exploration opportunities for students prior to finalizing specialty choice, dedicated time to focus on skill building and competency development in a low-stakes environment, and the ability to experience a clinical topic from the viewpoint of multiple specialties.

Factors affecting fifth year medical students' selection of elective subject in medical school

AUTHOR(S):

- Chonthicha Chawachart, MEC Phayao University, Thailand (Presenter)
- Anon Panyoyai, Medical Education Center Phayao Hospital, Thailand
- Kanokrot Kovjiriyapan, Medical Education Center Phayao Hospital, Thailand

ABSTRACT

Background: An elective subject was admitted to encouraging a positive perception of medical students in knowledge improvement, skill mastery, and professionalism. There are many different factors that affect the decision of medical student in choosing the elective subject. Knowing what factors can lead to a better syllabus arrangement that suits learner requirement and promote student engagement as student-centered learning.

Summary of Work: There are two elective subjects in fifth-year medical students curriculum at MEC Phayao hospital that the students have to choose themselves. After finished fifth year curriculum, all students were asked to fill in questionnaire about motivation in choosing each elective subject and satisfaction after finished program. 31 fifth year medical students, studied in 2014 - 2017, were included in this study.

Summary of Results: Personal factors took an important role in selection of elective subject in fifth-year medical students (75.4%). Learning environment (59.68%) and syllabus arrangement (26.89%) was also influencing medical students in the selection of elective subject. Moreover, peers (12.1%) and other factors (31.45%) such as facilities, accommodations, and distance were included in factors that medical student concerned when choosing the elective subject.

Discussion and Conclusions: Passion to learn is strong internal motivation for medical students to study and practice in medical school. Plenty of medical students desired to know or practice more than curriculum requirement and expected themselves to be a good doctor. This attention makes personal factor a major motive for elective subject selection. Positive attitude towards the subjects attracts students to learn. A good impression in teachers as the role model and low-pressure learning environment motivated medical students to pick out those elective subjects. Design of programs that lower than students expectation can be fulfilled by elective subject. In conclusion, personal factors and learning environment take the major role for medical students selection of elective subject in medical school.

Take-home Messages: Passion to learn and a positive attitude are a strong motivation for medical students learning.

Why did medical students choose Family Medicine elective?

AUTHOR(S):

- Siriluk Pongchitsiri, Buddhasothorn Hospital Medical Education Center, Thailand (Presenter)

ABSTRACT

Background: Elective rotation of Buddhasothorn hospital Medical Education Center(BMEC) spend around 2 week for fifth year and 4 week for sixth medical students. It wasnt associated with residency matching, but depend on their needs and interest to increased knowledge or experience in the particular clinical medicine. Family medicine was not a preferred specialty career choice for medical students in Thailand, so the aim of this study was to discover the reasons why did medical students chose Family Medicine elective.

Summary of Work: This is a qualitative research, group discussion at first met period about 30 minutes, 2-5 students per group. Topic covered the reasons that they intentionally chose Family Medicine elective, the let them freely discussed and shared. Totally 28 students between academic year 2011-2017, 17 students were fifth year and 15 students were sixth year(4 students chose elective both year). The majority was female(20)

Summary of Results: No being on duty after hour, had more time, to explored what family medicine entailed, most likely among elective options among BMEC choice, increased clinical skill at OPD, came together with close friend/lover and no ward round were the reasons why they selected family medicine elective, respectively. Only 3 students inquired about content and activity before choosing. 11 from 28 students whos elective became Family Medicine training. Overall during year 2011-2016, there were 19 from 150 medical students(12.57%) studied Family Medicine residency program.

Discussion and Conclusions: Medical students who chose Family Medicine elective showed no extra duty hour, had more time and to explored themselves as they wanted to be a Family doctor were the most reasons. About only 40% of elective, they became a Family Medicine residency training.

Take-home Messages: One reason that lack of knowledge about what Family Medicine entailed, so medical curriculum might consider early exposure included several activities which help them have decided to be a Family doctor.

Moderation of assessment in a Student Selected Component context

AUTHOR(S):

- Camille Huser, University of Glasgow, UK (Presenter)
- Leah Marks, University of Glasgow, UK
- Joanne Burke, University of Glasgow, UK

ABSTRACT

Background: At the University of Glasgow, Student Selected Components (SSCs) involve a wide range of supervisors and modalities of assessment, with over 800 students undertaking SSCs each year, involving more than 200 supervisors from a wide range of specialties. A key aim of the SSC programme is to provide a variety of options for students, while attempting to ensure assessment consistency and fairness of grades across SSCs. To this end, a pilot and subsequent formal implementation of a moderation process was undertaken.

Summary of Work: A moderation programme was piloted, then fully implemented across all SSCs. Supervisors of SSCs accounting for 10% of students were randomly selected for moderation. All written work for the selected SSCs was blindly double marked by a member of the SSC team, with knowledge of a wide range of SSCs. Grades were compared with those of supervisors, and discrepancies were discussed until a final grade was agreed.

