Background: As a junior psychiatrist, my training has centred around quantitative methods where ‘gold standard’ evidence is a systematic review of double-blinded RCTs. During my recent training I have been able to expand my understanding of the qualitative, interpretivist paradigm and have gained insight into how rigorous methodology and ethical consideration can develop excellent, valid qualitative research.

Summary of Work: In 2015 I completed a one year Severn Deanery ‘Educational Fellowship’, incorporating one research session a week and attendance at the Bristol University ‘Research Methods’ module (TLHP Certificate). I drafted a proposal: “Qualitative study: Have Foundation Doctors found that their rotation in psychiatry has affected their development as doctors? In what way?”. As a current ‘Senior Clinical Teaching Fellow’ I have regular supervision with a qualitative researcher, joined a learning set and I am recruiting for semi-structured recorded interviews to analyse and develop themes.

Summary of Results: This process has presented multiple learning opportunities which I have had to actively note and reflect on throughout, identifying solutions and addressing any practical and ethical consequences (Mason, 2006). Through supervision and using a reflective research diary, I have engaged in this process to develop my research skills and broaden my understanding of research paradigms. For example, I found that my purposive recruitment strategy, which had resulted in quickly recruiting 10 interviewees in 2016, was far less productive in 2018, indicating an interesting shift in the environment in which these doctors are working. I have needed to look at the reasons for this and pragmatically but thoughtfully adapt my strategy.

Discussion and Conclusions: This process, and reflecting on it, has enabled me to develop skills and attitudes as a researcher, a doctor and an educator. I have learnt to be flexible in my research practice, while adhering to rigorous methodology. I have a clearer, broader view of research, allowing me to both practice and read research in a newly thorough but open minded manner.

Take-home Messages: Junior doctors can benefit professionally by conducting qualitative research. Medical educators could consider earlier teaching in qualitative methods, to cultivate an ethos of broader research methods.

Cultural Adaptation of Maslach Burnout Inventory in Russian and Kazakh languages

AUTHOR(S):

- **Alessandra Clementi, Nazarbayev University School of Medicine, Kazakhstan (Presenter)**
- Sabina Mustafina, Nazarbayev University School of Medicine, Kazakhstan
- Valentina Stolyarova, Nazarbayev University School of Medicine, Kazakhstan
- Raushan Alibekova, Nazarbayev University School of Medicine, Kazakhstan

ABSTRACT

Background: Burnout syndrome is job-related emotional stress that affects workers in human services including healthcare jobs. Maslach Burnout Inventory adapted for medical personnel (MBI-HSS-MP), is one of the most internationally recognized tools to evaluate burnout. This survey aim is to detect the prevalence of burnout among clinical doctors in Astana, Kazakhstan, in the Central Asia region.

Summary of Work: Present research is about the process of translation, cultural adaptation and validation of MBI for Medical Personnel (MBI-HSS (MP)) in Russian and Kazakh languages, in fact Kazakhstan is officially bilingual country. The questionnaire consists of 22 statements graded by participants that contain positive or negative emotions associated with job. The questionnaire was not yet officially validated in Russian and Kazakh languages. The work of adaptation of MBI to Kazakhstani participants was conducted first by purchasing license and getting the translation agreement from the MBI copyrighter Mind Garden, Inc. The translation into Kazakh and Russian languages was performed by culturally competent and Russian-Kazakh speaking faculty members of the research team. Questionnaires were evaluated and revised by eight clinical doctors proficient/native in English, Kazakh and Russian languages. They assessed the pertinence of each statement in Kazakh and Russian versions of MBI- HSS (MP) and gave feedback. Finally, the last version of translated MBI -HSS (MP) was reconciled with research committee.

Summary of Results: The Russian and Kazakh version of the MBI -HSS (MP) was freely shared with Mind Garden Inc. The process of adaptation and validation of the questionnaire was challenging considering differences between American and Kazakhstan healthcare language, system and culture. The process is necessary to achieved meaningful results.

Discussion and Conclusions: Adapted MBI-HSS (MP) is now an efficient tool to assess the level of burnout syndrome in Kazakhstani physicians. Currently 50 physicians have been surveyed.

Take-home Messages: Research team needs to allocate proper time to translate and validate any questionnaire prior conducting the research, and according to copyright laws.

Workplace cultures and medical student burnout in clerkships

AUTHOR(S):

- Yung Kai Lin, Chiayi Branch, Taichung Veterans General Hospital, Taiwan (Presenter)
- Blossom Yen-Ju Lin, Chang Gung University, Taiwan
- Der-Yuan Chen, China Medical University Hospital, Taiwan

ABSTRACT

Background: Managerial studies have asserted that organisational culture can garner commitment from or exert control over individual employees, consistent with the hidden curricula discussed by medical educators in the workplace. Given that medical students are in transition from university-based learning to workplace-based learning in clerkships, this study examined the relationship of evaluated clinical department cultures on medical students' burnout in clerkships.

Summary of Work: Our target population was medical students from a 7-year medical education programme in Taiwan who served as clerks in their fifth and sixth year in one tertiary medical centre between September 2013 and May 2015. Informed consent was obtained from the medical students validated, structured, self-administered questionnaires were regularly web-mailed to participants to measure the perceived cultures and the students' burnout in individual clinical speciality rotations. The participants were free to decide whether to complete each survey, and they submitted various responses during the study period. The medical students responding in our survey responded to more than half of the speciality training rotation questionnaires in individual years; this resulted in 1630 responses from 59 medical students. Because each participant was not an independent cohort (i.e. their responses were treated as correlated data), hierarchical regression modelling was performed.

Summary of Results: The clinical department cultures characterised by teamwork and employee involvement, adaptability, flexibility, and creativity were related to medical students' reduced burnout. Additionally, older medical students showed lower burnout in clinical workplace training than did younger students.

Discussion and Conclusions: Medical students in clerkship, who are novices in the clinical workplace, might be as susceptible to the influence of their clinical workplace culture as other employees in healthcare organisations are.

Take-home Messages: Clinical teachers and mentors must recognise the diverse perceptions and responses of medical students trained in various clinical department cultures, which might be viewed as hidden curricula of trainees. Relevant assistance and mentoring should be provided to assure medical students' well-being.

10 minutes mindfulness - does it work for Thai medical students?

AUTHOR(S):

- Benjawan Yoosamran, Hatyai Medical Education Center, Thailand (Presenter)
- Araya Khaimook, Hatyai Medical Education Center, Thailand
- Prapa Ratthanachai, Hatyai Medical Education Center, Thailand

ABSTRACT

Background: Sustainable attention and memory are important requirements for effective learning in academic performance. Over the past few decades, a wealth of researches has emerged in academic journal on benefit of mindfulness meditation for both mental and physical health. Some findings are suggested that individuals who are merely initialing a meditation will improve learning effectiveness for both attention and memory aspect.

Summary of Work: For these reasons, we initiated the tranquility class, a brief 10 minutes guided mindfulness was implement before starting the hands on ventilator session by listening the relaxing music and following the instruction of basic body scan in 40 of 6th year medical students. After this period, we started to demonstrate the hands-on of the ventilator usage. At the end of the session, students reflected themselves through the global rating scale questionnaire regarding learning ability, self-engagement and cognitive improvement when we applied the mindfulness technique in this learning class.

Summary of Results: Obviously, They revealed that more than 70% rated the mindfulness technique motivated them in being focus on the whole class program especially promoted intentional stability and participation in activities provided.

Discussion and Conclusions: In conclusion, for the student perspective, they demonstrated that implement of short brief period of mindfulness program can be a positive effect and improve their executive attentional control even in naïve.

Take-home Messages: Even short period of mindfulness meditation could have positive effect on medical students.

Well being of Medicine students: an update of the Italian longitudinal study

AUTHOR(S):

- **Giuseppe Familiari, Sapienza University of Rome, Italy (Presenter)**
- Claudio Barbaranelli, Sapienza University of Rome, Italy
- Maria Grazia Strepparava, Milano Bicocca University, Italy
- Valerio Ghezzi, Sapienza University of Rome, Italy
- Gabriele Cavaggioni, Sapienza University of Rome, Italy
- Eugenio Gaudio, Sapienza University of Rome, Italy

ABSTRACT

Background: Current Italian undergraduate medical-school (UMS) assessment procedures test only applicants' cognitive skills. There are no studies investigating the importance of non-cognitive skills as well as the impact of academic life (course, training, exams, and the like) on students well-being. In order to fill this gap the Italian Conference of UMS Directors promoted a longitudinal research aimed to investigating students well-being across the 6-years of medical course.

Summary of Work: The research was longitudinal in design and involved 6 Universities equally distributed in the different geographic zones of Italy. A questionnaire measuring personality and self-efficacy, psychological well-being, motivational and vocational factors as well as socio-demographic variables was administered at the beginning of the first and third years. A total of 834 students were enrolled in the first wave: the remainders at the second wave were 478 (about 53%).

Summary of Results: Preliminary results obtained from the analysis of the questionnaire show that students personality profiles are relatively stable, especially rank order stability in personality traits (the so called big five), self-efficacy and empathy. Stability coefficients ranged from .42 to .62 with an average stability of .52. However, moderate although significant decrease in academic self-efficacy and life satisfaction, and increase in personal disease across time emerged.

Discussion and Conclusions: Although medicine students show high levels of self-regulation capability, as well individual profiles evidencing a substantial well being, the 3 years of course of Medicine show a significant (albeit moderate) impact on students perceptions of themselves. In particular, academic activities likely produced a more realistic self-evaluation of own academic capabilities. The commitments of the course of studies have a likely impact in increase a sense of personal disease of students.

Take-home Messages: Psychometric validated scales allow to predict medical students attitudes and to study psychological profiles through their academic career. Tracing changes in interpersonal and intrapersonal competencies contributes to identify vulnerabilities and strengths crucial for their professional development. Results allow to individuate non-cognitive variables to be included in national UMS tests.

Navigating medical student wellbeing: an exploratory study of students and staff

AUTHOR(S):

- Victoria Simpson, University of Liverpool, UK (Presenter)
- Laura Halpin, University of Liverpool, UK
- Kirk Chalmers, University of Liverpool, UK

ABSTRACT

Background: Mental Health concerns in young people are known to be a major public health challenge, and the prevalence of this is higher in medical students compared with age-matched controls. In order to offer additional wellbeing support to students, The University of Liverpool Medical School, UK, has run a dedicated support and wellbeing team for its MBChB students for the past few years. This project aimed to explore the impact of these services from both staff and student perspectives.

Summary of Work: In 2015-16, seventeen second year medical students and five members of academic and wellbeing staff participated in one-to-one semi-structured interviews. Student interviews focused on wellbeing at medical school and the support utilised. Staff interviews discussed their roles in providing wellbeing services to students. Interviews were recorded, transcribed and analysed thematically to identify common themes across both students and staff members.

Summary of Results: Both students and staff highlighted the taboo culture surrounding mental health amongst medical professionals. The benefits of consistent personal tutors throughout medical school were emphasized as one potential mechanism of support. However, students perceived barriers in accessing help from School staff due to concerns about impact on academic progress, revealing that some were dependent entirely on peer support networks in challenging circumstances. Conversely, staff highlighted that the demand for wellbeing services often outweighs capability to provide it, and expressed concerns that students have unrealistic expectations of what Medical Schools, as academic units, can offer.

Discussion and Conclusions: Wellbeing and resilience is vital for medical students. The presence of a wellbeing service at the University of Liverpool, and the fact it is stretched, shows there is a clear need for it. This project established that much of the services' reduced utility was due to students' preconceptions, alternative resource usage or unwillingness to seek help.

Take-home Messages: Wellbeing support services are widely used by students when available. However, investment in developing close staff-student relationships is needed to ensure students understand both the potential benefits of accessing such services, but also be realistic about what such services can offer, particularly when these are provided directly by Medical Schools themselves.

A novel study: how Hong Kong medical students' professionalism behaviours are affected by educational experiences before medical school

AUTHOR(S):

- Sophie Yau, The Chinese University of Hong Kong, Hong Kong (Presenter)
- Natalie Law, The Chinese University of Hong Kong, Hong Kong
- Isabel Hwang, The Chinese University of Hong Kong, Hong Kong

ABSTRACT

Background: In Hong Kong (HK), students enter university via JUPAS (when holding the HK Diploma of Secondary Education) or non-JUPAS (when holding other qualifications). Recently, medical schools have been admitting more non-JUPAS students, who are presumed to be more privileged. This raises public concern regarding their adaptability to healthcare workplaces. As levels of motivation, burnout and professionalism affect professional behaviour, our novel study aimed to investigate how these differ between the two groups.

Summary of Work: An online survey was distributed to preclinical medical students (Years 1-3). Respondents answered customised multiple-choice questions on motivation. Questions from Maslach's Burnout Inventory were used to investigate burnout. Questions covering various professionalism attributes were selected from UCAT's Situational Judgement Test. Answers were scored based on closeness to official answers.

Summary of Results: Responses were received from 253 students. Non-JUPAS students (n=108) had a higher average age ($p < 0.01$) than JUPAS students (n=145), and more (18.1%) lived in private housing, suggesting better socio-economic backgrounds. The primary reasons for applying to medical school were 'a wish to serve society in a clinical setting' (JUPAS:43%;Non-JUPAS:49%) and 'interest in medical sciences' (JUPAS:35%;Non-JUPAS:36%), with a post-entry shift of interest towards clinical work. Their burnout scores had no significant difference, but the average (JUPAS:35.7;Non-JUPAS:36.7) classified students as almost burnout. Regarding professionalism, non-JUPAS students (47.2) scored higher ($p < 0.01$;JUPAS:45.5), with no age correlation.

Discussion and Conclusions: A significant portion of students showed interest in medical sciences rather than clinical work initially, reflecting cultural values that favour professional careers. The curriculum ensures clinical exposure rather than research attachments, explaining the change in motivation. Academic pressure explains the high burnout scores. Studying medicine is challenging and mental wellness programmes (e.g. mindfulness and meditation workshops) must be introduced into the curriculum. Mean professionalism scores were high despite minimal clinical exposure. Non-JUPAS students may have scored higher because of greater exposure to related topics in previous schooling and admissions preparation. To minimise this gap, classroom sessions with physicians participating should complement pre-existing online activities.

Take-home Messages: Educational backgrounds make some difference to the professional behaviour of HK medical students. However, mental wellness initiatives must be introduced to address burnout. Supplementing online activities with interactive ones may equalise professionalism scores.

Experiences of Medical Students who Participated in a 6-Week Self-Compassion Program: A Qualitative Investigation

AUTHOR(S):

- Camila Velez, McGill University, Canada (Presenter)
- Namta Gupta, McGill University, Canada

ABSTRACT

Background: Medical students confront significant stressors throughout their training, including academic, clinical, psychosocial, and existential challenges. Research indicates a high prevalence of stress, anxiety, burnout, and depression in medical students. Poor psychological well-being among medical students can interfere with learning and success in medical school, decrease quality of life, and negatively impact the delivery of professional and compassionate patient care. Given this context, it is necessary to provide students with tangible and effective tools to cultivate self-care, compassion, and manage stress. Self-compassion interventions have been found to increase well-being, compassion, and resilience in diverse populations, but little is known about their effectiveness with medical students.

Summary of Work: This pilot qualitative study investigated the experiences of 11 medical students who participated in an adapted self-compassion group program. The program consisted of psychoeducation sessions, informal and formal meditation practices, experiential exercises, and group discussions. Participants met for 2 hours once a week for 6 weeks. Participants completed an individual, semi-structured interview at the end of the program. The interviews were analyzed using interpretative phenomenology analysis.

Summary of Results: Preliminary results suggest that participants valued the self-compassion program as helpful in dealing with the challenges of medical training. Reported benefits included increased self-kindness, ability to recognize and regulate difficult emotions, compassion towards others, increased motivation, and a reduced sense of isolation and inner-criticism. Participants also addressed several challenges associated with the program and provided recommendations to make the program more valuable to medical students.

Discussion and Conclusions: Preliminary results suggest that self-compassion programs have a promising potential for enhancing the personal and professional well-being and resilience of medical students. The results also indicate that self-compassion programs may be feasibly implemented as prevention interventions for medical students. Clinical implications and directions for future research are presented.

Take-home Messages: This is one of the few qualitative studies of the impact of a self-compassion intervention among medical students. Preliminary findings suggest that medical students find aspects of the program beneficial to their personal and professional well-being. Adapted self-compassion programs can be feasibly implemented as prevention and skill-building interventions for medical students.

Prediction of factors contributing toward highest and lowest Global Quality of Life levels among medical students using machine learning models

AUTHOR(S):

- Alice Q. C. Miguel, Faculdade de Medicina da Universidade de Sao Paulo, Brazil (Presenter)
- Milton de A. Martins, Faculdade de Medicina da Universidade de Sao Paulo, Brazil
- Patricia Tempski, Faculdade de Medicina da Universidade de Sao Paulo, Brazil
- Renata Kobaiasi, Faculdade de Medicina da Universidade de Sao Paulo, Brazil
- Fernanda Mayer, Faculdade de Medicina da Universidade de Sao Paulo, Brazil

ABSTRACT

Background: This is a cross-sectional study to evaluate factors contributing toward quality of life levels among medical students.

Summary of Work: Data were evaluated from a random sample of 1350 medical students from 22 Brazilian medical schools. Our outcome of interest was quality of life (QoL) related to medical course activities. We selected the following variables as predictors: World Health Organization Quality of Life Assessment abbreviated version (WHOQOL-BREF), VERAS-Q, a questionnaire created to evaluate the QOL of students in health professions, Epworth Sleepiness Scale (ESS), Pittsburgh Sleep Quality Index (PSQI), Beck Depression Inventory (BDI), Resilience Scale (RS-14), State-Trait Anxiety Inventory (STAI), Interpersonal Reactivity Multidimensional Scale (IRMS), Maslach Burnout Inventory (MBI), Dundee Ready Education Environment Measure (DREEM). The potential confounders selected were age, gender, body mass index, and school levels.

Summary of Results: We run a tree regression model (recursive partitioning), identifying the main sequential factors leading to the prediction of medical student's quality of life related (QoL) to the medical course. The model demonstrated that the VERAS-Q - physical health domain was the most important factor predicting QOL, followed by VERAS-Q-time management, VERAS-Q-learning environment, WHO QOL-physical health, and Maslach Burnout Inventory-Emotional exhaustion domain. We found that the students with a VERAS-Q-physical health score ≥ 60.9 and a VERAS-Q-time management score ≥ 55.7 presented the best QOL related to the medical course with a score of 8.08 (9.63%), while those with VERAS-Q-physical health score < 60.9 associated with a VERAS-Q-learning environment score < 56.2 were associated with the lowest QOL (3.79, 2.15%). Additional combinations of scores were associated with intermediate QOL scores as demonstrated in graphic.

Discussion and Conclusions: Physical symptoms, self-perception of health and self-care are significantly associated to quality of life of medical students. In the subgroup with higher quality of life, time management is a differentiator for better scores. Teaching environment and social relationships in medical course have a greater impact in the subgroup with worse quality of life.

Take-home Messages: A questionnaire developed specifically to evaluate quality of life in medical students (VERAS-Q) has greater power in discriminate better and worse quality of life in this group than questionnaires used for general population.

Enhanced health awareness for non-medical students through digital learning at Prince of Songkla University

AUTHOR(S):

- **Kanyanatt Kanokwiroon, Prince of Songkla University, Thailand (Presenter)**
- Kanyika Chamniprasas, Prince of Songkla University, Thailand
- Nongluk Rukleng, Prince of Songkla University, Thailand
- Kamonwan Songkroh, Prince of Songkla University, Thailand
- Sophin Kaewsalubsri, Prince of Songkla University, Thailand
- Srirat Fungtosatum, Prince of Songkla University, Thailand

ABSTRACT

Background: The “Health for all” course has been newly established to initiate the health awareness and self-care for first-year-non-medical students in Prince of Songkla University via digital learning.

Summary of Work: The course was run as a module for 2 weeks in each sections. Topics included were the principle and steps of basic life support, practice of basic life support in simulated situation; common mental health problems, warning signs, initial assessment and care; concepts of health and health promotion; first aid. During a section, 150 participants were divided into 10 groups, in order to individually practice the basic life support under supervision. Then, we aimed to evaluate the progress of health awareness of students who completed the course. At the end of the course all students had a self-evaluation, based on online questionnaires. Learning outcomes were scored from 1 (poor) to 5 (excellent) for each topics in order to assess their health awareness.

Summary of Results: A total of 1003 (52.13%) out of 1924 students (4 health science and 5 non-health science faculties) in Prince of Songkla University (4.49% of medical technology, 15.05% of nursing, 1.50% of veterinary science, 4.39% of physical therapy and radiological technology, 21.04% of liberal arts, 19.24% of management sciences, 4.29% of economics, 0.40% of international college students and 29.61% of science students) completed the survey. The average self-rating score of 4.46+/-0.09 was retrieved among all students. Learning outcomes of health promotion showed the highest score with 4.55+/-0.20 while the basic life support showed the lowest rate (4.30+/-0.26). The students from the health science faculties (n=255) demonstrated a slightly higher rating score of 4.46+/-0.10 on health awareness compared with non-health science (n=748) faculties (4.35+/-0.18).

Discussion and Conclusions: This course has been recently arranged for all first-year students in our university aiming to increase their health awareness. This strategy was used to enhance and promote health awareness in our university not only for medical, but also for non-medical students. The course helped them to be more health conscious during their daily life, and by this attitude to increase their own well-being.

Take-home Messages: Health awareness may boost the quality of life.

Improving wellbeing in medical students - A work in progress

AUTHOR(S):

- Jan McKenzie, University of Otago (Christchurch), New Zealand (Presenter)
- Kate Fitzmaurice, University of Otago Christchurch, New Zealand
- Fraser Jeffery, University of Otago Christchurch, New Zealand
- Bridget Lang, University of Otago Christchurch, New Zealand

ABSTRACT

Background: Medical student wellbeing and mental health issues have become an important topic that is being examined and addressed by many medical schools. Despite a number of strategies being put in place at our medical school in New Zealand it remains concerning how many students don't reflect on their own wellbeing and fail to seek help when stressed. Following the massive earthquakes in Christchurch 2010 and 2011 students were surveyed to assess the impact of the earthquakes on wellbeing and a number of other variables. The survey also included questions on what positives, if any, had emerged. A surprising finding was that despite the enormous stress and chaos the students and staff experienced, those in the earthquake areas did much better than predicted in their examinations. One of the other positive findings to come out of our survey was an increased sense of connectedness. This sense of community ... was also palpable between staff and students. That is, we were all vulnerable together.

Summary of Work: With the above issue in mind a number of initiatives have been developed to try and improve the sense of connectedness in the hope it will aid wellbeing, and help seeking in students. This presentation will describe these developments, including a wellbeing focus group made up of staff and students and presentations to students by panels of teachers and students including physician's surgeons and registrars talking openly about their experiences of burnout and seeking help.

Summary of Results: This will be presented in the form of feedback from students /staff as well as the number of students seeking advice.

Discussion and Conclusions: Students tend to see the teaching staff as invincible and often unapproachable. A combined approach to "wellbeing" including both staff and students is seen as a way to bridge the divide between staff and students. Staff being more open about their vulnerabilities and ways they dealt with their own wellbeing or ill-health also contributes to breaking down staff / student barriers and thus makes it easier for the students to address these issues.

Take-home Messages: Staff role modelling their attention to wellbeing may enable students to more readily address their own health.

Students' self-perception about their Quality of Life is overestimated: is this the base of their mental troubles?

AUTHOR(S):

- Patricia Maluf Cury, FACERES, Brazil (Presenter)
- Mariana Neves Ceratti, FACERES, Brazil
- Fernanda Pessato Quessada, FACERES, Brazil
- Patricia da Silva Fucuta, FACERES, Brazil
- Felipe Colombeli Pacca, FACERES, Brazil

ABSTRACT

Background: A good Quality of Life (QoL) is fundamental for the mental and physical health of medical student. In previous studies, we observed a high rate of stress in students (70% had emotional stress symptoms). As a coping mechanism for these students, focus on the problem was the most used (48.5%) followed by search for social support (31.6%). The aim of this study is to investigate the student perception about their QoL, in order to be aware of their own problems.

Summary of Work: Quali-qualitative survey with medical students from 1st to 4th year. We applied three instruments: SF36 health questionnaire; a QoL self-perception questionnaire and a questionnaire with self-knowledge and coping strategies questions.

Summary of Results: 203 students answered the questionnaires (women 64.5% and median age 20 years, range from 17 to 41 years). Students self-perception about QoL was overestimated in the domains of general health, role-physical, bodily pain, vitality, role-emotional, social functioning and mental health ($p < 0.001$) and underestimated in functional capacity ($p < 0.001$). Difference between the two scores was calculated and comparative analysis was performed. There was a significant difference between genders, and men showed a greater deviation from SF36 to QoL self-perception for mental health domain than women: 14.3 ± 21.8 and 7.67 ± 22.4 , respectively ($p = 0.04$). Regarding questionnaire that sought to justify the discrepancies, 67.5% felt that the way they think is consistent with what they act frequently, 72.9% think they know their own needs, 73.9% evaluate their QoL as good or great. Regarding coping strategies, 38.9% preferred to be alone with the problem, 41.9% to seek other people, 12.8% to use drinks or drugs, 33.5% to increase food intake, 10.8% to practice physical exercises, 13.3% to seek professional help, 11.3% to seek religious help and 11.3% to seek other methods. When analysing such results between genders, women increased their food intake more than men ($P = 0.002$). In other items, there were no differences between genders.

Discussion and Conclusions: The present study showed that students self-perception about their QoL is mistaken and overestimated.

Take-home Messages: Students are not aware of their real health and this fact leads them not to manifest the need for help and change their behaviour.

Special supplementary courses (Soft sciences) experience for reducing stress in medical students. Time for renovation

AUTHOR(S):

- Vich Thampanya, Medical Education Center Chiangrai Prachanukroh Hospital, Thailand (Presenter)
- Chulaphong Chanta, Medical Education Center Chiangrai Prachanukroh Hospital, Thailand

ABSTRACT

Background: A last year report of fifth-year medical students showed that medical students were stressed and suffered from hard works. Students did not know a proper way to handle and reduce their stress. Study also emphasized that stress can increase depression, up to 7.8 times.

Summary of Work: Special supplementary courses(Soft sciences) for the 4th year medical students year 2018, consisting of all eight activities from thirteen events for three months. These programs were organized in the course of medical students held on Wednesday from 3.00 p.m. to 4.30 p.m. The examples of these activities were yoga, music, art, etc. Students were assessed their E.Q. and stress level before the implementation and after the last activity. Students attending each activity responded to the satisfaction survey, and expressed their opinions after all activities ended.

Summary of Results: All of 42 medical students including 17 males, 25 females showed that students' stress level didn't change significantly before and after soft sciences' program (p-value= 0.66). Yoga, music, art, and aerobic dance were the top 4 popular activities. Students mentioned that "art activity help them in developing teamwork, creativity, harmony and humanity. Yoga and music promotes concentration. In addition yoga also helps in relaxation and strength of muscle.

Discussion and Conclusions: Duration of the study was short and the schedule for each activity was quite tight. Some students felt exhausted to join the activities in every consecutive Wednesday. However, they felt that the activities was helpful in promoting proper stress management skills. Students voted yoga, music, art, and aerobic dance for their top 4 activities. We might reduce the activities to these 4 activities for the next year students. Soft sciences are very helpful for promoting non technical skills. It should be part of the curriculum of medical students.

Take-home Messages: Soft sciences are the activities that should be promoted to integrate in the curriculum for healthy mind and body.

MuayThai boxing fights reduce stress and improve exercise attitudes in medical students

AUTHOR(S):

- **Narin Chindavech, Buriram Medical Education Center, Thailand (Presenter)**
- Detdanai Wannapong, Buriram Medical Education Center, Thailand
- Rungnapa Pengprakhon, Buriram Medical Education Center, Thailand
- Yada Siriphannon, Buriram Medical Education Center, Thailand
- Surasak Aumkaew, Buriram Medical Education Center, Thailand
- Thanatpong Thienwuttiwong, Buriram Medical Education Center, Thailand

ABSTRACT

Background: According to intense contents in clinical years, some medical students are maladjusted and lack of time to recreation, relaxation and regularity of exercise. They tend to be stress out, anxiety and depression leading to burn out and learning problems. Finding time for exercise beyond studying is a challenge part. There are many relaxation ways to refocus the body and the mind, boost energy and lift the mood examples of running and walking, yoga, perform high-intensity training in medical school. Currently, in oriental way, MuayThai is a famous widely exercise work out program. Therefore we incorporated MuayThai in the leisure time to enhance students' experiences.

Summary of Work: To determine the stressors, exercise behaviors and recreation time of medical students before and after program. The program consisted of 60 minutes exercise session (10mins warm-up, 40mins MuayThai, 10mins cool-down) on afternoon of Wednesday (faculty hour) for 2 week consecutive. The program led by MuayThai instructors and trainers of our hospital health club. The pre and post-test self-administered questionnaires were collected.

Summary of Results: Ninety of 4th to 6th year medical students were enrolled, 8 (11%) were junior doctors, female was 54.8%. The average mean age and BMI were 22.9 ± 1.4 , 20.9 ± 2.7 , respectively. Only half of students (52.2%) had exercise after off-duty, average time 40 (range 30-65) minutes, 3 (range 2-4) days per week. The favorite exercises were treadmill running, outdoor running, basketball (73%, 14%, 11%, respectively). Only 8% of them had experience in MuayThai. The other free time activities were internet surfing 65.8%, game playing 12.3%, watching television 8.2%, book reading 4.5%. The student stressor questionnaires (total score 4) were reduced significantly after the session ($2.1vs1.8$, $p < 0.05$). Student satisfaction ten-point scores were significantly increased (7.8 versus 9.7, $p < 0.05$) due to receiving new experiences and subsequent good night sleep. And they also were enthusiastic to participate in next session after the study.

Discussion and Conclusions: Medical students also have many stresses encountered. MuayThai and other relaxation exercise may incorporate in medical education to help them cope with stressors.

Take-home Messages: MuayThai fightburn sessions reduce stress and improve exercise attitudes in medical students.

Mental Health and Wellbeing Amongst Medical Students: How are we doing?

AUTHOR(S):

- Zayna Syeed, University of Glasgow, UK (Presenter)
- Nazlie Syeed, Queen Elizabeth University Hospital, Glasgow, UK

ABSTRACT

Background: Stress is defined as a state of immense emotional strain, whilst burnout is described as physical or mental collapse as a result of emotional exhaustion or overwork. Stress and burnout are symptoms that are frequently experienced by medical students and may exacerbate during their time at medical school. Poor mental health in university can often continue into working life. This not only has the ability to affect academic performance but could also increase human error, thus having detrimental effects upon patient care. The GMC has expressed concerns about the prevalence of mental health conditions in medical students. It indicates that it is the responsibility of the medical school to enforce that precautionary measures are implemented to encourage positive mental health and wellbeing in their students.

Summary of Work: A prospective anonymous study encompassing all students from 1st to 5th year of Glasgow University was sent out and completed online. It aimed to collect data on the effectiveness and availability of stress management provided by the university. The results of the study were used to compose an audit that will be made available to the medical school in order to improve the quality of support provided to students. This has the intended effect of shaping more resilient doctors to improve clinical governance.

Summary of Results: A proportion of students had experienced stress/burnout in medical school that affected their everyday activities and wellbeing. In addition, there were many forms of support provided by the medical school that students were either unaware of or did not find to be beneficial.

Discussion and Conclusions: Stress and burnout are common amongst medical students and although preventative measures are in place, they are not always effective, nor utilised to their full potential. Support is available in different forms. However, students in need may not be aware of services available and/or may not find them beneficial. Therefore, it is necessary to change current strategies.

Take-home Messages: Stress and burnout are commonly experienced by medical students throughout all year groups. Although there are steps in place to help medical students mental health, there is still scope for improvement.

Non-medical use of prescription stimulants by undergraduate medical students at a South African University

AUTHOR(S):

- **Lori Bocchino, Unit for Undergraduate Medical Education, Health Sciences Faculty, University of the Witwatersrand, South Africa (Presenter)**
- Muhammed Alli, UUME, Wits Medical School, South Africa
- Thandeka Dube, UUME, Wits Medical School, South Africa
- Xolani Manqina, UUME, Wits Medical School, South Africa

ABSTRACT

Background: There has been a documented increase in the off-label use of prescription psychostimulant drugs (e.g. methylphenidate) by university students. Multiple risk factors have been identified, including increasing academic/time pressures and competitive environments. In the context of medical schools with extremely demanding programmes, students are thought to be at even higher risk. Two South African universities have previously found prevalences of non-medical stimulant use amongst medical students of 11-18%.

Summary of Work: Objectives To determine the prevalence of non-medical prescription stimulant use by medical students at the University of the Witwatersrand in Johannesburg, South Africa. Methods This was a cross-sectional observational study, using an online survey administered to MBBCh students in years 3-6

Summary of Results: A total of 185 students completed the survey across all 4 years of study, yielding a response rate of 14.3% (total population = 1298), CI 6.67%. The highest response rate came from the MBBCh 3 class, the lowest from MBBCh 6. 15.1% (n=28) reported use of prescription stimulants for non-medical purposes, with 93% using methylphenidate. 61% of students used psychostimulants only when studying for tests/exams, and 100% reported 'improvement of concentration' as the reason for use. Multiple short-term adverse effects were reported, but 64% also reported positive effects in terms of improved grades. With respect to sourcing drugs, 58% obtained the stimulants from friends. There was a statistically significant difference ($p=0.003$) in usage between graduate-entry students (61%) compared to school-leavers (39%), and the highest prevalence was seen in the age group 24-26 years at 43% ($p=0.037$). There was no statistically significant difference in usage according to gender, race, or year of study.

Discussion and Conclusions: The prevalence of non-medical prescription stimulant use amongst medical students at the University of the Witwatersrand was found to be 15.1%, which is comparable with other South African universities. The highest prevalence was amongst graduate-entry students and those aged 24-26 years, with 93% using methylphenidate. The drugs appear to be easily procured.

Take-home Messages: Non-medical use of prescription stimulants by medical students is a concern, and there is still little known about the long-term effects. We should consider strategies to appropriately support students in dealing with the demands of tertiary education.

Resiliency of First Year Clinical Rotations in Thai Medical Students Managed With Burnout

AUTHOR(S):

- Piyaporn Sirijanchune, Medical Education Center Chiangrai Prachanukroh Hospital, Thailand (Presenter)
- Panomkorn Lhakum, Medical Education Center Chiangrai Prachanukroh Hospital, Thailand

ABSTRACT

Background: First year clinical rotations of the fourth-year medical students suffered from many pressure and stress. There were major changes during clinical years caused problems. They had burnout due to high level of expectations and responsibility with heavy academic workloads.

Summary of Work: This is a cross-sectional survey of first year clinical rotations of fourth-year medical students during 2018 academic year at Medical Education Center Chiangrai Prachanukroh Hospital. Aim to evaluate their burnout using questionnaires of PHQ-9 and Thai HADS. Survey the resilience of their burnout management during clinical years.

Summary of Results: 44 fourth-year medical students had completed the questionnaires. There were 25 medical students (56.81%) had problems of burnout by using PHQ-9 or Thai HADS questionnaires. 21 medical students (47.72%) had burnout by using PHQ-9 questionnaires with PHQ-9 score > 5 and 18 medical students (40.91%) had burnout by using Thai HADS questionnaires with Thai HADS score > 11. The burnout management in 25 medical students, 16 medical students (64%) chose to fulfill social interaction with their close friends, 5 students (20%) relieved their burnout by using favorite social media, 2 students (8%) relieved their burnout by exercise, 1 student (4%) chose to consult with mentor and 1 student (4%) chose to consult with parents.

Discussion and Conclusions: First year clinical rotations of fourth-year medical students had high level of burnout. The good resiliency for relief their burnout promoted well-being. Social interaction to close friends provided a great option for their resiliency.

Take-home Messages: Good resilience could relief the burnout problems.

Strengthening mindfulness to enhance learning outcomes by taking a brief meditation prior to a class: a research in fifth-year medical students

AUTHOR(S):

- Naphatsaphon Chumwong, Maharaj Medical Education Centre(MMEC), Maharaj Nakhon Si Thammarat Hospital, Thailand (Presenter)
- Kanchomkwan Kankorakoch, Maharaj Medical Education Centre(MMEC), Maharaj Nakhon Si Thammarat Hospital, Thailand
- Nathamata RUANGON, Maharaj Medical Education Centre(MMEC), Maharaj Nakhon Si Thammarat Hospital, Thailand
- Piya Mongkolwongrojn, Maharaj Medical Education Centre(MMEC), Maharaj Nakhon Si Thammarat Hospital, Thailand
- Nitikorn Poriswanich, Forensic medicine department, Siriraj Hospital, Thailand

ABSTRACT

Background: Though several evidences show advantages of meditation in medical education, different meditation courses may result differently. Maharaj Medical Education Centre (MMEC) has designed our own meditation program and this study conducted in fifth-year medical students is to show the effectiveness of the course.

Summary of Work: A subset of randomized fifth-year medical students were classified into the meditating and non-meditating groups that comprised of 14 each. A brief meditation (15 mins) was assigned for each individual in the meditating group prior to the test. Both groups were assigned to do the test of concentration which are complicated and require a dynamic form and a high level of mindfulness. Data was observed through the scores.

Summary of Results: The age, gender, and accumulative GPA in each group are comparable and the same in baseline characteristics(p-value = 0.19, 1.00, and 0.28 respectively). The scores in the tests were found to be higher in meditation group(10 vs 6) while the number of times to reach the score were not different..

Discussion and Conclusions: The individuals in both groups were pre-tested and showed comparable baseline concentration levels, however, meditation showed a significant improvement that the scores obtained from the test were higher. We believe that this study might reflect an advantage of meditation to help strengthen mindfulness and result in enhancing learning outcomes.

Take-home Messages: A brief prior-to-class meditation might assist learning outcomes in medical students via strengthening mindfulness.

Piloting Practicum Script, a clinical reasoning simulator, in a multi-centre European study

AUTHOR(S):

- Eduardo M Pleguezuelos, Practicum Institute of Applied Research in Health Sciences Education, Spain (Presenter)
- Amir Sam, Imperial College London, UK (Presenter)
- Carlos Collares, Maastricht University, The Netherlands
- Adrian Freeman, University of Exeter, UK
- Eduardo Hornos, Practicum Institute of Applied Research in Health Sciences Education, Spain
- Cees van der Vleuten, Maastricht University, The Netherlands

ABSTRACT

Background: Current tools for assessing applied knowledge in undergraduate medical education are limited in their scope for testing clinical reasoning and the ability to manage uncertainty in clinical practice. Practicum Script (<http://www.practicumscript.education>) is an online simulation-based program aimed at enhancing clinical reasoning and problem solving skills as well as introducing the concept of uncertainty for decision-making. This multi-centre pilot study, coordinated by the European Board of Medical Assessors (EBMA), aims to investigate the utility of Practicum Script as a clinical reasoning training tool in undergraduate teaching and assessment.

Summary of Work: It is envisaged that four UK medical schools as well as medical faculties from other European countries will participate. The assessment material will consist of clinical cases mapped to key topics in internal medicine. Cases currently under development by an editorial team will be reviewed by a reference panel consisting of internal medicine experts who will provide responses to the questions and their rationales. A Literature review of the clinical evidence relevant to the experts' judgments will also be performed. For each clinical scenario, final year medical students will be asked to generate hypotheses in 'free-text' format and justify them by identifying pertinent positive and/or negative findings in the case. Subsequently students will need to report, in five different clinical scenarios, how new data may affect their original hypotheses. Feedback for the participants will be based on the summaries of experts' answers and justifications, along with the clinical evidence base from the literature. Students will also be able to see the concordance between their responses and those of the experts.

Summary of Results: The project is ongoing. We aim to perform psychometric analyses of the students' answers to the items for each case. Student satisfaction and perceptions about the educational model will be also be evaluated.

Discussion and Conclusions: Practicum Script may be a valuable undergraduate educational resource for assessment of clinical reasoning and medical students' ability to manage uncertainty in clinical practice.

Take-home Messages: There is a strong need for effective approaches tailored to development of clinical reasoning skills at the undergraduate level, and Practicum Script could contribute meaningfully to this goal.

Time to investigate the path of clinical reasoning in chronic and multimorbid conditions

AUTHOR(S):

- Julia Sader, UNIGE (UDREM), Switzerland (Presenter)
- Claire Ritz, UNIGE, Switzerland
- Sarah Cairo Notari, UNIGE, Switzerland
- Thomas Fassier, UNIGE (UDREM), Switzerland
- Mathieu Nendaz, UNIGE (UDREM), Switzerland
- Marie-Claude Audétat Voirol, UNIGE (UDREM + UIGP), Switzerland

ABSTRACT

Background: According to Cook, management reasoning differs greatly from diagnostic reasoning (Cook et al, 2018), making it a more complex process. We intend to explore and shed some light on the different characteristics of this management reasoning.

Summary of Work: A qualitative descriptive study was carried out with semi-structured interviews about their management reasoning and the challenges they encountered with expert primary care physicians working with multimorbid patients in an ambulatory setting. A total of 9 participants were part of this study. Those 9 interviews were transcribed verbatim followed by an inductive and deductive data analysis.

Summary of Results: A few themes emerged from the data, confirming and developing further the perspective of Cook and al. Those themes helped us to better understand and better define how these complex factors coincide and interact with one another, especially regarding the collaborative reasoning with patients, family and other healthcare professionals.

Discussion and Conclusions: Our results gives us the opportunity to highlight Cook's findings as well as opening the bridge to further investigate how clinical reasoning is achieved in different settings. This study would enable clinicians to be more conscious of the richness and quality of their own clinical reasoning processes used during multimorbidity management. Our study contributes to better understand clinical reasoning in the context of patients with multiple chronic conditions during the long-term follow-up care of their patients. These results open the path to new research projects that will enable us to explicit the clinical reasoning processes used by physicians in the context of multimorbidity which might later support the teaching and supervision.

Take-home Messages: Primary care physicians are at the very heart of managing complex patients with multimorbid chronic conditions. This study enables us to think of clinical reasoning as a multi-faceted and longitudinal process.

Correlates of medical error and clinical reasoning

AUTHOR(S):

- Ching-Yi Lee, Chang Gung Memorial Hospital and Medical Education Research Center, Taiwan (Presenter)
- Hung-yi Lai, Chang Gung Memorial Hospital and Medical Education Research Center, Taiwan

ABSTRACT

Background: Clinical reasoning (CR) is the thought process guiding health professionals' practices. Research suggests that medical errors may arise from poor CR skills. Expertise and knowledge may contribute as factors to reasoning/medical errors and hence the likelihood of medical disputes. We examined the association between medical disputes and CR errors.

Summary of Work: A retrospective method was used to investigate medical dispute cases (MDC) (2011-2015) filed at four hospitals in Taiwan. Through discussion and classification, we identified the number of MDC associated with CR errors, clinical specialty, and seniority, respectively.

Summary of Results: 57.7% (45/78) of MDC cases were associated with CR errors (82.2% (37/45) and 22.2% (10/45) were knowledge- and skill-related errors respectively). MDCs related to obstetrician-gynecologists (10/90,11.1%), surgeons (8/90,8.9%) and emergency physicians (7/90,7.8%) who were equally associated with CR error-occurrence (5/51,9.8%). Physician seniority negatively related to CR errors.

Discussion and Conclusions: CR errors account for almost 60% MDCs, with seniority playing a role in mitigating errors. Given that seniority indicates greater expertise accumulated, and hence explains its association with a lower number of medical disputes, we suggest that the development of CR skills should play a pivotal role in students' training.

Take-home Messages: An examination of MDCs across a range of medical institutions can help us understand the issues better and develop strategies for establishing a safe medical environment for both patients and medical personnel.

Clinical reasoning training program for Japanese nurses using advanced patient simulator

AUTHOR(S):

- Takuzo Hano, Wakayama Medical University, Satellite Clinic for Integrative and Anti-Aging Medicine, Japan (Presenter)
- Momoko Buyo, Wakayama Medical University, Career Developing Center for Nursing, Japan
- Sayo Sekiguchi, Wakayama Medical University, Career Developing Center for Nursing, Japan
- Chiemi Kakutani, Wakayama Medical University, Career Developing Center for Nursing, Japan

ABSTRACT

Background: As nurses are usually performing the practice according to the instruction of the doctor, and there are few opportunities to diagnose the condition themselves at Japanese clinical sites. We established a new training program to teach clinical reasoning to nurses at the opportunity that the nurses' new training system related to specific medical treatment was decided by the Ministry of Health, Labor and Welfare in 2015.

Summary of Work: Ten nurses attending this course received lectures on physical assessment and clinical reasoning after receiving basic medical science, anatomy and physiology. After this curriculum, we conducted an objective structured clinical examination for physical assessment. Furthermore, we set four scenarios of common diseases of dehydration, hypoglycemia, heart failure and pneumonia in an advanced simulator to mimic the patients in the hospital or their home. Participants made an interview and physical assessment to do a clinical reasoning for these simulators. Evaluators made an objective assessment and a debriefing as to whether the medical interview and the physical examination were properly performed, enough information was obtained, and the correct clinical reasoning was performed. Finally, whether the understanding of clinical reasoning improved was evaluated using a graded evaluation questionnaire.

Summary of Results: Average score of OSCE for physical assessment was 94.4 ± 3.98 . Score about whether participants were doing clinical reasoning in clinical sites was 2.2 (Max 4.0). Scores of comprehension of clinical reasoning and the understanding of the procedure of clinical reasoning were significantly elevated from 2.1 ± 0.52 (mean \pm SD) to 3.3 ± 0.54 , 1.95 ± 0.60 to 3.17 ± 0.47 , respectively. And scores of the interview technique and the physical examination technique also rose significantly from 1.7 ± 0.48 to 2.8 ± 0.54 , 1.85 ± 0.47 to 3.0 ± 0.41 .

Discussion and Conclusions: Japanese nurses who have little experience for clinical reasoning were able to acquire medical interview and physical assessment skills by lecture and practical training using an advanced simulator. Simulated medical practice allowed nurses to understand the meaning and procedures of clinical reasoning. In addition, these programs were useful for deepening the medical interview and physical examination techniques.

Take-home Messages: Training of clinical reasoning using an advanced simulator is useful for nurses to understand pathological conditions and improve diagnostic techniques.