Summary of Results: The vast majority of grades of supervisors and moderators matched. This provided evidence that overall, grades for the written work of SSCs is already largely consistent across a variety of modules. When differences did exist then a mutual agreement was reached.

Discussion and Conclusions: Introduction of moderation was regarded positively by supervisors, students and external examiners. While grades tended to be higher in SSCs than in other MBChB components, this is likely to be due to factors including student choice, close supervision and the ability to spend 5 weeks studying a subject intensively. The moderation process has highlighted the varying levels of feedback given and thus has led to the introduction of measures to improve the quality of feedback.

Take-home Messages: (1) It is possible to ensure consistency of assessment in an SSC context without needing to standardise the assessment instruments; (2) Piloting the moderation process allowed supervisors and moderators to become familiar with the procedures before full implementation, as well as giving the SSC team time to develop a formal moderation policy, covering procedure to follow in all events; (3) Communication with supervisors and students was key in the success of this moderation process.

Elective: Enhancing practice in the University of Algarve medical curriculum

AUTHOR(S):

- Sofia Nunes, University of Algarve, Portugal (Presenter)
- Ana Marreiros, University of Algarve, Portugal
- Ricardo Afonso, University of Algarve, Portugal
- Isabel Palmeirim, University of Algarve, Portugal
- Pedro Catelo Branco, University of Algarve, Portugal
- Rosário Añon, University of Algarve, Portugal

ABSTRACT

Background: Elective is a curricular unit with an 8-week clinical training, in a specialty of choice, taking place preferably outside the region and the country. It aims to promote students ability to change and adapt to other professional and social realities with the opportunity to deepen their knowledge and confront themselves with what might be their potential future professional choice.

Summary of Work: The main objective of this study was to perceive the main preferences regarding the location and specialties of Elective students. A statistical descriptive analysis of the internships carried out between 2012 and 2018 and a comparative study between national and international preferences of the students has been made.

Summary of Results: 432 clinical internships carried out by 243 medical students under the Elective curricular unit, with a median of 2 internships per student. The majority of students (54%) chosen to carry out international internship, distributed across the five continents, being Brazil (13%) the first choice followed by UK (11%). 46% of the students choose to undertake, at least, half of their internships in Portugal. Half of the internships were in tertiary or university hospitals and 41% of the students chose specialties that are not part of the official course curriculum. The most requested specialties were General Surgery (9.3%), General Practice (8.1%), Anesthesiology (7.4%) and Emergency (6.6%). The bottom were Rheumatology/ Ophthalmology/ Urology with 0.2% each.

Discussion and Conclusions: The statistical analysis has showed that Elective students prefer to carry out an international internship, selecting Brazil as first option. Also when it's time to choose the specialty, students prefer to do the internships in a specialty integrated in their Medical Course Curriculum.

Take-home Messages: Electives enable students to acquire and develop new professional and personal competences in a clinical environment of their preference.

Integrating Undergraduate Medical Electives into the Medical College Curriculum at King Saud University

AUTHOR(S):

- Elizabeth Feeley, King Saud University, College of Medicine, Saudi Arabia (Presenter)

ABSTRACT

Background: In the 2012-2013 academic year, King Saud University, College of Medicine's new curriculum introduced undergraduate medical electives. This program provided students with a structured opportunity to investigate personal interests, develop professionalism, and facilitated both horizontal and vertical integration. All students did their elective during the same time period, at the end of the academic year, allowing for greater uniformity of preparedness. Many faculty expressed doubts about the feasibility of the program. Previously, electives were only offered during the internship year, and at different times. This study examines the development, implementation and progression of this seven-year old program at King Saud University, College of Medicine, Riyadh, Saudi Arabia. In addition, the electives unit had an advisory committee comprised of senior faculty. Evaluation forms for both students and physicians were developed, evaluated by the committee, and further validated. Students received a pass/fail grade. Quantitative data were analysed using SPSS and changes to the program were made, where feasible, utilizing principles of action research.

Summary of Work: Using online forms, developed after extensive interviews, students were allocated to the respective departments within selected institutions. Department leaders and administrators were met with before and during the electives. Remedial actions were taken when necessary.

Summary of Results: The Unit has placed all students to-date; most in their first choice of discipline. Less than 2% failed. Many faculty have changed from skeptics to enthusiasts with ongoing discussions on how to modify and improve the program.

Discussion and Conclusions: Including electives earlier allows students to better assess their strengths, weaknesses and preferences. It also addresses practical issues, such as time management, at an earlier stage, leading to less harm for the students. Faculty support has dramatically improved over the years. Each department now includes an electives coordinator who plans for the elective and communicates directly with the electives unit, facilitating better oversight and experience for both students and faculty.

Take-home Messages: More pre-elective materials need to be developed for both students and faculty allowing for better communication of expectations between students and faculty.