Evaluating the use of case based discussion in improving clinical reasoning: A pilot study with medical students

AUTHOR(S):

- **Rodger Laurent, Royal North Shore/Sydney Medical School, Australia (Presenter)**
- Ted Tsai, Australia
- Diana Learoyd, Sydney University Medical School, Australia
- Kirsty Foster, Sydney University Medical School, Australia
- Kieran Fallon, ANU Medical School, Australia

ABSTRACT

Background: Clinical reasoning is the cornerstone of clinical medicine; yet is difficult to teach and there is little data on optimal methodologies. Case based discussions (CBD) with key features method may be useful in teaching clinical reasoning. The Bordage diagnostic inventory is a well-validated assessment tool of clinical reasoning.

Summary of Work: Ten medicine III/IV students at the Australian National University attended two sessions one month apart. Each session involved a 45 minute structured CBD on polyarthritis, the 41 item Bordage inventory, 10 question MCQ on polyarthritis. The case included questions on key features which were scored. Feedback was given to the student at the end of each case. Scores of the various assessments before and after the two CBDs were compared.

Summary of Results: Median age of the 10 students was 30 years (24-44). The second CBD score was slightly lower (50% vs 56%, $p=0.06$). There was a trend for the poorer performing students to improve from the CBD. The pre and post CBD MCQ scores were unchanged (76% and 77%, $p=0.91$). Total Bordage score improved from 150 to 161 out of 246 ($p=0.18$): Flexibility in Thinking (FIT) score improved from 79 to 82 out of 126 ($p=0.63$). Structure of Memory (SOM) score improved from 71 to 80 out of 120 ($p=0.11$). The students with the poorest baseline Bordage scores improved the most (SOM 58 to 94, FIT 73 to 105).

Discussion and Conclusions: CBD is a labour and time intensive method for teaching clinical reasoning. The poorer performing students gained the most from the exercise. CBD significantly improves clinical reasoning in students with poor baselines, but may have less value in other students. Limitations of this pilot study include small sample size, high baseline student knowledge of polyarthritis, and short time interval between cases.

Take-home Messages: Case based discussions with key feature questions is an effective strategy to improve clinical reasoning when conducted by subject matter experts. Teaching strategies for clinical reasoning should focus on poorer performing students as identified by the Bordage diagnostic inventory score.

ClinicalCasesPod: Do medical students tune in to a case-based podcast series to help learn clinical reasoning?

AUTHOR(S):

- Keisha Marchon, Brighton and Sussex University Hospitals NHS Trust, UK (Presenter)
- Emma Davies, Brighton and Sussex University Hospital Trust, UK
- Rupert Phillips, Brighton and Sussex University Hospital Trust, UK

ABSTRACT

Background: There is a move towards finding new ways to expose clinical reasoning to undergraduates, as newly qualified UK doctors feel unprepared for this in practice. Podcasts are becoming a widely accepted method of supporting learning and are increasingly used in medical education, however their role facilitating the learning of clinical reasoning specifically is not yet clearly established.

Summary of Work: The project aimed to analyse medical students' understanding of clinical reasoning in their clinical years and assess whether the experience of listening to case-based podcasts created by foundation doctors highlighting clinical decision making is a useful learning tool. Three conversational-style case-based podcasts were created with the emphasis on why clinical decisions were made. Medical students in years 3-5 were given access to the podcasts and invited to participate in the study by completing an online questionnaire, and invited to attend a semi-structured interview. Thematic analysis of the qualitative questionnaire results and semi-structured interview transcripts is being undertaken.

Summary of Results: Preliminary results suggest that the students find the format helpful for increasing understanding of clinical reasoning in diagnosis and management, with greatest value being during clinical placement and in preparation for foundation training. There is a strong call for more clinical scenarios and insight into which presenting complaints are felt to be most needed. Semi-structured interviews will provide more in-depth understanding of how students felt about the podcasts as a learning aid and will enable the researchers to elicit information regarding students' understanding of clinical reasoning.

Discussion and Conclusions: This study will provide helpful insights into the behaviour of podcast use generally, and more specifically with regards to clinical reasoning; positive reporting suggests value in using this 'bite-sized' conversational format to help open up the 'black box' of clinical reasoning to learners. Furthermore, there are interesting insights into which points in the curriculum students feel this pedagogical approach has greatest value.

Take-home Messages: Preliminary results are positive, as this study aims to enhance understanding of the feasibility and educational value of delivering case-based podcasts for medical students, to support their development of clinical reasoning.

From Presentation to Pathology: A workshop on forming a Differential Diagnosis

AUTHOR(S):

- Charlotte Pallett, University College London Medical School, UK (Presenter)
- Anum Pervez, University College London Medical School, UK
- James Leveson, University College London Medical School, UK
- Paul Dilworth, University College London Medical School, UK

ABSTRACT

Background: Clinical reasoning is the cognitive process by which clinicians apply their knowledge and experience to formulate a differential diagnosis. It involves several steps such as data gathering, interpretation, and critical evaluation of arguments for and against a particular diagnosis. This process is seldom formally taught in medical schools due to the complexities involved in gaining the knowledge, experience, and breadth of skills required. Therefore the challenge facing the clinical teacher is how to provide students with a framework from which they can develop their own clinical reasoning skills.

Summary of Work: The aim of this project was to develop a standardised framework for teaching medical students about clinical reasoning and uncertainty of differential diagnosis. A workshop was designed and integrated into an existing teaching week for first year clinical students. During this week, students followed the journey of four patients from GP presentation, through hospital admission, and then discharge back into the community. The new workshop introduced learners to the concept of clinical reasoning using didactic teaching, and students then undertook an interactive session focused on arguments for and against a particular diagnosis. By testing their assumptions regarding the diagnosis, students were able to critically analyse the complexities surrounding a patient's presentation and management.

Summary of Results: Pre- (n=37) and post-workshop (n=32) evaluation forms were given to students to assess their understanding of clinical reasoning, as well as their confidence in applying these skills, using a 10-point Likert scale. Following the session, students felt more confident defining clinical reasoning (+2.8), formulating a diagnosis from history taking (+0.5), examining patients (+0.6), and interpreting test results (+0.7).

Discussion and Conclusions: By introducing students to the concepts of clinical reasoning early in training, it offers a strong foundation for ongoing learning and transferable skills into clinical practice. The ultimate aim would be to reduce patient errors around incorrect diagnosis, which can have serious implications on patient morbidity and mortality.

Take-home Messages: Clinical reasoning is an important skill that ought to be introduced early in medical training to avoid errors in patient diagnosis. By creating a framework for clinical reasoning, we believe this is a teachable skill that will benefit students.

Effect of a peer role playing simulation on the competency of medical students in performing musculoskeletal physical examination and clinical reasoning

AUTHOR(S):

- Kazuyo Yamauchi, Tokyo Women's Medical University, Japan (Presenter)
- Yoko Hagiwara, Tokyo Womens Medical University, Japan
- Yoshinori Nagata, Tokyo Womens Medical University, Japan
- Saori Kubo, Tokyo Womens Medical University, Japan
- Ken Okazaki, Tokyo Womens Medical University, Japan
- Yumiko Okubo, Tokyo Womens Medical University, Japan

ABSTRACT

Background: The traditional medical education curriculum in Japan includes insufficient opportunity for students to develop competency in musculoskeletal physical examination, clinical reasoning, and diagnosis, with the majority of residents reporting a lack of confidence in performing these tasks. Our aim was to assess the effectiveness of a peer role playing simulation education module in improving these skills among 90 of 112 female medical students completing their first Orthopaedic clinical clerkship.

Summary of Work: Participants were randomly allocated into two groups, one participating in the simulation-based module (simulation group, N=64) and the other not participating in this program (no simulation group, N=26). Effectiveness was assessed using the mini Clinical Evaluation Exercise (mini-CEX) as formative assessment and performance on an objective structure clinical examination (OSCE) as summative assessment for musculoskeletal case. The simulation-based module included 2 sessions, the first being a semi-structured encounter with a role playing for musculoskeletal cases and the second, a structured debriefing with the course instructor.

Summary of Results: The mini-CEX scores for the real-life MSK encounters were higher for the simulation than non-simulation group (Physical examination: P=0.0053, Clinical reasoning: P=0.027, Overall: P=0.0032, 95% confidence interval). Another result, the total OSCE score was not significantly difference between the simulation group and the non-simulation group (P=0.053). The simulation-based module using peer role playing increased the mini-CEX scores for real-life patients presenting with musculoskeletal complaints, not increased total OSCE scores.

Discussion and Conclusions: Simulation-based instruction (combining peer role playing and instructor feedback) was effective in improving the skill of students with MSK physical examination, clinical reasoning, and diagnosis during their Orthopaedic clerkship. The multiple assessment opportunities provided by using the mini-CEX may have been beneficial in improving learning outcomes. To achieve competency and establish of clinical skills for learners using peer role play, the ingenuity is necessary for formative feedback and debriefing methods. However, further research being required to identify optimal SBME opportunities to master and retain skills.

Take-home Messages: (1) Practical training of peer role playing and formative feedback from one instructor promotes a short-term achievement of clinical skills competency. (2) Peer role playing in simulation based medical education is one learning method of clinical skills considering cost benefit.

“What do all those numbers and images mean for my patient?”: A junior doctor led near-peer teaching programme to develop medical students’ clinical reasoning

AUTHOR(S):

- Viktoriya Boncheva, NHS Greater Glasgow and Clyde, UK (Presenter)
- Saif Khan, NHS Greater Glasgow and Clyde, UK
- James Boyle, NHS Greater Glasgow and Clyde

ABSTRACT

Background: The use and interpretation of clinical data is a core element of clinical reasoning (CR). A recent study highlighted CR as the weakest area of student performance on OSCEs. Our aim was to develop a small group near-peer teaching (SGNPT) scenario-based programme to enhance data interpretation by medical students in their clinical years.

Summary of Work: In partnership with Glasgow Medical School, core “data interpretation” topics were identified, from the intended course learning outcomes. These were developed into hour-long, lunch-time SGNPT scenario-based sessions. Partnering with the West of Scotland Near-Peer Teaching Programme, a tutor training day course was offered to 69 junior doctors that we recruited. A pilot session on systematic interpretation of chest radiographs (scenario-based) was delivered to nineteen fourth-year medical students by seven junior doctors. Anonymised student feedback was collected (n=19). Students’ confidence in chest radiograph interpretation was assessed pre- and post-session using a Likert-type scale (1 (low) to 5 (high)). Monthly sessions will be continued to gather more data.

Summary of Results: A significant increase in self-reported confidence post-session was noted in all participants (p 0.0001), with pre-session scores of 1 (5%), 3 (84%) and 4 (11%) and post-session scores of 4 (79%) and 5 (21%). All students rated the session enjoyable and useful (based on yes/no questions). The seven tutors delivering the session, provided positive feedback; finding it “enjoyable” and “useful” with all “interested in teaching again”. Tutors also commented subjectively on students’ increasing confidence and improvement in interpretation skills throughout the session.

Discussion and Conclusions: This SGNPT scenario-based programme complements the local medical school’s curriculum, providing a clinical context to data interpretation. It offers an opportunity to improve medical students’ CR and bridge the gap between medical students and senior clinicians. Once the core data interpretation topics are developed, this scheme will be easily rolled out to all years and locations, making it accessible to all students.

Take-home Messages: Utilising SGNPT to provide junior doctor led structured data interpretation scenario-based sessions to medical students contributes significantly to developing their confidence and CR skills.

Using a case-based framework to improve teaching and learning clinical reasoning for preclerkship students in Taiwan

AUTHOR(S):

- Yaw Don Hsu, Tri-Service General Hospital & National Defense Medical Center, Taiwan (Presenter)
- Hui Chen Lin, Tri-Service General Hospital & National Defense Medical Center, Taiwan
- Chin Sheng Lin, Tri-Service General Hospital & National Defense Medical Center, Taiwan
- Jiunn Tay Lee, Tri-Service General Hospital & National Defense Medical Center, Taiwan
- CY Cheng, Tri-Service General Hospital & National Defense Medical Center, Taiwan

ABSTRACT

Background: Clinical reasoning (CR) should be taught in early medical school. However, it is not explicitly addressed in our medical school curriculum early. In order to build the fundamental concept of CR for preclerkship students, we use case-based frameworks to teach preclerkship students before they contact the real patients.

Summary of Work: Subjects were 62 preclerkship students, using a flipped classroom approach to teach CR skill. In pre-class, preclerkship students were given a PowerCam to learn introduction of CR, a case-based framework to practice CR in a small-group, which was directed by instructor to practice CR in-class. Before and after class, all subjects completed a serial of questionnaires assessing attitude, motivation and satisfaction (5-point Liker scale), and final course achievement.

Summary of Results: The results showed that this strategy in teaching CR significantly increase students' motivation, attitude ($p < 0.05$), higher satisfaction rate (4.21 ± 0.74) and better achievement performance (83.74 ± 14.56) in learning CR. It also gave the learner's current abilities, to foster a sense of higher self-efficacy (83%) in realizing CR process. Most of learners showed an active discussion in-class under instructor help.

Discussion and Conclusions: The case-based frameworks could assist in teaching preclerkship students' CR, so that most of them could explicitly discuss CR processes and well integrate with basic science knowledge. Less complexity and authenticity case-based content setting definitely promoted students' motivation and changed their attitude to learn CR. It was also easy for them to realise the CR process and got better achievement. In conclusion, In order to promote preclerkship students motivation and create an easy way to learn CR, using less complexity of authenticity case-based content setting to teach CR proved to be a good strategy, and could easily achieve the goal.

Take-home Messages: It is believed that CR teaching should start early in the medical education, and using the case-based framework teaching while gradually increase the complexity of contents can increase student's clinical experience, so that they can take care of patients with less supervision over time.

Synergic combination to improve medical thought: We must teach clinical reasoning coupled with debriefing

AUTHOR(S):

- Daniel Contreras Reyes, Universidad de Chile, Chile (Presenter)
- Leonardo Pérez, Universidad de Chile
- Claudia Arancibia, Universidad de Chile
- Sergio Bozzo, Universidad de Chile

ABSTRACT

Background: Clinical reasoning is the heart of medical thought. However, just few clinicians manage to share their own processes of clinical reasoning, because clinicians differ from clinical teachers. Through of Debriefing, both instructor and student share their own perspectives or mind maps that allow them think about mistakes and successes. Therefore, the models of clinical reasoning must be formally discussed during the debriefing. Nonetheless, this issue has not been deeply studied. We propose that students learning improves when the instructor is a clinical teacher capable of formally guides and reinforces the clinical reasoning process during debriefing.

Summary of Work: Medical students participated in high fidelity simulation assessment developed with three clinical encounters with simulated/standardized patients (acronym ECLIPSE in Spanish), such as a real patients medical consultation. Subsequently, the debriefing was carried out through the method of good judgment with a clinical teacher. In a subgroup the concept and models of clinical reasoning were formally discussed during debriefing. To determine whether learning process is improving, we evaluated through a Likert 1-5 survey the benefit perception of this strategy and Debriefing Assessment for Simulation in Healthcare®- Student Version (DASH-SV). Both surveys were filled after debriefing.

Summary of Results: 28 students answered voluntarily both surveys. Clinical reasoning topic and scope had not been discussed with teacher before for 42.86% (12/28). For all of them, discussing the topic Clinical Reasoning in debriefing is a contribution to identify and improve mental processes, hypotheses and differential diagnoses (agree 14/28 and strongly agree 14/28). Besides, they all considered clinical reasoning should be included formally at the curriculum. The subgroup that formally discussed the issue with a clinical teacher before (16/28) had a better perception of benefit compared to the other group.

Discussion and Conclusions: Students perceive the formal discussion of clinical reasoning during debriefing session as a contribution to improve. The clinical teacher must understand how doctors think to articulate their own clinical reasoning in a skillful and didactic way and to be able to teach their students to build their own.

Take-home Messages: Must teach clinical reasoning coupled with debriefing.

Development of clinical reasoning competency using virtual clinical training among baccalaureate nursing students

AUTHOR(S):

- Shu-Yu Kuo, School of Nursing, College of Nursing, Taipei Medical University, Taiwan (Presenter)
- Hui-Wen Chen, School of Nursing, College of Nursing, Taipei Medical University, Taiwan
- Jen-Chieh Wu, Department of Emergency, Taipei Medical University Hospital, Taiwan

ABSTRACT

Background: Clinical reasoning skills is crucial for patient safety in nursing practice. Effective strategy for developing clinical reasoning are therefore important for nursing students. The aim of this study is to examine whether utilization of virtual clinical patients in clinical practicum is beneficial for clinical reasoning competence in nursing students.

Summary of Work: A total of 103 nursing students participated in this study, including 67 students in the group one, and 36 students in the group two, respectively. Students in the group one completed a 120-hour clinical practicum and virtual patient training, while the ones in group two received virtual patient training only. Critical thinking skill was measured using the 20-item Chinese version of Critical Thinking Inventory Scale with a six-point Likert scale (ranging from 1 'no' to 6 'always') at baseline and after the training program. Clinical reasoning competency was assessed using the objective, structured clinical examinations (OSCE) consisted of chart assessment, physical examination, and nursing diagnosis and intervention stations after the training course. Participants' satisfaction regarding virtual clinical training was measured.

Summary of Results: After training program, the students in group one had significantly better critical thinking (mean difference =3.5, $p < 0.001$), while the students in group two showed the trend of improving critical thinking (mean difference =2.8, $p = 0.06$). The results of OSCE indicated that a significant difference in the clinical reasoning competency between the group one (mean= 66.2, SD= 11.3) and group two (mean=57.1, SD= 15.1) ($p < 0.005$). The average of satisfactory score was 4.2 in a five-point scale for both groups.

Discussion and Conclusions: Combining virtual patient training in the clinical practicum are effective in enhancing clinical reasoning and critical thinking skills in nursing students. By using virtual patient training alone is helpful in cultivation of critical thinking skill. Computerized virtual patient is effective in enhancing the critical thinking skills among baccalaureate nursing students.

Take-home Messages: The use of computerized virtual patient training in clinical practicum education is effective in development of clinical reasoning skills in nursing students.

Clinical Decision-Making in Geriatric Emergency Medicine: A Systematic Review

AUTHOR(S):

- **Maria Louise Gamborg, Center for Health Sciences Education, Faculty of Health, Aarhus University, Denmark (Presenter)**
- Peter Musaeus, Center for Health Sciences Education, Faculty of Health, Aarhus University, Denmark
- Mimi Mehlsen, Department of Psychology, School of Business and Social Sciences, Aarhus University, Denmark
- Charlotte Paltved, Department of Clinical Medicine, Faculty of Health, Aarhus University, Denmark

ABSTRACT

Background: Clinical Decision-Making (CDM) traditionally refers to the cognitive processes involved in making clinical decisions. The ability to make competent clinical decisions in Emergency Medicine (EM) is challenged by high levels of uncertainty and task complexity. With a growing geriatric subgroup in EM, new challenges arise, especially for Post-Graduate Year 1 (PGY1) residents, whom are sparsely trained for this group of patients. This review explores the empirical literature on CDM in geriatric EM (GEM). It aims to describe the state of research in this field, in order to identify learning objectives for training PGY1 residents.

Summary of Work: A systematic search of terms related to CDM and EM was performed on title or abstract in PubMed, ProQuest, Scopus, EMBASE and Web of Science. Search terms related to geriatrics was searched in the entire manuscript to allow inclusion of articles that did not exclusively address geriatric patients. Title and abstract were screened for 622 peer-reviewed manuscripts, excluding ones if not empirical, in a Scandinavian or English language, or did not address all search terms. 134 full manuscripts were screened for eligibility.

Summary of Results: Preliminary results based on 32 full text manuscripts suggest that the majority of studies is quantitative, mostly investigating CDM tools to assist clinicians in making more accurate decisions. The qualitative studies primarily investigate which specific information is used when making clinical decisions. As such, the empirical literature does not reflect the theoretical background, in addressing the cognitive processes underlying CDM itself.

Discussion and Conclusions: Initial results indicate that the understanding of the cognitive processes underlying CDM in GEM is not well described. When training PGY1 residents to make complex decisions under uncertainty, it is not enough to know when competent decisions are made, but also how they are made. Further empirical work is needed to understand the process itself, in order to prepare our future clinicians to care for the 'baby boomers.'

Take-home Messages: In order to develop CDM learning objectives in GEM to train PGY1 residents, a better understanding of the CDM process is needed, than what is currently available in the empirical literature.

Healthy Volunteers Role-play Helped Training of Patient Decision Aids (PDAs) Implementation in the Simulation of Shared Decision Making (SDM)

AUTHOR(S):

- **Chiung-hsi Tien, National Defense Medical Center, Taiwan (Presenter)**
- Pei Liu, Tri-Service General Hospital, Taiwan
- Cheng-Tau Chen, Tri-Service General Hospital, Taiwan
- Chih-Ying Tu, Tri-Service General Hospital, Taiwan
- Cheng-Jueng Chen, Tri-Service General Hospital, Taiwan
- Cheng-Yi Cheng, National Defense Medical Center, Taiwan

ABSTRACT

Background: Shared decision making is a new concept that the healthcare system in Taiwan has adopted since 2016. Patient engagement is a central part of designing and implementation of patient decision aids in clinical settings. Role-play is a method of simulation used commonly to teach communication skills.

Summary of Work: Thirty medical teams implemented department-based designed PDAs in 40-minutes simulation in OSCE center in August 2018. Volunteers were recruited and trained by a short curriculum of SDM. Volunteers were asked to role-play in the simulated clinical encounters of PDAs designed for, and the encounter topics were assigned by themselves based on their favor and own life experiences. Questionnaires evaluated the health literacy of the volunteers and collected their feedbacks to PDAs and the process of SDM. The anxiety of the volunteers to the PDA topics was assessed pre- and post-simulation. The performance of medical teams was rated by measurement adopted from Observer OPTION 5 Measure.

Summary of Results: Twelve healthy volunteers participated in the department-based simulation activities. In team performance measurements, item 1 (alternate options) had the highest average score, while item 5 (integrating preference) had the lowest. Item 1 also had the highest rate of teams reached 7.5 indicating skilled effort in the simulation, while item 5 also had the lowest. In these simulations, the PDAs reduced the sim-patients' anxiety about the specific encounter topics. The average of satisfactory scores to PDAs and the SDM process were both high, regardless of the performance score of the teams.

Discussion and Conclusions: The content of PDAs and the skills performing SDM by teams of different departments could be examined by adopted measurement efficiently in volunteer role-play. The engagement of healthy volunteers by role-playing in the simulation of department-based clinical encounters helped to identify the skills of medical teams and the fitness of content of PDAs in SDM.

Take-home Messages: Volunteer-involved simulation with adequate assessment helps training the skills of the medical team with implementation of PDAs in SDM.

Teaching Critical Thinking with Osler Techniques

AUTHOR(S):

- Pongsakorn Srichan, Surin Medical Education Center, Thailand (Presenter)
- Chawalit Chayangsu, Surin Medical Education Center, Thailand
- Praphan Yodnopaklow, Surin Medical Education Center, Thailand

ABSTRACT

Background: Formal patient history taking without critical thinking may contribute to diagnostic error. We developed Osler techniques by reviewing practical wisdoms from old-school master clinicians. Techniques consist of “walking through event” “perceptual memory” “retrospective physical examination” “the power of patient own words” and “human reaction to disease”. The aim of this study is to evaluate the perception of medical students to use Osler techniques.

Summary of Work: Fourth year medical students learned Osler techniques as a part of critical thinking program during clinical year. After one year practicing Osler technique parallel with formal history taking, the questionnaire was used to evaluate the perception of students.

Summary of Results: Twenty-seven medical students responded to the questionnaire. The “retrospective physical examination” and “walking through event” were two most understanding by students 64.7% and 62.5% respectively, three-fourths misunderstood “the power of patient own words” “human reaction to disease” and only 1.7% of them understood “perceptual memory”. However, seventy-four percent of medical students agree that patient history taking with Osler technique should reduce diagnostic error and enhanced critical thinking skill.

Discussion and Conclusions: Most of medical students know five Osler techniques but they understand and properly use with two techniques. Like other learning skills, students need understanding and deliberate practice of these techniques by feedback and assessment. Overall, they understand more about the important of listening to patients for making correct diagnosis. Teaching Osler techniques should be included in the critical thinking program.

Take-home Messages: Teaching Osler technique may help critical patient data gathering and reducing diagnostic error.

The development of clinical thinking in junior doctors

AUTHOR(S):

- Rachel Locke, University of Winchester, UK (Presenter)
- Alice Mason, Health Education England through Wessex, UK
- Colin Coles, University of Winchester, UK
- Rosie Luszkat, University of Winchester, UK
- Mike Masding, Health Education England through Wessex, UK

ABSTRACT

Background: Currently we have limited knowledge about the contextual factors which serve to best develop clinical thinking amongst postgraduate medical trainees. This study explores how Foundation doctors acquire the capability to think appropriately so as to practise effectively in a clinical setting. It considers three specialities in particular, namely Emergency Medicine, General Practice, and Psychiatry, as these have been shown previously to report active engagement with their seniors regarding 'clinical thinking'. Two main research questions are: 1. Do Foundation doctors working in the three clinical fields already identified develop their clinical thinking more than elsewhere? 2. What are the factors in placements that appear to be associated with this development?

Summary of Work: The research is located within the 'non-positivist' paradigm (Golby & Parrott, 1999). The experiences of nineteen educators have been captured for the purposes of this study via in-depth research interviews. Rich qualitative data derived from the interview transcripts have been analysed thematically in a rigorous and iterative process.

Summary of Results: Preliminary findings suggest the importance of community (of trainers and of trainees, as well as the workplaces), collegiality (we are all still learning, and we are learning together; we are fallible, its about dealing with uncertainty), and criticality (we encourage trainees to look at their own practice, as we look at our own, we discuss cases between ourselves, its about risk).

Discussion and Conclusions: The mind-set of the people who work in the identified specialties is one that embraces (and enacts) what may be considered as educational ways of thinking and being. Factors that appear to be associated with the development of clinical thinking include a close proximity between the Foundation doctor and their senior(s) and the creation of a safe trajectory to independence by the educators for Foundation doctors.

Take-home Messages: The 'context' in which a medical trainee learns is crucial to what is learnt and how it is learnt. (2) Much of this learning happens naturally within the learner's everyday working environment. (3) There needs to be a culture supportive to learning, and educators have a significant role in reinforcing and sustaining that culture.

Engaging medical students in reflective practice - can we do it better?

AUTHOR(S):

- **Mariam Koronfel, King's College London, UK (Presenter)**
- Afra Jiwa, Kings College London, UK
- Edward Fenby, Kings College London, UK
- Eugene Ace McDermott, Kings College London, UK

ABSTRACT

Background: The importance of reflective practice for health professionals has been frequently reported in literature with most medical schools now incorporating learning modules that encourage undergraduate student participation in the process of reflection. However, various barriers to effectively teaching reflective practice have emerged with the authenticity of the exercise depending on aspects such as its incorporation in the education programme and its relevance to the needs of the student at the time.

Summary of Work: A primary literature search of peer-reviewed articles on PUBMED and MEDLINE was conducted to assess current research on reflective practice in the medical curriculum and the barriers that have been identified. A secondary search was carried out to identify the most effective ways in incorporating reflective practice in the medical curriculum.

Summary of Results: Engaging medical students in reflective practice has been shown to promote deep learning, improve core medical knowledge and enhance academic performance in social and community medicine. It has also been suggested that it can better improve relationships both with patients, as well as, between student and supervisor. However, establishing relevance of the reflective exercise, teaching learners about reflection, and assessment and feedback of reflections have been identified as the key factors preventing students from effectively engaging in reflective practice and reaping the associated learning and development opportunities embedded in the curriculum.

Discussion and Conclusions: Intended effort needs to be carried out to deeply embed reflective practice in the learning medical programme, as well as the wider medical practice. Crucial steps for this to be achieved include, supervisors embodying and modelling reflective practice, learn about guided reflection for undergraduates and how to assess reflection. The need for a standard tool to evaluate the current methods of assessment of reflection as well as set a framework for effective reflective practice is paramount in valuing and embedding this important skill in tomorrow's doctors.

Take-home Messages: A standardised framework of incorporating reflective practice into the medical curriculum should be used in order to effectively teach and demonstrate reflective practice.

Colleague Supervision of Research Degree Studies as Professional Development

AUTHOR(S):

- Linda Crane, Bond University, Australia (Presenter)
- Gary Hamlin, Bond University, Australia

ABSTRACT

Background: Over recent years there has been increasing attention to postgraduate student experience including the experiences of research students. A major element of this focus has been to improve supervisory experience and training. Coincident with this focus has been an increase in expectations of universities with respect to academic staff members possessing research higher degree qualifications - increasingly health professionals joining academe are required/choose to enroll in a PhD as professional development for their academic role. The experiences of academics undertaking PhD research programs and the PhD qualified academics who supervise their colleagues (colleague supervision) is an important dynamic which warrants further understanding.

Summary of Work: The work distills findings from multiple sources including: (i) an Australian Government Department of Education and Training, National Strategic Priority Project, which explored good practice in postgraduate education from perspectives of educators and students; and (ii) a pilot program supporting a small number of early career professionally qualified academics who through their own agency sought out mentoring whilst enrolled in a higher degree by research.

Summary of Results: A range of strategies to support good practice in colleague supervision are described within the broad areas of: (i) strengthening links between academia and industry; (ii) ensuring human resource and performance management/development policies are appropriate; (iii) developing innovative models of supervision and student support that support colleague supervision situations; (iv) development of self-identity and self-management strategies for individuals in a colleague supervisor situation.

Discussion and Conclusions: The dynamics between individuals in colleague supervision situations can be complex and require proactive strategies to maximize success for the student and supervisor(s). Development of these strategies across all levels from individual to institutional and involving industry partners external to academia will enhance the experience during candidature, outcomes for completion and future research success.

Take-home Messages: Colleague supervision is an important, and growing component of good supervisory practice. Greater attention to supporting those in these relationships can maximize the benefits for the individuals, academia and industry partners.

Fostering residency research skills through a multi-mentoring system

AUTHOR(S):

- Jirawat Moolasart, Sanpasitthiprasong Hospital, Thailand (Presenter)
- Parinya Chamnan, Sanpasitthiprasong Hospital, Thailand
- Piyawadee Wuttikonsammakit, Sanpasitthiprasong Hospital, Thailand
- Saranya Prathaithep, Sanpasitthiprasong Hospital, Thailand
- Orathai Srisawang, Sanpasitthiprasong Hospital, Thailand

ABSTRACT

Background: Research is an important part of residency training. Learning how to do research has traditionally been through working with a single clinical supervisor, which may not be adequately comprehensive. A new system based on simultaneous integrated consultation by a multidisciplinary team of supervisors called 'Multi-mentoring system for residency research' has been initiated for Sanpasitthiprasong residency training program since 2013. This study aimed to describe outputs and outcomes of this new approach to mentoring residency research.

Summary of Work: The multi-mentoring system for residency research at Sanpasitthiprasong Teaching Hospital was run by a multidisciplinary team of multiple supervisors with different expertise, from clinicians, research scientists to epidemiologists. This on-the-job training which included regular pre-scheduled consultation sessions provided residents opportunities to develop essential research skills alongside the progress of their research from setting a research question and proposal development to conducting and reporting research, all of which were closely and simultaneously supported and monitored by multiple advisors. We described research outputs in terms of the number of projects over 5 years, study designs, presentation at scientific conferences and successful peer-reviewed publications.

Summary of Results: Over 5 years, there was a steady growth in the number of residents participating in the multi-mentoring system from 3 in 2013 to 15 in 2018, with a total of 42 residency research projects from five major clinical specialties and two minor specialties. The large majority of the residency researches were observational analytical studies (n=26), mainly retrospective cohort based on medical records review, followed by 10 descriptive studies and 6 randomized control trials. All residents reported high satisfaction toward this new mentoring system. 28 (66.7%) researches were presented at national level scientific meetings, while only 4 (9.5%) researches were published in peer-reviewed journals.

Discussion and Conclusions: This innovative approach to mentoring residency research was effective to enhance residency research skills and research outputs with satisfactory quality designs. However, strategies to facilitate more peer-reviewed publications from residency research are needed.

Take-home Messages: Learning research skills through working with a multidisciplinary team is effective.

U.S. MD-PhD program graduates' engagement in research: Results of a national study

AUTHOR(S):

- **Dorothy Andriole, Association of American Medical Colleges, USA (Presenter)**
- Douglas Grbic, Association of American Medical Colleges, USA
- Jodi Yellin, Association of American Medical Colleges, USA
- Ross McKinney, Association of American Medical Colleges, USA

ABSTRACT

Background: As MD-PhD joint-degree-program graduates enter an increasingly broad range of specialties, we sought to determine if MD-PhD graduates' early-to-mid-career research engagement differed by specialty.

Summary of Work: Using a database of individualized records of U.S. medical-school MD-PhD graduates' responses to the 2015 Association of American Medical Colleges (AAMC) national MD-PhD program graduates' survey and selected data from the AAMC's Graduation Questionnaire, Student Records System and Graduate Medical Education (GME) Track, we tested a set of demographic and professional-development variables in logistic regression, identifying predictors of research (vs. no research) engagement among all graduates and in linear regression, identifying predictors of % time in research among graduates engaged in research.

Summary of Results: Of 3,297 1991-2010 MD-PhD graduates no longer in GME, 78% (2,572/3,297) reported research engagement. Research-related (vs. clinical practice) career intention at graduation (adjusted odds ratio [AOR]=2.98, 95% confidence interval [CI]=2.12-4.20), ≥1 year(s)-GME-research participation (AOR=2.52, 95% CI=2.00-3.18) and neurology specialty (vs. internal medicine [IM], AOR=1.52, 95% CI=1.62-3.91) predicted a greater likelihood, whereas female gender (AOR=0.80, 95% CI=0.66-0.97) and dermatology specialty (vs. IM, AOR=0.34, 95% CI=0.23-0.52) predicted a lower likelihood, of research engagement. Among 2,572 graduates engaged in research, mean % research time was 49.94%. In linear regression, ≥1 year(s)-GME-research participation (Beta-coefficient [β]=8.50, $p < .01$, equating to an estimated 8.5 percentage point difference) predicted a higher %, whereas female gender (β =-4.84, $p < .01$) and (each $p < .01$ vs. IM) dermatology (β =-14.74), diagnostic radiology (β =-32.77) and surgery (β =-28.97) specialties (among others) predicted a lower %, research time.

Discussion and Conclusions: Most MD-PhD graduates were engaged in research, but extent varied considerably by specialty. IM and neurology departmental approaches to supporting physician-scientists' research engagement may serve as "best practices" examples. Career-planning during medical school and substantive GME-research participation may promote MD-PhD graduates' early-to-mid-career research engagement. Female gender independently predicted a lower likelihood, and a lesser extent, of research engagement.

Take-home Messages: Strategies to promote greater participation in research are needed for MD-PhD graduates in specialties beyond "traditional" MD-PhD specialties (neurology, IM, pediatrics, pathology). The gender gap we observed in MD-PhD graduates' retention in the research workforce beyond training completion warrants further investigation.

Gender helps regulate internship GPA grades and 360-degree assessment in PGY-1 training: A preliminary study at an Army medical center

AUTHOR(S):

- Ying-Chen Chen, Department of Pediatrics, Tri-Service General Hospital, National Defense Medical Center, Taiwan (Presenter)
- En Chao, Department of Health Promotion and Health Education, National Taiwan Normal University, Taiwan
- Shu-Ling Hwang, Center for General Education, National Defense Medical Center, Taiwan
- Tony Szu-Hsien Lee, Department of Health Promotion and Health Education, National Taiwan Normal University, Taiwan
- Jin-Shuen Chen, Department of General Medicine, Tri-Service General Hospital, Taiwan
- Chun-Chi Lu, Department of Internal Medicine, Tri-Service General Hospital, Taiwan

ABSTRACT

Background: Gender bias in evaluations of Postgraduate Year One (PGY-1) competency was rarely inspected in army. 360-degree feedback allows PGY faculties accurately assess communication skills in addition to direct observation of procedural skills, in-training examination, mini-clinical evaluation exercise, the six core competencies, and case-based discussion. We aimed to analyze whether gender influences scoring systems of PGY-1 at a military hospital, where male physicians and female registered nurses (RNs) are extremely predominant respectively.

Summary of Work: A 7-year retrospective study was collected through 2012 to 2018, including seven cohorts of PGY-1 residents. Comments were collected at departments of internal medical, surgery, gynecology, pediatric and emergency medicine. Multiple regression analysis was used to determine how RNs and attending physicians evaluated PGY-1 residents, especially in the 360-degree assessment.

Summary of Results: Female or male PGY-1 residents who had higher grade point average (GPA) scales either in internship or medical school also had better performance in PGY-1. Using gender as a moderator, there is a stronger interaction in female PGY-1 residents between grades of internship GPA and of 360-degree assessment evaluated by RNs (gender: $p = 0.024$; internship GPA: $p < 0.001$; interaction: $p = 0.024$; regression coefficient: female B of 2.431, $p < 0.001$; male B of 0.675, $p < 0.001$). We did not identify an interaction between internship GPA and 360-degree assessment ranked from male attending physicians when using the gender as a moderator.

Discussion and Conclusions: Gender of PGY faculties did not influence consistency of high-ranking performance of female students at medical school, internship and PGY-1 training at a conservative army medical center. The doctor-nurse relationship did not contribute to traditionally defined gender bias when female residents were inspected by female predominant RNs. Considering changed gender distribution of students and faculties, defining how gender delicately regulates PGY-1 residents' communication and interpersonal relationship with faculties and colleagues of the same and opposite gender is warranted at a conservative system.

Take-home Messages: Well trained PGY faculties have endeavored to provide students with consistent feedback and help guard against gender bias in their perceptions of residents' capabilities at a conservative medical center.

Challenge or opportunity: The importance of women in orthopedics

AUTHOR(S):

- Tatjana Topalovic, AO Foundation, USA (Presenter)
- Amy Kapatkin, University of California-Davis, USA

ABSTRACT

Background: Based on an identified gap of diverse leadership, within and beyond the AO Foundation (a medically guided, not-for-profit organization led by an international group of surgeons specialized in treatment of trauma and disorders of the musculoskeletal system), research was initiated to identify and overcome barriers, to promote diversity with a first focus on female leadership within the organization.

% of women holding faculty roles in the AO Foundation: f:~10% / m:~90%;

% of women holding governance and leadership roles in the AO Foundation: f:~4% / m:~96%;

% of women in orthopaedics (AAOS);

2012 Undergraduates: f: 58% m: 42%;

2014 Medical students: f: 47% m: 53%;

2014 Orthopaedic residents: f: 14% m: 86%;

% of women in surgical residency programs (USA 2014 Graduate Medical Education): 13.7% Orthopaedics; 15.9% Neurosurgery; 22.7% Urology; 24.7% Plastic surgery; 37.5% General surgery ;38.6% Colo-rectal surgery.

Summary of Work: The AO Foundation, a global education provider in the health sector, collected quantitative data which shows a lack of women holding faculty, governance and leadership roles, within the organization. Based on this identified gap using qualitative data, quantitative data continues to be collected for further identification and analysis of barriers and how to overcome these to promote diverse leadership within the organization.

Summary of Results: Research shows that diverse groups are more creative and effective in problem solving, making an organization more resilient and adaptable; leading to benefits in research and innovation, and increased funding opportunities leading to improved patient health care. Seeking to increase diversity and women in orthopedics, AO continues to collect data.

Discussion and Conclusions: What can AO do to change the existing culture? People in leadership positions serving as role models Expand data collection focusing on other diversities currently difficult to access Educate and motivate to create new behavior addressing peoples mindsets, scope and awareness (Ross, 2011).

Take-home Messages: AO is actively seeking to create a paradigm shift, increasing diversity and women in orthopedics. Identifying the diversity gap, and its barriers, leads to concrete steps to be developed and implement-ed to address the identified gap. This will allow people and organizations to transform, approaching diversity on a comprehensive rather than an event-based approach.

From scaffolding to moulding in postgraduate medical training: A conceptual model for trainee-centered teaching

AUTHOR(S):

- Hadeil Morsi, Oxford University Hospitals, UK (Presenter)

ABSTRACT

Background: One of the grounding theories for Student-centred teaching is The Zone of proximal development which highlighted the unique learning potential for each student and the dynamic nature of this zone. Assessing this individual zone and supporting the trainee accordingly is the first pillar of scaffolding. The other two pillars are decreasing this level of support and handingover the regulation of learning to the student.

Summary of Work: Here I examined how well is scaffolding is applied in postgraduate medical training and more importantly if it is fit for purpose. A literature review of postgraduate medical training using the keywords scaffolding, assisted performance, zone of proximal development and cognitive apprenticeship model was conducted

Summary of Results: In summary the research on scaffolding in medical training was scarce and mainly in undergraduate teaching. Scaffolding was used interchangeably for supporting, without evidence of tailoring this support to the level of student. If dynamic scaffolding was offered, the focus was on the cognitive outcome only. More importantly, the decision on what is proximal enough for the student and when to handover the responsibility was directed by the teacher only without involvement of trainee.

Discussion and Conclusions: In summary, scaffolding in its full concept is not applied and further training of trainers is essential to implement it in postgraduate training. Nevertheless, there is a scope for revisiting the concept developed initially in children's language learning to fit trainee as adult learners, as they demand more autonomy and orientation. I propose a model where the trainee help the trainer in setting his educational zone. This zone encompasses the depth i.e complexity and breadth i.e. emotional and social aspects in addition to cognitive.

Take-home Messages: The best model is amending the CBD forms on eportfolio to involve what the trainee want to achieve, which aspect as alongside the trainer assessment. Pilot assessment of this model from a sample of trainees and trainer will follow.

Resistance, criticism, and solutions to the education online seminar

AUTHOR(S):

- **Olivia Espinosa-Vazquez, Facultad de Medicina, Universidad Nacional Autonoma de Mexico, Mexico (Presenter)**
- José Halabe-Cherem, Facultad de Medicina, Universidad Nacional Autonoma de Mexico, Mexico
- Gerard Heinze-Martin, Facultad de Medicina, Universidad Nacional Autonoma de Mexico, Mexico
- Liz Hamui-Sutton, Facultad de Medicina, Universidad Nacional Autonoma de Mexico, Mexico
- Angelica Licon-Villa, Facultad de Medicina, Universidad Nacional Autonoma de Mexico, Mexico
- German Fajardo-Dolci, Facultad de Medicina, Universidad Nacional Autonoma de Mexico, Mexico

ABSTRACT

Background: The online Medical Education Seminar (SemEdu, by its acronym in Spanish) is one of the four academic activities in the Unique Program of Medical Specialties. Is directed to 10,151 residents of 77 medical specialties in Mexico. The 7 units in the program develop several didactic activities centered on teacher training in clinical scenarios. SemEdu is a self-management platform, takes 40 hours, and may be completed in 3 months. The aim of this study was to identify the resistances and critics about the seminar and to present the implemented solutions.

Summary of Work: Quantitative and qualitative information was analyzed from the final satisfaction survey included in the seminar, in order to identify the reactions (first level of the evaluation scale of training programs from Kirkpatrick's model) of medical residents about this new educational proposal.

Summary of Results: About 3581 residents completed the seminar between July and December, 2018; 2144 of them answered the survey. 81.9% expressed that the platform's access and management were accessible; 79.4% considered the contents useful and understandable; 84.8% thought that evaluations were coherent and sufficient; finally, 74.5% reported that the length of each unit was adequate. The resistances and critics were identify from the free comments. Among the most frequent, medical residents mentioned: a) the thematic content was not applicable to their specialty context, b) the evaluations only required memory, c) time to complete the seminar was excessive, and d) there were countless didactic resources used. The implemented solutions were: a) diversify the examples in order to resemble several clinical contexts; b) verify the evaluation items using the online cognitive tasks model; c) adjust time by reducing readings and synthesizing contents; d) revise didactic resources and exercises in order to keep only those that integrate knowledge and practice, and could be applied.

Discussion and Conclusions: Teacher training is marginally promoted in a formal manner, even though it's part of the curriculum. Including this online seminar as a self-regulated activity compels the residents to reflect and practice medical education aspects.

Take-home Messages: Educational medical programs for residents must be concrete, simple and applicable to learning situations in clinical contexts.

Influence of Artificial Intelligence on Medical Postgraduates: A Multi-center Survey Study

AUTHOR(S):

- **Patranit Nuntasilapachai, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand (Presenter)**
- Pimpnipa Chaimongkonrojna, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand
- Nutnicha Pattanadee, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand
- Kullawan Chaichareonpong, Department of Family Medicine, King Prajadhipok Memorial Hospital, Chanthaburi, Thailand
- Jathurong Kittrakulrat, Khlung Hospital, Chanthaburi, Thailand

ABSTRACT

Background: Recently, artificial intelligence (AI) has been widely introduced into medicine. Although several studies have surveyed the impact of AI on medical students, the evidence regarding postgraduates' attitudes on AI is still lacking. This study aims to assess the perspectives regarding to impacts of AI on medical postgraduates after they have gained more experiences from their practice.

Summary of Work: An internet-based questionnaire consisting of demographic data, interested medical fields and various perspectives on AI was designed. In December 2018, these online surveys were distributed to medical postgraduates from sixteen medical schools in Thailand.

Summary of Results: Of all 66 respondents, 15 postgraduates (22.7%) declared internal medicine as the first choice of specialty. The second and third choices were surgery and paediatrics consecutively. Over one-third of them (37.8%) were familiar with AI, while only 4.5% did not know about AI. 32 general practitioners (48.5%) considered that AI would become a part of clinical practice especially in the role of disease screening. Of all respondents, 40.9% stated that medical specialists would not be replaced by AI, 54.6% considered AI as a new challenge for their medical training, and 73.9% of postgraduates insisted that AI developments would not change their choices of specialties.

Discussion and Conclusions: Although the development of AI would revolutionize medicine in the foreseeable future, this advanced technology might not affect medical postgraduates' preference on their choices of specialties. This might be explained by that the majority of them considered AI as assistance instead of substitution.

Take-home Messages: Most postgraduates did not consider AI in medicine as a threat but as assistance.

Medical trainees' professional identity formation and experiences in the community of practice

AUTHOR(S):

- Masami Tagawa, Kagoshima University, Center for Innovation in Medical and Dental Education, Japan (Presenter)

ABSTRACT

Background: The ultimate goal of medical education for medical trainees is professional identity formation (PIF), of which, socialization in the community of practice is an important process. Based on Kegan's human development model, the author developed multiple instruments to evaluate personal development and socialization as a physician, as well as PIF stage-specific attributes. Survey data from these scales were then used to investigate the PIF process among medical trainees.

Summary of Work: To reveal medical trainees' PIF process and promoting factors, sixth-year medical students and second-year residents at Kagoshima University responded to a questionnaire survey from 2016 to 2018 composed of PIF scales and items regarding their experiences during clinical training, such as whether they were acknowledged as a physician by patients and families, whether instructors and health professionals responded to them respectfully, and whether they had role models and effective mentoring. The medical trainees' scale scores and experiences were then analyzed to identify significant factors for PIF.

Summary of Results: Response data from 186 sixth-year medical students and 46 second-year residents indicated that acknowledgement as a physician by patients and families and respectful responses from instructors were significantly correlated with overall PIF scores. In addition, significant correlations were observed between these experiences and medical students' stage 3 and residents' stage 4 scores. The existence of a role model was weakly correlated with stage scores, but no significant correlation with gender was observed for any PIF score.

Discussion and Conclusions: Analysis using scales evaluating the overall degree of PIF and different stage-specific attributes indicated that medical trainees' professional role experiences in clinical practice were important for their PIF. These experiences were related to socialization (stage 3 attributes) among medical students and independence (stage 4 attributes) among residents. These findings suggest that being viewed as playing an authentic professional role by patients and staff promotes PIF among medical students and residents.

Take-home Messages: These findings suggest that PIF among medical trainees can be analyzed quantitatively and that the formation of a professional relationship with patients, instructors, and health professionals in the community of practice is a promoting factor.

Incorporating training of nursing staff into hospice care in the nursing home: a short course

AUTHOR(S):

- Chih-Pang Chu, Department of Psychosomatic Medicine, Taipei City Hospital, Songde Branch, Taipei, Taiwan (Presenter)
- Hsing-Cheng Liu, Department of General Psychiatry, Taipei City Hospital, Songde Branch, Taiwan
- Hsiu-Ching Chen, Department of Nursing, Taipei City Hospital, Songde Branch, Taiwan
- Ting-Fang Chiu, Department of Teaching and Research, Taipei City Hospital, Taiwan
- Lin-Yang Chi, Department of Teaching and Research, Taipei City Hospital, Taiwan
- Da-Chen Chu, Department of Teaching and Research, Taipei City Hospital, Taiwan

ABSTRACT

Background: Since 2015, Taipei City hospital, Songde branch has initiated a hospice care program in the nursing home. By the same time, a one-day rotation for hospice care was held in the same place as part of our two-year post graduate training for nurses (N-PGY2). The aim of this program was to enhance their idea about hospice care.

Summary of Work: Between 2015 and 2018, 52 post graduate nurses participated in the rotation. After brief introduction of the basic idea of hospice care, they followed our hospice team to visit the enrolled patients (~15) and evaluate candidates for hospice in the nursing home. They join our case discussion, decision making and family meeting. The medical rounds were followed by practicing nursing care on our enrolled patients with experienced nurses, including nasogastric and foley change, skin care and manual oral feeding. Narrative feedback was requested from each of the participants about what they have learned. The results were based on the analysis of their feedback.

Summary of Results: In the feedback of the participants, 39(75%) nurses felt positive about the hospice program. 37(71.1%) thought our team very helpful to the inhabitants of the nursing home. 19(36.5%) were impressed by the condition of the institutional patients. 16(30.8%) mentioned the difference between hospital and nursing home. 15(28.8%) considered hospice program on their family and themselves in the future. 9(17.3%) thought the experience affecting their career positively.

Discussion and Conclusions: Although the duration of the course is short, the participants followed our hospice teamwork intimately and had close contact to patients in hospice care. The experience made them think positive about the hospice program and had good effect on their career. The nursing homes can be a good place for learning about end-of-life care.

Take-home Messages: The nursing homes can be a good place for learning about end-of-life care.

Becoming the Medical Registrar - Addressing the Unmet Needs

AUTHOR(S):

- **Caroline Ming, King's College Hospital/King's College London, UK (Presenter)**
- Ambika Nedungadi, Kings College Hospital NHS trust, UK
- Barnaby Hirons, Kings College Hospital NHS Trust, UK
- Abubakar Khan, Kings College Hospital NHS Trust, UK
- Benjamin Clarke, Kings College Hospital NHS Trust, UK
- Ewa Zatyka, Kings College Hospital NHS Trust, UK

ABSTRACT

Background: The Medical Registrar role is traditionally perceived as challenging. In recent years, trainee satisfaction has declined, and specialty recruitment has been disappointing with trainees seeking alternative career paths. The Royal College of Physicians has suggested improvements to address this, and the new Internal Medicine (IMT) curriculum will commence in August 2019. However, the key issues driving trainees away from this role require sufficient understanding in order to be addressed appropriately. Burnout and low morale are prevalent in post-graduate training. There is a lack of focus on managing mental well-being, which is not a mandatory component within Core Medical Training (CMT) or IMT. Our aim is to improve trainee experience and support their educational needs with an emphasis on non-clinical skills.

Summary of Work: Core Medical Trainees at King's College Hospital NHS Trust completed a questionnaire to gain insight into their current job satisfaction, perceptions of training, confidence, and career prospects. We sought their views on how prepared they felt to become a Medical Registrar. 25 trainees completed the survey. Using this information, an educational programme including workshops, lectures and simulation was designed to address these areas of need. Feedback from trainees post implementation will be attained within 6 months.

Summary of Results: 12/25 (48%) trainees planned to apply for specialty training. 13/25 (52%) trainees were unsure of their plans, taking career breaks or changing training pathways. The key themes causing apprehensions about the Medical Registrar role were: • Taking referrals/ giving advice • Leadership/ team management • Prioritisation/ decision making • Confidence managing acutely unwell patients • Burnout/stress Post-course feedback will be attained in due course.

Discussion and Conclusions: The need for this innovative programme was evident. Our aim is to support medical trainees in building confidence, to enable a less stressful transition to 'becoming the Medical Registrar' and challenge this overall unfavourable perception of the role. Initial feedback has been extremely positive and we are using this to further shape the course and aspire to incorporate this as a mandatory component of IMT when this begins.

Take-home Messages: Trainees remain significantly apprehensive in becoming the Medical Registrar. Our programme aims to address the key themes contributing to this.

#5NN Conference Workshop

Location of Workshop: Suite E, Level 0

askAMEE: Using technology to support evidence-informed teaching practice

PRESENTER(S):

- Claire MacRae, AMEE, UK
- Trevor Gibbs, AMEE, UK
- Louise Russell, AMEE, UK

ABSTRACT

Background: This workshop explores how we access and use research findings to inform our day-to-day teaching practice. Technological developments have allowed us instant access to an overwhelming amount of knowledge, but how do we make decisions about what knowledge is useful and how it could be incorporated in our practices? askAMEE is a tool developed by AMEE to support this decision making process, and following a successful pilot we are aiming to develop the project further.

Who should attend: Anyone who struggles to keep up to date with the huge volume of medical education research. It will be particularly relevant to anyone who is interested in contributing to the future development of askAMEE.

Structure of workshop: The workshop will give participants the opportunity to reflect on questions such as ‘What is evidence?’; ‘How do you use evidence in your teaching practice?’; ‘How much evidence is required before you will consider changing your practice?’; ‘Who gets to decide what constitutes ‘evidence?’’

Participants will be encouraged to compare ‘evidence’ in biomedical and educational sciences, to discuss the quality of available evidence-based resources available to health professions educators and to consider the relationship between the quality of evidence and the strength of the resulting recommendations. We will move on to showcase askAMEE as a tool to support educators and ask participants to consider how technology can support the development of evidence-informed practice. Participants will have the opportunity to contribute to askAMEE’s next phase of development and those who are interested can sign up to our beta-testing programme.

Intended Outcomes: By the end of this workshop, participants should be able to:

- Describe the different types of evidence available to medical educators
- Explain ‘proxy’ measures of quality and consider their impact on practice
- Evaluate evidence in terms of ‘practical adequacy’ in addition to the more commonly used standards of validity, reliability and generalisability
- Discuss the benefits and limitations of technology in supporting evidence-informed approaches to teaching
- Contribute to the future development of AMEE’s newest initiative

A Call to Action: Patients as Partners in Healthcare Professions Education and Practice

Susan E. Sheridan (Society to Improve Diagnosis in Medicine (SIDM), USA) and Suzanne Schrandt (Arthritis Foundation, USA)

Summary: The Patients as Educators special theme plenary at the 2019 AMEE conference will be jointly delivered by two international patient leaders and will capitalise on the current momentum and emerging reports from medical educators that patient involvement as co-designers of medical education increases the relevance, legitimacy, and effectiveness of medical education and motivates powerful and lasting change in learners. The plenary co-presenters will provide a high level overview of innovative initiatives that are engaging patients as co-designers in all aspects of the healthcare ecosystem to achieve better health outcomes. It will focus on the critical role patient-partners can play in training clinicians to appropriately diagnosis and co-manage medical conditions by offering the rationale and benefit of this approach as well as case studies of successful patient-engaged clinical training initiatives. Evidence of the impact and benefit of each initiative will also be presented.

Suzanne Schrandt, JD, is the Director of Patient Engagement at the Arthritis Foundation. In this role, she develops and leads the Foundation's Patient Engagement strategy, working to infuse the wisdom and lived experience of patients into clinical research, drug and device development, and many other activities within the healthcare system. Previously Schrandt served for nearly four years as the Deputy Directory of Patient Engagement for the Patient-Centered Outcomes Research Institute (PCORI). While at PCORI, she helped to create and implement several key patient engagement initiatives including the Engagement Rubric, the concept of Engagement Officers, and the Pipeline to Proposal awards program. From the time of her diagnosis 27 years ago with polyarticular juvenile idiopathic arthritis, Schrandt has advocated on behalf of children and adults with arthritis and has been engaged in numerous patient and provider education initiatives aimed at increasing early diagnosis and appropriate, patient-centered management of chronic disease. Before joining PCORI, Schrandt served as the Health Reform Strategy Team Leader for the Kansas Health Institute, where she educated the state's policymakers, providers, and consumers on the implications of the Affordable Care Act.

Susan E. Sheridan, MIM, MBA, DHL, currently serves as the Director of Patient Engagement for the Society to Improve Diagnosis in Medicine (SIDM) where she spearheads efforts to ensure that the patient and family perspective informs all facets of SIDM's work to improve diagnostic accuracy and timeliness while reducing harm caused by diagnostic errors. She recently served as the Patient and Family Engagement Adviser in the Center for Clinical Standards and Quality at the Centers of Medicare and Medicaid (CMS) where she developed strategies and processes to integrate CMS's newly launched Person and Family Engagement Strategy throughout the CMS community. Previous to her joining CMS, Sheridan served as the Director of Patient Engagement of the Patient-Centered Outcomes Research Institute (PCORI) from 2012-2016 where she was responsible for creating networks and engaging patients across the nation to provide broad-based input on the development and execution of PCORI's research. She also was responsible for concept development and implementation of patient engagement related programs and processes at PCORI. In 2003, Sheridan co-founded Consumers Advancing Patient Safety, a non-profit organisation that seeks a safe, compassionate and just healthcare system through proactive partnership between consumers and providers of care. Sheridan served at President of CAPS from 2003-2010. Sheridan was asked to lead the World Health Organization's Patients for Patient Safety initiative, a program under the WHO Patient Safety Program who embraces the collective wisdom of the patient, patient empowerment and safe, patient-centered care. Sheridan served as Program Lead from 2004-2011.

#7A Symposia

Date of Presentation: Tuesday, 27 August 2019

Time of Presentation: 1015-1200

Location of Presentation: Hall A, Level 2

Expanding the Role of Patients as Partners in Education

Presenters:

- Janusz Janczukowicz, Medical University of Lodz, Poland
- Robina Shah, University of Manchester, UK
- Subha Ramani, Harvard Medical School, USA
- Neil Johnson, National Institute for Preventive Cardiology, Ireland
- Jools Symons, University of Leeds, UK

Summary of theme and why it is important: The passive role of patients in the education of health professionals is being reimagined in the context of a greater global focus on patient-centred care and patient safety. This symposium will explore a more active engagement of patients and their caregivers in instruction, development and assessment of professional qualities. The theoretical and research base underpinning an augmented patient-educator role will be discussed and existing models of practice in various countries considered. Patients as partners in health professions education is a novel area of research enquiry and the assembled speakers will propose unmet research questions and practice needs for an evolving healthcare system. A broad involvement of patients in education will be discussed, including an expanded role for patients in curricular design, student selection, student remediation, medical education research design, and health literacy. The speakers are engaged on multiple levels with patient and public involvement in education and share a passion for the translation of a deeper patient-educator role into improved care for patients and their family caregivers.

Who should participate in the symposium? This symposium would interest any patient, family caregiver, faculty, clinician, student or administrator who has an interest in cultivating a deeper and more meaningful involvement of patients as educational partners.

What will they gain from participating? By the end of the session, participants will be able to:

- Reflect on the benefits of a deeper engagement of patients and their caregivers in undergraduate and postgraduate health professions curricula.
- Identify aspects of their own educational practice which would be enhanced by facilitating an expanded role for patients as health professions educators.
- Critically appraise the published literature and examples of best practice in relation to patient involvement in the governance, development and delivery of educational programmes.

#7B Symposia

Date of Presentation: Tuesday, 27 August 2019

Time of Presentation: 1015-1200

Location of Presentation: Hall C, Level 2

Understanding student behaviour: The role of digital data

Presenters:

- Jennifer Hallam, Leeds Institute of Medical Education, University of Leeds, UK
- Martin V Pusic, NYU Langone Health, USA
- Stephanie Clota, ModMed, Australia
- Marie-Christine Rousset, Université de Grenoble-Alpes, France
- Fabrice Jouanot, Université de Grenoble-Alpes, France
- Tamsin Treasure-Jones, Leeds Institute of Medical Education, University of Leeds, UK

Summary of theme and why it is important: With the advent of more ‘just in time’ technology in medical education, it presents us with the opportunity to capture more digital data about student and trainee behaviour in relation to formative and summative assessments, the use of knowledge resources and consequently determine the impact of teaching and curriculum on student outcomes. With the abundance of data that we can collect about student behaviour, together with the availability of tools for automatic processing, educational institutions have exciting opportunities to innovate. However, institutions are often faced with the daunting task of exploring this voluminous data and not knowing where to begin, what information to capture and what pedagogy to apply. How can we explore this readily available data to better understand student behaviour and thus appropriately refine health professions education?

This symposium will present original thoughts and visions of the use of digital data in order to understand learner behaviour at scale. Alternate ways of how this data can be explored, as an effective learning and assessment resource, will be discussed based on examples from University level (undergraduate and postgraduate) medical education activities. The speakers approach the gathering and exploration of digital data in different ways and employ multiple theoretical and pedagogical perspectives. This symposium will explore these different approaches such as:

- Adoption of self determination and self-regulation theories
- Ontology based learning analytics
- Intervention development (e.g. behavioural nudges)
- Innovation of curriculum and assessment
- Analytical methods in trainees professional development to personalise CPD opportunities

It will also offer insights into research directions in this area.

Who should participate in the symposium? This symposium will be beneficial to all colleagues from within the health professions education community who have an interest in adopting innovative techniques to explore digital data in order to understand and explore student data in detail. It would also be beneficial for those who would like to learn more about utilizing the techniques in their research/ teaching, specifically for innovation within the curriculum. Those who are involved in policy making for health professions education programs would also be encouraged to participate.

What will they gain from participating? Participants in the symposium will gain a better insight into the different techniques and approaches that have been used to explore digital data to understand behaviour in order to optimise learner outcomes, improve decision making and organisational efficiencies. A variety of different approaches and theoretical models have been adopted by the speakers so participants will gain a better understanding of the philosophy behind the approaches used and how they can apply them to their own data.

Transformative Learning: A pedagogy for the health professions

Presenters:

- David Davies, Warwick Medical School, United Kingdom
- Jennene Greenhill, Flinders University College of Medicine and Public Health, Australia
- Ayelet Kuper, Wilson Centre, University of Toronto, Canada
- Tina Martimianakis, Wilson Centre, University of Toronto, Canada
- Susan van Schalkwyk, Centre for Health Professions Education, Stellenbosch University, South Africa

Summary of theme and why it is important: Transformative learning is rapidly becoming a buzzword in health professions education (HPE), but it is actually a complex theoretical construct. It speaks to learning experiences that challenge students' long-held assumptions and perspectives and encourage critical reflection on one's worldview. In so doing, it influences the formation of students' professional identities and leads to greater self-awareness, ultimately influencing behaviour in practice. Built on notions of social justice and accountability, transformative learning occurs over time and is typically catalysed by a 'disorienting dilemma' that results in critical reflection about oneself and one's assumptions, leading to new ways of being in the world.

First introduced through the work of sociologist Jack Mezirow, transformative learning is increasingly being taken up in the HPE literature, including featuring strongly in the Lancet Commission 2010 article that proposed a new direction for HPE in the 21st century. It is evident that there is much synergy between the fundamental principles of transformative learning theory and growing awareness around issues of health equity, person-centred care, and advocacy for changes in the structures and process of health care and of HPE.

In this symposium, we will explore transformative learning theory as a pedagogy for HPE from a number of different perspectives:

- **Susan van Schalkwyk:** Introduction to the symposium identifying some of the issues that will be probed during the symposium. Will provide an overview of transformative learning as it currently is being taken up in the HPE literature, highlighting both the ontological and epistemological dimensions of the construct. Thinking around the affordances that transformative learning theory can offer educators in the health professions will be highlighted.
- **David Davies:** Explore the role that threshold concepts potentially play in transformative learning. Thinking about transformative learning in the curriculum, given how personal it is to the individual, is it something to be welcomed when it happens, but cannot be expected for each and every student? Can we maximise the pre-conditions for it by identifying and agreeing threshold concepts that once crossed, can lead to a cognitive and/or affective transformation for all?
- **Jennene Greenhill:** Medical students learning in different contexts can transform their world view. Our research on transformative learning spans from clinical simulation to rural settings. Whilst many students do have transformative learning experiences some don't. Why and how transformative learning happens is it the context, the curriculum design, or the characteristics of our learners perhaps?
- **Tina Martimianakis:** What does reflexivity look like when educational programs adopt transformative learning pedagogies? Is transformative learning only a tool in the hands of the teacher or can it be used to make teachers and organizations accountable to social reform

mandates by offering important insights into curriculum gaps, hidden curriculum effects and other features of organizational structures and culture?

- **Ayelet Kuper:** We have many lofty individual and structural goals for transformative learning, but how will we know when we have achieved them? The constructs promoted through transformative learning seem incongruent with traditional HPE assessment modalities, so how can we assess our learners and/or evaluate our curricula and pedagogy?

Who should participate in the symposium? Transformative learning has been described as a theory that offers educators a lens through which they can view their students' learning. Anyone who is involved in the practice of HPE, as well as anyone whose research relates to current hot topics like equity and person-centredness, will be able to find touchpoints in the different presentations and engage meaningfully in the subsequent discussion.

What will they gain from participating? Participants will have the opportunity to critically reflect on the different positions explored during the session and contemplate how these resonate with their own understanding of how learning happens. They will be able consider (a) what sort of learning is needed to ensure a cadre of healthcare professionals who will be equipped to engage with global health challenges going forward; and (b) how HPE needs to change (globally or in their local context(s)) to accommodate that sort of learning.

The Tacit Knowledge Base Underlying Interprofessional Collaboration Competence

AUTHOR(S):

- Nicolas Fernandez, Université de Montréal, Canada (Presenter)
- Isabelle Perreault, Université de Montréal, Canada

ABSTRACT

Background: Clinicians engage in interprofessional collaboration on a daily basis. They use their 'tacit knowledge' (Polanyi, 1966; Henry, 2010) that comprises indirectly appreciated peripheral details about how regular tasks are accomplished. A deeper understanding and systematic appraisal of this knowledge would be beneficial for clinical supervisors providing feedback on Interprofessional collaboration.

Summary of Work: In this exploratory study, we have undertaken 12 explicitation interviews (Maurel, 2009) with clinical educators in 5 professions who teach in an interprofessional collaboration program at Université de Montréal. In these interviews, participants are free to recall an event, related to interprofessional collaboration, and describe their actions as well as their underlying reasoning in as much detail as possible. Our approach is based on the idea that actions described in this manner are aggregates accumulated in similar circumstances in the past, reflecting the clinician's personal theory (Eraut, 2004) about interprofessional collaboration. Thematic analysis was used to extract discrete descriptions of actions undertaken by individuals collaborating with colleagues in clinical work.

Summary of Results: Clinicians reported that they acted in subtle ways to ensure successful collaboration. Amongst these: discussing a case that the team is grappling with over coffee-break; stopping by in the corridor or in the doorway to discuss a case, face-to-face; deliberately sharing each one's working hypotheses while working on a case; creating a space for shy members to express themselves in meetings.

Discussion and Conclusions: The many described actions reflect the implicit theories about interprofessional collaboration, indicating that when these clinicians collaborate, they are likely to undertake these actions to ensure success. By describing the competence as a sum of such actions, students are likely to gain awareness as to what is required for successful collaboration.

Take-home Messages: 1. We have gained a richer and more nuanced view of collaborative practice 2. We have described tacit knowledge acquired during practice of interprofessional collaboration. 3. The description of these actions provide specific indicators that are useful for teaching and assessment of this competence.

How simulation can prepare interprofessional care teams for mass casualty response

AUTHOR(S):

- **Karlen Bader, Uniformed Services University, USA (Presenter)**
- Lara Varpio, Uniformed Services University, USA
- Meghan Hamwey, Uniformed Services University, USA
- Kevin Semelrath, Uniformed Services University, USA
- Elise Paradis, University of Toronto, Canada

ABSTRACT

Background: To improve interprofessional healthcare collaboration, clinicians and their organizations have often adopted practices from other fields (e.g., aviation). But we have yet to access lessons from those who, arguably, have the highest rates of success working in interprofessional healthcare teams in high-stress environments: those working in military deployment contexts. The skills harnessed by military care teams can usefully inform their civilian counterparts. Yet, little research has studied how the military prepares its interprofessional healthcare teams. To address this gap, we studied military interprofessional education (MIPE) in a simulated environment. We asked: What are the distinctive attributes of MIPE that could inform civilian interprofessional education?

Summary of Work: Using an ethnographic approach, three researchers conducted 30 hours of non-participant observations of an MIPE simulation over 4 days. This large-scale immersive simulation of battlefield deployment involves the 4th year medical cohort (n = 177), and learners in nursing (n = 29) and psychology (n = 5) from the American university that educates military healthcare professionals. Data were transcribed/analyzed by the three researchers and vetted by the rest of the research team.

Summary of Results: We identified three distinct aspects of MIPE. First, MIPE is delivered in a culture where flailing isn't failing. Instructors allow students to flail/fumble, rather than immediately guide the learner. Second, MIPE emphasizes the importance of followership. Followership requires members of the MIHT to actively and intentionally work in support of their team leader. Third, MIPE encourages interprofessional respect via role adoption. Learners were required to actively assume all the different roles in the care team. In so doing, learners gained appreciation for the work carried out by each team role.

Discussion and Conclusions: Using the theory of relational coordination as an analytic framework, we analyzed these findings. We contend that MIPE can provide important developmental opportunities for team members. These findings could easily be transferred to civilian contexts.

Take-home Messages: The lessons learned by interprofessional teams serving at the war front can inform teams who serve at home, and in turn, serve society at large.

Caring for underserved patients through neighbourhood health screening: readiness for interprofessional learning after participation in a longitudinal interprofessional home visit program in Singapore

AUTHOR(S):

- Liang En Ian Wee, Singapore General Hospital, Singapore (Presenter)
- Gerald Choon Huat Koh Koh, Saw Swee Hock School of Public Health, Singapore
- Geok Ling Lee, National University of Singapore, Singapore
- Yun Ying Tsang, National Healthcare Group, Singapore

ABSTRACT

Background: The Neighbourhood Health Service (NHS) occurs in underserved, low-income public rental flat neighbourhoods in Singapore, with volunteer teams comprised of medical, nursing and social work professionals going door-to-door to provide health screenings and mobile medical follow-up over a 6-month period. The volunteers work as an interdisciplinary team, re-integrating residents with social services and attending to health needs. We were interested in gauging whether our program successfully encouraged positive attitudes to interprofessional learning between the various members of the integrated care team.

Summary of Work: We assessed the effect of the NHS on readiness for interprofessional learning (RIPL), by using standardized questionnaires. We used the Readiness for Interprofessional Learning Scale (RIPLS) Questionnaire, a locally-validated 19-item questionnaire comprised of 3 domains (minimum score: 19; maximum score: 95). Participants were given the questionnaires at baseline and 1-month after participation in the program in 2018. We used paired t-test to compare before-and-after scores.

Summary of Results: A total of 265 professionals took part in the study, with a response rate of 75.9% (265/349). Of those, 54.3% (144/265) were from medicine; 12.4% (33/265) were from social work; and 33.2% (88/265) were from nursing. Post-intervention, across all participants, RIPL scores increased significantly, both overall (before: 80.22(S.D 7.21); after: 81.44 (S.D 7.25), $p < 0.001$) and across all three domains of teamwork/collaboration, professional identity and roles/responsibilities (all $p < 0.05$). All members of the integrated care team (medical, social work, nursing) demonstrated statistically significant gains in the professional identity subscale ($p < 0.05$). Individuals with >1 year of working experience demonstrated significant gains across all domains ($p < 0.05$), as well as those who had previously participated in IPE activities.

Discussion and Conclusions: A door-to-door volunteer-based interprofessional home-visit program encouraged positive attitudes to IPL amongst medical, nursing and social work professionals.

Take-home Messages: However, benefits largely accrued in individuals who had >1 year of working experience post-graduation, as well as those who previously participated in IPE.

Social identification and interprofessional learning of final-year nursing and medical students

AUTHOR(S):

- **Claudia Tielemans, Utrecht University, the Netherlands (Presenter)**
- W.E.S. van den Broek, Utrecht University, the Netherlands
- T.J. ten Cate, Utrecht University, the Netherlands
- C.L.J.J. Kruitwagen, Utrecht University, the Netherlands
- H.E. Westerveld, Utrecht University, the Netherlands

ABSTRACT

Background: As interprofessional healthcare collaboration is increasingly important, worldwide different educational methods are being developed to implement interprofessional learning (IPL). Social identification is a central concept of the social identity approach from social psychology. It offers valuable starting points for exploring group processes in healthcare, which influence IPL. We aimed to explore social identification with the professional group on one hand and the interprofessional team on the other hand, in final-year healthcare students, and to explore their views on IPL.

Summary of Work: A questionnaire was sent to 276 final-year nursing and medical students at Utrecht University. Using a validated questionnaire, which required rating of statements on a 7-point Likert scale, we measured strength of social identification (SSI) with the professional group and interprofessional team and compared group means using dependent and independent t-tests. Additionally, we asked 4 open-ended questions regarding IPL. Answers were analyzed qualitatively, using thematic analysis.

Summary of Results: 15 nursing students and 38 medical students responded. In both groups a significant but small difference was found for SSI, favoring the professional group. No significant between-group difference in SSI was found. In the open-ended questions we found that participants often defined membership of their interprofessional team broadly, including supportive personnel and management. They named the importance of complementary roles in healthcare and how best to combine these as items they had learned from interprofessional team collaboration. They also identified IPL inhibitors, including cultural aspects (hierarchy among professionals) and structural aspects (workload and time pressure). Finally, we found that students generally regarded the idea of interprofessional feedback and assessment favorably.

Discussion and Conclusions: SSI scores showed that final-year healthcare students hardly favored the own professional group over the interprofessional team. Supported by the findings of openness to interprofessional feedback and broadness in defining the interprofessional team, it seems that social identification processes do not obstruct IPL for these students. However, several important factors inhibiting IPL remain.

Take-home Messages: Social identification offers valuable insights for researching IPL. Both our qualitative and quantitative findings seem to indicate that social group identification processes do not hamper IPL in final-year healthcare students.

Introduction of an undergraduate interprofessional simulation based skills training program in obstetrics and gynaecology in India

AUTHOR(S):

- Arunaz Kumar, Monash University, Australia (Presenter)
- Suhas Gorantla, Monash University, Australia
- Atul Malhotra, Monash University, Australia
- J V Singh, Hind Institute of Medical Sciences, India

ABSTRACT

Background: Interprofessional Simulation Based Education (SBE) improves both core clinical skills and team training in clinical practice. While interprofessional simulation based learning is common in clinicians practicing, its role has not been explored extensively at an undergraduate level. Also such initiatives have not been reported in a developing country. In this study, the introduction of an undergraduate interprofessional SBE program for teaching obstetrics and gynaecology skills in India was evaluated.

Summary of Work: A well-established skills training interprofessional workshop in obstetrics and gynaecology was introduced for medical and midwifery students in a secondary level hospital in India. A mixed methods analysis of numerical and qualitative feedback data of the workshops was conducted. Thematic analysis of free text data was conducted and key themes identified.

Summary of Results: Ninety-five medical and midwifery students attended the workshop, the first of its kind in a low resource setting. The background clinical experience in obstetrics and gynaecology of the students across both groups was minimal. The improvement in self "reported feedback was similar in both health professional groups. The main theme that appeared was 'hands-on' learning compared to didactic teaching. The other themes were learning in simulation without clinical time constraints, retaining the ability to make mistakes, bridging theory to practice, valuing interprofessional experience and ensuring equal learning opportunities for all participating professional groups.

Discussion and Conclusions: SBE was identified to be different to other forms of learning due to provision of hands-on practice as it tied theoretical knowledge with practical skills. This concept can be explained through Fenwick's theory of socio-materiality, where humans interact with materials, that play the role of being fundamental tools in their learning. Active learning sought by participants through these deliberate interactions can therefore lead to greater knowledge gains and positively influence long-term retention of information. Simulation can help to reinforce clinical skills through deliberate practice, in a safe and educationally orientated environment. By eliminating the time pressure associated with a hectic clinical setting, a stress-free environment is created for learners to experiment and learn at their own individual pace.

Take-home Messages: The advantages of interprofessional SBE are reproducible in a low resource setting and helpful for participant skills and team training.

Implementation of Importance-Performance Analysis to Evaluate the Interprofessional Collaborative Practice Conference in a Tertiary Hospital in Taiwan

AUTHOR(S):

- Je-Ming Hu, Division of Colorectal Surgery, Department of Surgery, Tri-Service General Hospital in Taipei, Taiwan (Presenter)
- Tung-Wei Kao, Department of Family Medicine, Tri-Service General Hospital, Taiwan
- Yaw-Wen Chang, Department of Family Medicine, Tri-Service General Hospital, Taiwan
- PoKai Chan, National Defense Medical Center, Taiwan
- Li-Chen Lin, Department of Nursing, Tri-Service General Hospital, Taiwan
- Feng-Cheng Liu, Division of Rheumatology, Tri-Service General Hospital, Taiwan

ABSTRACT

Background: High audience satisfaction may mask the weakness of the interprofessional curriculum content. To improve the course quality, we introduce the Importance-Performance analysis (IPA) to the interprofessional collaborative practice conference (ICPC) held monthly in the Tri-Service General Hospital in Taipei, Taiwan.

Summary of Work: The research was carried out in each ICPC from June to December in 2018. The 17-item Likert scale IPA questionnaire, derived from the ICPC judge evaluation form, contains 3 domains: healthcare matrix (HCM), interprofessional education and shared-decision-making (SDM). The participants were asked to fill out the questionnaire online after the courses. The data were then analyzed and standardized with SPSS 20 for the descriptive statistics, reliability analysis, and IPA. The strength and the weakness distribution were then visualized on the Importance-Performance Matrix. We also check the correlation between the IPA performance scores, ICPC judge evaluation score and the Interdisciplinary Education Perception Scale (IEPS) gain scores.

Summary of Results: Totally 1552 respondents completed the importance-performance questionnaire last year with good reliability (Cronbach's alpha > 0.9). Through IPA, the author could compare the distribution in each month and provide improvement suggestion to the ICPC organizing team. In addition, among the 3 domains, the most highly-important and well-performed items were 'Interprofessional cooperation and alignment of care plan', while the item 'Using easy and understandable language for SDM' required more emphasis in the next year courses. For the correlation analysis, the IPA performance scores are significant highly correlated to the IEPS gain scores ($r > 0.7$), while only the domain of HCM was correlated between IPA performance and the judge scores.

Discussion and Conclusions: The IPA not only provides a novel way to look through the myth of high satisfaction but also helps the ICPC organizing team know their strength and weakness. This study is limited due to the lack of examination for the questionnaire validity, the bias of authenticity due to too many items in the questionnaire and the online self-reported form.

Take-home Messages: The IPA is a promising tool for the IPE course optimization and further study should be carried out for the factor analysis and validity construction.

Does Interprofessional Education for teachers enhance the Interprofessional Collaboration in airway management for new staffed nurses, respiratory therapists and physicians?

AUTHOR(S):

- **Mok Sam I, Taipei Medical University Shuang Ho Hospital, New Taipei City, Taiwan (Presenter)**
- Pei-hsing Hsieh, Taipei Medical University Shuang Ho Hospital, Taiwan
- Jiann Ruey Ong, Taipei Medical University Shuang Ho Hospital, Taiwan
- Yuh-Fen Lin, Taipei Medical University Shuang Ho Hospital, Taiwan
- Che-Wei Lin, Taipei Medical University Shuang Ho Hospital, Taiwan
- Hon-Ping Ma, Taipei Medical University Shuang Ho Hospital, Taiwan

ABSTRACT

Background: Hospital-based airway management is usually conducted in interdisciplinary teams consisting of physicians, nurses and respiratory therapists, but often new personnel is trained independently within their own professional group. It is not until they begin to work in the clinical environment that they begin to collaborate in the care of patients in need of airway management. Due to differences in the initial training, there is a significant lack of consensus and substantial specific-skill disparity such as such as suction methodology of sputum or blood, bag-mask-ventilation, oxygen use criteria, etc The purpose of this training program is to train airway management instructors in an interprofessional environment to achieve a better standardization of procedural skills and a better understanding of profession-specific practices. Through these interprofessionally trained instructors, we expect to improve consensus among trainees when performing airway management and enhance teamwork, patient safety and quality of care.

Summary of Work: Study method: The participants include 30 newly hired residents (n=10) and nurses (n=20) from 2 hospitals affiliated to Taipei Medical University. The participants will be assigned to 2 study groups, the intervention group will participate in an interprofessional airway management workshop while the control group will receive traditional discipline-specific airway management instruction. Participants from both groups will be assessed by a simulated scenario to ensure an acceptable level of technical competency has been achieved. Both groups will then participate in 3 standardized airway management scenarios, their performance will be evaluated using 3 assessments: Case-specific checklist, team performance measurement instrument and, self-reflection and expert observer impressions of teamwork.

Summary of Results: Expected outcomes: Preliminary surveys of learner satisfaction have highlighted that the fact that participants were able to learn additional skills which are hard to learn from instructors from the same professional field. There is also an increased awareness of the skills and capabilities of health professionals in other fields, which is conducive to better team integration.

Discussion and Conclusions: Our expected outcomes from this new interprofessional format include increased basic airway management competency, a better understanding of the roles and capabilities of other health professionals and improved team integration.

Take-home Messages: **Interprofessional Education for teachers may enhance teamwork, patient safety and quality of care.**

When teachers meet in interdisciplinary teams: hangouts, distribution centers and melting pots

AUTHOR(S):

- **Stephanie Meeuwissen, Faculty of Health, Medicine & Life Sciences (FHML), Maastricht University, The Netherlands (Presenter)**
- Wim Gijsselaers, School for Business & Economics Maastricht University, Maastricht, the Netherlands
- Ineke Wolfhagen, Faculty of Health, Medicine & Life Sciences Maastricht University, the Netherlands
- Mirjam oude Egbrink, Faculty of Health, Medicine & Life Sciences Maastricht University, the Netherlands

ABSTRACT

Introduction: Health care systems are increasingly complex and interdisciplinary. These systems call for medical doctors who have learned to understand the importance and interdependence of multiple disciplines when working with individual patients. Preparing graduates for these complex health care settings requires interdisciplinary teaching. This asks for integrated curriculum set-ups, which forces teachers from different scientific and clinical disciplines to work together to develop courses. However, teachers' teaching experiences often rely on offering course units strictly organized by distinct disciplines. Little empirical research is conducted on teachers' team processes in integrated health professions education and how they influence successful development and quality of integrated curricula. In management sciences, it is shown that team performance increases with high-level team learning processes, ranging from sharing and co-construction to constructive conflict. In the current study, we set out to explore team learning processes and outcomes among interdisciplinary teacher teams in the development of integrated health professions education.

Methods: We conducted an exploratory study, using a sequential mixed-methods design. First, we used maximum variation sampling and conducted 17 vignette-guided, semi-structured interviews with teachers originating from diverse disciplines. These teachers worked in 17 different courses of the integrated, undergraduate health profession programs at Maastricht University. The interview guide and vignettes were based on team learning research. These sensitizing concepts of team learning informed our template analysis. Sequentially, evaluation data of the different courses were used to provide a descriptive analysis of students' perspectives on course quality (course organization, quality, learning effect and alignment).

Results: Three interdisciplinary teacher team approaches were identified. Each approach was characterized by the team learning behavior, focus of work, feeling of responsibility, teachers' commitment, feeling of identity, psychological safety, boundary setting, and teachers' perspectives on both teamwork and the produced course. 1) In fragmented teams, characterized as 'hangouts', teachers worked individually on tasks that they were interested in, leaving their disciplinary mark. 2) Framework-guided teams, functioning like 'distribution centers', aimed to work within the given frameworks and organizational expectations, striving for disciplinary balance. 3) Integrated teacher teams, imaginary 'melting pots', worked interdisciplinary on all topics and put students at the center. Integrated teams reflected high-level team learning processes and were most satisfied with their (team)work. In contrast, fragmented and framework-guided teams mainly reflected low-level team learning processes; sharing and co-construction, respectively. Students evaluated courses of integrated teacher teams highest on all investigated course quality items.

Discussion & conclusions: Our results yield insight in the team learning processes and outcomes of interdisciplinary teacher teams working in integrated curricula. Findings show that successful interdisciplinary teacher teams are represented by integrated teams with high-level team learning behavior and the best course evaluations. Therefore, health professions education management should actively encourage and facilitate integrated teacher teamwork. A focus on learning cultures in which people feel safe to speak up and learn from each other seems vital to achieve high team learning levels in interdisciplinary teacher teams. Framework-guided teams further showed that a strong task cohesion could work protective in order to cover the intended learning outcomes. Teachers need to get the experience and knowledge of how to share and exchange knowledge with colleagues from different disciplinary backgrounds, and understand that just sharing tasks among the different disciplines does not result in interdisciplinary, integrated teamwork. Continuous faculty development programs could offer solutions for its dissemination.

The exotic other: A constructivist analysis of cultural diversity in medical curricula

AUTHOR(S):

- **Albertine Zanting, Maastricht University, Maastricht, Netherlands (Presenter)**
- Janneke Frambach, Maastricht University, Maastricht, The Netherlands
- Agnes Meershoek, Maastricht University, Maastricht, The Netherlands
- Anja Krumeich, Maastricht University, Maastricht, The Netherlands

ABSTRACT

Introduction: To meet the health needs of increasingly diverse patient populations and to enhance the quality of medical care, dealing with cultural diversity in medical education is considered essential. Despite this attention for cultural diversity, educators struggle how to adequately integrate the concept in medical training, and the expected quality impulse fails to occur. Theoretically, notions of culture vary from static concepts focused on fixed categories, to more dynamic ones seeing culture as continuously changing practices. Studies outside medical education show that the used notion of cultural diversity is not innocent; the way the concept is interpreted or 'constructed' - e.g. in educational materials - has important implications for policies, practices and people concerned. For healthcare this implies that the used notion of cultural diversity influences the patients' treatment. We therefore investigated how the concept of 'cultural diversity' is constructed in medical curricula and what its implications are for curriculum contents.

Methods: We purposefully sampled three medical bachelor curricula offered at two Dutch universities, which differed as to educational approach, student population, language (Dutch and English), and diversity or internationalization policies. We analyzed the curriculum material including 39 main courses, and electives, minors, internships, and longitudinal tracks. Consistent with a constructivist paradigm, we studied how meanings were constructed and embodied in language. The qualitative content analysis was conducted as iterative process, including thorough reading and open coding, identifying patterns, and creating and structuring themes. We explicitly looked for contradicting information; interpretations of the data were discussed within the research team.

Results: Our analysis identified four mechanisms of constructing cultural diversity:

1. Consideration for 'culture' differed throughout the curriculum parts: in mainstream Dutch courses patients and diseases were unambiguously presented with limited references to 'culture', whereas in the English curriculum and in specific courses paying attention to culture was considered essential, and patient cases included references to nationality, religion, and ethnicity.
2. Although provided explicit definitions of 'culture' did not refer to specific groups, the way patient cases were constructed implied that 'culture' predominantly referred to people or circumstances outside the Netherlands or Western world.
3. A static concept of culture was predominant, which presented non-Western patients as stereotypical "others".
4. Culture often referred to broad categories, and linking these to medical issues lead to a causation versus correlation misconception. These four mechanisms together resulted in a notion of cultural diversity being something or someone exotic; an exception and deviant to the implicit Dutch or Western standard, and therefore problematic.

Discussion and conclusions: Employing and conveying this notion of cultural diversity as deviant in medical curricula may lead to insecurity among (future) doctors about whether and how to consider culture in the doctor's office, and lack of clear guidelines needed for accurate medical diagnosis and treatment. The notion of culture as deviant cannot only be found in medical education and in relation to culture, but seems similar to noted mechanisms in medical research and in relation to other diversity aspects. Awareness of these mechanisms and how they problematize large sections of the patient population is crucial for equitable healthcare. This study suggests that the quality of medical education could be enhanced by developing a consistent and dynamic vision on culture that uses smaller categories and pays more attention to aspects such as living environment and habits, and by integrating this vision in mainstream training.

Medical students' negative affective responses to meeting patients with mental illness – do these represent stigma?

AUTHOR(S):

- Helen Caisley, University of Cambridge/Cambridgeshire and Peterborough NHS Foundation Trust/Collaboration for Leadership in Applied Health Research and Care East of England, Cambridge, UK (Presenter)
- Diana Wood, University of Cambridge, School of Clinical Medicine, Cambridge, UK
- Robbie Duschinsky, University of Cambridge, UK
- Paul Wilkinson, University of Cambridge/Cambridgeshire and Peterborough NHS Foundation Trust, Cambridge, UK

ABSTRACT

Introduction: Medical students have been a particular focus of work addressing stigma in health professionals. However, there has been limited evaluation of stigma towards patients with mental illness from medical students. Vague conceptualisations of stigma have hampered research in this area. Medical students were interviewed about their experiences of learning psychiatry. Early analysis indicated that many of the students described strong emotional reactions to meeting patients with mental illness. This study aimed to evaluate whether these reactions represented stigma (as defined by the Link and Phelan (1) (L&P) and Knowledge, Attitudes and Behaviour (2) (KAB) models) and on this basis appraise what further teaching might be required.

Methods: Year 5 students at the University of Cambridge School of Clinical Medicine who had undertaken their specialty psychiatry placement were invited to participate. Purposive sampling of the first eligible students to volunteer was used to obtain a gender balance. Fifteen students were recruited. Saturation was reached. Semi-structured interviews were conducted between January and March 2017. Data were analysed using thematic analysis within a contextualist framework. Key concepts were identified in initial rounds of inductive coding. From these rounds, anxiety and stigma were noted to be important themes. Review of the relevant literature pertaining to these areas facilitated formulation of a coding framework for a second round of deductive coding. In addition, possible course factors that may have contributed to an anxious response were identified.

Results: Some components of stigma, described in the L&P and KAB models were present in the transcripts. However, there was no evidence of status loss and discrimination described by the L&P model, or of negative thoughts towards patients or rejecting behaviour described by the KAB model. The strong emotional reactions that students exhibited were better explained by the concept of anxiety than by stigma. A feeling of threat - a psychic component of anxiety - was described by many students who used metaphorical language of being 'thrown in the deep end'. Descriptions of avoidant behaviours, recognised as a feature of anxiety, were widespread. Students' anxiety appeared to arise from concern for patients, alongside the belief that they lacked the knowledge and skills to alleviate patients' distress. They were also concerned for their own safety and psychological well-being.

Discussion and Conclusion: The negative affective responses of students meeting patients with mental illness are better described by anxiety than stigma. This is in keeping with previous research highlighting anxieties of medical students about meeting those with mental illness. It is important to recognise that patients may attribute anxious-avoidant behaviour by students to stigma. Lack of knowledge about mental illness and skills for communicating with patients with mental illness were described as significant sources of anxiety. It has long been recognised that conversely, anxiety impacts learning. Therefore students' anxiety needs to be addressed in parallel with improving teaching of knowledge and skills. The interviews also highlighted that it may be helpful for some educators to consider the impact of their behaviour on students' anxieties. Examples included doctors choosing to 'protect' students from seeing patients with mental illness early in their training. Limitations of the study include the possibility of unconscious bias, possible reluctance to talk about stigmatising attitudes and behaviour with a psychiatrist and the small number of participants in one setting.

Experiences and motivation of ethnic minority students in medical education: a qualitative study

AUTHOR(S):

- **Rashmi Kusurkar, VUmc School of Medical Sciences, Amsterdam, the Netherlands (Presenter)**
- Ulviye Isik, VUmc School of Medical Sciences, Amsterdam, the Netherlands
- Anouk Wouters, VUmc School of Medical Sciences, Amsterdam, the Netherlands
- Petra Verdonk, VUmc School of Medical Sciences, Amsterdam, the Netherlands
- Gerda Croiset, VUmc School of Medical Sciences, Amsterdam, the Netherlands

ABSTRACT

Introduction: With the patient population becoming increasingly diverse, in order to ensure equitable healthcare ethnic minority groups should be adequately represented in the medical workforce. Unfortunately, medical students from ethnic minorities underperform compared to the majority group¹; The reasons for which are not fully understood. Ethnic minority students underrepresented in medicine experience barriers in competing successfully for residency programs and entering academic careers. Non-Western minority students exhibit higher autonomous motivation (acting out of true interest or personal endorsement) than Dutch students.² In light of this, their underperformance is even more difficult to understand. We hypothesize that ethnic minority students experience factors at different moments in the medical curriculum that influence their motivation at that moment (situational motivation) and for medical study in general (contextual motivation). This study aimed to explore ethnic minority students' perspectives on their motivation and interactions in medical education.