An Elective Course in The 1000 First Days Of Life

AUTHOR(S):

- **Diani Puspa Wijaya, Faculty of Medicine Islamic University of Indonesia, Indonesia (Presenter)**
- Edi Fitriyanto, Faculty of Medicine Islamic University of Indonesia, Indonesia
- Miranti Dewi Pramaningtyas, Faculty of Medicine Islamic University of Indonesia, Indonesia
- Ukhti Jamil Rustiasari, Faculty of Medicine Islamic University of Indonesia, Indonesia
- Tien Budi Febriani, Faculty of Medicine Islamic University of Indonesia, Indonesia

ABSTRACT

Background: The first 1000 days are considered to have a crucial effect on the growth and development of children. Health workers, including doctors, should have sufficient knowledge and skills to manage health and nutrition appropriately in this period so that they can support the improvement of the quality of human resources. The development of the first 1000 days of life elective block is expected to provide crucial clinical knowledge and skills related to health and nutrition management in the early 1000 days of life for medical students.

Summary of Work: To improve clinical knowledge and skills related to health management in the early 1000 days of life, we developed an elective course for final year students. We designed this block into four modules (the basics of the first 1000 days of life, prenatal period, first six months period and first two years period). The contents in the module developed into learning goals that disseminated in tutorials, lectures and clinical skills practices. The assessment to evaluate student achievement conducted in the form of written examinations, assignments and clinical skill practice examination. Evaluation with standardized evaluation forms performed at the end of the block.

Summary of Results: Written examinations conducted to evaluate student knowledge about the first 1000 days of life. The OSCE exam was conducted to assess the ability of students clinical skill on the topic of breastfeeding counseling, counseling for complementary feeding and breastfeeding techniques. The evaluation found that students felt they had increased their knowledge about the first 1000 days of life. Students hope to have the opportunity to do better exercise in breastfeeding counseling directly with patients and practice in making complementary foods.

Discussion and Conclusions: Participation in the elective course the first 1000 days of life resulted in a greater student understanding of the early 1000 days of life and students feeling more capable of assessing and managing health practice related to the 1000 first days of life.

Take-home Messages: The first 1000 days of life elective block has emphasized the knowledge and clinical skill practice of our medical students and developed their commitment to promoting better health management during the early 100 days of life.

Impact of Overseas Clinical Elective on clinical practice: Perception of the Clinicians and Students

AUTHOR(S):

- **Thomas Y.B. Lau, Department of Medicine and Therapeutics, Faculty of Medicine, The Chinese University of Hong Kong, Hong Kong (Presenter)**
- Rachel W.C. Lai, Department of Medicine and Therapeutics, Faculty of Medicine, The Chinese University of Hong Kong, Hong Kong
- Vincent C.T. Mok, Department of Medicine and Therapeutics, Faculty of Medicine, The Chinese University of Hong Kong, Hong Kong

ABSTRACT

Background: In both Asian and European medical schools, overseas clinical electives are often compulsory in the medical curriculum where medical students self-organise the learning experience. Previous research on benefits of overseas electives often solely enquires from students' perspective before and upon completion. Long-term impact on clinical practice is uncertain. We seek to understand the factors on determining the outcome sustainability on future clinical practice.

Summary of Work: To assess the subjective and objective factors, a qualitative and quantitative approach is employed. In the study, we identified 6 licenced medical practitioners with more than 1 year of clinical practice and arranged semi-structured focus group with survey in Prince of Wales Hospital, Hong Kong. We then conducted focus group discussions with 14 medical students with the purpose to investigate any contrast and disagreement on perceived outcome on their future clinical practice. All interviews were recorded, transcribed and analysed. Keywords from each conversation is identified, then categorized in parallel with further data collection.

Summary of Results: Common themes were conceptualised. With heterogeneous degree of agreement, clinicians endorsed improved judgement based on clinical findings. Degree of impact was obvious only when given a personalised mentorship (in contrast to attachment to a general facility), adequate prior medical knowledge, and active participation in clinical scenario (in contrast to bare observation). Interestingly, despite general satisfaction, students returnees were uncertain on any isolated effect on future clinical practice, acknowledging variable hospital environment at their home institution and aboard. Meanwhile, both groups identified individual and institutional preparedness as contributing factors towards long-term impact. While self-identifying precise learning objectives could direct students' focus on relevant topics in match with their curriculum, formal mentorship could strengthen the bond between the student and the medical team, provide feedback and inculcate a sense of responsibility in the students.

Discussion and Conclusions: Lack of individual and institutional preparedness often undermine the effectiveness of an overseas clinical elective. A structured mentorship programme at the host institution and clear learning outcomes from home institution should improve the sustainable impacts on future clinical practice.

Take-home Messages: Students should carefully weigh the benefits and costs associated to clinical electives, and efforts should be made to ensure the effectiveness of electives.