Methods: All medical students from ethnic minority backgrounds, enrolled at VUmc School of Medical Sciences, Amsterdam, the Netherlands, were invited to participate in this qualitative study. Focus groups conducted between December 2016 and May 2017 were audiotaped and transcribed verbatim. Focus groups were conducted until sufficiency for answering the research questions was reached. A constructivist paradigm was adopted for the focus groups and analysis in which knowledge is constructed through interaction between the researcher and participants. Data were coded and analyzed using thematic analysis. This analysis method is used for identifying, analyzing and reporting themes within data. During the analysis an intersectional approach was adopted to study the interactions between gender, race and other categories of difference in individual lives. Three researchers coded the interviews independently and finalized the results through consensus. A diverse team, with different ethnic backgrounds and expertise, together with an intersectional perspective, encouraged reflexivity and generated a holistic picture on this sensitive topic.

Results: Six focus groups were conducted, three with pre-clinical students and three with clinical students. Twenty six ethnic minority students (8 male, 18 female) participated in this study. The focus groups varied in size from 3 to 6 students; this was acceptable because of the sensitive topic of the study and allowed us to go into personal narratives. The findings from the focus groups could be categorized as follows: (1) the role of autonomy in the formation of motivation including their own study choice and the role of family, (2) interactions/othering in practice in which hierarchy played a role, (3) interactions/othering in the learning environment like standing up for yourself, (4) influences on academic performance like the role of family, and (5) intersections of culture and gender like being the other based on ethnicity.

Discussion & Conclusion: Ethnic minorities experienced that multiple factors influenced their learning, motivation and academic performance, like having a role model, 'being the other' because of their ethnic background, miscommunications, and remarks on their accent. They seemed to experience discrimination and cultural distance. Students expressed that their experiences were a process of growing awareness for them, for example they realized that their appearance matters. Autonomy and family expectations played a great role in forming their motivation. Moreover, students' experiences at a particular moment could demotivate them (situational motivation), but in the longer term they learn to cope with this and continue to be autonomously motivated for their education and their goal to become a doctor (contextual motivation).

Exploring the influence of undergraduate health professions students at distributed health service facilities

AUTHOR(S):

- **Ian Couper, Ukwanda Centre for Rural Health, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa (Presenter)**
- Susan van Schalkwyk, Centre for Health Professions Education, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa

ABSTRACT

Introduction: As academic institutions explore ways to produce a health workforce that meets the needs of both the health system and the communities it serves, distributed training is being adopted as an increasingly common strategy to improve the relevance of medical education and increase graduate retention in underserved communities. There is a growing literature on the student experience at distributed health care facilities, but less is known about how the presence of students influences the site itself. We therefore set out to elicit insights from key role-players at a number of distributed health service-based training sites about the contribution that students make.

The Stellenbosch University Faculty of Medicine and Health Sciences offers differentiated experiences in five undergraduate health professions programmes, which include clinical involvement at multiple district and community health care facilities. As these experiences are premised upon the interdependence between service and education, this study aimed to understand the views of key role-players at these facilities about the contributions made by students and the influence of their presence (Van Schalkwyk et al, in press).

Methods: Set within an interpretivist paradigm, this study analysed qualitative data obtained during interviews held at eight purposively selected public health care facilities. A sampling grid was used to select sites that proportionally represented location, level of care and mix of health professions students. The facility manager, one clinical supervisor and another clinician were invited to participate, leading to 24 individual, semi-structured interviews conducted at the participant's place of work. Transcribed data was subjected to thematic analysis. Following an iterative process, initial analyses and code lists were discussed and compared between team members after which the data were coded systematically across the entire data set.

Results: Students' contributions were seen to coalesce around three over-arching themes: influence on the facility (culturally and materially); on patient care and community (contribution to service; improved patient outcomes); and on supervisors (enriched work experience, attitude towards teaching role). However, we sought to delve beyond what Elder-Vass (2007) describes as a 'level abstracted view' to obtain a richer understanding of the mechanisms at play beneath what is perceived empirically. Subsequent stratified analysis of the emerging data identified some consequences of taking clinical training to distributed sites. These consequences occurred when certain conditions were present. Further critical reflection pointed to a set of caveats that modified the nature of these conditions, emphasising the complexity inherent in the context.

Discussion: This study shows that students have an effect on health care services, at facility, staff, patient, and community levels. This effect is mediated by critical factors, such as clinicians involving students in everyday practices of the clinical team, and enabling the pursuit of their learning outcomes to enhance fields such as evidence-based

practice, holistic care, community projects, etc. In order to achieve this, issues need to be addressed such as the level of the students, space and time, and adequate supervision.

Conclusions: Provided certain conditions exist, students in distributed clinical training sites have the potential to make an important contribution to health care, adding value to the health facilities where the training takes places, those responsible for student supervision, and the patients and communities that these facilities serve. In establishing and maintaining relationships with these facilities, academic institutions need to be mindful of the conditions and caveats that may moderate this contribution.

ABSTRACT

This study aims to provide validity evidence for using two scales to assess medical students' communication skills in a simulated environment. The first, the Communication Assessment Tool is a 14-item questionnaire developed by Makoul assessing doctor-patient communication from the patient's perspective. Items are scored according to a five-point scale (1=poor to 5=excellent) and summed to obtain a total score (ranging from 14 to 70). The second, the Analytic Global OSCE Rating Form developed by Hodges and McIlroy to assess four domains of medical communication (empathy, interview coherence, verbal and nonverbal expression) using a likert scale of 5 points completed by the examiner. The authors translated and adapted the original scale into Brazilian Portuguese using translation, transcultural adaptation, back-translation, and content analysis. The adapted versions were applied in a pilot study during the Obstetric Emergency Course of the Ob-Gyn Residency Program at the Medical Sciences School of Unicamp, in two OSCE stations focused on communication. Four simulated patients, four medical examiners, and 28 residents participated in this phase. The second phase consisted of the study of the psychometric properties of the Brazilian-Portuguese version of the Analytic Global OSCE Rating Form. The scale was applied during the clinical skills assessment to 249 students from the fourth to the sixth year of the medical school of Unicamp by 40 examiners. For the Communication Assessment Tool, thirteen of the 14 items of the Brazilian-Portuguese version were considered as "equivalent" by at least 70% of the judges; adjustment was necessary in one item. Regarding content validity, all items were considered relevant by at least 70% of the judges. The Item Content Validity Index ranged from 0.9 to 1 and Scale Content Validity Index was 0.99. The Brazilian-Portuguese version of the Communication Assessment Tool showed good internal consistency (Cronbach's alpha=0.93 and 0.95). Simulated patients considered the tool easy to understand and complete. Results indicate that the Communication Assessment Tool is a valid option for assessing communication skills of medical students. For the Analytic Global OSCE Rating Form, in the content analysis, 9 of 10 experts rated all items as relevant for assessing communication. Forty faculty members then used the scale to assess 249 medical students during a two-station OSCE. The Multifacet Rasch Model demonstrated good model fit. The internal consistency reliability (Rasch reliability of separation) was >0.80 for items and examinees. The Principal Component Analysis suggested an one-factor model for the scale. The Analytic Global OSCE Rating Form had a strong and significant correlation with the estimated examinees' measure ($r=0.883$) but moderate correlations with the clinical skills checklist scores for the internal medicine and Ob-Gyn stations ($r=0.376$ and 0.476 , respectively). The

Brazilian version of the Analytic Global OSCE Rating Form demonstrated good validity. Furthermore, the scale was accurately completed by OSCE examiners, rather than communication specialists. Altogether, the scale may be a useful and robust assessment of communication during OSCEs in medical education.

A roadmap for attending to medical students' professionalism lapses

AUTHOR(S):

- **Marianne Mak-van der Vossen, Amsterdam University Medical Centers, VUmc School of Medical Sciences, Amsterdam, The Netherlands (Presenter)**
- Anne de la Croix, Amsterdam University Medical Centers, VUmc School of Medical Sciences, Amsterdam, The Netherlands
- Arianne Teherani, University of California San Francisco, San Francisco, USA

- Rashmi A. Kusurkar, Amsterdam University Medical Centers, VUmc School of Medical Sciences, Amsterdam, The Netherlands

ABSTRACT

Introduction: Attending to professionalism lapses of undergraduate medical students is a demanding and effort-intensive task. While models for managing professionalism lapses have been described in several perspective papers, there is no empirical evidence for a policy regarding the management of lapses. Empirical knowledge about managing professionalism lapses can provide medical schools with research-based tools by which to make decisions about their students (i.e. should a student be allowed to graduate). Furthermore, educators could be more willing to report professionalism lapses, if the school's policy and the effects it has on the learner were clearer to them. The aim of this study was to develop a roadmap for educators attending to medical students' professionalism lapses, aiming to offer an empirical basis for approaching students who display such lapses.

Methods: A constructivist grounded theory approach was used to develop an explanatory model for attending to students' professionalism lapses. Between October 2016 and January 2018, 23 in-depth interviews with 19 purposively sampled professionalism remediation supervisors (PRSs) were conducted about the way they handle students' professionalism lapses. PRSs came from 13 different medical schools in the United States; each of them had been responsible for remediation of students' professionalism lapses for at least three years. Four of them were interviewed twice as part of an iterative process of data collection and analysis. Three researchers independently completed coding in three rounds. Data collection, coding, and analysis were performed iteratively, in a constant comparative process, to ensure that the resulting model was grounded in the data. The researchers reached consensus about data sufficiency and the final results.

Results: The findings revealed three phases for handling professionalism lapses. Phase 1: Explore and understand, phase 2: Remediate, phase 3: Gather evidence for dismissal [1]. The threshold between phases 1 and 2 was determined by the understanding of PRS and student that remedial teaching was necessary, based on the factors perceived to be contributing towards the lapse. A lack of reflectiveness and adaptability was seen as reason to proceed to phase 3, and thus formed the threshold between phases 2 and 3. PRSs' roles differed per phase. In phase 1 they enacted the role of a concerned teacher, exploring the lapse from the student's perspective. In phase 2, they functioned as a supportive coach, providing feedback on professionalism values, improving skills, creating reflectiveness, and offering support. In phase 3, if the student did not demonstrate reflectiveness and improvement, and especially if (future) patient care was potentially compromised, PRSs assumed an opposite role, that of gatekeeper of the profession. PRSs' different roles could create conflicts of interest.

Discussion & Conclusion: The resulting roadmap for attending to professionalism lapses fits in the overarching 'communities of practice' framework [2]. Our findings indicate that in phases 1 and 2, the individuals involved in remediation make a concerted effort into integrating students into the community of practice. If a student does not show progress in reflectiveness and adaptability, as evidenced by an ongoing pattern of lapses despite remedial teaching, he/she is no longer absorbed into the culture of the medical community. This can lead to dismissal. The findings provide support to earlier descriptive, opinion-based models, and may offer medical educators an empirical basis for approaching students who display professionalism breaches. The research was conducted only in the United States, limiting generalizability to other contexts.

Speaking up amongst Clinical Teachers in a formal meeting of Post Graduate Medical Education (PGME)

AUTHOR(S):

- Irene Slotweg, Leiden University Medical Center, Leiden, The Netherlands (Presenter)
- Albert Scherpbier, University of Maastricht, Maastricht, The Netherlands
- Renée van der Leeuw,
- Maas Jan Heineman, Amsterdam University Medical Center, Amsterdam, The Netherlands
- Cees van der Vleuten, University of Maastricht, Maastricht, The Netherlands
- Kiki Lombarts, Amsterdam University Medical Center, Amsterdam, The Netherlands

ABSTRACT

Introduction: The importance of team communication, or more specifically speaking up, for safeguarding quality of patient care is increasingly being endorsed. Speaking up is defined as a sincere and direct manner of communication between individuals. The price of not speaking up is an organisation that does not learn from mistakes. (1, 2) If clinical teachers do not speak-up about mistakes this could harm not only patients but also the learning of residents. We are interested in the way in which clinical teachers apply speaking up behaviours and talk about problems and mistakes. What is still unknown is how speaking up is displayed and interpreted by clinical teachers in the context of their discipline-specific teaching teams. In order to determine how clinical teachers demonstrate speaking up in formal teaching team meetings and what factors influence this, we carried out an exploratory study based on ethnographic principles.

Methods: We selected 12 teaching teams and observed, audio recorded and analysed the data. Subsequently, during an interview, the program directors reflected on speaking up of those clinical teachers present during the meeting. Program directors have the formal hierarchical position of head of the clinical teaching team and the formal meeting of PGME are meant to facilitate mutual learning. Finally, we analysed iteratively all data, using a template analysis, based on Edmondson's behaviours of speaking up.(1)

Results: The study was conducted from October 2013 to July 2014 and ten teams participated; four from non-surgical specialties, four from surgical specialties and two from the supporting disciplines. The team size varied from 7 to 30 clinical teachers. Although the clinical teachers exhibit most behaviours of speaking up, the extent to which they exhibit this varied and could lack depth. For example "sharing information" strongly resembles providing information and "talking about mistakes" occurs in a general sense and without commitment of improvement activities. "Asking questions" was often displayed by closed questions and at times several questions simultaneously. We identified three factors that influence speaking up by clinical teachers: relational ("people just want to show who's the boss"), cultural ("we know what we think without having to say it") and professional ("it's typical of anaesthetists to give an OK, shut the door and do whatever they want").

Discussion & Conclusions: The clinical teachers exhibit speaking up, but there is only limited awareness to discuss problems or mistakes and the discussion centred mainly on the question of blame. Mistakes and conflicts are often neither directed at the individual nor adequately result-oriented. The fact that in the meetings the clinical teachers potentially not learn adequately from mistakes, may have an impact on the quality of PGME. It is likely that clinical teachers could supervise residents better if they themselves knew what it is like to learn from mistakes. Safety is not always felt in teaching teams and the positive effect that speaking up could have on the quality of PGME is largely lacking. This study provides direction for program directors to improve speaking up as a learning process that could help clinical teachers in their task of training residents. (2) If clinical teachers are to develop the behaviours of speaking up, it is important to take into account the relational, cultural and professional factors that influence speaking up in order to stimulate sincere and direct communication during the teaching team meetings.

ABSTRACT

Introduction: While many students are treated with dignity as part of their work-integrated learning (WIL), from the literature we know that students sometimes experience violations of their dignity during WIL (Monrouxe & Rees, 2017). The existing literature typically focuses on students' experiences as narrated by students and is limited to healthcare professions. Instead, the current study aims to better understand both students' and workplace supervisors' perspectives on students' workplace dignity during WIL across multiple healthcare (medicine, nursing and counselling) and non-healthcare professions (education, law and business). The study has the following research questions: What are the: 1) types of student dignity experiences during WIL; 2) factors contributing to experiences; 3) consequences of experiences; 4) common student responses to dignity violations; and 5) patterns in student/supervisor perspectives?

Methods: Sixty-five semi-structured interviews were conducted with 30 supervisors and 46 students exploring workplace dignity experiences during WIL, where student dignity was either upheld or violated. Narrative interviewing techniques were employed to capture participants' stories of student dignity experiences. Data were analysed using team-based framework analysis (Ritchie & Spencer, 1994).

Results: A total of 344 stories about students' dignity during WIL (105 supervisor-narrated and 239 student-narrated) were identified. Of these stories, 182 were about dignity violations, 137 were about dignity being upheld, and 21 were about dignity being violated then upheld. Nine common narrative types were identified: verbal abuse, right for learning opportunities, care, inclusion, reasonable expectations, right for appropriate feedback, equality, trust, and right to be informed. The factors contributing to workplace dignity experiences were identified at the individual, relational and environmental levels. The most common factors contributing to dignity experiences were at the individual level, with supervisor-related factors (e.g. personality, attitude towards students) more commonly reported by students and student-related factors (e.g. life experience, initiative) more commonly reported by supervisors. The most common consequences of dignity experiences were at the individual level, which were commonly about well-being (e.g. relaxed and confident for dignity upheld; sad and depressed for dignity violated). Increased learning was also identified for both dignity violated and upheld stories. In terms of how students responded to dignity violations, in 53% of stories students did nothing. Other common actions taken by students, in descending order of frequency were: directly raising concerns after the event, discreetly raising concerns after the event, and directly raising concerns during the event.

Discussion: The study identifies that both student and supervisor perceptions are similar for the types of workplace dignity experienced by students. However, the factors contributing to the experiences differ in that students tend to attribute supervisor-related factors as contributing to the experiences and vice-versa. In addition, relational and environmental factors were less commonly reported by both students and supervisors. This highlights that more

awareness is needed around the differing factors that contribute to dignity in the workplace. In addition, the study finds that students commonly enact extreme responses in the face of dignity violations: either doing nothing or reporting perpetrators to higher authorities after the events, revealing the need to help students deal more proportionately with dignity violations.

Conclusions: This study suggests that future policy and practice should focus on increasing awareness of the factors that contribute to student dignity experiences and on increasing student comfort and opportunity to respond to dignity violations to further enhance student workplace dignity during WIL.

Using empirical ethics to guide clinical communication education: moving beyond abstract and generic communication skills training

AUTHOR(S):

- Clare Delany, The University of Melbourne, Melbourne, Australia (Presenter)
- Merle Spriggs, The Childrens Bioethics Centre, The Royal Children's Hospital, Melbourne, Australia
- Maria McCarthy, The Childrens Bioethics Centre, The Royal Children's Hospital, Melbourne, Australia
- Lynn Gillam, The Childrens Bioethics Centre, The Royal Children's Hospital, Melbourne, Australia

ABSTRACT

Introduction: Doctors are expected to be highly effective communicators. In addition to articulating their clinical reasoning to patients, they can be expected to discuss treatment options, based on likely, as well as hoped for outcomes, and to routinely seek out and include patients' values and concerns, all with empathy and clarity. Pedagogical approaches to teaching skilled communication to clinicians have largely been normative in approach. Clinicians are told that they should communicate using ethical principles of respect for patients' autonomous choices and draw from patient-centred models of communication that include shared decision making. ¹ However, these top down and abstract approaches to communication skills education have been criticised for not adequately preparing clinicians for the messy, diverse and ethically complex dimensions of clinical communication.² This talk addresses such critiques by showing how findings from empirical research about ethically complex communication challenges encountered by doctors can be used to directly inform communication education.

Methods: We used qualitative in-depth interviews to ask 30 paediatricians at a large specialist children's hospital in Australia about specific communication challenges. We were interested in how they encountered and responded to situations where they needed to provide information to parents and children about complex and chronic health conditions including disorders of sexual development; life limiting conditions and parental requests for experimental or unproven treatments. Transcripts of the interviews were analysed using inductive content analysis.

Results: We found considerable variation in the types of information given to families and children; when it was given; and for what purpose. For children living with chronic conditions associated with stigma and potential misunderstanding, some clinicians suggested parents should take their cues from questions posed by the child. Uncertainty was expressed about when, and how the truth should be told to children with life limiting illnesses, and whether to offer hopeful prognoses over more realistic illness trajectories. Some expressed concern about damaging the therapeutic relationship with parents should they not act on requests for treatment for which there was little evidence. Models of clinical communication and specific communication skills were not mentioned. Instead participants described their clinical communication as a dynamic and intuitive process of weighing up facts, values and individual circumstances.

Discussion: The research findings point to a potential mismatch between on the one hand, formal and generic communication skills education grounded in normative principles of patient-centred care, and on the other, the ethically complex communication challenges encountered in real practice. Based on the research findings, pedagogies suitable for preparing doctors for the complexities of clinical communication need to be (1) pragmatic; focused on applying communication principles to real and diverse examples, and (2) involve interpersonal reflection; to facilitate clinicians to use their communication to draw out and balance the perspectives and values they bring with the values and goals of their patients.

Conclusions: By drawing from the empirical realities of clinical practice, the pedagogical focus of teaching skilled communication necessarily shifts from learning abstract and generic communication skills to purposefully cultivating empathic dispositions and capacities for acknowledging and weighing up values, uncertainties, fears and hopes of both the doctor and patient.

Set Up to Fail: Do we really believe a learner in difficulty can be successfully remediated?

AUTHOR(S):

- Teri Turner, Baylor College of Medicine, USA (Presenter)
- Melissa Carbajal, Baylor College of Medicine, USA
- Linessa Zuniga, Baylor College of Medicine, USA
- Charlene Dewey, Vanderbilt University School of Medicine, USA

ABSTRACT

What if the difference between a successful and an unsuccessful trainee in remediation was more about whether or not the teacher(s) believed the trainee would be successful? We have all dealt with learners in difficulty and multiple workshops, articles and books focus on the ‘mechanics’ of remediation. In a landmark educational article from the 1960’s, researchers demonstrated that teacher attitudes and behaviors have a significant impact on student outcomes. They called this the Pygmalion effect. The bottom line is that if we expect certain behaviors from people, we treat them differently - and that treatment is likely to affect their behavior. Thus, whether or not you think a trainee can succeed, you are probably correct and you will behave in a way that triggers/reinforces more of the same behavior on the part of the trainee. If you believe a trainee will not be successful, then this is the first in a series of actions that will trigger the set-up-to-fail syndrome. This interplay between teacher and trainee can be a vicious cycle and in order to successfully remediate a trainee, educators must adopt a growth mindset and create an environmental milieu to set the trainee up for success. We may point a finger at the learner and place blame on the learner when they do not succeed.

This session will challenge this notion and point out those teacher directed actions that contribute to this failure such as setting unrealistic expectations for the learner. The Stages of Change model challenges us to recognize that relapses of behaviors are a normal part of the growth process. During this session, we will also discuss strategies to overcome a group think philosophy in which a learner’s poor past performance is continually highlighted. We will challenge the audience to reflect on their own beliefs and assumptions about whether or not every trainee can really be successfully remediated. Participants will leave with a different perspective on remediation and hopefully internalize a growth mindset in regard to their trainees.

'First do no harm' - overdiagnosis and transitioning to the 'expert generalist'

AUTHOR(S):

- Oliver Morris, Southampton GP Education Unit, UK (Presenter)
- Laura Sheldrake, Southampton GP Education Unit, UK

ABSTRACT

Recognising and attempting to combat the dangers of 'Too Much Medicine' (1) is not new: Balint wrote in 1957 that 'there is danger, not only in missing a physical sign, but also in finding one'(2). Overdiagnosis presents significant risks to our patients, both the physical consequences of unnecessary investigation and treatment, and the emotional and psychological burden that can follow. Wider society also suffers as limited resources are consumed ineffectually, and diverted away from more appropriate interventions.

From our perspective as GP training programme directors, overdiagnosis has had little or no impact upon medical education at undergraduate or Foundation level. The exhaustive investigative approach typical to hospital-based medicine is of limited help to our trainees when faced with their first primary care consultations: (1) 'the art of doing nothing' (2), or even simply less, feels alien. Balancing the potential benefits and harms of action and inaction is a challenging skill to develop. There are significant forces at work, including unease with uncertainty, patient anxiety, societal expectations, external performance targets, 'awareness' campaigns and fear of litigation. We believe that a better appreciation of overdiagnosis will help rebalance these forces and aid our trainees' transition to 'expert generalists'.

We are introducing concepts of overdiagnosis to our training programme in various formats: 'Evidence Based Learning' sessions, 'Clinical Pearl' presentations and small group tutorials delivered by both trainees and programme directors. Overmedicalisation also arises spontaneously as a topic for discussion in small group work, triggered by cases brought by trainees.

We are interested in the views and experiences of other medical educators: is it time for overdiagnosis to feature more prominently in our medical curricula and at earlier stages of training?

A nationwide collaboration for student councils - the next big thing in student representation

AUTHOR(S):

- Erica Aldenbäck, OMSiS (Nationwide network for all student councils at the medical programmes in Sweden), Sweden (Presenter)
- Oskar Krakau, OMSiS, Sweden
- Josefin Wede, OMSiS, Sweden
- Nicole Laszlo, OMSiS, Sweden

ABSTRACT

Engaged medical students fill an important role in the continuous maintenance and development of our medical educational system. By both tradition and law, this realization is well established in Sweden. Over the past couple of years, committed students from Sweden's medical schools have taken student engagement even further. Our aim with this presentation is to convey what we have done, why it is a success and inspire to similar initiatives.

Sweden has seven medical educations and approximately 8000 medical students. Each university has a student council with the main purpose of reporting concerns as well as suggesting ideas of improvement. The student educational councils most commonly consist of appointed students representing each class. Furthermore, there are student representatives in all the various executive groups and committees of the faculty. This construction ensures that the student perspective is raised in all aspects of the education. Taking student engagement to the next level, all Swedish medical schools' education councils have collaborated since 2014 in a joint organization called OMSiS. This has three obvious benefits:

- 1) We gather information and solutions. The problems are often very similar across medical schools, however, ways of handling them usually differ. By discussing this we get inspired by solutions from each other and further improve different aspects of our education.
- 2) We also confer other areas such as course evaluations and clinical rotations, workshops and how we can improve mental health among students.
- 3) We are a strong representative voice for the Swedish medical students, resulting in OMSiS answering several memorandums from the government regarding national changes in the medical education system.

The collaboration is relatively easy to sustain and entails clear benefits. We now hope that we may encourage others to similar collaborations, leading to improved educational quality and increased student engagement throughout the world.

Let's learn from mistakes - also in education!

AUTHOR(S):

- Pekka Louhiala, University of Helsinki, Finland (Presenter)

ABSTRACT

According to a professor emeritus of medicine, a doctor who makes no mistakes sees too few patients. By analogy, I'd like to argue, a teacher who makes no mistakes, sees too few students. We learn new things in many ways, and one of the most important ways is learning from mistakes. This aspect of learning was first acknowledged in aviation and later in clinical medicine, but has so far not been very visible in the discussions concerning medical education (e.g. in the AMEE conferences).

In my presentation, I will describe some of my own mistakes in medical education and elaborate the lessons I have learned from them. One of the mistakes was subtle blaming the students in a situation where they were not responsible for the failure of the teaching session.

My main thesis is that we should be more open to learning from mistakes also in medical education. By creating an atmosphere, where we feel safe to discuss not only successes but also failures, we could help each other to become better teachers. This would enhance the learning of our students and in the long run be helpful to their patients also.

Student feedback should not influence medical school rankings - the current system is consumerising medical education, to the detriment of both educators and students

AUTHOR(S):

- Hamed Khan, St George's, University of London, UK (Presenter)

ABSTRACT

Student feedback has a decisive influence on medical school 'league table' rankings. In theory this is logical - after all, nothing motivates us more than seeing students inspired by our teaching. And teaching must be positively received to be effective. But in my opinion, the influence of feedback has become excessive, and detrimental, to both educators and students. This is compounded by the encroaching marketisation of education, which policies such as tuition fees have exacerbated.

Policymakers in universities associate higher rankings with greater prestige, which they hope will help attract more applicants, and lead to increased student numbers - and ultimately greater financial revenue. As student feedback weighs so heavily in these rankings, educators are encouraged to collect, address and improve it - regardless of its validity and the motivation behind it. Thus educators are forced to adopt a consumeristic approach towards students - where 'the customer is always right'. It becomes difficult to have honest - and sometimes difficult - conversations with students, to enhance their insight and justify teaching policies. In addition, the marketisation of medical-school education encourages rising expectations from students, which they feel entitled to because of their monetary contributions. This leads to a vicious circle, with student expectations, and feelings of entitlement, constantly rising - and educators under rising pressure to unquestioningly do whatever it takes to improve feedback. This fuels resentment and disillusionment amongst educators, who are motivated by their passion for teaching, and their subject of expertise - rather than generating revenue for their institution. This is why I believe that the impact of student feedback on university rankings should be removed - or at least reduced substantially.

Student feedback is fundamentally important - but it is driven by a complex array of factors. These need to be teased out and addressed with nuance and sophistication, rather than in a reactive 'populist' way.

Quality in Education - what does it really mean?

AUTHOR(S):

- Jo Brown, Barts and The London School of Medicine and Dentistry, UK (Presenter)

ABSTRACT

Much is written about quality in education (1) which forms an important part of the governance of every university, and yet what does it really mean? The term Total Quality Management comes from industry and yet has been borrowed by universities and applied to education.

This presentation will look at the changing culture in higher education, the rise of quality as a powerful concept and how quality has been adopted and adapted to manage education, sometimes in unhelpful ways. We shall look at what a subjective concept quality is and explore what quality in education really looks like (2) and what the key ingredients are to bring this about. We shall then attempt to build consensus in the room for a quality agenda and will end with a look at how one English medical school has made sense of quality.

Restriction of working hours - Do the residents appreciate?

AUTHOR(S):

- Ling-Yu Yang, Department of Medical Education, Taipei Veterans General Hospital, Taiwan (Presenter)

ABSTRACT

Taiwan healthcare authority has made policy to restrict residents' working hours to less than 88 hours per week total since 2014 and continuous working hours not more than 28 hours since 2017. Many medical educators, especially the surgical specialists, concern that the training quality and competency of the residents might be inadequate. However, the feedbacks from the trainees upon the policy are less advocated.

We did a general survey with group interviews to inquire opinions from the residents of different programs in a tertiary teaching hospital to assess the impact of restriction working hours on their changes in quality of life and competency of training. The opinions from different residency program cohorts were also compared. The residents, especially the senior residents, did feel restricting working hours had significantly improved their quality of life and decreased the risks of burnout syndrome. But they also concerned the policy might limit their learning intensity and delay the maturation of their professional development. The residents of surgical department did not appreciate the rigid confinement of their working hours. They were worried about their clinical competency and hoped the policy can be more flexible and can get reasonable money compensation from organization if they do the extra working hours.

The point of view is that we may not have a rigid working hour restriction policy for all disciplinary programs. It should be individualized according to the needs of specialist or sub-specialist programs.

#7H Short Communications - Curriculum: Entrustable Professional Activities (EPAs)

Evaluation of the AAMC's 13 Core EPAs

AUTHOR(S):

- Eric Meyer, USUHS, USA (Presenter)
- Steven Durning, USUHS, USA
- Sebastian Uijtdehaage, USUHS, USA
- David Taylor, Queen's University, Canada

ABSTRACT

Background: While Entrustable Professional Activities (EPAs) were originally conceived for graduate medical education, the Association of American Medical Colleges (AAMC) proposed 13 Core EPAs in 2014 for undergraduate medical education that defined 'key tasks' US medical students should be entrusted with when starting residency. Shortly after, concerns surfaced about whether these 'core EPAs' met the definition of an EPA. In 2015, a tool for assessing the quality of EPAs was published, named 'EQual rubric,' that used expert consensus to define the three quality domains of EPAs: EPAs as Discrete Units of Work; EPAs as Entrustable, Essential, and Important Tasks of the Profession; and EPA as an Educational Tool. The 14-item rating scale has high reliability and supportive validity evidence. In this study we will seek to determine how well the core EPAs meet quality standards and, if not, which aspects of each core EPA need to be improved.

Summary of Work: We designed an assessment tool that combined a training video on using the EQual rubric, descriptions of each of the AAMC's core EPAs followed by the EQual questions, and free text questions. We invited twelve of the most prolific EPA authors to complete the analysis, seven of which agreed - above the minimum requirement of four to achieve our desired reliability. The deadline for completing their analyses is May 2019.

Summary of Results: For each core EPA, we will describe the overall EQual score, noting whether each score was above or below the 'good EPA' cut-off. We will also describe the strengths and weaknesses of each EPA, indicating potential areas for improvement.

Discussion and Conclusions: The AAMC's core EPAs represent an important step for EPAs in UME: ensuring their quality is important.

Take-home Messages: Understanding the strengths and weaknesses of the AAMC's core EPAs should help guide future work.

Development of EPAs for Teaching in Undergraduate Medical Education

AUTHOR(S):

- **Harm Peters, Scheffner Center for Medical Education, Charité - Universitätsmedizin Berlin, Germany (Presenter)**
- Ylva Holzhausen, Scheffner Center for Medical Education, Charité - Universitätsmedizin Berlin, Germany
- Asja Maaz, Scheffner Center for Medical Education, Charité - Universitätsmedizin Berlin, Germany
- Jan Breckwold, Scheffner Center for Medical Education, Charité - Universitätsmedizin Berlin, Germany
- Anja Czeskleba, Scheffner Center for Medical Education, Charité - Universitätsmedizin Berlin, Germany

ABSTRACT

Background: Entrustable professional activities (EPAs) have emerged a useful concept to operationalize the tasks of physicians related to patient care. Teaching in various contexts represents also professional responsibilities of physicians. Aim of this study is to define teaching activities in undergraduate medical education using the EPA concept.

Summary of Work: The study was conducted at the Charité - Universitätsmedizin Berlin and builds on its competency-based, fully integrated undergraduate medical curriculum. A content validation process for teaching EPAs (t-EPAs) was conducted. This process was an iterative, systematic approach from task identification and definition of the supervision level to elaboration of task specifications and corresponding knowledge, skills and attitude (KSA). The approach involved interaction between an interdisciplinary writing team and a validation panel with content expertise.

Summary of Results: We identified 13 teaching activities in our undergraduate medical program to be conducted without direct supervision. The t-EPAs were organized in the overarching domains: classroom-based teaching (from facilitating a Problem-Based Learning group to giving a lecture) and workplace-based teaching (from training and supervising of early to final year clerkship students). Tasks of both groups are specified in a behavioral, step-by-step manner. In addition, the specification of class-room-based teaching activities follows the temporally schema: before, during and after the teaching session. The specification of workplace-based teaching activities is centered around the students' achievements on clinical EPAs. The KSA section was used to delineate what foundation and training in teaching is required to perform each of the teaching activity.

Discussion and Conclusions: The EPA concept allows a tangible and performance-based operationalization of the teaching activities in an undergraduate medical program. The t-EPAs may support especially new teachers to prepare and conduct their teaching tasks. The performance expectation is uniformly 'without direct supervision'.

Take-home Messages: Teaching EPAs may serve as tangible new approach to operationalize the performance expectation for teaching in undergraduate medical education.

First-year EPAs for Anaesthesia training - do trainees and supervisors agree?

AUTHOR(S):

- Jan Breckwoltd, University Hospital Zurich, Switzerland (Presenter)
- Adrian P. Marty, University Hospital Zurich, Switzerland
- Sarah Schmelzer, Zurich University of Applied Sciences, Switzerland
- Reto Thomasin, Kantonal Hospital of Winterthur, Switzerland
- Marco Zalunardo, University Hospital Zurich, Switzerland
- Donat R. Spahn, University Hospital Zurich, Switzerland

ABSTRACT

Background: Entrustable Professional Activities (EPAs) are proposed a promising concept for specialty training. Mostly, EPAs have been defined by education experts. However, if postgraduate training was conceptualized as an educational alliance, also the perspective of trainees should be included. This might raise concerns that trainees could overestimate their capabilities. Therefore, we let trainees of all stages and supervisors define EPAs appropriate for the first year of training in anaesthesiology.

Summary of Work: An expert group of 12 stakeholders (trainees, supervisors, and medical educators) drafted 16 EPAs potentially suitable for independent practice within the first and second year of training in anaesthesiology. Via an online survey all physician trainees and supervisors of two major teaching hospitals were invited to rate these 16 EPAs for appropriateness of independent execution by the end of the first, or the end of the second year of training ('1st-year EPA', and '2nd-year EPA'). Appropriateness was defined by more than 80% concordance between participants. Differences between first-year trainees, more advanced trainees, and supervisors were assessed.

Summary of Results: 23 first-year trainees, 98 advanced trainees, and 120 supervisors completed the survey (overall response rate 68%). In all groups consensus for '1st-year EPAs' was reached for the same seven EPAs. For one '2nd-year EPA' ('rapid sequence induction') all trainees found that it could be executed significantly earlier than supervisors did (Chi-square: 4.12, $p < .05$, binominal test $z = -1.73$, $p < .05$). For five '2nd-year EPAs' first-year trainees found that these could to be managed significantly earlier than advanced trainees did (e.g. 'rapid sequence induction': Chi-square: 11.46, $p = .001$, binominal test $z = 2.84$, $p < .001$).

Discussion and Conclusions: The views of first-year trainees on EPAs appropriate for the first year of anaesthesiology training did not differ from the views of advanced trainees and supervisors. Significant differences could be shown for a number of '2nd-year EPAs' which first-year trainees consistently found to be executed earlier than advanced trainees, or supervisors.

Take-home Messages: Our results support the hypothesis that trainees and supervisors have a similar view on the appropriateness of EPAs. However, first-year trainees might overestimate their capabilities compared to the view of more advanced trainees and supervisors.

Sequencing Entrustable Professional Activities through a whole-task model for instructional design: An early experience in a Latin-American medical school

AUTHOR(S):

- **Alvaro Enrique Romero Tapia, School of Medicine Universidad de La Sabana, Colombia (Presenter)**
- María Inés Maldonado, School of Medicine Universidad de La Sabana, Colombia
- Luis Carlos Domínguez, School of Medicine Universidad de La Sabana, Colombia
- Julio Cesar Garcia Casallas, School of Medicine Universidad de La Sabana, Colombia
- Nancy Patricia Jara, School of Medicine Universidad de La Sabana, Colombia
- Mónica María Díaz, School of Medicine Universidad de La Sabana, Colombia
- Pedro José Sarmiento, School of Medicine Universidad de La Sabana, Colombia

ABSTRACT

Background: Competency-based Medical Education (CBME) and the Entrustable Professional Activities (EPA) frameworks have confronted part-tasks models of instructional design. Both have started an academic conversation on the complexity of learning at the workplace, in order to develop integrated curriculum, while the compartmentalization and the 'paradox of transfer' are prevented. The Four-Component Instructional Design (4C/ID), a whole-task model, can contribute to overcome these challenges, bringing and translating these frameworks into practice. The evidence these contributions, however, is still limited. We present the early results of an experience in one medical school in Colombia.

Summary of Work: A self-assessment (2017), indicated high fragmentation on the intended knowledge, constituent skills and attitudes (KSA), high compartmentalization across basic and clinical disciplines, and recurrent use of traditional methods for teaching. These results encouraged to the faculty to reform the curriculum and move towards a CBME and EPA frameworks. Five task-forces of stakeholders developed the first component of the 4C/ID ('learning tasks'). They identified the main workplace-learning tasks (EPAs), the level of the entrustment decisions, as well as the indicators of performance and the assessment instruments across the new curricula. By using iterative discussions, the task forces lead to the main faculty to sequence these tasks until they reached a consensus.

Summary of Results: The 4C/ID contributed to thrive a reflection in the faculty on the fragmentation and compartmentalization in the curricula and build a shared vision of five workplace-learning tasks (EPAs). Sequence of these tasks contributed to diminish the length of the program to six years; and to prepare the faculty, students and organization to introduce new methods for teaching and assessment, and infrastructure, to ensure the level of entrustment decisions.

Discussion and Conclusions: CBME and EPA frameworks require translation into practice. Whole-task models are required in this endeavour. Our results illustrate an early experience to bring these frameworks, by sequencing workplace-learning tasks, indicators of performance and assessment across the curriculum. Further stages should include support, procedure information, and part task practice for each EPA.

Take-home Messages: The 4C/ID offer opportunities to bring CBME and EPA models together and translate them into practice. Change management and active participation of stakeholders is required in this process.

Using Entrustable Professional Activities (EPAs) as curriculum organizers in a major medical undergraduate curriculum renewal

AUTHOR(S):

- **Marcelo Garcia Dieguez, Instituto Universitario Hospital Italiano, Argentina (Presenter)**
- Eduardo Durante, Instituto Universitario Hospital Italiano, Argentina
- Sergio Giannasi, Instituto Universitario Hospital Italiano, Argentina
- Dolores Arceo, Instituto Universitario Hospital Italiano, Argentina
- Maria Laura Eder, Instituto Universitario Hospital Italiano, Argentina
- Marcelo Figari, Instituto Universitario Hospital Italiano, Argentina

ABSTRACT

Background: Outcome-based education has influenced curriculum design in the last decades. Competency-based medical education (CBME) is the prevailing method of outcome definition. However, concerns about CBME have appeared. EPAs are an effort to bridge the gap between the theory of competencies and practical clinical work. In our University, a major graduate curriculum renewal was implemented. Outcomes were defined as EPAs and used as curriculum organizers across the curriculum.

Summary of Work: **Aim:** To provide a description of the innovative use of EPAs as curriculum organizers in a curriculum renewal process **Methods:** This article describes the process of curriculum renewal at the Instituto Universitario Hospital Italiano (Argentina). A Curriculum Change Committee (CCC) designed and implemented a new integrated outcome- and community- based curriculum with an EPA based structure. In a three-year process,

Summary of Results: The graduate profile was defined taking into account the inputs from teachers, graduates, students and general population. This profile was converted into competencies. A set of EPAs, to address these competencies, was written based on available frameworks in the published literature and teachers' consultation. Finally, the 6- year curriculum was organized in three cycles: pre- clinical, clinical and internship. The integrated pre- clinical cycle was organized in six semestral modules around the life cycle and based on PBL and skills labs. Planning groups organized activities around EPAs. Every content, teaching activity or assessment must address one or more EPAs. In each module, the contents (biological, psychological, social etc) of PBL and skills lab activities were integrated using EPAs as curriculum organizers. The 'Professional Practice Lab' was the activity in which the EPAs of the week were completely integrated in order to play 'the whole game' in Perkins' terms. The new curriculum has finished successfully the first year of implementation. Early programme evaluation showed alignment with planned curriculum and high levels of student and teacher satisfaction

Discussion and Conclusions: This EPA- based framework for curriculum design shows the possibility of integration between competency-based curriculum and real tasks. Curricular development is an ongoing process and requires further evaluation.

Take-home Messages: Using EPAs framework as curriculum organizers guarantees a real outcome-based curriculum plan and implementation.

Arrested Development? Measuring Progression of Student Performance by Entrustable Professional Activity (EPA)

AUTHOR(S):

- Caroline Milne, University of Utah School of Medicine, USA (Presenter)
- Sonja Raaum, University of Utah School of Medicine, USA
- Katie Lappe, University of Utah School of Medicine, USA
- Danielle Roussel, University of Utah School of Medicine, USA
- Jorie Colbert-Getz, University of Utah School of Medicine, USA

ABSTRACT

Background: Accurate assessment of clinical skills is an essential component of competency based medical education. While it is anticipated that students' clinical skills will improve over time, there is a paucity of literature on how performance progresses across the clinical years. At the University of Utah School of Medicine our curriculum includes an internal medicine clerkship in year 3 and an advanced internal medicine rotation in year 4. We implemented the same Entrustable Professional Activity (EPA) aligned evaluation form in both internal medicine courses to allow measurement of skills progression across the clinical years.

Summary of Work: Internal Medicine faculty and residents rated students on a 0-4 scale for 7 EPA domains: patient interviewing, physical examination, clinical reasoning, clinical testing, documentation, presentation, and inter-professional teamwork. To date, 50 students have completed both the internal medicine clerkship (Y3 IMED) in AY17-18 and the advanced internal medicine rotation (Advanced IMED) in AY18-19. Students' average EPA domain ratings in Y3 IMED and Advanced IMED were compared with paired samples t-tests and the percentage of students who increased by half point or more for each EPA was computed to determine meaningful differences.

Summary of Results: Average ratings were significantly higher in Advanced IMED compared to Y3 IMED for each EPA, $p < 0.003$ for all comparisons. The percentage of students with ratings half a point higher or more from Y3 IMED to Advanced IMED was 50% for clinical reasoning, 48% for clinical testing, 40% for physical examination and presentation, 38% for documentation, 36% for teamwork, and 30% for patient interviewing.

Discussion and Conclusions: Average EPA ratings showed significant improvement from year 3 to year 4. However, meaningful differences were found for 50% or less of students. The lack of meaningful differences could be due to a number of factors: baseline grade inflation, rater inconsistency/biases, insensitivity of the instrument to detect subtle skills development, or plateauing of skills development in the clerkship curriculum.

Take-home Messages: Students' clinical skills significantly increase over time, but meaningful differences vary by student and EPA.

Design and assessment of an EPA based national residents training program: From theory to practice

AUTHOR(S):

- **Reinoud Gemke, Amsterdam University Medical Center, the Netherlands (Presenter)**
- Maaïke Smit, Erasmus University Medical Center, the Netherlands
- Janielle van der Velden, Radboud University Medical Center, the Netherlands
- Hein Brackel, Catharina Ziekenhuis, the Netherlands
- Matthijs de Hoog, Erasmus University Medical Center, the Netherlands

ABSTRACT

Background: Entrustable Professional Activities (EPA's) are broadly adopted in post graduate medical education (PGME), yet evidence about their feasibility in this context is limited. In the Netherlands, a national pediatric residents training program based on 9 generic EPA's was implemented in 2016, supported by 21 clinical presentations that signify reasons for consultation of a pediatrician. The program incorporates a structured process for monitoring and assessment of EPAs, enabling summative entrustment decisions. The objective of this paper is to assess experience with an innovative EPA based national pediatric PGME program.

Summary of Work: The procedure for uniform summative entrustment decisions (denoted as Evaluation and Assessment of Residents by Supervisors - EARS) was implemented with an educational program. The EARS-procedure comprises a prolonged observation period by at least 5 staff-supervisors to provide independent input, also including subjective elements (gut-feeling), enabling succinct Clinical Competency Committee (CCC) meetings with comprehensive feedback to the resident. For evaluation of the EARS-procedure, input from invitational conferences, feedback from pilot institutions and from implementation workshops was used.

Summary of Results: In 2 years 125 pediatric residents from all 8 Dutch residency regions were trained according to the new program. Application of EPAs as primary goals during PGME and a standardized EARS-procedure were well received by residents and staff. Residents adopted a more (pro)active attitude and a more focused approach for an EPA during their rotations. Despite increased preparation time, staff appreciated the EARS-procedure, enabling more robust high stakes summative entrustment decisions. Endorsed by the Royal Dutch Medical Association application of EPA's and the EARS-procedure are currently implemented in other national PGME programs.

Discussion and Conclusions: Issues to be addressed in further development include: Handling of disagreement in CCC meetings, Transferability of EPA's to other units/hospitals and Implementing supervision only on resident's request when an EPA has been obtained.

Take-home Messages: In this national pediatric PGME program, EPAs appear feasible tools to assess development, enabling individualized stepwise progress of residents toward unsupervised practice. A structured (EARS) procedure enables summative entrustment decisions in well prepared succinct CCC meetings. Broader application in other settings and/or countries requires adaptations to accommodate differences in health care systems and training programs.

Comparing psychometric characteristics of short-answer and multiple-choice questions in the NBME internal medicine subject examination

AUTHOR(S):

- Amy Morales, National Board of Medical Examiners (NBME), USA (Presenter)
- Polina Harik, NBME, USA
- Miguel Paniagua, NBME, USA
- Matthias von Davier, NBME, USA
- Justin Wolczynski, NBME, USA
- Brian Clauser, NBME, USA

ABSTRACT

Background: The NBME medicine subject examination is designed to provide standardized assessment of medical students' knowledge. In addition to traditional multiple-choice questions (MCQs), the 2018 administration included open-ended short answer questions (SAQs) that required examinees to type in their answer. The goal of this study is to compare MCQs with SAQs on psychometric characteristics such as item difficulty, discrimination and time intensity of questions.

Summary of Work: One hundred items were developed in MCQ and SAQ formats. Item vignettes described patients and their pertinent clinical information. For the MCQ format, examinees were asked to choose an answer from a given set of options. For the SAQ format, examinees were asked to answer the lead-in question such as 'What is the most likely diagnosis?' by typing their response in a free-text entry field. Each examinee saw only one format of an item, and each item was seen by more than two thousand examinees. Using natural language processing algorithms, examinee responses for the SAQs were matched to scoring keys developed by a group of subject matter experts. Item difficulty, discrimination, and the time it took examinees to answer the questions were compared for MCQ and SAQ items using standard statistical significance tests.

Summary of Results: Examinees spend slightly more time on SAQ version of an item than on an MCQ, and SAQs appear to be more difficult and discriminating than MCQs.

Discussion and Conclusions: In addition to the apparent face validity of SAQs, free-text response items have an added advantage of being more challenging and discriminating than the MCQs. A marginal increase in time intensity of SAQs as compared to MCQs should not significantly impact overall duration allotted for similarly-focused examinations.

Take-home Messages: Short free-text response items provide test developers with an opportunity to create more challenging items that better discriminate among examinees with different abilities. SAQs may enhance traditionally MCQs-based assessments because they (1) better reflect the need for making clinical decisions without the cuing that is inherent in the MCQ format and (2) eliminate the possibility of answering an item correctly simply due to chance.

Experts' responses in script concordance tests: A response process validity investigation

AUTHOR(S):

- Matthew Lineberry, University of Kansas Medical Center and Health System, USA (Presenter)
- Eduardo Hornos, Practicum Institute of Applied Research in Health Sciences Education, Spain
- Eduardo Pleguezuelos, Practicum Institute of Applied Research in Health Sciences Education, Spain
- Jose Mella, Practicum Institute of Applied Research in Health Sciences Education, Spain
- Carlos Brailovsky, College of Family Physicians of Canada, Canada
- Georges Bordage, University of Illinois at Chicago, USA

ABSTRACT

Background: The script concordance test (SCT), designed to measure clinical reasoning in complex cases, has recently been the subject of several critical research studies. Among other issues, response process validity evidence remains lacking. We explored the response processes of experts on an SCT scoring panel to better understand their seemingly divergent beliefs about how new clinical data alter the suitability of proposed actions within simulated patient cases.

Summary of Work: Ten Argentine gastroenterologists who served as the expert panel on an existing SCT re-answered 15 cases 9 months after their original panel participation. They then answered questions probing their reasoning and reactions to other experts' perspectives.

Summary of Results: The experts sometimes noted they would not ordinarily consider the cases' proposed actions at all (30/150 instances [20%]) or would collect additional data first (54/150 instances [36%]). Even when groups of experts agreed about how a case's new clinical data affected the suitability of a proposed action, there was often disagreement (118/133 instances [89%]) about the suitability of the proposed action before the new clinical data was introduced. Experts reported confidence in their responses, but showed limited consistency with their responses from nine months prior (linear weighted kappa = .33). Qualitative analyses showed nuanced and complex reasons behind experts' responses, revealing for example that experts were often considering the unique affordances and constraints in their varying local practice environments when responding. Experts generally found other experts' alternative responses moderately compelling (M = 2.93 on a 5-point scale, where '3' is 'moderately compelling'; SD = 0.80). Experts switched their own preferred responses after seeing others' reasoning in 30/150 (20%) instances.

Discussion and Conclusions: Expert response processes were not consistent with the classical interpretation and use of SCT scores, as their reasoning shows nuanced considerations and inconsistencies that are not captured by the classical SCT methodology. However, there are several fruitful and justifiable alternatives for using SCT-like methods going forward, such as to guide assessments for learning.

Take-home Messages: For those exploring experts reasoning in complex cases, this study suggests the value of bringing new curiosity about how experts respond to SCT cases, along with skepticism about past methods for scoring and judging such reasoning.

Does subjectivity play a role on the correlation of written exams with continuous assessment? A third year pilot study at the Lisbon School of Medicine

AUTHOR(S):

- Nuno Lupi Manso, Lisbon School of Medicine, Universidade de Lisboa, Portugal (Presenter)
- Paulo Nogueira, Lisbon School of Medicine, Universidade de Lisboa, Portugal
- João Eurico da Fonseca, Lisbon School of Medicine, Universidade de Lisboa, Portugal
- Madalena Patrício, Lisbon School of Medicine, Universidade de Lisboa, Portugal

ABSTRACT

Background: A variety of formats are used at the Lisbon School of Medicine to assess undergraduate medical students in the different curricular areas. This pilot-study aims to identify if 1. Continuous assessment correlates with written exams; 2. Subjectivity in continuous assessment influences the correlation between continuous assessment and written exams; 3. The correlation between continuous assessment and written exams is stable in Semester 1 and 2. Introduction to the Clinic (IC) and Oncobiology (O) were the selected curricular areas for this study because in both cases the final written exams address the contents of practical classes where tutor/student ratio is 1/12. However, although in both areas criteria are clearly defined for continuous evaluation, tutors' decision is differently supported: while in O there is a short written text in each practical class, in IC there is no such objective data.

Summary of Work: Students' grades (O=385; IC_Semester1=332 / IC_Semester2=336), were used in SPSS analysis. Scatter plots were obtained and Pearson and Spearman correlation coefficients calculated.

Summary of Results: Significant linear correlations between continuous assessment and written exams, with high variability, were found for O ($r_2=0.269$, Spearman's $\rho=0.565$) and for IC in both semesters (Semester1 $r_2=0.149$, Spearman=0.381 Semester2 $r_2=0.04$, Spearman=0.195). Correlation was stronger in O, when compared to either semester in IC. Variability was similar in both areas.

Discussion and Conclusions: While limitations exist in the current analysis, the fact that continuous assessment in O partially relies on an objective measure of performance may justify a stronger correlation with the exam grade, when compared to IC. As a follow-up to this analysis, it would be interesting to compare each student to himself/herself for each curricular area (as a control) as well as to determine the correlation of continuous evaluation in each curricular area with the student's global grade average.

Take-home Messages: The fact that the degree of subjectivity underlying tutors' continuous assessment appears to influence the correlation with written exams, urges teachers to define transparent and objective criteria for continuous assessment.

The mistakes we have made in constructing written questions and how you can learn from them

AUTHOR(S):

- Ellinor Kenne, Karolinska Institutet, Sweden (Presenter)
- Wilhelmina Ekström, Karolinska Institutet, Sweden
- Charlotte Leanderson, Karolinska Institutet, Sweden
- Riitta Möller, Karolinska Institutet, Sweden

ABSTRACT

Background: Written assessments are largely used in the assessment of learning in medical education. Although constructing written questions is a common task for teachers less attention is given to the quality assurance of the questions itself. The aim of this study was to explore the quality of summative written assessments in an undergraduate medical program. The written assessments at the studied medical school have never previously been evaluated by teachers from different disciplines.

Summary of Work: Peer review of written assessments was conducted by the curriculum committee (CC), comprising 20 senior teachers from all semesters of the program. The committee includes both basic scientists and clinical teachers facilitating collaboration and dialogue across disciplines. Six written summative assessments from basic science and clinical courses were selected for a detailed analysis. The comments were documented and categorized in consensus by the authors.

Summary of Results: The most common flaws were categorized in three groups: 1) Indistinct wording, i.e., the questions were inaccurate and/or difficult to understand. Moreover, the wording was sometimes unnecessarily long including information not needed to answer the question; 2) Unclear point value of questions, or that a point value of a question did not match that of other questions in the same exam; 3) In SBA questions, that distractors were not homogenous or plausible.

Discussion and Conclusions: The primary aim of testing is communicating what is considered important. We show that peer review of summative assessments may identify mistakes not noticed by those involved in the examination. In addition, it will help teachers grasp how exams align with learning outcomes and how questions are perceived by teachers from other areas. Advantages of the peer review included dialogue between basic scientists and clinicians that may bridge possible gaps between study years and disciplines as well as identification of relevant knowledge.

Take-home Messages: Peer review of written assessments is highly recommended as an addition to faculty development in question writing. Think ahead how you will score your assessment!

Content Validity Assessment after Syllabus Revision

AUTHOR(S):

- **Agneta Månsson Broberg, Karolinska Institute, Sweden (Presenter)**
- Charlotte Leanderson, Karolinska Institute, Sweden
- Wilhelmina Ekström, Karolinska Institute, Sweden
- Peter Henriksson, Karolinska Institute, Sweden
- Riitta Möller, Karolinska Institute, Sweden

ABSTRACT

Background: The medical program at the Karolinska Institute performed a major revision of most syllabi to secure a consistent structure for summative assessment of all national learning outcomes. The revised syllabi were based on taxonomic categorization of course-specific learning outcomes (csLO) and followed by a revision of written assessments. Our study aims to describe the relation between the revised syllabi and the yet unrevised summative assessments.

Summary of Work: 80% of the basic course leaders participated (n=12) in an interactive workshop (WS1) where the task was to relate every single item of their summative assessment to the csLOs and to perform a taxonomic levelling. The results were discussed and analysed in relation to the new course syllabus and presented at a second workshop (WS 2).

Summary of Results: csLO were summatively assessed in by the written exam in 58% of the PBCs. In 33 % individual items were predominantly constructed at a too basic level in relation to the taxonomic levelling of the revised syllabi.

Discussion and Conclusions: Eith this study we point out the need of revision of all associated summative assessment of all LO is crucial. The course teams internal analysis' resulted in rerevision of syllabi in 2 cases, revision of item construction in 4 cases, and total transformation into a true outcome based assessment in 1 case.

Take-home Messages: Assessing content validity with blueprinting and taxonomic levelling of summative assessments is fruitful in follow-up quality control after syllabus change. Well-structured syllabi contribute to the creation of constructive alignment, but only in resonance with the summative assessments.

The Role of Narrative Medicine as a Didactic Resource in Humanistic Education of Medical Students

AUTHOR(S):

- Pablo Blasco, SOBRAMFA - Medical Education And Humanism, Brazil (Presenter)
- Maria Craice De Benedetto, SOBRAMFA - Educação Médica e Humanismo, Brazil
- Dante Gallian, Escola Paulista de Medicina - Universidade Federal de São Paulo (UNIFESP), Brazil

ABSTRACT

Background: The biomechanical model of teaching and practice of medicine is responsible for innumerable advantages to patient care. For not considering the subtle dimensions of human being, so important in the way individuals become ill and in healing processes, such a model presents limitations and may have contributed to the dehumanization in public and private health observed in our country, Brazil. Strategies to address the issue depend on the presence of well-trained health professionals from a technical and humanistic point of view. The greatest deficiencies concern humanistic education.

Summary of Work: The object of this study was an elective discipline named Narratives in Health - a way to humanization, which was addressed to two groups of twenty-five students of a public medical school in São Paulo, Brazil, in which narratives - reports of heart transplant recipients and their relatives, medical narratives emerged in Palliative Care and literary narratives - were used to promote reflexion about humanistic questions. The data were collected from three sources: participant observation, interviews of students obtained through Oral History Approach and narratives presented by students in a narrative session. Data were interpreted by immersion/crystallization techniques.

Summary of Results: From data emerged subtopics, which were organized in major themes: from the death to the rebirth of narrative; breaking the isolation to recognize emotional issues; empathy; hidden curriculum; from narratives to humanization.

Discussion and Conclusions: The results of didactic experience show that, in a short period, it was possible to cover many of the essential issues that permeate the life of health professionals. The narratives represented a stimulus and a means for reflection, favouring an improvement of interpersonal relationships, the contemplation of affectivity and the recognition of the constant need for searching meaning in health practices.

Take-home Messages: Stimulating reflexion about difficult issues in medical students and giving them resources for that is a powerful instrument to educate humanized doctors.

Humanities in Medicine and the Art of Healing: Shared experience of integrating Humanities in Medical Residency Training

AUTHOR(S):

- **Abd Moain Abu Dabrh, Mayo Clinic Florida, USA (Presenter)**
- Stephen Trigg, Mayo Clinic Florida, USA
- Chrysanthe Yates, Mayo Clinic Florida, USA
- Elizabeth Mattson, Mayo Clinic Florida, USA
- Tara Brigham, Mayo Clinic Florida, USA
- Nell Robinson, Mayo Clinic Florida, USA

ABSTRACT

Background: Humanities in Medicine (HiM) uses the arts, literature and other cultural disciplines as strategies to enhance critical thinking, communication skills, empathy and work-life balance for all stakeholders in healthcare and medical education (MedEd). There is paucity in evidence about structure, integration, and sustainability of multi-faceted HiM curricula into MedEd.

Summary of Work: 1- The Family Medicine Residency Program (FMRP), in collaboration with its Center for Humanities in Medicine, at Mayo Clinic Florida (MCF) established the FM-HiM program as part of the FMRP core curriculum. 2- The structure involves one hour sessions held monthly on campus, and four half-day sessions held quarterly offsite; faculty and trainees (participants) experience different types of humanistic activities; examples of established activities include visits to museums and musical venues, painting, sculpting, music therapy, meditation, yoga, using horticulture, and Medical Improv. These activities build on community partnerships and collaborative educational work with various cultural institutions. 3- These activities aim to encourage creative self-expression, increasing workplace joy through shared experiences and promoting work-life balance. 4- Concurrently, the educational goals emphasize communication skills and professionalism milestones growth. 5- At the end of each seminar, attendees interpret HiM activities and share stories in narrative, reflective essays.

Summary of Results: FM-HiM was established in 2012; due its highly-perceived value by participants, the program has grown from biannual offerings to its current format. Through pre/post reflective, short surveys, participants consistently expressed high ratings of joy, satisfaction, and a sense of minimized burden. We also solicit participants opinions and ideas for future HiM activities to encourage a sense of belonging and inclusion.

Discussion and Conclusions: Current MedEd prepares trainees to become clinicians, with empirical focus on medical and technological advancements and regulations. This may inadvertently provided a culture that undermines the true healing mission of medicine, leading to higher prevalence of burnout. Through this quality improvement experience, implementing HiM as part of core curricula provides opportunities for self-growth, exploration, creative expression, understanding of empathy as well as the professional environment; the same goals of core competencies and milestones of MedEd.

Take-home Messages: HiM complements MedEd and training by supporting the growth of a 'humane clinician;' thus, HiM and the practice of medicine are synergistic.

Person-centred Art Experiential -The Medical Student's Journey Within

AUTHOR(S):

- **Ying Pin Toh, National University Hospital Singapore, Singapore (Presenter)**
- Elizabeth Mei Qi Chan, National University Hospital Singapore, Singapore
- Jasline Xin Ying Chua, National University Hospital Singapore, Singapore
- Vivian Wong, Assisi Hospice, Singapore
- Choon Ling Lian, Freelance, Singapore
- Victor Weng Keong Loh, National University Hospital Singapore, Singapore

ABSTRACT

Background: Creative art has been demonstrated validate a learner's individual experiences and emotions in patient encounters and facilitates perspective taking. This study seeks to understand the students inner experience in reflecting on their patients journey through art.

Summary of Work: Third-year medical students were invited to participate in a half-day person-centred art experiential. Participants were invited to select a patient and were given a person-centred reflection tool to guide their reflections. These events were held in groups of 6-8 facilitated by 2 trained art therapists, who explained the use of art for reflection, and introduced collage as the art directive. Audio-recording of the students sharing at the end of the art experiential was transcribed by a third party and anonymised. Transcripts and students reflective notes were coded and thematically analysed.

Summary of Results: Students expressed that the art experiential provided a safe, comfortable and free space where they could trust their feelings and opinions would be dealt with sensitively and with respect. The experience was described as therapeutic and cathartic, and in the words of a student as though the wall in my heart had been broken down. The art-making engaged their visual senses facilitating the processing of the affective aspects of their experience, allowing them to face their own vulnerability and humanity in the face of their patients illness and suffering. Some students approached the art-making as creating a legacy to commemorate patients who passed on, providing closure.

Discussion and Conclusions: Art-making provides rich and deep reflective experience for students, it facilitates the development of students self-awareness and validates of their own responses to their patients journey thus keeping them human in the face of an increasingly technically complex healthcare environment. Whilst students are constantly challenged with cognitive overload in training for clinical competencies, it is also crucial for educators to remember that students and doctors are first and foremost human and need a safe space to express and process their day to day clinical experiences.

Take-home Messages: Art-making engages the visual and tactile senses to facilitate reflection, allowing participants to engage their affective selves. The art reflective exercise allowed students to connect with their own and their patients humanity.

The “Vertical Domains” at the University of Minho Medical Course: a longitudinal experience of student immersion in humanities applied to clinical practice

AUTHOR(S):

- Nadine Santos, University of Minho, School of Medicine, Portugal (Presenter)
- João Bessa, School of Medicine, University of Minho, Portugal
- Pedro Morgado, University of Minho, School of Medicine, Portugal
- Nuno Sousa, School of Medicine, University of Minho, Portugal
- João Cerqueira, School of Medicine, University of Minho, Portugal
- Cecília Leão, School of Medicine, University of Minho, Portugal

ABSTRACT

Background: Based on a person-centred anthropological model the University of Minho Medical School (Braga, Portugal) has been a pioneer in the implementation of an holistic medical education in its curriculum. The 'concept' of humanism emerges as a genuine concern of the School in its strategy for the centrality of the human person at the core of learning. This humanist vision is formally inscribed in the study plan in the 'Vertical Domains (DV)' curricular units -termed DV1, DV2, DV3, DV4 and DV5, corresponding to each year of studies.

Summary of Work: In each year of studies, across the 5 formative years, the student is exposed, per year, to 9 separate sessions, of 4hrs each, across the modules 'Ethics, Bioethics and Scientific Integrity', 'Forensic Medicine', 'History of Medicine', 'Arts and Literature', 'Palliative Medicine and Human Integrity' and 'Workshops in Medical Humanities'. Each session starts by either a short seminar, a film visualization, or a book reading, followed by group work, and, finally, a final interactive discussion. Topics covered include medical ethics, human rights, art, literature, creeds and religions, solidarity and citizenship. It also includes two moments of workshops.

Summary of Results: Every year the students perception on the functioning of the DVs is collected via a questionnaire. The results are overall very positive, encouraging the continuity of these units in the medical course. In the most recent 6 years, on average, 89% of students ranked the Vertical Domains curriculum as Excellent.

Discussion and Conclusions: In addition to students satisfaction with this pedagogical format of integrating humanities education into their training, it is our conviction that we are contributing to the formation of more educated health professionals with values, knowledge, sensitivities, attitudes and behaviours in future medical professionals who will certainly be active promoters for humanisation in health care.

Take-home Messages: Are strong points of approach the curricular integration between the DVs, and across the school years, with the curricular units, fomenting the student learning at all levels. In terms of Awareness Indicators, it is of note the positive perception of the DVs by the students and the positive informal feedback regarding the attitudes and caring displayed by the students in the clinical context.

Evaluation of Medical Humanities Course in College of Medicine Using the Context, Input, Process, and Product (CIPP) Evaluation Model

AUTHOR(S):

- So-young Lee, Seoul National University College of Medicine, Republic of Korea (Presenter)
- Seung-Hee Lee, Seoul National University College of Medicine, Republic of Korea
- Jwa-Seop Shin, Seoul National University College of Medicine, Republic of Korea

ABSTRACT

Background: The College of Medicine of the Seoul National University has provided a new Medical Humanities Course on the basis of the competence-based curriculum since 2016 in order to improve the quality of the education. In this study, course of medical humanities was evaluated by the Context, Input, Process and Product (CIPP) evaluation model, based on a representative education evaluation theory, in order to identify the aspects requiring improvement.

Summary of Work: This study analyzed the course of medical humanities, provided to the freshmen and sophomores in 2017 and to the freshmen, sophomores, and juniors in 2018. Firstly, an evaluation criteria and indicator were developed according to the CIPP classification. The materials collected from the course were analyzed by the data analysis spiral according to the evaluation criteria. An independent sample t-test was performed to verify the difference in the responses between the students and the professors. In addition, a correlation analysis and a multiple regression analysis were performed to analyze the relationships between the detailed elements of the context, input, process, and product.

Summary of Results: The results of the survey on Medical Humanities Course showed that responses of students were more positive in 2018 than in 2017. In the context evaluation, the goal of the class was clear. In the input evaluation, the methods of education were appropriate. The product evaluation showed that the satisfaction to the education course and the students academic accomplishment were high. However, in the overall result of the analysis, there was a difference in the opinions of professors and students.

Discussion and Conclusions: The results of this study showed that there is a difference in the recognition of the overall CIPP elements between the students and the professors. Therefore, the school and the professors should effort to elevate the students appreciation for the courses related to humanities and social medicine and to motivate the students in this regard.

Take-home Messages: Evaluation result of Medical Humanities Course in College of Medicine Using the CIPP Evaluation Model, there was a difference in the opinions of professors and students in most of the criteria.

Evaluation of a novel workshop to improve students' confidence in dealing with challenging workplace culture: a pilot study

AUTHOR(S):

- Louise Nash, University of Sydney, Australia (Presenter)
- Kimberley Ivory, University of Sydney, Australia
- Karen Scott, University of Sydney, Australia
- Paul Dwyer, University of Sydney, Australia
- Claire Hooker, University of Sydney, Australia
- Sabrina Pit, University of Sydney, AUstralia

ABSTRACT

Background: Mistreatment, burnout, depression, safety and suicide among healthcare trainees and students are significant concerns. Applied theatre is often used to air difficult social issues, including in healthcare. Sydney Arts and Health Collective developed the verbatim theatre play *Grace Under Pressure* from health professionals' personal stories, which premiered, with great success, in Sydney in 2017. A teaching package using short video excerpts and interactive exercises to prompt guided discussion of significant issues was developed and trialled in workshops with healthcare students. We explored whether the workshops helped students critically reflect on healthcare culture and develop personal awareness and supportive strategies.

Summary of Work: In October 2018, two workshops were held with nursing, medical and allied health students at the University Department of Rural Health in Lismore, Australia. These were evaluated through pre-/post-surveys comprising demographic items, four five-point Likert-scale items (concerning perceptions of confidence in seeking help for depression, understanding mandatory reporting laws of health professionals, seeking help with mistreatment, and not driving when tired) and three free-text items seeking suggestions for improvement. Improvement and decline in confidence/understanding were measured by change of at least one point on the five point Likert-scale. Qualitative data were analysed using content analysis.

Summary of Results: Workshop One comprised 49 students from allied health, medicine and nursing. Workshop Two comprised 16 medical students. There was improvement in confidence in all closed-item topics, but each also showed a smaller percentage of decline. Understanding mandatory reporting laws improved most (36/63 students, 57%), but there was some decline (6/63, 10%) and some remained the same (21/63, 33%). Free text analysis showed students valued the use of real stories and interdisciplinary discussions, and wanted more information on mandatory reporting. 'Tiny tips' about interventions by bystanders to prevent bullying were well received.

Discussion and Conclusions: Theatre-based workshops can help students reflect on issues in healthcare culture and develop supportive strategies. Some lost confidence in workshop topics, possibly through increasing appreciation of issues' complexities, following the 'conscious competence' learning model.

Take-home Messages: Theatre-based workshops on challenging situations may help improve students' confidence in managing complex professional issues and promote changes in workplace culture.

The impact of a Work-life Balance (WLB) assessment on doctors' continuing professional development and performance

AUTHOR(S):

- **Jeremy Ferguson, Blackmore Vale Practice, UK (Presenter)**
- Kerry Ball, Research Consultant and Senior Lecturer in Education, University of Winchester, UK
- Duncan Walling, FourteenFish, UK
- Samantha Scallan, GP Education Unit, UK
- Johnny Lyon-Maris, GP Education Unit, UK

ABSTRACT

Background: Clinician wellbeing, stress and burnout have been the focus of increasing research activity in recent years and is an area of educational development for intervention /support. This is in recognition of the impact of clinician health and wellbeing on performance, and caregiving ability for patients. There is a growing body of literature around medical student and trainee experiences, however less in relation to post-qualification experience and support as part of continuing professional development.

Summary of Work: The present work sought to embed an opportunity for reflection on GP health and wellbeing in the appraisal discussion. A series of questions concerning work-life balance (WLB) (n.26) were added to an online appraisal portfolio to gather information on the impact of clinical work on GPs and allow users an opportunity to think about this in relation to their own experience. Appraisees' views of the value of these questions was also evaluated using a qualitative approach. This work presents findings from data gathered and reflection on the value of this opportunity by appraisees.

Summary of Results: 1046 GPs provided information on aspects of their work-life balance. Descriptive analysis of the data indicated that there was a blurring of boundaries between the two, where home life activities would be impacted by work demands, and areas where there was 'work leakage' for example working through lunch. Further statistical analysis is underway to identify deeper trends and relationships within the data. 88% of participants found the WLB questions useful for reflection, in particular to think more deeply about different aspects of WLB, and to compare their answers with their peers. The questions served to surface issues the participants were aware of, and for some, to prompt change or the intention to change.

Discussion and Conclusions: The appraisal discussion presents a golden opportunity to reflect on the demands of clinical work and their impact, as well as to support positive behaviour change.

Take-home Messages: GP health and wellbeing should form an area for discussion in appraisal, beyond the standard requirements of a health declaration. The appraisal interview can act as a driver for change.

Fostering organizational compassion in the ICU through the Three Wishes Project

AUTHOR(S):

- **Meredith Vanstone, McMaster University, Canada (Presenter)**
- Marina Sadik, McMaster University, Canada
- Marilyn Swinton, McMaster University, Canada
- France Clarke, McMaster University, Canada
- Feli Toldedo, St. Joseph Healthcare Hamilton, Canada
- Deborah Cook, McMaster University, Canada

ABSTRACT

Background: Clinicians working in the ICU are at substantial risk of compassion fatigue, vicarious traumatization, and burnout. Current descriptive and interventional research on burnout tends to focus on individual solutions, rather than the organizational and structural contributors to occupational distress. Heeding the call to recognize systemic contributors to burnout, we describe multi-center implementation of the 3 Wishes Project (3WP), a simple intervention designed to humanize end-of-life care for patients dying in the ICU, their family members, and their clinicians. In this study, we focus on the ways in which this project has succeeded in fostering compassion in three Canadian ICUs, while also improving clinician experiences of the workplace. This research asks: how does the 3WP influence the way ICU clinicians experience and exhibit compassion at work?

Summary of Work: After implementing this end-of-life project in hospitals in Hamilton, Toronto, Vancouver (Canada), we used a qualitative descriptive approach to collect interview and focus group data. We performed thematic analysis on transcripts of 10 clinician focus groups and 19 manager interviews. We used the theoretical framework of Organizational Compassion to orient ourselves to the ways that individuals experience distress and exhibit compassion within their place of employment.

Summary of Results: The 3WP is described as valuable because it supports clinicians to recognize and demonstrate latent compassion lost in the transactional or stressful aspects of practice. The project fosters ways for clinicians to re-discover and demonstrate their innate compassion by: giving clinicians a programmatic vehicle to connect with patients and families beyond performing technical tasks; offering opportunities to provide care for patients and families when cure is no longer possible; and acknowledging, then addressing, the suffering that they witness every day.

Discussion and Conclusions: The 3 Wishes Project is an example of an organizational intervention which can improve clinician experiences of work by creating pathways through which to forge meaningful, human connections with colleagues, trainees, patients and family members. By encouraging a different way of engaging, the 3WP helps clinicians to more fully experience how their daily work aligns with the central mission of their healing vocation.

Take-home Messages: - Burnout requires an organizational response - 3WP demonstrates value in recognizing and eliciting organizational compassion.

Developing and piloting a well-being program for hospital-based physicians

AUTHOR(S):

- Maarten Debets, Amsterdam UMC, AMC, the Netherlands (Presenter)
- Kiki Lombarts, Amsterdam UMC, AMC, the Netherlands
- Nathalie Hugenholtz, Veiligheid NL, the Netherlands
- Renée Scheepers, Erasmus University, the Netherlands

ABSTRACT

Background: Physicians' well-being is under pressure, likely harming patients, the physician workforce and healthcare systems. Well-being related problems are primarily caused by factors in the work environment. However, most well-being interventions focus on improving individual physicians' skills and on reducing burnout. By focusing on cultivating positive work environments, all physicians are stimulated to thrive. We describe the development and pilot outcomes of a well-being program for hospital-based physicians in the Netherlands.

Summary of Work: From October 2016, the program was developed in three consecutive steps: literature review, needs assessment and design. The program was designed using the JD-R framework and consisted of: an online well-being and work environment assessment, facilitated team discussions and team training job crafting. Team meetings used the appreciative inquiry method. That is, focusing on identifying what is working well and doing more of it. Next, the program was piloted from April until September 2017.

Summary of Results: In total, 352 physicians from multiple hospitals completed the assessment. We pilot tested four facilitated team discussions and two job crafting training sessions. Physicians' experienced the program as feasible and applicable in the medical work environment. Assessment questions were recognizable and represented physicians' work. Physicians valued discussing well-being and their work environment in a structured, theory-based way. Knowledge sharing and discussing personal interests led to practical well-being improvement plans. Physicians experienced team training as positive due to gained insights in their own and colleagues' weaknesses, strengths and preferences. Hence, some exchanged tasks accordingly.

Discussion and Conclusions: The program developed seems to offer a flexible system to monitor, maintain or enhance physicians' well-being in various work context. Physicians experienced time investment for the meetings as a barrier. However, after completion of their well-being assessment, teams were more prone to participate in the facilitated discussions. This indicates that initiating an assessment might contribute to a culture in which well-being can be discussed or problems are revealed that need to be addressed.

Take-home Messages: 1) Hospitals are recommended to provide and sufficiently facilitate well-being programs for physicians. 2) Careful attention should be paid to initiating well-being measurements, its consequences and follow-up.

Where have all the doctors gone? The UK Foundation Programme careers destination survey 2011-2018

AUTHOR(S):

- Clare Van Hamel, UK Foundation Programme, UK (Presenter)
- Mike Masding, UK Foundation Programme, UK
- Alexander Hollis, UK Foundation Programme, UK
- Oluseyi Adesalu, UK Foundation Programme, UK
- Russell Smith, UK Foundation Programme, UK
- Clare McKenzie, UK Foundation Programme, UK

ABSTRACT

Background: The UK Foundation programme undertakes an annual careers destination survey of doctors at the end of their second year of practice. We assessed trends over 8 years in their self-reported career intentions.

Summary of Work: Every year between 2011 and 2018, all UK Foundation Year 2 (F2) doctors were surveyed about their career intentions. The number of responses ranged from 6,407 (86.8%) to 7,168 (95.2%). The data were recorded and analysed to assess trends.

Summary of Results: The number of F2 doctors reporting that they will directly enter specialty training has fallen year on year from 4,908 (71.3%, 2011) to 2,415 (37.7, 2018), with numbers choosing to remain in the NHS workforce also decreasing from 5,479 (79.6%, 2011) to 3,927 (61.3%, 2018). The proportion of F2 doctors choosing to do non-NHS work has increased from 206 (3%, 2011) to 577 (9%, 2018), whilst there has also been a marked increase over time in doctors leaving medicine or taking a career break from 324 (4.7%, 2011) to 948 (14.8%, 2018). The number of doctors indicating they will work abroad remained unchanged over this time period (819, 11.9% in 2011, 724, 11.3% in 2018).

Discussion and Conclusions: We report the results of a unique national survey of the career intentions of doctors following completion of FY2. These results highlight a steady decrease in the number of doctors who are intending to directly enter specialty training and remain in the NHS workforce post foundation training. Equally concerning is the significant increase in foundation doctors who are intending on leaving the profession or taking a career break away from medicine. These findings are in contrast to the current popular narrative that declining specialty training numbers are simply due to doctors leaving to work abroad.

Take-home Messages: After finishing their second year of UK practice:

- The numbers of doctors who remain working in the NHS is decreasing.
- The numbers of doctors going into non-NHS work is increasing.
- The numbers of doctors leaving medicine or taking a career break is increasing.
- The numbers going abroad is static, there is no evidence of an increasing international 'brain drain'.

Applied Drama Techniques in Obstetrics: Development of a Novel Educational Workshop to Improve Obstetrician Awareness of Compassion, Communication and Self-Care around the time of Stillbirth

AUTHOR(S):

- Aisling Smyth, Royal College of Physicians of Ireland (Presenter)
- Karen McNamara, Cork University Maternity Hospital, Ireland
- Lucia Prihodova, Royal College of Physicians of Ireland
- Chris Fitzpatrick, Coombe Women and Infants University Hospital, Ireland
- Keelin ODonoghue, The Irish Centre for Fetal and Neonatal Translational Research, Ireland

ABSTRACT

Background: Obstetricians have described feeling shocked, sad, isolated, afraid, angry and traumatised in the aftermath of a stillbirth. Despite the considerable impact that involvement in a stillbirth has on obstetricians, existing research shows that few if any at all receive adequate training in how to care for parents in the aftermath of a stillbirth, or training in self-care skills.

Summary of Work: Ireland's national theatre, the Abbey Theatre and, the Royal College of Physicians of Ireland collaborated to develop an innovative educational intervention for trainees in Obstetrics. It was designed using blended narratives from parents and obstetricians who had experienced a stillbirth and utilised applied drama techniques. The aim of this study was to evaluate this new workshop.

Summary of Results: Of those who attended 38/59 (66%) trainees completed the workshop evaluation questionnaires. Most had received no prior training in the management of stillbirth. Following the workshop, trainees reported a statistically significant improvement in key skills and attributes with respect to stillbirth management; 1)breaking bad news, 2)communicating clearly with the family when breaking bad news, 3)communicating empathetically with the family when breaking bad news, 4)recognising the emotional needs of the family, 5)recognising their own emotional responses and 6)supporting their colleagues. Trainees were very positive about the course content with all bar one trainee advising that they would recommend this course to a colleague.

Discussion and Conclusions: This study evaluated the impact that attendance at a novel educational workshop had on improving obstetricians' awareness of compassion, communication and self-care around the time of stillbirth. The workshop was positively received. We identified a subjective improvement in some of the key skills that obstetricians must have when caring and communicating with parents who are bereaved. We also identified a subjective improvement in how trainees recognise their own emotional responses and support their colleagues in the aftermath of a perinatal death.

Take-home Messages: There is a need for structured support and training for obstetricians to access to assist in their management of stillbirth as well as managing their own emotional needs. New novel training programmes, that utilise different teaching methods may have a role to play in medical education in the future.

Permanent health education workshops: a learning process with the use of active methodologies

AUTHOR(S):

- **Luiza Forte, Faculdades Pequeno Príncipe, Brazil (Presenter)**
- Margareth Grassani, Faculdades Pequeno Príncipe, Brazil
- Patricia Rauli, Faculdades Pequeno Príncipe, Brazil
- Fernanda Biernatski, Faculdades Pequeno Príncipe, Brazil

ABSTRACT

Background: The complexity of health work requires workers to constantly improve their work practices. Continuing education brings in its scope the need for the development of workers as well as the expansion of the resolution of health problems of the population. Thus, teaching-learning processes need to be aligned with the reality of work, proposing problematization, dialogue and bringing Brazilian public policies closer to the singularities of people, communities and workers. This work was carried out with 553 workers: physicians, dentists, nurses, pharmacists, community health agents, psychologists, physical educators and social workers in a municipality in the State of Paraná, in the form of workshops using active teaching-learning.

Summary of Work: Method: Eight workshops were held. The topics covered the national policy of humanization: principles, methods, guidelines and devices (expanded clinical and unique therapeutic design); teamwork, communication processes and the use of active methodologies. The active methodologies used were oral dialogue and problem-solving with the support of group dynamics, case studies, construction of territorial maps and production diagrams and knowledge organization.

Summary of Results: The oral dialogue allowed the perception that, although the theoretical references are online on the website of the Ministry of Health, workers do not appropriate the availability of the contents. The problematization with the support of the group dynamics indicated situations of leadership, motivation, inclusion or exclusion of participants as well as problems of solvency and theoretical fragility to base the work. The case studies with questions provided the exercise of the expanded clinic and the experience of this work tool. The construction of territorial maps indicated the need to better define the territories to know them properly as the diagrams showed the work cut that is done by the teams for ease and choice of tools that dominate.

Discussion and Conclusions: The workshops provided the stimulation of the cognitive structure of the participants, the theoretical visualization and practical experience of the use of active teaching-learning methodologies as important resources for improvement, extension and evaluation of health work performance.

Stackable learning modules for flexibility and responsiveness in Continuing Professional Development (CPD)

AUTHOR(S):

- Catherine Regan, University of Newcastle, Australia (Presenter)
- Brian Jolly, University of Newcastle, Australia
- Miriam Grotowski, University of Newcastle, Australia
- Kerry Peek, University of Newcastle, Australia
- Jennifer May, University of Newcastle, Australia
- Dimity Pond, University of Newcastle, Australia

ABSTRACT

Background: CPD, to improve skills in teaching and supervision, exists to support those working in hospital and university settings, but often does not translate optimally to the general practice context, in either content or delivery. Many general practitioner (GP) supervisors report feeling under-prepared for the perceived increasing demands in this area. They are also often spread over wide geographic areas with limited opportunities and support for appropriate CPD, particularly at the undergraduate teaching level.

Summary of Work: Learning needs, proposed topics and appropriate delivery methods were explored based on a survey and interviews of GPs plus expert educator discussion. Existing courses were reviewed but none fulfilled the specific flexibility requirements. Modules were developed and piloted both on-line and face-to-face and modified according to feedback.

Summary of Results: Topics emerged from the results of the surveys, interviews and educator review. Nine stackable modules, in a range of formats, have been developed so far with positive feedback from the piloting process. Modules were divided into two parts for ease of accessibility.

Discussion and Conclusions: Modules and part-modules may be undertaken individually as CPD topics but a total of five, with assessment tasks, are required to complete certificate requirements. In the absence of compulsion there is a challenge with engaging GPs in such CPD activities in medical education and yet they are very involved in teaching. There are challenges for GPs in terms of time and cost. Sustainability for courses is also difficult in the absence of ongoing funding certainty and infrastructure. To meet these challenges, the decision was taken to focus on flexibility in topic and delivery options. This stackable certificate fills a gap between ad hoc CPD and costly graduate certificates.

Take-home Messages: With appropriate CPD in clinical teaching and supervision, there is scope to enhance the quality of learning in a clinical setting such as general practice with its broad educational potential and distinct challenges.

Fake it till you make it? How does an innovative Longitudinal Integrated Clerkship affect student perceptions of the 'educational authenticity' of their experience?

AUTHOR(S):

- **Andy McKeown, Imperial College London, UK (Presenter)**
- Sonia Kumar, Imperial College London, UK
- Martyn Kingsbury, Imperial College London, UK

ABSTRACT

Background: In 2016, Imperial College launched an innovative Longitudinal Integrated Clerkship (LIC), which placed 24 year 5 students in GP practices for one day/week for the entire year. Students accrued a patient caseload, whom they cared for and followed into secondary care where appropriate. There is a growing evidence base for such LICs worldwide, but very little research within the UK, where authenticity in medical education has been decreasing over many decades.

Summary of Work: A qualitative research method was used, with a phenomenological approach. Semi-structured interviews were conducted with 6 of the 24 students, aiming to broadly define the concept of authentic learning and explore students' perceptions of the development of professional relationships within the LIC. Thematic analysis was undertaken using open and axial coding. The Cognitive Apprenticeship model by Collins et al (1989) was used as a framework to interpret the data.

Summary of Results: Four main themes relating to educational authenticity were identified: 'Authenticity Through Relationships', 'Time as a Vessel for Authenticity', 'Reality of Apprenticeship' and 'Value of Apprenticeship'. This presentation will concentrate on the value of creating a liminal space for creation of student paraprofessional relationships. Students perceived themselves as bridges between the patient and their care and between primary and secondary care. Such relationships between tutor, student and patient reinforced authenticity and can lead to a transformative learning process.

Discussion and Conclusions: The nuances of the UK healthcare system and the innovative design of the hybrid LIC model appeared to allow time for students to experience beyond the usual situated learning available in most 'block' rotations. The liminal space created within this paraprofessional context allowed students to negotiate roles with authentic power and agency. Students can develop meaningful roles within authentic settings if they are afforded time and continuity with peers, patients and tutors.

Take-home Messages: Undergraduate learning should include long-term, negotiated paraprofessional relationships, where students are afforded the opportunity to do more than passively observe within a situated context. Such opportunities lead to the creation of transformative learning environments with authentic student agency.

Can Longitudinal Integrated Clerkships help protect against a decline in professional attributes in medical students? Evidence from a longitudinal cohort study

AUTHOR(S):

- Ravi Parekh, Imperial College London, UK (Presenter)
- Andrew McKeown, Imperial College, UK
- Judith Ruzangi, Imperial College, UK
- Arabella Simpkin, Imperial College, UK
- Gareth Tudor-Williams, Imperial College, UK
- Sonia Kumar, Imperial College, UK

ABSTRACT

Background: There is evidence of a decline in professional attributes in medical students and a lack of students' preparedness for practice. The model of Longitudinal Integrated Clerkships (LICs) promotes the development of attributes such as patient-centredness and resilience in medical students. Since 2016, Imperial College has run a novel LIC in 5th year of the MBBS, entitled the 'Integrated Clinical Apprenticeship' (ICA), to better prepare our students for their transition to practice. ICA students develop an authentic and meaningful role with their patients and reflect on professional attributes e.g. managing risk and uncertainty. We therefore researched: 1. Is there a change in professional attributes in our medical students? 2. Does an LIC model impact these attributes?

Summary of Work: In 2016 and 2017, 5th year MBBS students were invited to complete validated inventories at the beginning and end of the years, looking at the following: tolerance of uncertainty, risk-taking, patient-centredness, empathy, resilience and work-based empowerment. Paired data from students on the ICA and not doing the ICA (control) were analysed using paired student T-tests.

Summary of Results: ICA students had an improved tolerance of uncertainty (p0.05), with no change in the control group (p0.13). Control students become more risk-averse (p0.02), less resilient (p0.002), and less empowered on clinical placements (p0.0002) with no significant change in the ICA group in any of these attributes. There were no significant changes seen in either group regarding patient-centredness or empathy.

Discussion and Conclusions: This longitudinal study in a UK medical school adds to the evidence base showing a decline in professional attributes of medical students, with students becoming more risk-averse, less resilient and less empowered. Results suggest that LICs may be a model that protects this decline, however further research is needed to evaluate this.

Take-home Messages: This study adds to the international evidence, supporting the notion that medical students' professional attributes are eroded during their clinical placements. As UK medical students enter a challenging, fragmented healthcare system with an increasingly complex and multi-morbid workload, LICs could be an important educational intervention that protects medical students against this phenomenon and better prepares them for clinical practice.

The Dundee Longitudinal Integrated Clerkship - a phenomenological exploration of the experiences of patients

AUTHOR(S):

- Zoe McElhinney, University of Dundee, UK (Presenter)
- Maggie Bartlett, University of Dundee, UK

ABSTRACT

Background: The Dundee Longitudinal Integrated Clerkship (LIC), in which medical students spend their fourth year attached to a GP practice, is the first of its kind in the UK, although it is a model of medical education employed by a number of medical schools worldwide. Longitudinal clerkships aim to increase continuity of care and patient centeredness by allowing students to consult with patients in general practice and to follow them into secondary care as they receive further investigations or treatment. The LIC is currently a pilot in its third year. Initial research has found that students value the immersive experience offered by the LIC. This study will explore the patient experience of the LIC. There is limited literature exploring the patient experience of longitudinal clerkships.

Summary of Work: The study is a qualitative exploration of the patient experience of the Dundee Longitudinal Integrated Clerkship. It will explore three main areas: 1. the impact of involvement of LIC students on patient care; 2. the impact of the involvement of the LIC student on patients' understanding of their illness or disease and its management; 3. the effects of patients' relationships with LIC students on their experience of healthcare. The evidence gained from the study will contribute to the development of the LIC in future years, enhancing the experience for future students and patients.

Summary of Results: Results are not yet available. Patient interviews will be carried out towards the end of the current academic year (May/June 2019), with results available for presentation at AMEE 2019.

Discussion and Conclusions: Discussion of the patient experience of seeing medical students involved in the longitudinal clerkship, in particular with regard to the impact the students involvement had on patients care, understanding of their illness and experience of healthcare.

Take-home Messages: Patient centredness, continuity of care and longitudinality are central features of the longitudinal clerkship model of undergraduate medical education. There is limited literature exploring the patient experience of involvement in the clerkship model of undergraduate education. This study will increase our understanding of patients experiences of the longitudinal clerkship including impact on their experience of healthcare.

Comparing the personalities of medical students in rural and urban education programs highlights differences in perfectionism: Implications for nurturing competence and confidence in medical students

AUTHOR(S):

- **Di Eley, The University of Queensland, Australia (Presenter)**
- David V. Power, Department of Family Medicine and Community Health, University of Minnesota Medical School, USA
- Kathleen Dwyer Brooks, Department of Family Medicine and Community Health, University of Minnesota Medical School, USA

ABSTRACT

Background: Rural longitudinal integrated clerkship (LIC) programs have contributed to our understanding of selecting and training students for rural practice. Studies have explored personality profiles of students who participate in rural LICs although few have compared them with classmates who have not. This study compared personality and psychological characteristics of four consecutive cohorts of students in the LIC Rural Physician Associate Program (RPAP) with their non-RPAP classmates.

Summary of Work: In a longitudinal cross-sectional comparative design (2013/2014 through 2016/2017), RPAP and non-RPAP medical students completed identical questionnaires measuring temperament and character traits, Perfectionism-CoM: (concern over mistakes) and Tolerance of Ambiguity (ToA). T-tests, ANOVA and post-hoc tests compared groups.

Summary of Results: Gender and age were not different between groups (RPAP=128, non-RPAP=158). More RPAP reported a rural background and strong interest in rural practice. RPAP were significantly lower in levels of Perfectionism-CoM (driven by goals and achievement versus fear of failure), and higher in Cooperativeness (tolerant, empathic) compared to non-RPAP classmates. ToA levels were moderately high and not different between the groups. Significant ($p < 0.001$) correlations (> 0.3) were negative between Perfectionism-CoM and Cooperativeness and ToA, but positive with Harm Avoidance (anxiety proneness).

Discussion and Conclusions: The influence of personality is context dependent. Lower Perfectionism-CoM and higher Cooperativeness in RPAP students point to advantages in coping with particular aspects of rural practice. Higher Perfectionism-CoM and its association with anxiety can provide insight into behaviours such as coping with challenging environments and gaining confidence in ambiguous situations. Nonetheless, all students appear to be managing ambiguity, which is encouraging given its ubiquitous role in medical practice.

Take-home Messages: Physicians are constantly required to act decisively - even at the risk of making a mistake. Putting our findings into the context of a rural LIC suggests that students who are highly perfectionistic and overly concerned with mistakes may feel uncomfortable in, or even avoid situations with limited resources and consultation. Curricular modifications that support students in tasks outside their comfort-zone may be helpful for those particularly high in perfectionism. A goal as educators is to nurture competence and confidence in all students whatever the environment.

Participation, interpersonal relationship and interaction among medical students in longitudinal integrated clerkship and rotation-based clerkship

AUTHOR(S):

- Yaw-Wen Chang, Tri-Service General Hospital, National Defense Medical Center, Taiwan (Presenter)
- Shih-Chung Huang, Kaohsiung Armed Forces General Hospital, Taiwan
- Wen-Hui Fang, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Pauling Chu, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Senyong Kao, Graduate Institute of Life Science, National Defense Medical Center, Taiwan

ABSTRACT

Background: Longitudinal integrated clerkships (LIC) is an innovative educational model and its curriculum design is different from traditional rotation-based clerkships (RBC). The purpose of this study was to explore the impact of curriculum design on students' participation in clinical activities and interaction with medical team members.

Summary of Work: The survey was conducted in April 2018, the second to last month of M5 clerkship. All students finished their first-year internal medicine (IM) rotation. In academic year 2017/18, there were 15 LIC students and 97 RBC students. All LIC students were enrolled, and 29 RBC students were enrolled by using convenience sampling. The data were collected using an anonymous questionnaire. In the first part, the students were asked to list a typical daily schedule (from 7:00 am to 5:00 pm) of IM rotation. In the second part, the students would draw an ecomap of clinical team members. The reference was a patient who was illustrated by a circle (1cm in diameter) located in the center of the map. The size of the circle meant the importance of this member. The distance between circles showed the relationship between members. The number of connecting lines between circles demonstrated the interaction between members.

Summary of Results: LIC students spent more time on direct patient care and participating in outpatient clinic/operation room. For the importance of clinical team members, there was no difference in the circle size of attending, resident, intern among LIC and RBC students. But the circle of nurse was larger in RBC students. For the interpersonal relationship, LIC students were closer to attending but more distant to intern. For the interaction between team members, LIC students had more frequent interaction with patient and attending.

Discussion and Conclusions: In this study, there are significant differences in the clinical participation and interpersonal relationship and interaction among LIC and RBC students during IM rotation. The curriculum design had an effect on students' participation and interpersonal interaction.

Take-home Messages: The LIC students had more opportunity to care patients directly and more frequent interaction with patients and attendings.

The Undergraduate Clinical Skills Progress Test: First Outcomes of Longitudinal Student Skill Assessment

AUTHOR(S):

- Klara Fluher, Faculty of Medicine, University of Maribor, Slovenia (Presenter)
- Luka Oblak, Faculty of Medicine, University of Maribor, Slovenia
- Monika Sobočan, UMC Maribor, Clinic for Gynecology and Perinatology, Maribor, Slovenia
- Breda Pečovnik Balon, Faculty of Medicine, University of Maribor, Slovenia
- Radovan Hojs, UMC Maribor, Clinic for Internal Medicine, Faculty of Medicine, University of Maribor, Slovenia
- Sebastjan Bevc, UMC Maribor, Clinic for Internal Medicine, Faculty of Medicine, University of Maribor, Slovenia

ABSTRACT

Background: Testing student progress through longitudinal examination serves as a formative assessment tool to understand current curriculum outcomes and improve student evaluation. Next to assessing theoretical knowledge it is becoming more important to assess clinical skills knowledge. Objective structured clinical examination (OSCE) is a method to assess the level of clinical skills knowledge. The purpose of this study was to evaluate in a low-stakes formative assessment the clinical skills level improvement of finishing medical students prior to and after their 9 week Internal medicine clerkship.

Summary of Work: Medical students (n = 34) voluntarily participated in this study during their mandatory Internal medicine clerkship. Each student was assessed in three different clinical skills before and after the clerkship. OSCE was used to grade students in history taking, venipuncture and rectal examination. Our study analyzed the correlations of students' knowledge in clinical skills before and after the clerkship. Data was analyzed using the SPSS program.

Summary of Results: Our study shows a significant improvement in history taking score (p=0.001) and in total OSCE score (p=0.006) on the second testing. A significant reduction in time needed to complete the task was observed in rectal examination (p=0.003) and history taking (p=0.013) compared to the first testing. There was no significant difference between the score on the first and the second testing in rectal examination (p=0.924) and venipuncture (p=0.096).

Discussion and Conclusions: This data is first data of ongoing implementation of a clinical progress test in our intermediate and final medical students. Our study indicates that students improve in history taking as a consequence of performing this skill most often during clerkship. Thus, also improving time management on history taking. We hypothesize that other skills were not practiced by students as often, therefore there was no observed improvement.

Take-home Messages: The results of the study show, there was a progress in history taking after completing the Internal medicine clinical clerkship. No progress was observed in performing the rectal examination and venipuncture. In order to improve these clinical skills, training activities should be considered.

What do medical students learn in Shadowing Modeled Inter-Professional Education (SMIPE)? A preliminary report of SMIPE Project

AUTHOR(S):

- **Shu-Liu Guo, Taipei Medical University Hospital, Taiwan (Presenter)**
- Chien-Chih Wu, School of Medicine, College of Medicine, Taipei Medical University, Taiwan
- Yu-No Kang, Department of Education, Taipei Medical University Hospital, Taiwan
- Shu-Tai Shen Hsiao, Nursing Department, Taipei Medical University Hospital, Taiwan

ABSTRACT

Background: Currently, schools implemented a nurse-shadowing program, in which participants observe professionals at work, to help medical students learn more about the role of nurse in health care. Few studies used shadowing-based curriculum to build up IPE attitude in medical students. The purpose of this study described the shadowing modeled inter-professional education in medical students in Taiwan.

Summary of Work: We developed the SMIPE project for five-year medical students in Taipei Medical University in 2018. The 8-week project involved nurses, pharmacists, physical therapists, respiratory therapists, dietitians, case managers of discharge preparing, members of hospice term and social workers. Participants (N=55) were grouped (3 to 4 students/group) and separately participated 3-hours shadowing with one healthcare professional every week. Each section consisted of 4 phases including the explanation of learning purpose, the observation toward preceptors, the discussion at the end of each section, and the reflective assignments. They finished a satisfaction questionnaire (range 1 to 5) after this project. To understanding the learning of SMIPE, content analysis was performed for categorical of reflective assignments.

Summary of Results: Students reported a high satisfaction in SMIPE (M=4.7, SD=0.2). Three highest satisfactions were shadowing with pharmacists (M=4.92, SD=0.02), respiratory therapists (M=4.88, SD=0.01), and nurses (M=4.81, SD=0.02). In their reflections, the majority (82%) reported that learning inter-professional collaboration was necessary between physicians and other healthcare providers in clinical. They must respect more other healthcare providers, especially nurses, case managers of discharge preparing, and term members of hospice care. They learned great communication skills from nurses and social workers. 30% of students reported that they learned more about hospice care on hospice care section since they didn't take those before in school. They noted that they got a lot of interesting knowledge and understanding of job's roles on respiratory therapists (25%), pharmacists (20%), and dietitians (20%).

Discussion and Conclusions: The results suggested that SMIPE might have the effectiveness on IPE attitude in medical students. They learned the roles of other healthcare professionals on inter-professional collaboration and then to redraw their professional position in clinical practice.

Take-home Messages: We plan to exam the effectiveness of this project to determine whether it influences medical students' behavior on inter-professional collaboration.

Experiences from developing a Student-led Medical Education Journal Club

AUTHOR(S):

- Keerthi Senthil, University of Cambridge, UK (Presenter)
- Dominic O'Neill, University of Cambridge, UK
- Gloria Lau, University of Cambridge, UK
- Manu Shrivastava, University of Cambridge, UK
- Michelle Arora, University of Cambridge, UK
- Diana Wood, University of Cambridge, UK

ABSTRACT

Background: Journal clubs are useful for students to remain informed with latest advances in research and develop critical appraisal skills. Many medical schools support students attending journal clubs discussing biomedical research. However, as there are fewer medical education journal clubs, it is challenging for students to develop experience in critically appraising educational literature. In particular, qualitative research is covered less in undergraduate curricula so can feel daunting for students. We developed a student-led medical education journal club to facilitate debate amongst students on current hot topics in a supportive environment whilst cultivating skills needed to develop research projects.

Summary of Work: We describe the benefits and challenges of running a student-led medical education journal club and synthesise key learning points which other students can use when starting their own. Our sessions run roughly once per month and are split into two parts: a senior student-led teaching session, occasionally facilitated by an invited senior educationalist, to discuss methodology, ethics and other research skills, followed by a student-led discussion around a medical education research article. We collect evaluation data after each session.

Summary of Results: Attending journal clubs aided understanding of basic study designs and qualitative and quantitative concepts. Students found it beneficial to practise critical appraisal techniques. A structured approach to reviewing research articles was particularly valued. The main challenge was selecting a time and location which would increase attendance since most students are allocated to various regional teaching hospitals during the week. Refreshments were also notably appreciated and improved attendance.

Discussion and Conclusions: Participating in a journal club provides a community of practice to develop an appreciation of medical education literature from an early stage and may foster more academic interest in medical education research. Maintaining attendance is a major challenge which was overcome by regular meetings and careful planning. Further remedies might involve implementing an online platform for journal discussion.

Take-home Messages: A medical education journal club is a worthwhile way for students to pursue an interest in medical education and might encourage participation in medical education research, particularly in qualitative methods. An online journal club might increase participation.

Empowering patients, empowering students: a mixed-methods study on the impact of training medical students in health coaching

AUTHOR(S):

- **Arti Maini, Imperial College London, UK (Presenter)**
- Sonia Kumar, Imperial College London, UK
- Molly Fyfe, Imperial College London, UK

ABSTRACT

Background: Health-coaching aims to facilitate patients' active participation in managing their health, based on the assumption that people are resourceful with internal strengths and capabilities. Recent work has described involving medical students in authentic, educationally-constructive service roles that add value to health systems. This study explored the impact of training medical students in health-coaching.

Summary of Work: We piloted skills-focused health-coaching training for cohorts of Year-3 medical students undertaking 10-week community placements from 2016-18. Training emphasised opportunities for authentic practice and feedback. Students were placed in diverse community settings with opportunities to draw on health-coaching skills when seeing patients. A mixed methods approach explored the impact of training medical students in health-coaching. The Patient Practitioner Orientation Scale (PPOS) was administered pre and post intervention, and six focus groups were conducted to explore students' perceptions and experiences.

Summary of Results: Thematic analysis suggests that students experienced changes in their mindset whereby they increasingly recognised others as resourceful and positioned themselves to facilitate conversations rather than 'solve' issues. This related to positive changes in students' attitudes, skills and motivation in using person-centred communication approaches, and on their ability to empower others to develop agency, thus adding value in authentic clinical and non-clinical contexts. Students also described enhancements in their own sense of agency, and described internalising coaching skills for effective self-reflection and solution-finding. Questionnaire findings demonstrated a significant increase in patient-centred attitudes ($p < 0.000$).

Discussion and Conclusions: These findings suggest that training medical students in health-coaching enables a mindset-shift which supports development of agency in themselves and others in both clinical and non-clinical contexts. This results in developing skills to hold empowering conversations with patients around health issues and increases students' ability to add value in authentic contexts. Development of agency also impacts positively on students' own personal and professional development. Our medical school now plans to train all entering medical students in health-coaching skills.

Take-home Messages: Medical schools should consider training their students in health-coaching skills with a view developing student agency, resulting in positive impact on both clinical and non-clinical encounters and on students' own personal and professional development.

TMET: a peer-led Medical Education workshop

AUTHOR(S):

- Silvia Matilda Aștefanei, International Federation of Medical Students' Associations (Presenter)
- Obada Yousef Al-Nahawi, International Federation of Medical Students' Associations
- Muhammad Nouman Shuja, International Federation of Medical Students' Associations

ABSTRACT

Background: Medical education should be at the core of each medical student's interests, as it defines our practice. The International Federation of Medical Students' Associations (IFMSA) aims to raise awareness about this matter, where its Standing Committee on Medical Education (SCOME) implemented TMET- Training Medical Education Trainers so students can acquire the necessary theoretical knowledge in approaching different issues in this field.

Summary of Work: The first TMET took place in 2014. Each workshop has a set of 2-4 facilitators who are responsible for developing its content and have had previous training on the topic. The training takes place in 3-4 days, with a maximum workload of 24 hours in total and with no more than 25 participants attending. Participants explore concepts about Advocacy, Social Accountability, Medical Students Involvement, Assessment & Evaluation, Curriculum Development among others. Participants are required to perform a graduation training no later than 6 months after their forming took place, so they can harness their brand-new skills at their fullest, keeping themselves updated within this area.

Summary of Results: Since 2014, more than 45 TMET workshops have taken place, with more than 500 trainers specialized in medical education. Trainers represent all regions of the world, with the majority of them from the Eastern Mediterranean Region and Europe, being followed by Africa, Americas and Asia-Pacific. Tunisia, Sudan, Malta, Brazil, and Taiwan together with Pakistan and India are the countries with the highest number of medical education trainers/region, some of them being also TMET hosts at some point throughout this period of time.

Discussion and Conclusions: All the TMET trainers are internationally accredited by IFMSA, meaning they can hold sessions and presentations on medical education topics all around the world, for any medical students' local or national association or medical faculty which requests this type of lecture.

Take-home Messages: Engaging students to take part in this type of event not only makes them better future physicians, but it also empowers them to take proper actions in their faculties or countries and to improve the medical systems.

An educational innovation to promote students' skills as teachers and leaders

AUTHOR(S):

- **Serena Cottrell, Education, Faculty of Medicine, University of Southampton, UK (Presenter)**
- Karen. E Morrison, Education, Faculty of Medicine, University of Southampton, UK
- Ahmad Elmansouri, University Hospital Southampton, UK
- William Freake, Faculty of Medicine, University of Southampton, UK
- Rhian GL Jeffery, Faculty of Medicine, University of Southampton, UK
- Edward O Murray, Faculty of Medicine, University of Southampton, UK

ABSTRACT

Background: World Restart a Heart Day (RAHD) teaches Cardiopulmonary Resuscitation (CPR) to the public. Southampton was the first UK medical school to participate in RAHD in 2017. In 2018 nine UK medical schools volunteered to participate. The educational aims of RAHD are to provide students with the opportunity to lead a project, develop their clinical skills and their skills as teachers.

Summary of Work: The opening session was a panel discussion for 2nd year medical students, which included personal and professional experiences from the Dean and other members of faculty alongside a cardiac arrest survivor. This session concluded with a demonstration of CPR skills and an outline of the day's learning outcomes. The students then implemented delivery of CPR sessions across the campus with staff and members of the public. Sessions were also delivered to local school children to reach the wider community.

Summary of Results: 642 people were trained and the day was widely promoted on social media. Two students champions gave an interview at the local radio station and were filmed teaching the radio presenter CPR, which received 1291 views. Feedback forms on the experience were returned by 80 students. After the session the majority of students reported an increased confidence at performing CPR. They reported an increase in confidence in teaching skills from 56% to 84% and a decrease in anxiety about teaching of 13% (36% to 23%).

Discussion and Conclusions: Feedback from the students said they found teaching CPR skills to staff and the public a valuable learning experience. RAHD champion Rhian Jeffery stated 'This worked incredibly well, the students were enthusiastic about teaching and many other university students and staff stopped by to learn these lifesaving skills'. This clearly demonstrates the benefits of experiential learning through an exciting and innovative educational programme. 4 student champions led the organisation of the project.

Take-home Messages: World Restart a Heart Day provides a rich opportunity for students, staff and patients to benefit from peer teaching CPR in the community.

Doctor as Teacher - Peer markers for teaching, learning and feasibility of essay assessment

AUTHOR(S):

- Russell Hearn, King's College London, UK (Presenter)
- Tristan Fraser, Kings College London, UK

ABSTRACT

Background: We have sought to pilot the potential for students to provide summative quality-assured peer marks as part of a Doctor as Teacher module for medical students. This study looks to consider the quality, reliability, validity and feasibility of peer-provided summative marks for written work. We also consider the learning acquired by markers and their relationship with assessment.

Summary of Work: Students were invited to submit 3000-word essays. Essays were anonymously submitted and randomised with each student submitting one essay and then marking four of their peers, providing qualitative and quantitative marks. Peer marks were then assessed for reliability and validity against existing faculty marks. A qualitative thematic analysis of the written feedback was undertaken. After moderation, feedback was sent back to students and a focus group and questionnaires were used to elicit the students insight into what they learnt from marking essays. Ethics approval was granted by KCL.

Summary of Results: Twelve students took part. Eight students took part in focus groups and survey response rate was 100%. Using quality assurance processes, four students provide sufficient triangulation to produce a valid and reliable mark with a consistent bias of -2.38% ($p < 0.01$) compared to faculty marks. Peers provide higher-quality and more useful feedback to their peers than faculty. Students in this pilot felt they learned about using mark schemes and how to improve their own writing in future.

Discussion and Conclusions: Students appreciated the larger amount of written feedback that peer markers provided. We anticipate being able to provide insight into useful methods of identifying hawk/dove markers, help students gain insight into the assessment process and prepare them to deliver on the GMC duty of doctor as teacher. This pilot supports our intended roll out of peer marking to the cohort of 400 students.

Take-home Messages: 1. With appropriate training peer-markers produce valid and reliable marks for essays, with increased quality of qualitative feedback and improved feasibility of marking. 2. Specific mark schemes, example essays and a brief guide on how to assess written work improves quality. 3. Insider exposure of being an assessor improves student satisfaction with regards to assessment overall and helps learning.

Sexual education by medical students

AUTHOR(S):

- Clémence Musy, France (Presenter)
- Justine Boulekouane, France
- Caroline Tilikete, France
- Caroline Combes, France

ABSTRACT

Background: There are serious shortcomings in France concerning sexual education. High schoolers lack knowledge on basic notions such as anatomy, contraception. Moreover, in 2016, according to a study led by INED, 14,5% of women suffered from sexual violence in France. We believe this violence to be partly due to a poor education on respect and consent. The aim was to organize interventions in schools based on peer teaching.

Summary of Work: In Lyon Est Medical School, a group of 26 students was constituted by two leading students to receive training on subjects relative to sexuality. Formations were performed by different actors involved in sexual education or in the treatment of sexual violence. To further their knowledge on those subjects and their capacity to discuss with pupils, debates and role games were organized amongst the medical students. The main objective was for medical students to receive this training to intervene in secondary cycle classes. The interventions were separated into two sessions. One to address sexual life: contraception, sexually transmitted diseases, abortion... The second one to develop the students' reflection on respect (homophobia, gender equality) and sexual violence.

Summary of Results: 33 schools were contacted for the interventions, 6 responded positively. 25 classes are to receive the interventions in March-April, each class separated in half groups, involving 750 pupils. The medical students will intervene in pairs.

Discussion and Conclusions: With medical students motivated, many pupils are reached. We hope interventions open to great discussion within the classes and we believe they will improve knowledge and awareness on sexuality, respect and consent. Peer teaching was suggested to be a great way to achieve such objectives. Future step of this project is to integrate the new 'Health Service' curriculum that had been organized within health schools this year in France. This project aims at developing peer teaching of preventive actions in population, based on multidisciplinary Health students groups.

Take-home Messages: Sexual education should be part of medical studies, and be achieved through peer teaching.

Involvement of students in academic medicine: using poster presentations as an educational strategy

AUTHOR(S):

- Irma Elisa Eraña Rojas, Tecnológico de Monterrey, School of Medicine and Health Sciences, Mexico (Presenter)
- Nancy de los Angeles Segura-Azuara, Tecnológico de Monterrey, School of Medicine and Health Sciences, Mexico
- Mildred Vanessa López Cabrera, Tecnológico de Monterrey, School of Medicine and Health Sciences, Mexico
- José Eduardo Pérez Saucedo, Tecnológico de Monterrey, School of Medicine and Health Sciences, Mexico

ABSTRACT

Background: There is an intense debate about the skills that Universities need to develop in undergraduate medical students. It involves constant competition in an already busy curriculum. Practitioners involved in academic medicine, understand the practical aspects and skills needed to work in research. Students could achieve early development of those skills by doing case reports, short communication presentations, and participation in research seminars. The objective of this study was to assess the effectiveness of the educational strategy of poster presentations in developing research skills in students.

Summary of Work: This research study used a quantitative approach with a descriptive, cross-sectional and quasi-experimental design. The sample consisted of 118 medical students from a private university in Latin America enrolled in the Pathology courses. Students were required to work in teams of 5 members, mentored by a faculty member. The teams prepared a poster presentation of a gynecologic pathology case report. The judges that assessed the posters were Oncopathologist or Gynecologic Oncologist, randomly assigned.

Summary of Results: 23 posters were produced, which participated in the Oncology Conference of Medical Students. The results indicate that students exceeded expectations on the use of language, as it was both formal and technical. The written structure was clear and easy to read. Results show an excellent performance in the identification of relevant bibliographic support and references, while the clinical case summary presented a lower performance. The judges found that it was coherent and kept a chronological order; however, it did not include all the relevant laboratory test and analysis, and it did not describe the diagnosis fully.

Discussion and Conclusions: This educational strategy has proven valuable to promote interest in academic careers in students. An outcome of this implementation was that a national pathology conference accepted the students' best-evaluated poster for presentation. This experience allowed participants to become aware of the importance of adopting a systematic approach and methodologies to document, analyze and share knowledge.

Take-home Messages: Future research should deepen in the study of the involvement of students in research courses, conferences, and publications during training starting from the undergraduate program until they become involved in professional practice.

Real Life, Real Drama: Learning behavioural sciences in the clinical environment

AUTHOR(S):

- Tanya Kane, College of Medicine, Qatar University, Qatar (Presenter)
- Suhad Daher-Nashif, College of Medicine, Qatar University, Qatar
- Ayad Al-Moslih, College of Medicine, Qatar University, Qatar
- Susannah Hart, College of Medicine, Qatar University, Qatar
- Alison Carr, College of Medicine, Qatar University, Qatar

ABSTRACT

Background: There is no gold standard for teaching Behavioural Sciences to medical students. With few models to replicate, the College of Medicine at Qatar University is designing and implementing a longitudinal programme introducing the theories of Behavioural Science in the pre-clerkship phase and embedding it in patient encounters in the Clerkships.

Summary of Work: Entering the clerkship phase, we are converting students' theoretical knowledge into practice as they encounter real cases in the hospital setting. Central to this approach is positioning the patient as educator. Weekly experiential review sessions deconstruct student's observations, struggles and fears gleaned from their clinical exposures. This provides opportunities for knowledge acquisition and critical reflection of ethical and professional issues.

Summary of Results: Embarking on hospital placements contrasts the relatively safe and ideal confines of the medical school. Preliminary observations suggest this longitudinal approach supports students in developing professionalism as it allows them to reinforce expected behaviours. This approach may counter the hidden curriculum that could potentially undermine the skills and values inculcated in the pre-clerkship phase.

Discussion and Conclusions: The inclusion of Behavioral Sciences in the clerkship phase of medical education is unprecedented in the Arabian Gulf Setting. Authentic interactions with a myriad of people in the hospital setting can be harnessed to provide rich learning opportunities. It is within the clinical setting and under the guidance of clinicians that the medical students hone their skills and cultivate their professional identities. This is also where differing knowledge paradigms and practices are mediated. Embedded within the hospital setting, behavioral science curricula can play a vital role in fostering professional growth and challenging unprofessional behaviours.

Take-home Messages: The unique constellation of academic, cultural, professional and ethical practices witnessed in the hospital setting generates rich learning material. Clinical exposure to Behavioural Sciences provides students multidimensional platforms upon which to observe, engage and reflect on patient interactions, cultivate professionalism and apply knowledge in meaningful ways.

The use of educational interventions in preparing medical students for interactions with the pharmaceutical industry: a systematic review

AUTHOR(S):

- Eugene Ace McDermott, King's College London, UK (Presenter)
- Mariam Koronfel, King's College London, UK
- Afra Jiwa, King's College London, UK
- Edward Fenby, King's College London, UK

ABSTRACT

Background: A doctor is often subject to activities of pharmaceutical promotion throughout their medical career, and it is well documented that these interactions begin in medical school. A medical student's inexperience with the pharmaceutical industry may unduly influence the appropriateness of their interactions with industry and future clinical decision-making. Therefore, it is important to provide medical students with educational opportunities to develop conscious and appropriate professional values and behaviours toward industry influence.

Summary of Work: A systematic review of peer-reviewed articles indexed in MEDLINE and Embase was undertaken to identify educational interventions targeted at medical students and their interactions with pharmaceutical promotion.

Summary of Results: The literature search yielded 232 articles. These were subsequently screened resulting in four articles meeting inclusion criteria. Educational interventions included lectures, workshops, interactive web-based courses and faculty-debates. Three studies evaluated effects of intervention on the students' perceived influence of pharmaceutical marketing on prescribing habits and all studies demonstrated that students were more likely to believe that promotional activities do influence prescribing behaviours. One study that provided a lecture and discussion intervention saw second-year students becoming less accepting of marketing practices, however, the same change was not seen in first-year students. In addition, two studies evaluated the educational value of industry interactions - both studies, showed an increase in the students' perceived educational value.

Discussion and Conclusions: The results of these studies show these interventions do make students more aware of the effects of pharmaceutical promotion. However, few high-quality studies on these educational interventions exist in the literature. The long-term effects of these interventions have not been shown. Restrictive policies on industry interaction in medical school have not been shown to influence future behaviours as doctors (Yeh et al., 2015). As such, fostering critical thinking in medical school is vital to promoting the professional values and behaviours that are needed for tomorrow's doctors as stipulated in the GMC's 'Outcomes for Graduates 2018'.

Take-home Messages: Tactics of pharmaceutical industry should be highlighted to students during their medical studies to prepare for inevitable interactions with the pharmaceutical industry.

Short Communications Curriculum - Subjects in the Curriculum

Defining learning outcomes for infectious disease control in the medical curriculum in the Netherlands: a modified Delphi study

AUTHOR(S):

- Nienke van den Berg, UMC Utrecht, the Netherlands (Presenter)
- Marieke de Hoog, UMC Utrecht, the Netherlands
- Conny Seeleman, UMC Utrecht, the Netherlands
- Mariëlle Jambroes, UMC Utrecht, the Netherlands

ABSTRACT

Background: Physicians play an important role in the control of emerging infections and expanding antibiotic resistance. Therefore they should have sufficient knowledge regarding infectious disease control (IDC). It is unknown what is considered as sufficient knowledge; the Dutch National Framework on learning outcomes only offers general terms for this topic. As IDC is an international problem, we performed a literature review and identified sixteen potentially important learning items. The aim of this study was to determine which of these learning items are considered as essential knowledge for junior doctors in the Netherlands. The outcomes may help to develop educational programs.

Summary of Work: We performed an online two-round Delphi study involving four expert groups: general practitioners; public health physicians; fifth year medical students who did a clerkship at a public health service; and public health educational coordinators of the Dutch universities. Experts were asked to rate the sixteen selected learning items. A learning item was considered as essential knowledge if at least 80% consensus was reached on a 5-point Likert scale. Respondents were able to explain their score, to alter the exact wording after each learning item and to add learning items. This input was used for qualitative analysis, in addition to the quantitative scores.

Summary of Results: 27 experts (77%) completed both rounds of the study. Six learning items were identified as essential knowledge for junior doctors based on the 80% criterion, nine had 30-78% consensus, one was considered as not important. We identified two additional learning items based on analysis of the qualitative data. Important learning items were mainly focused on understanding and applying basic principles on a case, like identifying measures to prevent spread of infections based on transmission route. Detailed knowledge about each communicable disease in itself was qualified as not important.

Discussion and Conclusions: This study identified a list of eight learning items on IDC, that can be used in medical curricula in the Netherlands. Further research is needed to evaluate the generalizability of this list for international use.

Take-home Messages: The Delphi method appears to be a suitable method to identify relevant learning items for medical curricula.

Japanese Public Health Courses in Medical Education

AUTHOR(S):

- Yuka Yamazaki, Tokyo Medical University, Japan (Presenter)
- Ayane Kanai, Juntendo University, Japan

ABSTRACT

Background: In Japan, public health (PH) education differs from that in other countries. It is strongly related to the role of medical doctors (MDs). For example, PH is taught only at the undergraduate level in medical schools in Japan, unlike at the graduate- or postgraduate-level Master's in Public Health in other countries. Also, the national medical licensing examination requires that MDs have a sound knowledge of PH, and the core curriculum in medical education emphasizes the importance of social medicine. However, few reports have described PH education in Japan.

Summary of Work: Data collection started in April 2018 and is ongoing. Targets are PH and hygiene departments in all 82 medical schools in Japan. From each medical school's website, department names, research topics, target year of medical students, total length of lectures and practical trainings, number of credits, lecture content, and number of full/part-time faculty, MDs, and females being examined.

Summary of Results: At the present, 61 schools' data were collected: 36 national/public and 25 private schools, 23 schools had PH and hygiene combined departments. The main themes of departments were community health and life style diseases. The average number of full time faculties was 4.0 ± 0.7 . At least one MD worked in one department. The target years of medical students were 3 year and 4 year. The mean length of PH related class was $3,811 \pm 1,485$ (min). Private schools gave significantly more PH classes than national/public schools ($p < .05$). Although basically course content followed a core curriculum, several departments addressed regional PH issues such as suicide, epidemiological issues after earthquake disasters, and local cancer registration.

Discussion and Conclusions: Japanese PH courses focus on diverse contents of PH instead of focusing on specialties such as epidemiology and health policy. In preparation for globalization in Japan, future PH education should address cultural competency. For future studies, investing on the most beneficial PH content will greatly contribute advancement of the medical profession.

Take-home Messages: Japanese MD learn basic PH to focus on patients background and their home and work environment. As a next step, investing to what extent PH knowledge actually play a role in clinical settings is needed.

#70 Short Communications - Clinical Reasoning

Development of an 8-step, instructional approach for bedside teaching courses to facilitate clinical reasoning in medical students

AUTHOR(S):

- Antje Degel, Charité Universitätsmedizin Berlin, Germany (Presenter)
- Dorothea Penders, Charité Universitätsmedizin Berlin, Germany
- Till Rech, Charité Universitätsmedizin Berlin, Germany
- Ulrike Sonntag, Charité Universitätsmedizin Berlin, Germany
- Christian Gröschke, Charité Universitätsmedizin Berlin, Germany
- Harm Peters, Charité Universitätsmedizin Berlin, Germany

ABSTRACT

Background: Bedside Teaching (BST) has been the cornerstone of medical education ever since Hippocrates putting the patient and not the disease in the center of attention. Unfortunately, with the rise of technological progress, BST has been increasingly neglected. Many clinical teachers rely heavily on technical innovations and thus themselves 'unlearn' working with the patient. BST has become a cumbersome, albeit necessary burden, that every department, even every teacher interprets differently, and leaves students frustrated and wanting of the clinical expertise they need later on.

Summary of Work: At the Charité Berlin, evaluation of BST courses was obtained. Workshops with clinical teachers and students with the aim of identifying problems with current BST as well as needs and wishes for the future were conducted. Literature review into problem-based, task-based, self-directed learning, critical thinking was conducted. Based on this, a task-force comprised of clinicians, students and educators developed a new concept.

Summary of Results: The new concept represents a 8-step-approach beginning with the patient's chief complaint, history and examination. These are synthesized into a cardinal presentation and translated into medical terminology. Thereafter, students are to develop a table considering the diseases connected to the cardinal presentation and identify clues from history and examination to deduct the most probable and most lethal differential diagnoses. Looking into further diagnostics, a working diagnosis is developed. Based on this, the students present the patient case to a clinical teacher and identify their own learning needs for further self-directed learning.

Discussion and Conclusions: The new concept provides a common clinical reasoning structure for BST course in general, while it still allows a tailoring to the context of various medical disciplines. Its implementation is closely monitored and evaluated to make this approach as feasible as possible for the individual clinical departments.

Take-home Messages: A common core, with discipline-specific adaptation, 8-step, instructional approach was developed for bedside teaching courses that facilitate clinical reasoning in medical students.

Teaching clinical reasoning: what elements of the institutional context should be included?

AUTHOR(S):

- Annie Carrier, Université de Sherbrooke, Canada (Presenter)
- Mélanie Levasseur, Université de Sherbrooke, Canada
- Andrew Freeman, Université Laval, Canada

ABSTRACT

Background: Health professions programs aim to develop their students' clinical reasoning (CR), a core competency. In doing so, teaching activities usually focus on elements pertaining to interventions with patients. However, in clinical practice, CR occurs within an institutional context (legal, regulatory, administrative and organizational elements) that might influence its process. To tailor teaching activities to explicitly address institutional influence, greater understanding about which elements impact health professionals' CR and how this occurs is of the utmost importance. This study thus aimed to identify: 1) what elements of the institutional context impact health professionals' CR and 2) how these elements impact CR.

Summary of Work: A scoping study was used to search nine databases from various fields (health, administration, law and politics) with 51 predetermined keywords. Data were exhaustively charted, analyzed (descriptive statistics and qualitative themes), organized and synthesized by two research assistants following PRISMA-guidelines. Knowledge users were also consulted throughout the process.

Summary of Results: Of the 100 selected articles, the majority reported findings of qualitative studies (73.0%), conducted in the United States (26.0%), and focused on organizational (88.0%) or administrative (60.0%) elements. Organizational elements mainly concerned team composition and functioning modes (55.7%) and waiting lists or delays (51.1%). Administrative elements related to policies and processes (43.3%), professional and techno-scientific norms (36.7%) and human and financial resources (28.3%). Most studies (82.0%) concluded that the precise influence of investigated elements was unclear. However, in those cases in which greater clarity emerged, the impact on CR was generally negative, i.e. generating obstacles to problem-solving and restricting decision-making.

Discussion and Conclusions: The present study offers a better understanding of the impact of the institutional context, mainly administrative and organizational elements, on clinicians' CR. As such, results inform educators on which elements should be included in their teaching activities aiming at developing students' CR. Results also identify areas where insufficient evidence exists about the institutional context and future interdisciplinary research is necessary.

Take-home Messages: In clinical practice, CR is influenced by the institutional context in which it occurs. Teaching activities aiming to develop students' CR should explicitly address these elements and their influence.

Journey from novice to expert: Comparing clinical reasoning skills of third year and final year medical students

AUTHOR(S):

- Tanzeela Khalid, The University of Faisalabad, Pakistan (Presenter)
- Claudio Violato, University of Minnesota Medical School, USA
- Mussarat Ul Hasnain, Rashid Latif Medical College, Pakistan
- Sumera Badar, Faisalabad Medical University, Pakistan

ABSTRACT

Background: Clinical reasoning is considered an essential competency for any medical graduate. Early clinical exposure has been advocated to promote development of this skill in medical students. Clinical reasoning abilities of students are expected to improve progressively as they move from third year to fourth year and then final year of their medical education. However this progress is not routinely assessed quantitatively.

Summary of Work: University Medical College, Faisalabad is a private sector Medical college in Pakistan, having five years MBBS program with a discipline based curriculum. The clinical reasoning skills of 64 third year and 98 final (fifth) year medical students were measured using Bordage, Grant and Marsden diagnostic thinking inventory. The overall reliability was $\hat{\pm}$ coefficient 0.84. There were group differences validity indices obtained ($F(8, 261) = 9.80, P < 0.0001$). The mean scores for two main constructs in the inventory i.e. flexibility in thinking and evidence for structure in memory were compared between two groups using t test.

Summary of Results: The mean score of 3rd year was 78.5 for flexibility in thinking and 78.4 for evidence for structure of memory. For final year students the mean scores were 80.7 and 81.1 respectively. There was no statistically significant difference ($p > .05$) in the scores between third year and final year students. The scores for third year were comparable, however to those available for their peers in other studies done with the inventory i.e. 81.6 and 76.7.

Discussion and Conclusions: Despite two years of supervised clinical training in a tertiary care teaching hospital, the lack of a significant difference in the clinical reasoning abilities of students is surprising. Further studies need to be done with the students and faculty members to explore the reasons behind this phenomenon. The potential use of diagnostic thinking inventory as a quantitative measure of clinical reasoning skills also needs to be investigated further for evidence of validity.

Take-home Messages: Clinical exposure does not guarantee development of clinical reasoning skills in undergraduate medical students. Explicit measures are required for the development and assessment of this essential skill.

A randomized controlled trial of students' individual and collaborative clinical reasoning: Effects on diagnostic accuracy, time-on-task and knowledge

AUTHOR(S):

- Helene Werl, Institute for Medical Education, LMU University Hospital, LMU Munich, Germany (Presenter)
- Katharina Nederstigt, Institute for Medical Education, LMU University Hospital, LMU Munich, Germany
- Michael Sailer, University of Munich, LMU Munich, Germany
- Frank Fischer, University of Munich, LMU Munich, Germany
- Martin R. Fischer, Institute for Medical Education, University Hospital of LMU Munich, Germany
- Jan Kiesewetter, Institute for Medical Education, University Hospital of LMU Munich, Germany

ABSTRACT

Background: Clinical reasoning is a key skill of the medical profession. Therefore, it is necessary to teach and practice these skills during medical education. Findings suggest that simulations with virtual patients advance development of clinical reasoning skills, i.e. strategic knowledge. Diagnostic accuracy, seems to be superior in dyads, compared to individual diagnosis. Learning in collaborative settings has the advantages of being externally more valid and to implicitly train collaborative knowledge. In our study, we investigated whether collaborative clinical reasoning leads to superior outcomes compared to individual clinical reasoning. We assessed the outcomes based on students' diagnostic accuracy, time-on-task and increase in strategic knowledge.

Summary of Work: Participants consisted of 3rd to 6th year medical students (N=71, M=24 years, SD=2.5, 60% female). Their prior knowledge was assessed with ten key-feature problems before working on 6 virtual patients either individually (N=21) or in dyads (N=50 students, N=25 dyads). To initiate the clinical reasoning process, participants selected three differential diagnoses before choosing their next diagnostic step. After their final diagnosis they received an experts solution as feedback. Finally, ten key-feature problems were assessed, as indicators for learnt strategic knowledge.

Summary of Results: Collaborative groups (M=4.37, SD=1.41 correct diagnosis) had higher diagnostic accuracy than individuals (M=3.24 SD=1.51 correct diagnosis, $F(1,45)=6.81$, $p<.01$, $\eta^2=.14$). Both groups gained strategic knowledge ($F(2,69)=14.35$, $p=.01$, $\eta^2=.17$), and no difference between the groups was found in the strategic knowledge post-test. Alike, no difference for time-on-task was found ($F(1,69)=.704$, $p=.40$, n.s.).

Discussion and Conclusions: The current study replicated the effect, that collaboratively working students are more likely to find the correct diagnosis. Moreover, we found that, dyads and individuals required the same amount of time to gain strategic knowledge. To implicitly learn collaboration while learning content had been suggested earlier and this study did not find disadvantages of learning in dyads.

Take-home Messages: In order to find how to best foster collaborative clinical reasoning in medical students and physicians, we need to create more evidence regarding feedback, structure and complexity of cases.

Effect of a knowledge-oriented intervention on physicians' diagnostic accuracy and susceptibility to bias: A randomized controlled experiment

AUTHOR(S):

- **Silvia Mamede, Institute of Medical Education Research, Erasmus University Rotterdam, the Netherlands (Presenter)**
- Marco Antonio de Carvalho Filho, Faculty of Medicine, UNICAMP, Brazil
- Rosa Malena Delbone de Faria, Faculty of Medicine, Federal University of Minas Gerais, Brazil
- Ligia Cayres Ribeiro, UNIFENAS Medical School, Brazil
- Julia Biegelmeier, Faculty of Medicine, University of São Paulo, Brazil
- Henk G. Schmidt, Institute of Medical Education Research, ErasmusMC, Erasmus University Rotterdam, Netherlands

ABSTRACT

Background: Biases in physicians' reasoning have been frequently implicated in diagnostic errors. Interventions to immunise trainees and physicians against bias have focused on improving reasoning process and largely failed. We investigated the effect of a knowledge-oriented immunisation intervention on physicians' diagnostic accuracy and susceptibility to bias.

Summary of Work: A multicenter randomised three-phase experiment (immunisation, biasing-phase, test-phase) with internal medicine residents was conducted in 7 teaching hospitals in Brazil. Immunisation: physicians worked with one of two sets of diseases (either associated with chronic diarrhea or with jaundice) by applying a procedure that involved comparing/contrasting alternative diagnoses and feedback. Biasing-phase (one-week later): Physicians evaluated cases of either inflammatory bowel disease (IBD) or viral hepatitis, thereby being biasing towards one of them. Test: All physicians diagnosed the same vignettes, half of them resembling IBD, half resembling hepatitis (all with different diagnoses). Test-vignettes preceded by a similar-looking disease in the biasing-phase would be bias-prone (vignettes preceded by the alternate disease, not-bias-prone); physicians who worked with the same disease in the immunisation would be immunised (physicians who worked with the alternate disease, non-immunised). We computed diagnostic accuracy and frequency with which the diagnosis of the biasing-phase was incorrectly given to the similar-looking diseases in the test on bias-prone and not-bias-prone vignettes diagnosed by immunised and non-immunised physicians.

Summary of Results: Ninety-one residents participated. Diagnostic accuracy differed on bias-prone vignettes, with immunised physicians performing better than non-immunised physicians ($p=.004$), but not on not-bias-prone vignettes ($p=.45$). Bias only affected non-immunised physicians, who performed worse on bias-prone than on not-bias-prone vignettes ($p=.005$); immunised physicians' accuracy did not differ ($p=.56$). Vignettes diagnosed after exposure to a similar-looking disease were more frequently confused with this disease by non-immunised than by immunised physicians ($p=.02$).

Discussion and Conclusions: An intervention directed to refine knowledge of findings that discriminate between look-alike diseases decreased residents' susceptibility to bias, reducing diagnostic errors. Further research should investigate the value of the intervention for experienced physicians.

Take-home Messages: Teachers concerned with making their trainees less susceptible to bias in diagnostic reasoning should focus on interventions aimed at developing disease knowledge rather than improving reasoning process.

Assessing clinical reasoning in a serious game: Comparison of two different scoring approaches

AUTHOR(S):

- **Angéline Middeke, University Medical Centre Goettingen, Goettingen, Germany (Presenter)**
- Insa Frisch, University Medical Centre Goettingen, Goettingen, Germany
- Nikolai Schuelper, University Medical Centre Goettingen, Goettingen, Germany
- Sven Anders, University Medical Centre Hamburg-Eppendorf, Hamburg, Germany
- Tobias Raupach, University Medical Centre Goettingen, Goettingen, Germany

ABSTRACT

Background: An analysis of student activity during a Serious Game (SG) by means of logfiles recently showed that SG can be used to train and assess student performance related to clinical reasoning (CR) (1). While logfiles reflect every action during a game session, handoff protocols written by students (2) give a focused report on a case they were exposed to during the SG. This study assessed the convergent validity of these two approaches to measure CR.

Summary of Work: In summer 2017, fourth-year medical students participated in six 90-minute sessions of playing a SG simulating an A&E department. Student performance on a virtual patient presenting with stable pulmonary embolism was assessed from logfile and handoff scores (0-4 points each). Internal consistency of the two approaches was calculated as Cronbach's alpha, and both scores were compared using Spearman's Rho.

Summary of Results: Data from 133 students were analysed (response rate 68.2%). Cronbach's alpha of logfile and handoff scores was 0.330 and 0.465, respectively. Mean scores were 2.67 +/- 0.09 and 2.50 +/- 0.10, respectively. The two measures were closely correlated (Rho = 0.755; p<0.001).

Discussion and Conclusions: The low internal consistency is probably due to only one virtual patient case being included. The high correlation explaining 57% of the variance coupled with the higher alpha value found for handoff scores suggests that the latter might be more suitable to grade student performance. The comparison of logfile and written handoff protocol analyses suggests that students are capable of summarising the key points of a case history, thus obviating the need to assess in-game activity in greater detail in order to grade CR competence.

Take-home Messages: Serious game logfiles and written handoff protocols can both be used to grade student performance regarding clinical reasoning.

Students' clinical reasoning focused on client behaviour change assessed with the web-based Reasoning 4 Change instrument

AUTHOR(S):

- Maria Elvén, Mälardalen University, School of Health, Care and Social Welfare, Sweden (Presenter)
- Jacek Hochwälder, School of Health, Care and Social Welfare, Mälardalen University, Sweden
- Elizabeth Dean, Department of Physical Therapy, Faculty of Medicine, University of British Columbia, Canada
- Anne Söderlund, School of Health, Care and Social Welfare, Mälardalen University, Sweden

ABSTRACT

Background: With the recognition of the impact of lifestyle-related behaviours on health and illness there is a need to advance the clinical reasoning of health professionals in general and physiotherapy students in specific. Enabling such advancements requires robust assessments and knowledge regarding factors associated with physiotherapy students' clinical reasoning outcomes. The aim of this project was to develop a web-based clinical reasoning instrument to assess physiotherapy students' clinical reasoning and investigate individual- and curriculum level predictors of their clinical reasoning outcomes.

Summary of Work: A new clinical reasoning instrument was developed based on theory, evidence and expert opinions. Reliability and validity of the instrument were evaluated including physiotherapy students and physiotherapists. 151 physiotherapy students in their final semester at the eight entry-level programmes in Sweden responded the instrument and data were analysed with multiple regression analysis.

Summary of Results: The web-based instrument, named Reasoning 4 Change (R4C), comprise four domains related to 1) physiotherapists' capabilities, skills, attitudes and beliefs, 2) history-taking and examination, 3) analysis, and 4) treatment strategies to support behaviour change. The instrument is built up of several case scenarios and incorporates a holistic, client-centred and behavioural focused clinical reasoning process. The instrument demonstrated satisfactory reliability and validity. Cognitions, attitudes and curricula content were significantly associated with students' clinical reasoning outcomes in the end of their education.

Discussion and Conclusions: The R4C instrument fills a gap in education and can support investigations and evaluations of physiotherapy students' clinical reasoning focused on clients' behaviour change. To develop students' clinical reasoning competence, cognitive, metacognitive capabilities and skills, positive attitudes, and behavioural medicine content in curricula need to be targeted.

Take-home Messages: The web-based R4C instrument is ready to be used in physiotherapy education evaluation. With some modifications the instrument may be used in other health professional educations as well. To improve physiotherapy students' clinical reasoning for the benefit of clients' health-related behaviour change, education interventions should focus on developing students' analytical and reflective capabilities and skills. Also, a learning environment that support positive attitudes towards the integration of biopsychosocial and behavioural considerations in clinical reasoning should be encouraged.

Educational online videos for students from different disciplines: The impact on learning and attitude toward inter-professional cooperation

AUTHOR(S):

- Johannes Grosser, Leibnitz Institut für Wissensmedien (IWM), Germany (Presenter)
- Martina Bientzle, Leibnitz Institut für Wissensmedien (IWM), Germany
- Thomas Shiozawa-Bayer, Institute for Clinical Anatomy and Cell Analysis, University Tuebingen, Germany
- Bernhard Hirt, Institute for Clinical Anatomy and Cell Analysis, University Tuebingen, Germany
- Joachim Kimmerle, Leibnitz Institut für Wissensmedien (IWM), Germany

ABSTRACT

Background: Students from different health-related courses of study use medical educational resources on the Internet, such as educational videos, to learn about certain study-related content. Often they use material that is explicitly designed for medical students and it is an open research question to what extent students with different professional backgrounds can make use of medical educational videos.

Summary of Work: Method: In a quasi-experimental study 75 medical students and 38 physiotherapy students watched the same educational online video that dealt with the surgical treatment of shoulder trauma and the physiotherapeutic follow-up treatment of this operation. The content was presented by an anatomist, a surgeon, and a physiotherapist. Before as well as after watching the video the participants conducted a knowledge test regarding basic medical knowledge (10 items), physiotherapeutic knowledge (10 items), and clinical knowledge (5 items). We also measured their attitude toward inter-professional cooperation with the interprofessional learning subscale of the University of the West England Interprofessional Questionnaire (UWE-IP).

Summary of Results: We found that both medical and physiotherapy students learned from watching the video. They had more overall knowledge after the video ($M=14.92$, $SD=3.52$) than before ($M=11.01$, $SD=3.87$; $P<.001$). It is particularly revealing, however, that medical and physiotherapy students could benefit in different ways concerning the different types of knowledge. The medical students gained more physiotherapeutic knowledge ($M=1.59$, $SD=1.93$) than the physiotherapy students ($M=0.87$, $SD=1.74$; $P=.046$), while the physiotherapy students gained more medical knowledge ($M=3.05$, $SD=2.39$) than the medical students ($M=0.61$, $SD=1.40$; $P<.001$). There were no differences in knowledge gain regarding clinical knowledge ($P=.914$). Moreover, watching the educational video improved the attitude toward inter-professional cooperation (pre: $M=3.68$, $SD=0.63$; post: $M=3.84$, $SD=0.77$; $P<.001$) for both medical and physiotherapy students.

Discussion and Conclusions: The results of this study indicate that educational videos that present content from various health-care professions are suitable for conveying knowledge to students from different disciplines in different ways. Educational videos that explicitly demonstrate inter-professional work in a medical setting are also a promising approach for supporting awareness of the relevance of inter-professional cooperation in medicine.

Take-home Messages: Learners from different medical professions profit differently from videos that explicitly demonstrate interprofessional work in medical settings.

Reliable assessment of simulation-based surgical technical skills training is highly dependent on context: an exploration of different training variables using generalizability theory

AUTHOR(S):

- Steven Arild Wuyts Andersen, Copenhagen Academy for Medical Education and Simulation, Denmark (Presenter)
- Yoon Soo Park, University of Illinois - College of Medicine, USA
- Lars Konge, Copenhagen Academy for Medical Education and Simulation, Denmark
- Mads Sølvsten Sørensen, Rigshospitalet, Denmark

ABSTRACT

Background: Reliability of simulation-based assessment of technical surgical skills is often expressed as the number of observations needed to achieve a G-coefficient >0.8 . Such analysis is typically based on single-study data - i.e. a specific training context - but then assumed a general trait of the particular assessment tool. The effects of different training variables such as training organization, simulation fidelity, learner level, could influence assessment reliability due to varying score distributions, yet remains little explored.

Summary of Work: We pooled 3,574 assessments of simulation mastoidectomy performances from several studies conducted in 2012-2018. This included data on 287 participants (medical students, otorhinolaryngology residents, experienced surgeons) and ratings by four raters using a modified Welling Scale for mastoidectomy performance assessment. G- and D-studies were used to explore the effects on reliability of: organization of practice (massed vs. distributed); learner level (medical students, residents, and experts); modality (cadaver dissection vs. virtual reality (VR) simulation); VR graphic realism; VR simulator-integrated tutoring; and point of assessment on the learning curve.

Summary of Results: Training organization and tutoring in VR simulation did not affect reliability. However, different aspects of fidelity did: only 2 observations of cadaver dissection were needed for reliable assessment in contrast to 5 observations of VR simulation performance. Increased graphic realism of the simulator resulted in fewer observations needed (7 vs. 4 observations). For more advanced learners more observations were needed for reliable assessment (5 for medical students, 7 for residents, and 8 for experts). Finally, more observations were needed in the steep initial part of the learning curve compared with the later plateau phase (6 vs. 4 observations).

Discussion and Conclusions: The reliability of simulation-based assessment of surgical technical skills is dependent on a number of training variables including fidelity and graphic realism, learner level, and slope of the learning curve. In contrast, organization of training matters little. Training variables should therefore be considered in the context of reliability, which should not be generalized outside the specific study context without thorough investigation.

Take-home Messages: Reliability for surgical technical skills assessment cannot be directly extrapolated to other contexts as training variables influence reliability.

The effect of ultra high fidelity graphics on surgical simulation training and cognitive load: a prospective interventional trial

AUTHOR(S):

- **Andreas Frithioff, Copenhagen Academy for Medical Education and Simulation (CAMES), Rigshospitalet, Copenhagen, Denmark (Presenter)**
- Martin Frenndø, Department of Otorhinolaryngology, Head and Neck Surgery, Rigshospitalet, Copenhagen, Denmark
- Steven A. W. Andersen, Copenhagen Academy for Medical Education and Simulation (CAMES), Rigshospitalet, Copenhagen, Denmark
- Mads Sølvsten Sørensen, Department of Otorhinolaryngology, Head and Neck Surgery, Rigshospitalet, Copenhagen, Denmark

ABSTRACT

Background: Ultra-high-fidelity (UHF) graphics in virtual reality (VR) simulation could improve surgical skills acquisition. However, UHF does not necessarily translate to better learning, as cognitive overload might be induced. This study aimed to compare the effects of UHF with conventional high fidelity (CHF) on novices' cognitive load (CL) and performance during VR surgical simulation.

Summary of Work: In a randomized, cross-over design, 24 medical students completed a total of four mastoidectomy procedures on the Visible Ear Simulator: two in UHF graphics simulation and two in CHF simulation or vice versa. Two blinded experts rated performances using an established assessment tool (the 17-item modified Welling Scale). CL was estimated as relative change in secondary-task reaction time during simulation compared with baseline measurements. Data were analyzed using linear mixed models analysis.

Summary of Results: CL was significantly higher using UHF graphics compared with CHF (linear mixed models, $P < 0.001$): compared with baseline, CHF simulation increased CL by 14% and UHF simulation increased CL by 26%. Even after crossover, the group starting with UHF simulation had a significantly higher CL in CHF simulation (mean difference = 6%, $P = 0.001$). Furthermore, performances were significantly worse in UHF simulation than CHF (mean difference = 0.95 points, $P = 0.02$). However, the most important factor for novice performance was ability to achieve stereovision during UHF simulation (mean difference = 3.37 points, $P < 0.001$).

Discussion and Conclusions: UHF VR simulation induced higher CL and lower performance score compared with CHF simulation training. This suggests UHF led to cognitive overload and had a negative effect on learning. Therefore, UHF VR simulation has limited use in early training of novices in complex surgical skills training such as mastoidectomy.

Take-home Messages: UHF graphics in VR simulation training have no or limited benefit in early training of novices but may have a role in training of intermediates or experts. Future development of surgical simulation for novices should aim at improving the learning supports such as tutor-functions and gamification instead of focusing on improving realism through ultra-high visual fidelity.

Development and validation of a simulator-based test in transurethral resection of bladder tumors (TURBEST)

AUTHOR(S):

- Sarah Bube, Urology Department, Zealand University Hospital, Roskilde, Denmark (Presenter)
- Rikke Boelling Hansen, Urology Department, Herlev/Gentofte Hospital, Denmark
- Claus Dahl, Urology Department, Zealand University Hospital, Roskilde, Denmark
- Lars Konge, CAMES Copenhagen Academy for Medical Education and Simulation, Denmark
- Nessn Azawi, Urology Department, Zealand University Hospital, Roskilde, Denmark

ABSTRACT

Background: A thorough transurethral resection of bladder tumors (TURB) is of particular importance in the treatment of bladder tumors. The purpose of our trial was to develop and validate a simulator-based TURB test using Messick's framework of validity.

Summary of Work: Forty-nine doctors were recruited. The group consisted of eleven novices (no TURBs), twenty-one intermediates (<75 TURBs) and seventeen experienced (>100 TURBs). In order to develop the test, the simulator was assessed at an expert meeting. After pilot-testing, the final test consisted of three procedures on the TURB Mentor™ VR simulator, Simbionix. Participants completed a standardized warm-up session. Simulator metrics were used as outcome measures to minimize bias. Analysis of variance (ANOVA) was used to identify metrics with ability to discriminate between groups; these were combined in a total simulator score (TSS). Item reliability was analyzed by intra-class correlation, Cronbach's alpha. Relation to number of TURB performed was explored using Generalizability Theory constructing a decision study (D-study) exploring the effect of repeated procedures on test scores. Finally, a pass/fail score was identified using the contrasting groups' method.

Summary of Results: Four metrics had significant discriminatory ability: resected pathology (%) ($p=0.008$), cutting in bladder wall ($p=0.004$), time ($p=0.034$), and inspection of bladder wall ($p=0.002$). The internal structure of the TSS [(resected pathology*inspection of bladder wall)/time] was high, Cronbach's alpha: 0.85. The D-study identified an acceptable generalizability coefficient above 0.80 after three procedures. Relation with other variables was explored for TURB experience and the mean TSS was significantly lower in the novice group (14.9) than in the intermediates (25.6) (mean difference=9.7, $p=0.011$) and experienced group (30.6) (mean difference=14.7, $p<0.001$). A pass/fail score of 22 was identified. No novice doctors passed, four experienced doctors (23%) did not pass the test.

Discussion and Conclusions: We have established validity evidence from all five sources in Messick's framework of validity for a newly developed VR simulator-based test including a pass/fail score identifying surgical skills in TURB. The test can be used for accreditation in a mastery learning training program.

Take-home Messages: The TURBEST VR simulator-based test in TURB is a reliable and valid assessment tool and can be used for proficiency-based training prior to supervised procedures.

The Why and How of Guided-Discovery: Exploring Learning Mechanisms in an open-surgical skills course

AUTHOR(S):

- **Andreas Höier Aagesen, Copenhagen Academy for Medical Education and Simulation (CAMES), Denmark (Presenter)**
- Rune Dall Jensen, MidtSim, Denmark
- Jeffrey Cheung, The Wilson Centre, Canada
- Ryan Brydges, The Wilson Centre, Canada
- Kulamakan Kulasegaram, The Wilson Centre, Canada
- Ebbe Thinggaard, Copenhagen Academy for Medical Education and Simulation (CAMES), Denmark

ABSTRACT

Background: Recent experimental studies suggest that guided-discovery learning (GDL) in surgical simulation can be efficacious. However, the effectiveness of GDL in real-world settings with non-naïve trainees is unknown. In this cohort study we examine the effectiveness of GDL for surgical skill training practicing physicians and investigate how GDL affects the learning processes of trainees participating in a basic open surgical skill course.

Summary of Work: The open surgical skill course trains 50 physicians a year. The course consisted of six teaching sessions, one 1 ½ hour session a week for six weeks. Two rotations of eight trainees (n=16) were taught using GDL. At the beginning of each training session participants spent the first 10 minutes exploring the task without instruction. Afterwards the instructor demonstrated how to do the task and then participants would practice with the aid of the instructor. Six rotations of approximately eight trainees (n=51) were taught in the traditional method without time for exploration. Trainees' suturing skills were assessed by the instructor on a summative suturing assessment as well as transfer to live animal model. To examine the participants interaction with tasks, instructors and other students, we used participant-observation throughout the GDL-course using ethnographical principles. We also conducted individual semi-structured interviews for ten out of sixteen participants at different stages of the GDL-course.

Summary of Results: The GDL cohort was superior to the traditional cohort on the summative suturing assessment ($F(1,65)=6.23$, $p<0.015$, $d=0.68$) though other metrics of competency were not significant. The preliminary qualitative data shows themes of enhanced preparation for future-learning, as well as the importance of structure and choice of procedural skill in a GDL-style learning environment.

Discussion and Conclusions: GDL is a promising approach to surgical education. This study provides preliminary evidence on effectiveness in real-world settings for retention and transfer of skill. We aim to elucidate how this educational strategy works using qualitative data. The results of the study will have implications for the structure and educational strategy used in future surgical skill courses.

Take-home Messages: Implementing Guided-Discovery-Learning is an effective educational strategy and emphasizes preparation for future-learning as opposed to immediate performance.

#7Q Short Communications - Selection Methods

Opening the black box in selection: What are we really measuring?

AUTHOR(S):

- **Sanne Schreurs, Maastricht University, the Netherlands (Presenter)**
- Kitty Cleutjens, Maastricht University, the Netherlands
- Carlos Collares, Maastricht University, the Netherlands
- Jennifer Cleland, University of Aberdeen, UK
- Mirjam oude Egbrink, Maastricht University, the Netherlands

ABSTRACT

Background: Medical school selection assesses a variety of competencies to ensure the recruitment of well-performing students. However, there has been no systematic consideration of which specific constructs are actually assessed in selection. Combined with an abundance of research on predictive value, this has led to the paradoxical situation in which selection tools predict outcomes, but which constructs are doing the predicting is unknown. To enable improvement of the selection process, it is essential to know which constructs are really measured. The aim of this study was to shed light into the ‘black box’ of selection by gathering evidence for the construct validity of an outcome-based selection procedure.

Summary of Work: Downing's validity framework was applied to organize evidence for construct validity. The focus was on evidence related to content and internal structure, as these were most useful in terms of illuminating the ‘black box’ of the selection procedure at Maastricht University. First, we examined content-related evidence pertaining to the creation and application of the competence-based selection blueprint. Second, we investigated the internal structure of the selection process by connecting applicants' selection performance to the blueprint using Cognitive Diagnostic Modeling (CDM).

Summary of Results: Setting up the selection procedure proved to be a multi-step, robust process to determine content, which translated into good face validity and was transparent and replicable. Moreover, CDM showed that there is over 90% overlap between the expected blueprint and the latent variables in the applicants' performance data.

Discussion and Conclusions: To the best of our knowledge, this is the first time Downing's validity framework and CDM have been applied to investigate the construct validity of a selection procedure for medical school. We can conclude that the current outcome-based selection procedure indeed measures what was intended to be measured, therewith shedding some light in the black box that is selection.

Take-home Messages: Our results support the notion that the focus placed on creating the right content and following the competence-blueprint was effective in terms of internal structure. This information can be used to change selection procedures to make them more fair, predictive and efficient.

#7Q Short Communications - Selection Methods

Stories of selection from medical students with progression delay

AUTHOR(S):

- Sandra Carr, The University of Western Australia, Australia (Presenter)
- Ben Canny, The University of Tasmania, Australia
- Tony Celenza, The University of Western Australia, Australia
- Basia Diug, Monash University, Australia
- Andy Wearn, University of Auckland, New Zealand
- Tim Wilkinson, University of Otago, New Zealand

ABSTRACT

Background: There is limited qualitative research focused on understanding medical students' experiences of selection and how those experiences may relate to or influence academic progression. This study forms part of the Narratives of Progression: from medical student to doctor multi-centre research funded by the UMAT Consortium of Australian and New Zealand medical schools.

Summary of Work: The purpose of the study was to explore reflections of selection, progression and support from senior medical students who had failed, repeated or taken leave for a year during medical school. Thirty-eight students from five medical schools were purposefully selected and underwent in-depth interviews to record their lived experiences.

Summary of Results: "... I was sort of interested in medicine I suppose, quite liked the sciences ... but to be honest, didnt really know what I was getting myself into completely". Descriptive analysis demonstrated a range of demographic characteristics and selection scores for the participants. Thematic analysis of selection experiences illuminated five influencing themes: Motivation for Medicine, Relocation, Past Educational Experiences, Life Experiences, and Personal Health and Well Being.

Discussion and Conclusions: Many identified being motivated for higher education, but not specifically motivated for medicine. This was more overt in school leaver participants. For several, the experience of relocation and resultant isolation contributed to their delayed progression, particularly early in the medical course. Others discussed how their past education and past life experiences contributed to their academic difficulty and/or how they responded to it. Some reported physical and mental health concerns as affecting how they sought support or assistance.

Take-home Messages: Being selected into medicine, and the required commitment to undertake the course often results in the need for relocation, excessive workloads and different realities compared to expectations. Students are over extending themselves and for some it becomes too difficult to sustain. The findings will inform better ways of supporting applicants and students.

Keeping the bandwagon on track: Facilitating best practice and collaboration in MMIs as an admissions methodology across UK Medical Schools

AUTHOR(S):

- Angela Kubacki, St George's, University of London, UK (Presenter)
- Paul Garrud, University of Nottingham, UK
- Alison Callwood, University of Surrey, UK
- Austen Spruce, University of Birmingham, UK
- Rachel Chall, Medical Schools Council, UK

ABSTRACT

Background: Medical schools across the UK are increasingly employing multiple mini interviews (MMIs) to assess non-cognitive domains of prospective students. Research suggests considerable variations in MMI models within and between medical schools (Rees et al, 2016). Following recommendations that medical schools should 'work together to develop a bank of items that can be used in MMIs' (MSC, 2014), the MMI Expert Group was established to facilitate convergence on good practice in the design and operation of MMIs and to develop a process to improve and assure the quality of MMIs (and individual stations).

Summary of Work: We will present our experience of building consensus for content and construct coverage and the development of well designed stations to be shared across medical schools. This will include best practice in MMI station writing, stakeholder involvement, quality assurance, considering diversity and widening participation during development and piloting and collaborative implementation across institutions. This work is under-pinned by an inclusive approach to the development and trialling of shared stations.

Summary of Results: Through a series of residential workshops and station piloting across geographically dispersed UK institutions with candidates from diverse backgrounds, 27 MMI stations were developed. Initial feedback suggests that an inclusive approach to station development improved participants understanding of the principles of MMI station design. Participants strongly agreed that working with a variety of stakeholders to develop MMI stations was helpful.

Discussion and Conclusions: The aim of this work was to develop the evidence-base for MMIs through the collaborative development of generic stations informed by current principles of best practice. The authors acknowledge the complexities associated with this aim and the challenges of getting consensus. The stations and assessment criteria are intended to be refined to meet 'local' need assuming that no one station can/should meet all medical schools requirements. Through a facilitative and inclusive process, we developed a bank of quality assured stations that can be used in MMIs across institutions. A longitudinal study examining predictive validity is planned within UKMED.

Take-home Messages: We conclude that working towards developing a consensus of what works best in MMIs needs a creative and inclusive approach.

Developing Situational Judgement Tests for Ophthalmology Specialist Training in Australia and New Zealand

AUTHOR(S):

- Catherine Green, Royal Australian and New Zealand College of Ophthalmologists, New Zealand (Presenter)
- Rebecca Khan, Monash Institute for Health & Clinical Education, Australia
- Michael Merriman, Royal Australian and New Zealand College of Ophthalmologists, New Zealand
- Justin Mora, Royal Australian and New Zealand College of Ophthalmologists, New Zealand
- Margaret Hay, Monash Institute for Health & Clinical Education, Australia

ABSTRACT

Background: The Royal Australian and New Zealand College of Ophthalmologists (RANZCO) is the organisation accredited to train ophthalmologists in Australia and New Zealand. Until now, selection has been undertaken by employing hospitals in seven different networks, with variation in selection criteria and processes. From 2019, centralised selection will be undertaken by RANZCO to provide a cohort of applicants deemed eligible for selection, through a matching process. Evidence-based selection processes and tools, including situational judgement tests (SJTs) and multiple mini interviews will be introduced. We report on our pilot to locally develop SJTs for selection for post-graduate ophthalmology specialist training.

Summary of Work: The CanMEDS competencies Professional and Collaborator were selected as the focus for item development. Scenarios were created by a group of subject matter experts (SMEs). These were validated by two different groups of SMEs in a two-stage process, following which psychometric validation was undertaken and a scoring matrix developed. After a multi-round deletion-recalculation cycle, final items deemed suitable for piloting were confirmed. All 131 applicants for ophthalmology training in 2018 were required to complete the online, invigilated test.

Summary of Results: 182 Collaboration and 45 Professionalism items were initially developed. After 11 rounds of a deletion-recalculation cycle removing low-performing items, 79 Collaborator and 28 Professional items were included in the pilot. Cronbach's alpha was calculated as follows:

Overall SJT: 0.799; Collaborator: 0.783; Professional: 0.467. All items were able to distinguish between high and low performing test takers. The items demonstrated an appropriately wide range of difficulty. Despite the novelty of the SJT for selection into ophthalmology training, the majority of applicants found the test to be enjoyable, relevant, relatable and suitable. There was no difference in performance by gender and no correlation between age and items.

Discussion and Conclusions: The pilot confirms feasibility, with high acceptance from applicants, and following its success, with College members. Ongoing development of the tool with the continued development of new items is planned. SJTs will be incorporated into the selection process from 2019.

Take-home Messages: The RANZCO SJT is a valid and reliable tool for use in selection. Development of the tool has not only strengthened selection processes.

Does a qualitative selection procedure including non-academic criteria result in a medical student group with higher empathy than a lottery procedure?

AUTHOR(S):

- Anouk Wouters, Amsterdam UMC, Location VUmc, VUmc School of Medical Sciences, Research in Education, the Netherlands (Presenter)
- Wendy Homan, Amsterdam UMC, Location VUmc, VUmc School of Medical Sciences, Policy Innovation & Quality, the Netherlands
- Marleen Westerhof, Amsterdam UMC, Location VUmc, VUmc School of Medical Sciences, Policy Innovation & Quality, the Netherlands
- Rashmi Kusurkar, Amsterdam UMC, Location VUmc, VUmc School of Medical Sciences, Research in Education, the Netherlands

ABSTRACT

Background: Empathy, a desirable attribute in doctors and medical students, is related to patient satisfaction and positive clinical outcomes (Derksen et al., 2013). For years, Dutch admissions into medical study consisted of the simultaneous use of qualitative selection and a lottery weighted based on pre-university grade point averages. Because qualitative selection procedures usually incorporate non-academic criteria related to the interpersonal domain, and a lottery does not, we hypothesized that selected students have more empathy towards patients than lottery-admitted students.

Summary of Work: In 2017-2018, students from all six years of medical study at our institute were invited to complete the Jefferson Scale of Physician Empathy-Students (JSPE-S) to measure empathy using a 7-point Likert scale. We used Hojat et al.'s (2002) definition of empathy: "a cognitive attribute that involves an ability to understand the patient's inner experiences and perspective and a capability to communicate this understanding." We compared the total scores on the JSPE-S and the scores on all subscales, i.e. 'Perspective taking', 'Compassionate care' and 'Standing in the patient's shoes' of selected and lottery-admitted students using ANCOVA's. Gender and study phase were included as covariates.

Summary of Results: 317 students completed the questionnaire (ca. 15% response): 212 students could be categorized as selected and 85 as lottery-admitted students. Mean scores of the total group were 5.60 (SD = 0.57) for total Empathy, 5.74 (SD = 0.64) for 'Perspective taking', 5.72 (SD = 0.75) for 'Compassionate care', and 4.49 (SD = 1.32) for 'Standing in the patient's shoes'. No significant differences were found between selected and lottery-admitted students.

Discussion and Conclusions: The current findings suggest that the use of non-academic selection criteria does not result in the uptake of a group of students with higher empathy compared to a lottery procedure. However, due to a relatively low response rate and a potential response bias we cannot draw strong conclusions. Furthermore, measurements based on actual behaviour, rather than self-reported empathy, may be able to reveal differences between the groups.

Take-home Messages: This study suggests that empathy levels are similar in medical students who are admitted through selection or weighted lottery.

Comparison of the Performance Characteristics of the AAMC Standardized Video Interview (SVI) and the Electronic Standardized Letter of Evaluation (eSLOE) in Emergency Medicine

AUTHOR(S):

- **Laura Hopson, University of Michigan, USA (Presenter)**
- Linda Regan, Johns Hopkins University School of Medicine, USA
- Jeremy Branzetti, New York University School of Medicine, USA
- Elizabeth Samuels, Alpert Medical School at Brown University, USA
- Michael Gisondi, Stanford University School of Medicine, USA
- Bobby Naemi, Association of American Medical Colleges, USA

ABSTRACT

Background: We analyzed the performance characteristics of the Electronic Standardized Letter of Evaluation (eSLOE), a widely used, structured, norm-referenced evaluation of emergency medicine residency applicants in the United States, and the AAMC Standardized Video Interview (SVI), a new tool designed to assess communication skills and professionalism knowledge.

Summary of Work: The authors examined correlations and group differences for EM residency applicants in the 2018 Match. The authors matched 3469 applicants with valid SVI scores to 3223 applicants with 7544 unique eSLOEs, resulting in a matched sample of 2884 applicants. IRB approval was obtained.

Summary of Results: SVI scores have a normative distribution (range 6-30, mean 19.33, SD = 3.17). eSLOE ratings showed range restriction with preferential use of the higher ratings. SVI and eSLOE global assessment ratings demonstrate small positive correlations approaching $r = 0.20$. eSLOE ratings correlate higher with measures of academic ability (USMLE scores and academic honor society membership) than SVI scores. Group differences are minimal for the SVI, with the exception of applicant type, which favors MDs. There are small group differences in eSLOE ratings favoring women over men (Cohen's $d = -0.20$) and white over black applicants (approaching $d = 0.40$).

Discussion and Conclusions: The small positive correlation between SVI and eSLOE global ratings, suggests these are complementary although not duplicative instruments to assess residency applicants. Both tools need further examination to understand their predictive ability. The eSLOE is subject to similar sources and degrees of bias as other common assessment tools; group differences are not observed with the SVI. Our study was not designed to identify factors contributing to differences in performance ratings. These findings may affect design and adoption of standardized assessment letters in other specialties in order to emphasize development of a diverse medical workforce. Future research directions include developing strategies to refine the eSLOE to minimize sources of group differences in this heavily weighted assessment of residency applicants.

Take-home Messages: A dedicated communication and professionalism assessment has only weak correlation with the standardized letter for residency applicants. Understanding sources of bias and potential interventions are important next steps.

All Aboard for Social Paediatrics (SoPeds) Residency Training Programme

AUTHOR(S):

- Chayakamon Niyasom, Department of Paediatrics, Faculty of Medicine, Naresuan University Hospital (NUH), Thailand (Presenter)
- Jiranun Weerakul, Department of Paediatrics, Faculty of Medicine, Naresuan University Hospital (NUH), Thailand

ABSTRACT

Background: Comprehensive healthcare from birth to adolescent requires thoughtful multidisciplinary work, accounting for the local culture. SoPeds curriculum serves the vulnerable children while promoting their development, the program which is in keeping with Thailand Royal College of Paediatrics Core Competency on Community Child Health. In 2018, Department of Paediatrics, Faculty of Medicine, Naresuan University Hospital (NUH) initiates the challenging and innovative SoPeds programme for paediatric residency training programme. Traditionally, general paediatric training focuses on disease management more than psycho-social supportive. Therefore, this refined programme encompasses the holistic perspective of health and social care. Objective: To allow the very first paediatric resident in training to capture the essence of Community Child Health.

Summary of Work: The resident rotated through the one month programme with experiences in managing special needs children, health promotion and injury prevention. Daily visit, accompanied by at least one staff and a departmental secretary, the team worked with private bodies, charity works, governmental establishment at daycare, school, law court and homes of patients.

Summary of Results: At each stage, the resident and staff acquire new knowledge, be it home visit, meetings with other agencies or at the final presentation and feedback. For children with chronic illnesses, an evolving health, education and overall care plan is offered. All paediatric subspecialists devoted time to be involved. A limitation of programmed instruction is understanding the inconsistent learning objectives. The feedback from our network, while simultaneously establishing a growing relationship offer options to develop further this program for the next generations of paediatric residency training at NUH.

Discussion and Conclusions: SoPeds curriculum offers insight for transition and continuing of care. The opportunity is both rewarding and a learning process while creating network exercise. Starting from the resident level, branching to general paediatricians and subspecialists, as well as children and families all stands to benefit.

Take-home Messages: The holistic perspective of health and social care leads to a productive life, with improved self-esteem and contributing positively to society.

Challenging the simulation panacea: Preparing junior doctors for the stress of acute care

AUTHOR(S):

- **Scott Clarke, Edinburgh Medical School: Medical Education, University of Edinburgh, UK (Presenter)**
- Janet Skinner, Edinburgh Medical School: Medical Education, University of Edinburgh, UK
- Catriona Bell, The Royal (Dick) School of Veterinary Studies, University of Edinburgh, UK
- David Hope, Edinburgh Medical School: Medical Education, University of Edinburgh, UK

ABSTRACT

Background: High quality and timely resuscitation of deteriorating patients saves lives. As the hospital's first responders, the performance of junior doctors is critical but they often report feeling underprepared for this role; narrating feeling overwhelmed, and even paralysed, by the stress of providing acute care. Little research has explored the factors contributing to this stress. This study aims to explore junior doctors' perceptions of stress during the management of acutely unwell patients and the effectiveness of medical school at preparing them for it. Furthering our understanding offers the potential to develop educational interventions and tools to mitigate its effects.

Summary of Work: Following institutional approval, semi-structured interviews have been carried out with Foundation Doctors working in South-East Scotland. Interviews have been transcribed and, subsequently, analysed through thematic analysis.

Summary of Results: Early analysis points to a challenging transition after graduation. Participants described learning about the management of sick patients through short-lived, simulated scenarios, where support was readily available. On entering clinical practice they faced the stress of having to take responsibility on their own, over longer periods, where investigations and equipment were not immediately available. Uncertainty leading to indecision has been a commonly cited stressor, especially in complex patients with unclear diagnoses or multiple problems. Calling for help appears to be a pivotal moment, with many describing the stress relieving effect of interacting with a supportive senior, who is readily available and assumes responsibility for decision making. Conversely, seniors not being available or unwilling to help was described as further exacerbating stress.

Discussion and Conclusions: Simulation is purported to 'bridge-the-gap' between learning and practice, but our work suggests that undergraduate scenarios frequently don't accurately portray real-world stressors. Managing uncertainty and complexity are promising candidates for educational interventions to improve preparedness, and thus reduce stress. Finally, the impact of a supportive and readily available senior should not be underestimated; institutions should continue to focus on this in teaching and escalation policies.

Take-home Messages: Our current approach to undergraduate simulation leaves students underprepared for the stress of acute care. Exposure to realistic stressors is required to better prepare them for practice.

Developing professionalism amongst medical interns who have taken part in open disclosure after medication error: Feedback that avoids 'Facebook reflection'

AUTHOR(S):

- Andrew Lane, Sydney Medical School, Australia (Presenter)
- Christopher Roberts, Sydney Medical School, Australia

ABSTRACT

Background: Mistakes are common within healthcare. Open disclosure is a policy stating doctors should apologise for errors, discussing them with the harmed parties. Many junior doctors take part in open disclosure without training or experience. However, how do junior doctors make sense of their experience of open disclosure?

Summary of Work: A Phenomenological study of ten medical interns involved in open disclosure. Participants were selected using purposive and criterion sampling. Face-to-face semi-structured interviews illuminating their experiences of open disclosure after medication error. The descriptive audio-data was analysed using Interpretative Phenomenological Analysis.

Summary of Results: Three super-ordinate themes were identified. The superordinate-theme 'Rationalisation of medical error' described how the interns rationalised error in three different ways. 'Error is in the eye of the beholder' described rationalisation of their observations: interns demonstrated knowledge gaps and poor clinical reasoning when conceptualising their clinical practice. 'Apologetic justification' described rationalisation of their thoughts: interns justified errors using diffusion and distortion of responsibility. 'Softening the blow' described rationalisation of their language: interns utilised euphemistic language and discourse markers.

Discussion and Conclusions: The interns appeared to lack important elements in their cognitive frames, demonstrating conscious incompetence associated with rationalisation: they were aware of their mistakes but framed them due to something that was beyond their practice. Their cognitive frames also demonstrated unconscious incompetence, associated with cognitive dissonance. A learning model developed from the data suggested the presence of a prior cognitive frame, which was labelled 'readiness to apologise'. This learning model was linked to the competency framework, along with inherent and future cognitive abilities. 'Readiness to apologise' meant that the interns were; aware of the need to apologise; aware of the rationale to apologise; and aware of the want to apologise. This resonated with the theory of intellectual humility. Inability of reflective competence, ensuring the appropriate development of professionalism, was labelled 'Facebook reflection'.

Take-home Messages: Medical educators need to be aware of how learners are situated cognitively before they embark on a period of learning, and ensuring they are in the correct mindset to learn will optimise their progression through the competency matrix.

Conversations with interns - a safety net for personal and professional support

AUTHOR(S):

- Cecilia Moore, Austral University, Argentina (Presenter)
- Soledad Alvarez Campos, Austral University, Argentina
- Carlos Navari, Austral University, Argentina
- Angel Centeno, Austral University, Argentina

ABSTRACT

Background: The interns complete their practices at different affiliated hospitals, and face diverse social and human situations. We have several assessment and monitoring strategies at each practice site, but insufficient opportunities for interns to talk and reflect with their peers and tutors about their professional and human experiences.

Summary of Work: Periodic and voluntary reflection meetings were incorporated. All interns (52) in groups of five met twice a year with the internship coordinator and two educators. They participated in the two scheduled meetings and then evaluated the experience. The aim of this presentation is to highlight the experiences that the interns considered most relevant during their internship and the contribution of these meetings to handle them.

Summary of Results: The emerging themes are grouped into three dimensions: teaching experience, human personal aspects and professionalism. The most relevant teaching experience was to identify their own learning gaps, point out good and bad rotations and teachers, and to discover new areas of professional development. In personal human aspects they highlighted situations that had impacted them emotionally, such as the suicide of a young patient, the suffering and death of patients, not having anyone to talk about these distressing situations. In relation to professionalism, indifference towards relatives of patients, lack of communication skills and respect for the autonomy of patients. They also highlighted positive aspects of the teaching experience and professionalism and identified what kind of doctor they wanted to be. The interns spontaneously enunciated most of these topics. Sharing and reflecting on these experiences with their peers and educators had allowed them to discover that they were not alone facing complex and emotionally powerful professional situations. Talking about these experiences, helped them to reduce the anguish and uncertainty.

Discussion and Conclusions: The interns live in their daily practice challenging experiences that they need to share with their peers and faculty. The career has to provide opportunities that allow them to reflect on them in a safe and supportive environment.

Take-home Messages: Activities that facilitate the conversations of the interns with their peers and their tutors should be incorporated as a systematic activity in the curriculum.

Developing a shared purpose for each hospital admission: An essential component of team competence

AUTHOR(S):

- Mark Goldszmidt, Schulich School of Medicine & Dentistry, Canada (Presenter)
- Katherina Baranova, Schulich School of Medicine & Dentistry, Canada
- Jacqueline Torti, Schulich School of Medicine & Dentistry, Canada

ABSTRACT

Background: In addition to addressing acute problems, prior research has shown that attending physicians hold three different perspectives on admission purpose: 1) discharge swiftly; 2) ensure patient safety by monitoring co-morbid chronic active conditions; 3) monitor and identify opportunities for improving overall health. Given the patient care implications and potential collaborative challenges of such varying perspectives, this study explored how perspectives are negotiated and enacted within a clinical teaching team context.

Summary of Work: The research took place on two internal medicine teaching units each with three separate teams. Constructivist grounded theory was used to inform data collection and analysis. Fifty-four individuals participated including residents, medical students, and attending physicians. Data was collected through 150 hours of direct observation with field interviews. Management decisions around purpose of admission were observed across 185 patients.

Summary of Results: We identified a dominant perspective for each observed attending and senior resident (SR). For attendings, purpose of admission appeared to be taken as a 'matter of fact' and not a 'matter of concern' (Latour 2004). Moreover, we were unable to identify any instances where the team explicitly discussed purpose or why a particular perspective was held. Team member perspective differences became most noticeable at the extremes and when differences existed between the SR and attending. Strategies used by attendings for implicitly signaling their perspective included using authority, shutting down and re-directing discussion. Trainees also participated in maneuvers to perform their perspective ranging from direct advocacy to covert manipulation such as avoidance/forgetting and delaying until attending changeover.

Discussion and Conclusions: Achieving a shared admission purpose is hampered by collaborative tension, dysfunctional advocacy, and an overstressed healthcare system. Attendings' holding perspective on admission purpose as a 'matter of fact' may impact both patient care and teaching. Not explicitly addressing purpose may also lead to covert maneuvers by trainees to work through the conflict.

Take-home Messages: Attending physicians play a pivotal role in directing patient care, supporting collective competence and shaping trainees' future practices. It is therefore essential they be explicit about admission purpose and create a flexible approach to each patient characterized by shared decision making amongst team members and the patients themselves.

Disentangling residents' engagement with communities of clinical practice in the workplace

AUTHOR(S):

- **Francisco M Olmos-Vega, Pontificia Universidad Javeriana, Colombia (Presenter)**
- Diana Dolmans, Maastricht University, The Netherlands
- Carlos Guzmán-Quintero, Pontificia Universidad Javeriana, Colombia
- Camila Echeverri-Rodriguez, Pontificia Universidad Javeriana, Colombia
- Pim Teunissen, Maastricht University, The Netherlands
- Renée Stalmeijer, Maastricht University, The Netherlands

ABSTRACT

Background: The workplace is an unstructured learning environment, which often results in residents missing learning opportunities that are afforded to them in this setting. Other professionals' lack of acceptance of residents as participants within the healthcare team constitutes one reason for this problem. Although some research has explored how residents engage with supervisors, nurses and pharmacists individually, there is little research on how residents enter into and engage with the broader community of clinical practice (CoCP).

Summary of Work: Through a constructivist grounded theory approach, we conducted 13 semi-structured interviews using the Pictor technique with residents from different training levels and disciplines during the first weeks of their new rotations at Universidad Javeriana in Bogotá, Colombia. Results were constructed through iterative data collection and analysis, constant comparison methods and theoretical sampling.

Summary of Results: Residents were identified to either have a central or a peripheral trajectory in the CoCP. How residents' goals for their rotation aligned with those of the CoCP strongly influence the learning experience. The identification of relevant CoCP members and understanding how these members could assist their successful engagement with the community's practices was vital. Negotiation between the resident and the CoCP member determined ultimate resident participation in the CoCP.

Discussion and Conclusions: Balancing resident's agency and the needs of the CoCP strongly influence workplace learning. It needs to be considered that not all residents have the same trajectory during their rotations in post-graduate training. Optimising workplace learning includes being mindful as to how each member of the healthcare team influence residents' engagement on practice, and on understanding the nuances of residents' participatory trajectories while interacting with them.

Take-home Messages: Recognising the variety of residents trajectories within a community and aligning workplace affordances related to these trajectories might help optimize workplace learning during post-graduate training. Promoting residents' alignment with the healthcare team might include introducing themselves to all members, promoting open dialogue about their goals and understanding how each member could assist them in their learning agenda. It also includes for residents to be flexible enough to balance their goals against the healthcare team needs.

Promoting high-order thinking in medical students using semi-unstructured learning activities

AUTHOR(S):

- Lance Miller, American University of The Caribbean School of Medicine, Dutch Antilles (Presenter)
- Mark Quirk, American University of The Caribbean School of Medicine, Dutch Antilles

ABSTRACT

Background: High-order thinking is an essential skill for the practice of medicine. However, teaching these skills to medical students remains challenging. Medical education is highly structured by nature, with little time dedicated to unstructured learning activities (i.e., discovery learning). Research suggests that unstructured learning is better at promoting higher order thinking in both humans and artificial intelligence. We designed a series of weekly activities that promote higher-order thinking using semi-unstructured learning activities.

Summary of Work: A group of 10 students meet weekly (live or online) and participated in 90-minute semi-unstructured learning activities. Each session consisted of four separate primers. Each primer consisted of a brief description of a disease with minimal clues. Each student was allotted 10 minutes to define the problem, develop hypotheses, generate questions, and/or illustrate a pathway and five minutes to confirm their hypothesis, correct assumptions, or discover something about the primer using external resources. Next, students were given 10 minutes to share their ideas and solutions with others in the group. Finally, students were given a 6-question open-ended quiz at the end of each session and one week later.

Summary of Results: Student engagement was initially slow and variable but improved over time and correlated with the degree of practice. Percentage pass rates on National Board of Medical Examiners (NBME) subject exams plus Comprehensive Basic Science Exams (CBSE) increased 10% over the previous five-semester running average. Based on strong correlations among NBME exams and USMLE performance at our institution (.64) these findings predict increase Step 1 performance.

Discussion and Conclusions: We show that weekly semi-unstructured learning activities are correlated with improvements in higher-order thought processes, e.g., generating a hypothesis, asking relevant questions, and application of knowledge to solve novel problems. Preliminary data suggest that semi-unstructured learning activities promote higher-order thinking and can feasibly be incorporated into the medical school curriculum.

Take-home Messages: Allowing for semi-unstructured learning activities and providing the request time to engage in these activities is correlated with improvements in higher-order thinking.

Using Activity Theory to Change the Cognition of Nursing Clinical Preceptors on Workplace Bullying

AUTHOR(S):

- Chien Chien Tung, Tungs Taichung MetroHarbor Hospital, Taiwan (Presenter)
- Tzu-Sang Chen, Tungs Taichung MetroHarbor Hospital, Taiwan
- Ching-Shiang Chi, Tungs Taichung MetroHarbor Hospital, Taiwan
- Yi-Fei Chung, Tungs Taichung MetroHarbor Hospital, Taiwan
- Jui-Fen Huang, Tungs Taichung MetroHarbor Hospital, Taiwan

ABSTRACT

Background: In Taiwan, some senior preceptors treat young nursing staff in a language of cynicism or loud insults, which is regarded as a reasonable training--the perception of taking hardship as a supplement. Not only it does cause the young nursing staff's anxiety or stress, but it forms a negative workplace environment. By the report of 2017-2018 on resigning from young nursing staff, 37% of the reasons were down to senior preceptors inappropriate behavior. In order to solve the problem, we arranged an 8 hour-workshop on workplace bullying to change the cognition of senior preceptors and prevent the formation of bullying culture.

Summary of Work: This was a single group of pretest and posttest design. 61 senior preceptors were from the acute/critical care units. The goal was acquisition of knowledge and cognition about workplace bullying. An educational workshop-understanding workplace bullying was held on 6th December 2018. Activity theory was applied and the class design was: the body of learning-preceptors, tool-experts' speech, video appreciation, personal reflection and group discussion.

Summary of Results: The average age of the senior preceptors was 31 years old and the average working experience in nursing was 8.6 years. Scores for pretest and posttest on cognition were 54.1 and 99.3 respectively. 93% was obtained on the survey of learning satisfaction.

Discussion and Conclusions: Chinese culture and ethical thinking might play an important role for shaping bullying culture. Subordinates obey seems an acceptable social norm and particularly in the nursing field, which apprenticeship system runs predominantly. Thus, applying the activity theory was to change cognition to increase friendly interaction between the preceptors and young nursing staff after conducting reflection and situational simulation that could revise the twisted concept and reshape the legitimate behavior. Applying activity theory into multiple learning methods proves improvement on bullying culture and enhances awareness of workplace bullying. In sum, it is superior to traditional narrative teaching courses.

Take-home Messages: Effective use of activity theory has positive effects on the changes in the knowledge acquisition and cognition of clinical senior preceptors.

Using on-line spaced education to improve learning in the health sciences: A systematic review

AUTHOR(S):

- David Hak, AO North America, USA (Presenter)

ABSTRACT

Background: Spaced education is a novel online educational method has been shown to improve knowledge acquisition, increase learning retention, and improved adherence to clinical practice guidelines. On-line asynchronous spaced education also allows introduction of game mechanics to aid engagement. Learners receive multiple-choice questions and feedback by email, text, or app. The questions are then re-presented in a cycled pattern over 8 to 42 days to reinforce the content.

Summary of Work: An electronic literature search of PubMed using the search phrases 'spaced education', 'spaced learning', and 'Qstream' was performed identifying 362 potential English-language articles published between 2001 and January 2018. Abstracts and or full text articles were reviewed to assess whether these articles studied the effect of on-line spaced education in the health sciences.

Summary of Results: 47 articles were identified that examined on-line spaced education in the health sciences. All but one study reported a positive impact of spaced learning on knowledge acquisition or retention. 53 % of the studies were randomized trials. 42 studies used a commercially available platform (Qstream, Inc. Burlington, MA) while the others used a self-developed spaced education delivery system. Published studies have included a total of 9800 subjects. The studies involved assessment of residents in training (14 studies), medical students (12), practicing physicians (9), fellows in training (4), and the others a combination of providers including dental students, nurses, and other healthcare workers. An increased number of publications were seen in recent years: 2018 (5 studies), 2017 (6), 2016 (7), 2015 (3), 2013 (3), 2012 (6), 2011 (2), 2010 (4), 2009 (3), 2008 (4), and 2007 (2).

Discussion and Conclusions: Discussion: While many of the early publication authors included one of the Qstream founders, an increasing number of publications by independent researchers have validated the beneficial impact of spaced learning. Conclusion: An increasing number of randomized studies are proving the effectiveness and popularity of on-line delivery of spaced education. This method has been shown to be beneficial in studies involving a spectrum of different learners in a variety of specialty areas.

Take-home Messages: On-line spaced education is a powerful method to engage learners, increase knowledge acquisition, increase retention, and improve adherence to clinical practice guidelines.

#7S Short Communications - Teaching and Learning 2

Date of Presentation: Tuesday, 27 August 2019

Time of Presentation: 1100-1115

Location of Presentation: Room 0.51, Level 0

Do Dental Medical Students Develop Visual Diagnostic Expertise Already During their Studies?

AUTHOR(S):

- Katharina Scheiter, Leibniz-Institut für Wissensmedien, Germany (Presenter)
- Juliane Richter, Leibniz-Institut für Wissensmedien, Germany
- Thérèse Felicitas Eder, Leibniz-Institut für Wissensmedien, Germany
- Fabian Hüttig, Tübingen University Hospital Center for Dentistry, Oral Medicine, and Maxillofacial Surgery, Germany
- Constanze Keutel, Tübingen University Hospital Center for Dentistry, Oral Medicine, and Maxillofacial Surgery, Germany

ABSTRACT

Background: In dentistry, X-rays are the most common source of diagnostic information. Hence, radiology training is mandatory for dental students. Expert-novice comparisons reveal pronounced differences between medical students and professionals in how they inspect images and in their ability to detect anomalies, but it is yet unclear whether these differences emerge already during study. Hence, we investigated differences in visual expertise between students from different clinical semesters.

Summary of Work: 280 data sets from dental students studying in one of five clinical semesters were analyzed. Students were asked to identify anomalies in 10 X-rays by first inspecting an X-ray and then marking all suspicious areas that would require follow-up diagnostic procedures. We assessed diagnostic performance (i.e., percentage of anomalies correctly identified), the number of fixations on anomalies, and the time it took students to first attend to them (time to first fixation). Additionally, we measured clinical dentistry knowledge with 24 multiple-choice items developed by two professionals.

Summary of Results: Whereas students' clinical knowledge improved across semesters ($p < .001$), there was no advancement in their diagnostic performance ($p = .23$). Moreover, on the process level students displayed a similar number of fixations on anomalies across semesters ($p = .33$). The time to first fixating an anomaly tended to differ as a function of semester ($p = .054$), with students in the 7th semester attending to anomalies relatively late and students in later semesters becoming faster.

Discussion and Conclusions: While students' clinical knowledge improves with increasing experience, competencies related to diagnosing anomalies do not. On the one hand, these findings are disconcerting when considering that diagnostic performance lingers at approximately 55 percent. On the other hand, we know from expert-novice comparisons that professionals' diagnostic competencies are clearly better than that of students, suggesting later improvements.

Take-home Messages: It seems that image interpretation competencies are mostly acquired as a function of repeated confrontation with cases during professionals' everyday work. Because these learning processes at the workplace are more likely to be subject to random influences (e.g., case variability), further research regarding systematic training approaches already during university study is warranted.

Active learning in medical education: Case study of a medical faculty in Papua New Guinea

AUTHOR(S):

- Jerzy Kuzma, Faculty of Medicine and Health Sciences, Divine Word University, Papua New Guinea (Presenter)
- Iwona Kolodziejczyk, Divine Word University, Papua New Guinea

ABSTRACT

Background: Although active learning designs are increasingly utilized in medical education, many faculties are facing the situation where most of their current medical educators have been educated in a traditional lecture-based way. The study was conducted in the context of a developing country and in a new, working for three years, medical school. The aim of the study was to evaluate the current understanding and practice of active learning among the faculty members and explore ways forward towards increasing implementation of active learning techniques.

Summary of Work: It was a case study employing in-depth interviews and focus group discussions as data collection tools. Purposive selection included 10 of medical educators and 10 learners for in-depth interview, and two focus discussion groups with 6 participants in each group. Thematic content analysis was used for the data analysis.

Summary of Results: Face-to-face lecture remains a dominant teaching method. Medical educators viewed their role predominantly as imparting basic concepts and materials to students. Occasionally, some interactive techniques were introduced to lectures including brainstorming, questioning for checking understanding and keeping attention. Additionally, participants affirmed engaging other interactive functions such as conducting exercises, feedback, problem and case-based learning, portfolio, group work, and leading discussions. While most of the educators understood active learning as making students doing, they did not utilize students' reflection. In interactive activities, they focused only on teacher-student interactions underestimating peer-to-peer interactions. Majority of faculty members was aware about the effectiveness of active learning methods and looking forward to learn more interactive techniques applicable during lectures. Generally, students were more enthusiastic and convinced that active learning techniques help them learning.

Discussion and Conclusions: Despite being aware of effectiveness of active learning methods and being familiar with a wide array of active approaches, still preferable method of teaching was a lecture with rare application of interactive techniques. Because educators are comfortable with lectures, the first step in our strategies for implementation active learning will involve changing a lecture to become more interactive.

Take-home Messages: Awareness of the effective teaching methods among the medical educators are not enough to change old teaching habits. The implementation of active learning requires a well-planned implementation strategy and continuous faculty efforts.

#7S Short Communications - Teaching and Learning 2

Cultural Preparedness for Active Learning

AUTHOR(S):

- Haruko Akatsu, International University of Health and Welfare School of Medicine, Japan
(Presenter)

ABSTRACT

Background: The effectiveness of active learning has been well established; however, related cultural factors have not always been addressed explicitly. Active learning would be difficult without the basic cultural components such as valuing individual opinions and encouraging debate, and viewing student questions not as a loss of teacher authority or power, but rather as an indispensable opportunity for life-long learning. Traditional Japanese culture values obedience and silence in the classroom, and students often do not readily participate in class. Nonetheless, International University of Health and Welfare (IUHW) School of Medicine, which opened in Narita, Japan in 2017, is unlike any other Japanese medical school in that it places active learning at its educational core.

Summary of Work: IUHW worked first to establish the right culture for active learning: (1) Creating a first-name based student community to eliminate typical vertical senior-junior relationships and provide an equal platform and community; (2) Introducing students to small group discussion and group work from Day 1 (3) Incorporating Team-based Teaching (TBT), where faculty members meet, discuss, and plan every class curriculum in advance; (4) Implementing daily after-class survey questionnaires; (5) Providing weekly FD (faculty development) to assist faculty members in planning and executing active learning.

Summary of Results: The above efforts successfully created an active learning culture at IUHW School of Medicine. Students embraced active learning immediately, despite many of them having only ever experienced traditional lecturing prior to entering this school. On the other hand, faculty members varied in their interest in and willingness to try active learning.

Discussion and Conclusions: The effectiveness of active learning has been well established; however, related cultural factors have not always been addressed explicitly. We report five tips from our experience in overcoming the lack of an active learning culture in Japan.

Take-home Messages: Successful active learning partly depends on the cultural preparedness of the students and faculty involved. In countries that lack a culture that facilitates active learning, schools can still cultivate such a culture to prepare students to embrace active learning.

#7T Round Table – Learner in Difficulty

“But they seem nice”- Is failure to fail medical students failing them?

AUTHOR(S):

- George Greenlees, Royal Wolverhampton NHS Trust, UK (Presenter)

ABSTRACT

Failure to fail describes the award of passing grades to students who fail to perform satisfactorily in clinical assessments. The phenomenon has been described in a range of professions including medicine, nursing and social work. Purported motivations for this behaviour include empathy and identification with students as well as anxiety that negative marks reflect poorly on the teacher (1). However, unless medical school entry is capable of identifying people who are perfectly suited to the role then some students must fail at medical school (2).

Local experience has seen both junior doctors and medical students who have progressed through their training despite significant concerns regarding their ability or preparedness for the role. Whilst these cases are rare there are both public safety and student welfare motivations for addressing them. Frequently these are complex cases that incorporate multifaceted elements of physical and mental health. We must be conscious of the extreme distress that can be caused to colleagues by allowing them to progress to such a point where they can no longer cope, particularly if issues have been identified earlier in training. The aim of this Round Table is therefore to generate discussion around the topic of failure to fail and consider how these issues can be addressed.

1. Cleland, J. A., Knight, L. V., Rees, C. E., Tracey, S. and Bond, C. M. (2008). Is it me or is it them? Factors that influence the passing of underperforming students. *Medical Education*, 42: 800-809.

Remediation of Technical Skills for Surgical Trainees

AUTHOR(S):

- Oleg Safir, University of Toronto, Canada (Presenter)
- Justin Chang, University of Toronto, Canada

ABSTRACT

Surgical training depends chiefly on knowledge acquisition and skill development across a broad set of competencies. Aptitude for technical skills in surgery is notoriously difficult to evaluate in surgical residency candidates, and the late identification of technical deficiencies in senior trainees presents a significant challenge to both the trainees and the training program. It is therefore imperative to closely monitor technical skills acquisition early in residency.

Surgical competency based training provides a suitable platform for early identification of trainees with deficiencies in their technical skills acquisition, however, the management and remediation of these trainees remains a challenge. We believe remediation must be needs focused, non-punitive, towards the goal of improving trainee performance. Remediation must be informed, and driven by reliable assessment tools. It must be transparent, with due process, given the high stakes competitive environment of surgical training. Finally, remediation must be effective and demonstrably achieve its objective.

We will review our ten-year experience with the early identification of technical deficiencies and remediation of junior orthopaedic surgical residents through our Surgical Bootcamp – an intensive one-month knowledge and skills training program for our incoming trainees.

If At First You Don't Succeed: Transforming the Culture of Failure

AUTHOR(S):

- **Clasina Leslie Smith, SIU School of Medicine, USA (Presenter)**
- Rachel Lewin, University of California, Los Angeles, USA
- Maria Rudolph, Independent Consultant, USA
- Colin Greengrass, Royal College of Surgeons in Ireland – Medical University of Bahrain, Bahrain
- Kate Schwertman, SIU School of Medicine, USA

ABSTRACT

Failure, burnout, resilience, and remediation are ubiquitous but under-explored topics in medicine and medical education today. These topics are perpetuated by a culture of perfection, in which it is unacceptable for learners and instructors to openly discuss their struggles. A culture of perfection is isolating, prevents connection, and limits growth. When failure is expected and struggle supported, challenging experiences are more manageable and provide opportunities for growth.

We will look at how to identify opportunities for using failure as an instructional strategy and how current educational strategies can be improved to use failure more effectively.

#7U Simulation Journal Club

Date of Session: Tuesday, 27 August 2019

Time of Session: 1015-1200

Location of Presentation: Room L8, Level 1

Do you want a quick update on the most recent literature regarding the use of simulation in medical education? Please join us for the Simulation Journal Club where members of the AMEE Simulation Committee have identified the newest simulation literature and handpicked the most influential, innovative, provocative, and interesting papers. We will present these papers and where possible invite the authors to comment on their impact. The format of the Simulation Journal Club will be interactive – allowing time for questions and participant voting for the Premier Paper on Simulation in Medical Education. This paper will win a £1000 award from the Copenhagen Academy for Medical Education and Simulation. This is an excellent opportunity to keep up to date with the increasing amount of research published on this very important topic in medical education.

#7V Conference Workshop

To self-direct or not to self-direct, that is the question: Shining a light on curriculum dilemmas

PRESENTER(S):

- James McMillan, School of Medicine, University of Dundee, UK
- Linda Jones, Centre for Medical Education, University of Dundee, UK
- Shihab Khogali, School of Medicine, University of Dundee, UK

ABSTRACT

Background: In the current climate of medical education there are a number of dilemmas affecting curricula development. These include: ever increasing and rapidly evolving content; increasing emphasis on adaptive learning and systems of assessment; attention to the hidden curricula; and maintaining student engagement. This workshop aims to study the role of self-directed learning (SDL) in addressing these challenges. The Centre for Medical Education at the University of Dundee has recently designed an SDL module to develop educators who are able to recognise and integrate the skills, knowledge and attitudes required for career long learning into their own practice and pedagogy. This workshop will draw on the experiences of some of those involved and allow participants to discuss whether and how the concept of SDL manifests itself within their curricula.

Who Should Attend? We hope to attract anyone with curiosity about SDL, particularly in relation to curriculum development or day-to-day teaching and learning.

Structure of Workshop: This interactive session will generate discussion through short inputs, interspersed with small group conversations, aimed at identifying the what, why and how of enhancing the self-directing capacities of undergraduate and postgraduate learners. It will allow space to explore participants experiences of encouraging learners to lead their own learning processes, describe what works for them and share their curriculum design ideas.

Intended Outcomes: By the end of the session participants will have:

- Shared experiences of developing their own SDL skills and also of facilitating the development of SDL skills of faculty and students.
- Expanded their understanding of the evidence base supporting the importance of SDL as a professional skill for the healthcare workforce.
- Identified a range of strategies for integrating SDL into curricula development and pedagogical processes.

Level: All levels welcome.

#7W Conference Workshop

7W (3374)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1015-1200

Location of Workshop: Room 0.49-0.50, Level 0

From Young Teacher to Young Educator: Crystallising Educational Aspirations into Practical Steps

PRESENTER(S):

- Rille Pihlak, University of Manchester, UK
- Susannah Brockbank, University of Liverpool, UK
- Robbert Duvivier, Maastricht University, The Netherlands
- Margot Weggemans, University Medical Center Utrecht, The Netherlands
- Kevin Garrity, University of Glasgow, UK
- Matthew J. Stull, Case Western Reserve University, USA

ABSTRACT

Background: Engaging in clinical teaching is intrinsic to the day-to-day work of a modern healthcare professional. It is recognised that healthcare professionals in training will need to have a clear understanding of their roles and responsibilities as educators. Furthermore, many clinicians have a passion for education and want to build a future career that combines clinical and educational work. Whilst it seems relatively straightforward to gain experience and develop as a clinical teacher, forging a career as a clinical educator can be more challenging. This interactive workshop seeks to explore what healthcare professionals in training can do to develop their educational practice. The workshop will explore potential differences between the roles of ‘teacher’ and ‘educator’ and the career management tools that trainees will require to bridge this divide. It will help participants define their goals as future educators and identify clear, practical steps to achieving them.

Who Should Attend? Young medical educators, such as students, junior doctors and residents, who hope to gain an understanding of how they can develop their own practice as educators.

Structure of Workshop: The workshop will introduce an Individual Development Plan (IDP) as a planning tool. Using the IDP, participants will have an opportunity to identify their goals and plan tangible ways to achieve them. We will also offer strategies for identifying and overcoming potential future challenges.

Intended Outcomes: By the end of this workshop, participants should be able to:

- Identify the differences between ‘teacher’ and ‘educator’
- Define their own medical education aspirations.
- Break down educational aspirations into measurable and achievable goals.
- Identify potential challenges they may face and identify ways to overcome these.
- Identify potential collaborators locally.
- Leave with a clear plan for their own practice to ensure their development as educators of the future.

Level: Introductory

#7X Conference Workshop

7X (2411)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1015-1200

Location of Workshop: Room 0.96-97, Level 0

Medical Education: The costs vs the profits

PRESENTER(S):

- Aikaterini Dima, International Federation of Medical Students' Associations (IFMSA), Greece
- Adonis Wazir, International Federation of Medical Students Associations (IFMSA), Lebanon
- David Gordon, World Federation for Medical Education, France
- John Boulet, Foundation for Advancement of International Medical Education and Research (FAIMER), USA

ABSTRACT

Background: Recent years have seen a rapid increase in the number of medical schools, particularly in the number of private institutions. The argument of whether medical education represents a profitable business arises, particularly when looking at its costs, with an average cost of \$278,455 in the US and £70,000 in the UK, numbers much higher when compared to other professional degrees. Alarming is the lack of unambiguous data regarding tuition fees across the world and more so, the lack of rationale for the costs. Medical students often have no access to information on what exactly it is that they are paying for, raising necessary questions regarding the transparency of medical schools. This workshop aims to stimulate a discussion on why this scarcity of information exists, what can be done about it and why, if education is a human right, we are still posing so many financial barriers to access it.

Who Should Attend? Anyone with an interest in the finances of medical education, including students and faculty.

Structure of Workshop:

1. Introduction of facilitators and workshop aims (5')
2. Literature review: What do we know so far about how much medical education costs and how much profit it generates? (15')
3. Behind the costs: Which parts of medical education are the costliest and how can we cut the costs? What are the educational benefits and challenges? (20')
4. Private and public education: What are the pitfalls of each? Should education costs be subsidized by governments? (30')
5. Students access to information: How much should students know about their tuition fees? (10')
6. Wrap up and going over the outcomes (10')

Intended Outcomes:

1. Offer a literature review on the costs and the profits of medical education across the globe, as well as the scarcity of information
2. Identify reasons why medical education costs are so high and whether they are justified or not
3. Consider public vs private medical education and potential pitfalls of each
4. Raise awareness on medical education costs around the globe
5. Information exchange among participants and consideration of a follow-up network

Level: Intermediate

#7Y Conference Workshop

7Y (521)

Date of Workshop: Tuesday, 27 August 2019

The Cultivation of Cognitive Curiosity: Key for Learning, Clinical Competence, Engagement, and Well-Being in the Healthcare Profession

PRESENTER(S):

- Vijay Rajput, Nova Southeastern University, Dr. Kiran C. Patel College of Allopathic Medicine, USA
- Anuradha Mookerjee, Cooper Medical School of Rowan University, USA
- Marcus Henning, Faculty of Medical and Health Sciences University of Auckland, New Zealand

ABSTRACT

Background: A contemporary view of clinical competencies falls short of building engagement and well-being for both learners and faculty. In 1899, William James called curiosity “the impulse towards better cognition.” The current working definition of curiosity is a “penchant for seeking new experiences, knowledge, and feedback and an openness to change.” The deprivation sensitivity, joyous exploration, social curiosity, stress tolerance and the seeking of thrills are five dimensions of curiosity described and analyzed in current literature by George Mason. The dopaminergic neural system is the primary intrinsic reward system for curiosity. The generation of intrinsic reward can create “curiosity contagion:” the phenomenon when someone’s curiosity is contagious and can spread from one observing another’s curiosity. This can be used when “role modeling curiosity”. The “Learning Progress” hypothesis shows an association with positive feedback between curiosity and learning. The exploration trait of curiosity also has a positive association with well-being through the Broaden-and Build Theory of positive emotions and psychological research. Curiosity helps decrease diagnostic error by reducing confirmation bias. Faculty members who are curious tend to be more innovative and less adversarial within teams, more openly communicative, and collaborative.

Who Should Attend? Medical educators, administrators, junior and mid-career faculty

Structure of Workshop:

- Identify gaps in knowledge on cognitive curiosity from participants - 10 minutes
- Make a case for curiosity as competence and review current literature - 20 minutes
- Participants respond to a brief personal curiosity instrument and compare their scores with national reference scores - 10 minutes
- Participants discuss and reflect on their score with colleagues (Dyad) - 10 minutes
- Participants in groups of 4-6, identify practical methods to bolster curiosity in learners and faculty (15 minutes)
- Take home points and messages - 10 minutes

Intended Outcomes: The learners and faculty are encouraged to enhance the practice of curiosity in the healthcare profession. Curiosity is a key competency that can improve clinical care, promote education, develop inter-professional collaborative practice and nurture well-being.

Level: Intermediate or advanced faculty and medical educators and administrators

#7Z Conference Workshop

7Z (2638)

Date of Workshop: Tuesday, 27 August 2019

Burnout amongst European Junior Doctors: recurrent themes, contributing factors and possible solutions

PRESENTER(S):

- Ellen McCourt, European Junior Doctors Association
- Vicky Soomers, European Junior Doctors Association
- Josephine Elliott, European Junior Doctors Association
- Brigita Jazbar, European Junior Doctors Association
- Agostinho Moreira de Sousa, European Junior Doctors Association
- Kitty Mohan, European Junior Doctors Association

ABSTRACT

Background: Burnout amongst doctors is characterized by emotional exhaustion, depersonalisation and reduced feelings of work-related personal accomplishment. Doctors are at an increased risk of mental health issues, including burnout, compared to the general public. The European Junior Doctors' Association (EJD) conducted a review of data from existing surveys amongst ten member countries in order to quantify the rate of burnout in doctors in specialist training, identify recurring themes and define contributing factors. Burnout is a major concern in terms of both the professional and personal needs of doctors. The review data suggests that action should be taken at an organisational level, rather than individual level, to reduce burnout rates amongst doctors across Europe. This workshop will present the findings of this review of burnout rates amongst European Junior Doctors. Participants will be invited to share their experiences, identify recurrent themes and contributing factors to burnout, and discuss possible solutions.

Who Should Attend? Doctors in specialist training, postgraduate educators and supervisors, and those with a professional interest in the wellbeing of doctors in specialist training.

Structure of Workshop: The workshop will begin with a presentation on burnout amongst European junior doctors, including the burnout data from ten European Countries. This will be followed by group discussions on the themes raised from the data, including excessive work, poor work-life balance and lack of administrative support. We will also discuss contributing factors, such as staff shortages, high workload, increasing administrative burden, low professional autonomy, dissatisfaction with working environment, and lack of appreciation. Participants will be invited to contribute their own experience and discuss possible solutions to this issue.

Intended Outcomes: After the workshop participants will

- Understand what burnout is and how it effects doctors in specialist training
- Appreciate the recurring themes and contributing factors to burnout amongst doctors in specialist training
- Consider possible solutions for burnout in their own working environment.

Level: Introduction

#7AA Conference Workshop

7AA (1178)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1015-1200

Location of Workshop: Room 2.61, Level 2

Coaching for Professionalism Remediation: Tools for establishing trust, diagnosing learners and creating remediation plans

PRESENTER(S):

- Felise Milan, Albert Einstein College of Medicine, USA
- Adina Kalet, New York University School of Medicine, USA
- Michael Allen, The Albert Einstein College of Medicine, USA

ABSTRACT

Background: Trainees across the health professions education spectrum must demonstrate professionalism to remain in good standing and progress in training. Some trainees do not meet expectations in this domain and must undergo remediation. However, few educators have received training in remediating learners with professionalism issues and many identify this as one of their most challenging and least favorite educational responsibilities. Learners and practitioners develop at different paces, but the vast majority of medical education programs, base learner progression in time, rather than in competency development or in professional identity development. With a myriad of definitions and theoretical frameworks to consider, educators may benefit from guidance on the use effective and respectful methods to work with trainees who struggle with professionalism.

Who Should Attend? This workshop aims to provide best-practice communication tools and skills to healthcare educators at any level who assess or remediate professionalism.

Structure of Workshop: After introductions, key concepts including theoretical constructs of professionalism will be reviewed in interactive group discussion. After review of three communication frameworks (Ladder of Inference, Prochaska Stages of Change, and building trust with the PEARLS model- partnership, empathy, acknowledgement/apology, reflection, legitimation, support) and viewing of a video of a meeting between a faculty member and struggling learner, there will be small group exercises involving the application of frameworks to case material with use of checklists to identify specific communication skills demonstrated and discussion of how to tailor approaches to conversations with learners, based on their stage of change. After reviewing assessment of professional identity formation stages through use of the Defining Issues Test (DIT2) and the Professionalism Identity Essay (PIE), we will wrap up with reflections and application to cases at participants' home institutions.

Intended Outcomes: Learning Objectives:

1. Describe theoretical frameworks that currently influence how we define and assess professionalism in medical education and the essential role of forming a trusting relationship with anyone in need of professionalism remediation.
2. Apply empathy building skills ("PEARLS") and the trans-theoretical model of stages of behavior change to professionalism remediation.
3. Apply the DIT2 and PIE tools to construct professionalism remediation plans for your learners.

Level: Intermediate/Advanced (weve also done beginners version of workshop)

#7BB Conference Workshop

7BB (58)

Date of Workshop: Tuesday, 27 August 2019

Location of Workshop: Room 2.83, Level 2

An international perspective on testing accommodations

PRESENTER(S):

- Ioanna Maraki, General Medical Council, UK
- Ilona Bartman, Medical Council of Canada, Canada
- Carl Matheson, Australian Medical Council, Australia

ABSTRACT

Background: Candidates for assessments in medicine can apply for testing accommodations on the grounds of functional limitations such as physical or mental disabilities. The organisation conducting the assessment is then responsible for deciding which accommodations to grant and how to deliver these. Organisations responsible for assessments across all three countries involved in the presentation (Australia, Canada, and the UK) report that the requests for testing accommodations have greatly increased in the last few years. Disability legislation in those countries also states medical students and licensed individuals must be able to meet the essential requirements of the role, with reasonable accommodations enabling them to do that. Careful decision-making is required by medical education and licensure bodies to balance making assessments as accessible as possible for a wide range of candidates, while maintaining the high standards required for valid assessments in medicine.

Who Should Attend? Medical educators and assessment managers involved in the design and delivery of assessments.

Structure of Workshop: Each of the speakers will give a short presentation on testing accommodations in their country (Australia, Canada, UK), from the perspective of their organisation (AMC, MCC, GMC). The presentations will cover the common requests and aspects to consider such as relevant legislation, fairness to candidates and examination integrity. The presentations will also highlight the parallels and differences between the three systems. After the presentations, we will run an interactive activity with the audience asking them to consider examples of requests for testing accommodations and make a suggestion on how to support the candidate. This will lead to discussion and Q&A with the audience. At the end, one speaker will summarise the key messages and issues on testing accommodations from the full session.

Intended Outcomes: To introduce the considerations for testing accommodations in medicine; launch a global discussion on testing accommodations; understand the international parallels and issues for making accommodations in assessments; and outline considerations for decision-making in the context of common requests.

Level: Introductory

#7CC Conference Workshop

7CC (1121)

Date of Workshop: Tuesday, 27 August 2019

Location of Workshop: Room 2.95, Level 2

Quality through innovation in medical education: Planning for the future

PRESENTER(S):

- David Taylor, Gulf Medical University, United Arab Emirates
- Hossam Hamdy, Gulf Medical University, United Arab Emirates

ABSTRACT

Background: As part of the 40th Anniversary of Medical Teacher, a series of articles was published aiming to look towards the future (Editorial, 2018). The future is, of course, uncertain, but several themes were addressed (Harden 2018) which allow us to consider what we might, could, or indeed should do to prepare our students. Our options range from developing our use of information technology, through re-thinking curriculum design and delivery, to completely re-visioning medical schools. Since there is a finite amount of time and limited resources, we need to think about those things which must be retained at all costs, and those things which we can do that widen the possibilities for our graduates.

Who Should Attend? Anyone who is interested in health professions education and who feels that we have a responsibility to try and make a difference to the communities we serve.

Structure of Workshop: There will be a brief presentation to outline the ideas published in the journal, but we will spend most of the time in discussion and debate. Participants will identify innovations already introduced in their context and share them with others in addition to innovations they would like to develop and implement. By the end of the workshop a list of innovative ideas can be produced with feedback given on the practicality of its implementation and possible generalisation to other contexts. We expect that this will lead to a series of proposed action research projects.

Intended Outcomes: The minimum outcome for each participant will be a greater understanding of what we face in the future and an idea of the options that are open to us. We will be hoping to extend the intention to developing a series of small scale action research projects that will impact upon the systems and places in which we work.

Level: Introductory/intermediate/advanced - those with predictive knowledge of the future would be most welcome.

Protecting and Respecting Individual Dignity at End-of-Life (PResIDE) - A Resuscitation Status Discussions Audit, and Barriers to their Occurrence

AUTHOR(S):

- Norshima Nashi, National University Hospital, Singapore (Presenter)
- Benjamin Hooi, National University Hospital, Singapore
- John Soong, National University Hospital, Singapore

ABSTRACT

Background: Discussion of resuscitation status with patients/families are not done consistently by doctors. A Korean study found that 64-70% of older patients do not wish for resuscitation in event of deterioration. In a study of 5 tertiary teaching hospitals, resuscitation status was not documented in up to 97.5% of patients. In cases where resuscitation status was discussed, the literature suggests that the quality may be suboptimal.

Summary of Work: The aims of the study were to find out the proportion of suitable patients who had their resuscitation discussed, and barriers to their occurrence. A retrospective cross-sectional audit of 127 patients admitted to the medical service of an integrated hospital for a 1-week period in January 2019 was done to assess the proportion of resuscitation status discussed for suitable patients (defined as patients who had poor pre-morbid states or had one or more irreversible organ dysfunction). An online survey was undertaken among junior doctors to find out the barriers to such discussions taking place.

Summary of Results: 32.3% (41/127) of patients fulfilled the criteria for having their resuscitation status discussed. Out of these patients 48.7% (20/41) did not have their resuscitation discussed. 100% (20/20) of the participants responded to the survey. Among the important factors identified were lack of knowledge (50%), lack of formal training (65%), and lack of confidence (only 55% had moderate to high confidence level). Participants demonstrated a positive attitude towards discussion of resuscitation status, with 85% stating that it is important, and 80% stating that it was their duty. The most frequently identified barriers were difficulty in deciding patients' suitability for resuscitation (95%), concern about difficult patients/families (90%), insufficient time (85%), and fear of inducing anxiety in patients/families (85%).

Discussion and Conclusions: There was a significant proportion of patients who did not have their resuscitation status discussed even though they warranted it. Lack of knowledge and training, and difficulty in deciding patients' suitability for resuscitation were main contributing factors.

Take-home Messages: Formal training sessions for discussion of resuscitation status should focus on imparting knowledge and communication skills. Senior doctors can facilitate this process by identifying if patients were suitable candidates for resuscitation.

Bottom of the social safety net', 'gatekeepers', 'bridge of communication': Using metaphors to make sense of physicians' profession

AUTHOR(S):

- Yu-Che Chang, Chang Gung Memorial Hospital, Taiwan (Presenter)
- Lynn Monrouxe, Chang Gung Medical Education Research Center, Taiwan
- Nothando Nkambule, Chang Gung Medical Education Research Center, Taiwan
- Hsu-Min Tseng, Chang Gung University, Taiwan
- Chung-Hsien Chaou, Chang Gung Memorial Hospital, Linkou, Taiwan
- Chia-Te Kung, Chang Gung Memorial Hospital, Kaohsiung, Taiwan

ABSTRACT

Background: Metaphors are invaluable tools employed to make sense of the world. This is especially important in understanding the complex social dynamics of communities of practice in specialties requiring multidisciplinary medical skills. This study examined the use of metaphors within emergency physicians (EPs) narratives around aspects of their profession.

Summary of Work: Using convenience sampling method, we invited 25 Taiwanese EPs to participate in one-to-one interviews. The interviews were transcribed and the transcripts were analyzed using ATLAS.ti. Drawing on social constructionism theory and the Metaphor Identification Procedure (MIP) we identified several conceptual metaphors and metaphorical linguistic expressions underpinning EPs' talk about their profession.

Summary of Results: Preliminary results indicated EPs' use of 'white paper', 'journey' metaphors within their narratives of professional development. 'Bottom of the social safety-net', saving people from the 'jaws of death' were used to describe EPs' societal roles. 'Front-line', 'façade', 'gateway', 'gatekeeper', 'bridge' described functions of emergency medicine (EM) in the hospital.

Discussion and Conclusions: The notion that EPs are generalists presented EPs with a unique challenge in understanding who they are, and their specific contribution to the healthcare system. The metaphors we identified demonstrate that EPs roles extend beyond their clinical skillset, echoing their 'social mission', emphasizing their role as the hospital's 'face'. Metaphors allow us to relate with EPs' narratives of their specialty. These results demonstrate that metaphor analysis is a conceptual tool to be deployed to construe how physicians from multidisciplinary specialties like family and internal medicine conceptualize their profession.

Take-home Messages: The contribution of multidisciplinary specialties such as EM is hard to ascertain, therefore the public has difficulty recognizing such specialties. The choice of metaphors used discloses how EPs interpret their position in society and hospitals in ways that resonate with the public. This is essential in establishing EM as an irreplaceable specialty and in enhancing professional identities of EPs.

Post-Graduate Year Doctors' Life Education: Rare Disease Clinic Holistic Health Care Training

AUTHOR(S):

- Chiang Chia-Wei, Tungs' Taichung MetroHarbor Hospital, Taiwan (Presenter)
- Ching-Shiang Chi, Tungs Taichung MetroHarbor Hospital, Taiwan

ABSTRACT

Background: The members of rare disease clinic teams are made up of psychologists, dieticians, respiratory therapists, rehabilitation physicians, and neurologists. Life education is seldom taught at medical school, and we found that it is appropriate to learn life education at rare disease clinics. This study focuses on the life education of PGY doctors.

Summary of Work: We invited eight PGY doctors to join our teaching program. This program has three stages: In the first stage, the doctors have to join the Rare Disease Clinic Holistic Health Care lessons. One week later, the participants completed the second stage, which consisted of psychologist-led, in-depth interviews with the PGY doctors. The interview topics included knowledge gained from the observation of outpatients, personal values, life education issues, and philosophical conversations. One month later, the third stage took place where we invited the PGY doctors to complete self-reports to understand the influence of the program on them; we also used metacognition to explore their philosophical thinking toward life.

Summary of Results: According to their self-reports, every PGY doctor showed significant improvement in self-awareness abilities and adjusted to using metacognition to reflect on life philosophy. For example, one PGY said, 'I never reflected on people who were born in different kinds of families, so I was too arrogant before. I have to do deep reflection, and I should learn how to respect patients' bitterness in life.' Now, if these PGY are confused about life education issues, they will take the initiative to make appointments with psychologists to have philosophical conversations.

Discussion and Conclusions: On the basis of this personalized teaching program, we have realized that if we want to teach life education well, we should help participants understand themselves so that they are aware of their own life philosophy. Thus, they can integrate their personality and their spiritual self.

Take-home Messages: This study also summarizes some conceptual topics that are important factors in assisting medical life education : a) exploring medical students' connection to their personal fragile experiences, b) exploring their life values and the lifestyle they want, and c) the identity of a doctor and its meaning.

Desirable characteristics of medical doctors from the perspectives of medical students and academic staff in rural generalist medical training program

AUTHOR(S):

- Krongkaew Thongruangsooksai, Trang Medical Education Center, Thailand (Presenter)

ABSTRACT

Background: Trang Medical Education Center collaborates with the Collaborative Project to Increase Production of Rural Doctors. Our mission is to produce an MD to serve in the rural region of Thailand. This study aimed to explore the perspective on desirable characteristics of a medical doctor in faculty staff who are all working in the tertiary care hospital, and medical students in our program who are aiming to be a rural physician after graduation.

Summary of Work: - A hundred staff were enrolled in this cross-sectional analytic study, 51 women and 49 men completed the questionnaire. - Sixty-eight clinical year students were enrolled and completed the questionnaire, 38 women and 30 men.

Summary of Results: - The most ranking desirable characteristics of rural physician in staff's perspectives was 'knowledge' while 'caring' came the second, which is similar to students' perspectives. - Both groups had no difference in the perspective. The three ranking were 'knowledge,' 'caring,' and 'moral,' respectively.

Discussion and Conclusions: - Regarding 'knowledge,' the staff weighted on its necessity more than the students, 92% and 83.8% respectively. - The staff's perspectives focused on 'moral,' 'selfless,' and 'detailed patient examination,' and may be associated with the duration of medical practice experiences. - Neither the staff nor the medical students weighted that proactive work in the community as necessary, 16% and 28% respectively. - The students valued punctuality, professional confidence, and competency in common diseases management more than the staff. This might relate to their outcome-required as a generalist after they graduate from the program. Therefore, generalists from rural hospitals should be included in faculty team.

Take-home Messages: Agenda of faculty staff and medical students in the rural generalist training program should be emphasized on characteristics of rural physician who are able to work with the rural community.

Cadaver as a First Teacher: Implementation of a Module for Learning Values & Ethics with Anatomy in a Medical School

AUTHOR(S):

- Anne D Souza, Kasturba Medical College, Manipal, India (Presenter)
- Sushma Kotian, Kasturba Medical College, Manipal, India

ABSTRACT

Background: As a part of learning human anatomy, dissection still plays a major role in the medical curriculum. Therefore, the humanistic values and ethics related to the cadavers could be learnt as a part of early medical curriculum. Making the students aware about the sources of cadavers, the body donation programme and their ethical issues would benefit them to widen their perspective about cadavers in the early phase of their education.

Summary of Work: The module was planned and designed by the Anatomy faculty and was introduced to the students during their first visit to the dissection hall. The module included a pre-session survey to obtain their existing knowledge about various aspects of cadaver and the body donation programme. The lectures focused on the importance of cadaver in learning anatomy, body donation and their ethical issues.

Summary of Results: Pre-session survey revealed that the students had considerable knowledge about body donation through internet and social media. However, they were not aware about the ethical and humanitarian aspects related to it. A tribute wall created outside the dissection hall, started filling with the words of gratitude for the donors. Students used their creativity to pen down their thoughts through reflections and poems. Paying a silent tribute to the donors before the dissection classes was also practiced.

Discussion and Conclusions: Sensitizing them towards handling of the cadavers and understanding the importance of a body donor's contribution would create an impact. This would be an initial step showing respect and empathy to the patients in their future career. This was an attempt to include the essential aspects of handling cadavers in the form of a learning module in the beginning of the academic year of the first year medical students.

Take-home Messages: In a medical school where the major source of cadavers is through the body donation programme, sensitizing students during their early days in medical school would add a tiny step towards their journey of practicing professionalism, human values and empathy.

Impact of research profile of faculty on their evaluation provided by medical students

AUTHOR(S):

- **Abida Shaheen, Shifa College of Medicine, Shifa Tameer-e-Millat University, Pakistan (Presenter)**
- Fahad Azam, Shifa College of Medicine, Shifa Tameer-e-Millat University, Pakistan
- Nismat Javed, Shifa College of Medicine, Shifa Tameer-e-Millat University, Pakistan

ABSTRACT

Background: Medical research at academic institutions helps healthcare systems as new knowledge is created. Faculty members actively involved in medical research further help their students with their updated knowledge and enhanced skills to critically analyze and interpret scientific data which is eventually imparted to their students. Students' feedback for teachers' evaluation is an integral part of medical education for continuous improvement in curriculum. Students may evaluate those faculty members better who keep their knowledge updated with current clinical practices and employ latest learning strategies in their teaching sessions. We conducted a study to assess the impact of teachers' research background on their feedback given by students in a module.

Summary of Work: A cross-sectional survey was conducted to correlate feedback score provided by third year medical students for faculty members conducting teaching sessions in one of the modules at Shifa College of Medicine with the recent and total number of research publications of the faculty.

Summary of Results: The mean number of total publications of faculty members was 13.45 ± 12.41 and the mean number of recently published articles in the last twelve months was 2.18 ± 1.47 . The mean feedback score for all faculty members on a five point scale was 4.73 ± 0.14 . The p-value for the t-test comparing mean number of recent publications and evaluation score was significant ($p\text{-value} < 0.001$). The p-value for the t-test comparing mean number of total publications and evaluation score was also significant ($p\text{-value} < 0.05$).

Discussion and Conclusions: The t-test comparing mean number of recent publications and evaluation score was highly significant illustrating that students provide good feedback to the faculty who continuously update their knowledge and provide recent and high-yield facts in their sessions. The learners also provided positive feedback to faculty who had a comparatively better research profile as it helps create an environment conducive for innovative ideas and stimulate critical thinking of students.

Take-home Messages: Participation of faculty members in research activities may improve their teaching skills, generate genuine interest for research among students and improve research output of students in the field of medicine.

Impact of a career simulation program using gamification with virtual turning point for medical students in Japan

AUTHOR(S):

- **Shuzo Teruya, Okinawa Yaeyama Hospital, Japan (Presenter)**
- Ayako Shibata, Yodogawa Christian Hospital Obstetrics & Gynecology, Japan
- Junichi Tanaka, Tohoku University Hospital Department of Education and Support for Regional Medicine, Japan
- Tatsuya Fujii, Sanno Hospital Orthopedics, Japan
- Takeshi Kondo, Center for Postgraduate Clinical Training and Career Development, Nagoya University Hospital, Japan

ABSTRACT

Background: Transition is events, or non-events that results in changed relationships, routines, assumptions, and roles. Students go through transitions and development constantly and consistently throughout their lived experience. However, transitions can be challenging for medical students and doctors. One reason is that transition comes at an unexpected time. Moreover, overcoming the transition itself is accompanied with considerable difficulty. There is a possibility that valuable opportunities are missed by burnout, depression, or escape. Schlossberg stated that the 4S's, ie self, support, situation, strategy, are important to overcome the transition. Here we report simulation-based education using gamification technique to support transitions in medical students' careers in Saitama Medical University, Japan.

Summary of Work: A workshop using table talk type career simulation game was conducted for 131 medical students in Saitama Medical University. The students had completed all lectures of basic medicine and clinical medicine and was in a state just before entering bedside learning. The students created fictitious medical student characters and virtually experience doctors career while randomly acquiring career event cards by group work. We analyzed changes before and after the workshop using questionnaires.

Summary of Results: All 131 students who participated got responses. Characteristic of the student was that 112 (85.4%) belonged to some club activities in their college. 6 students who would not prioritize their interests in deciding the future specialties had a tendency to choose specialty with emphasis on human relationships and rewards of the job. The number of students who noticed the new strengths was 51 (38.9%), the number of students newly noticed support was 29 (22.2%).

Discussion and Conclusions: Schlossberg's transition theory is one of the practical theory applicable to career education. A virtual experiential game of doctors life using virtual turning points might be useful for students to think about their strength and surrounding support.

Take-home Messages: Approach using gamification is useful for career education.

Class attendance in the disruptive era: what undergraduate medical students and teachers think

AUTHOR(S):

- Vorapol Jaroovanichkul, Faculty of Medicine, Chulalongkorn University, Thailand (Presenter)
- Stella Howden, The Centre for Medical Education, University of Dundee, UK

ABSTRACT

Background: In the era of disruptive technologies, class attendance is widely discussed among medical educators in many aspects; furthermore, attendance is perceived differently by students and teachers. In many Thai medical schools, attendance is mandatory, but the same debates are evident. The study aims to explore Thai students and teachers' attitudes towards attendance and a monitoring system as well as their perspectives on reasons for attendance and absenteeism.

Summary of Work: A mixed-method approach was used to explore students and teachers' attitudes. An internet-based survey was implemented to collect data. Five-point Likert scales were adopted for collecting attitudinal data whilst free-text answers were used to capture qualitative data. Descriptive statistical analysis, univariate analysis, and the Mann-Whitney test were applied for generating the quantitative results while content analysis was implemented for constructing the qualitative findings.

Summary of Results: A total of 188 (20.5%) of 917 preclinical students and 71 (43.6%) of 163 teachers at Faculty of Medicine, Chulalongkorn University completed the survey. The findings showed the significantly different attitudes between the students and the teachers towards learning from lecture videos instead of attending classes in person ($P < 0.05$). Most students proposed that lecture videos could replace actual class attendance (76.1%) while the teachers were more likely to reject them (42.3%). The common reason for absenteeism was student's sickness while the main reason for attending their classes was an attendance mark. Additionally, both of them opposed attendance monitoring in every session, particularly lecture classes.

Discussion and Conclusions: Technology advancement has an impact on their attitudes towards attendance differently. Many teachers suggest that class attendance is beneficial for students to interact with them directly whilst the students argue this is not the case and raise some scenarios that technology can assist their learning in support of absenteeism. However, they do have some mutually agreeable ideas on several aspects which could be the basis for developing future joint agreements to enhance class attendance.

Take-home Messages: The value of class attendance is perceived differently among students and teachers. To resolve the conflict, all stakeholders should share their views to formulate the attendance rules and policy.

Changes on medical students' specialty preferences during their degree: the role of gender

AUTHOR(S):

- Ana Isabel Gouveia, Faculdade de Ciências da Saúde - Universidade da Beira Interior, Portugal (Presenter)
- Ricardo Rodrigues, Faculdade de Ciências Sociais e Humanas - Universidade da Beira Interior, Portugal
- Isabel Neto, Faculdade de Ciências da Saúde - Universidade da Beira Interior, Portugal

ABSTRACT

Background: Specialty preferences are associated with different categories (Querido et al, 2015) such as school and student characteristics, student values, career needs (as expected income or status) and perception of specialty characteristics. Controversial results were found in the literature when students gender is considered. Some works didn't find any evidence (e.g., Diderichsen S et al 2013) but some revealed significant gender differences (e.g., Alers et al, 2014).

Summary of Work: The aim of our work is to analyze the specialty preferences in two different moments of Medical Degree (the first and the final year), and the specialty preferences by gender in each of these moments. Questionnaires were responded by medical students in their first year (2012/13) and in their last year (6th, 2017/18). One hundred forty-two students responded to the survey on the first moment, and eighty-two on the second moment. The students' preferences for choosing their medical specialty were assessed. We used the related-samples Wilcoxon signed rank test to examine differences between the choices in the two moments.

Summary of Results: Most preferred specialties in the first year were Pneumology, Cardiology, and General Surgery for female students, and Cardiology, Neurology, and Palliative Medicine for male students. In the final year, the preferred specialties were General and Family Medicine, 'Undecided', and Gynecology/Obstetrics for female students and Gastroenterology, Nephrology, and General and Family Medicine for male students. Besides Gynecology/Obstetrics, all the other preferred specialties in the final year had got no preferences in the first year, and there were no undecided students. Palliative medicine, preferred in the first year, was not chosen at all in the last.

Discussion and Conclusions: Specialties preferences changed dramatically (e.g., General and Family Medicine) during the medical degree and gender differences were identified, some consistent with literature as Gynecology/Obstetrics (Alers et al, 2014).

Take-home Messages: Students' specialty preferences change a lot during their medical degree. Besides, male and female students tend to show different preferences. More research should be performed to uncover what motivates specialty preferences during different moments of medical degree - as curriculum and students characteristics - and the relations between possible reasons.

Evaluating the effect of training final-year medical students in telephone communication and prioritisation skills in the simulated environment

AUTHOR(S):

- **Sophie Ragbourne, King's College London, UK (Presenter)**
- Josephine Seale, Kings College London, UK
- Nicola Purkiss Bejarano, Kings College London, UK
- Ranjana Raj, Kings College London, UK
- Lewis Whittingham, Kings College London, UK
- Colin Butchers, Kings College London, UK

ABSTRACT

Background: Receiving clinical tasks from fellow healthcare professionals via the telephone and appropriately prioritising the resultant job list are essential non-technical skills of a doctor that are paramount to patient safety. However, despite an increasing focus of medical curricula on human factors such as doctor-patient interactions, there exists limited training on skills related to telephone communication with colleagues and job list prioritisation. The acquisition of these abilities is instead reliant upon often variable clinical placements and exposure. The present study sought to address this issue by providing formalised training in these skills to final-year medical students.

Summary of Work: The effect of a communication and prioritisation training session on the ability of final-year King's College London medical students (Group A, n=25) to extract relevant information and prioritise workload in a simulated on-call environment was compared to untrained final-year students (Group B, n=25) using a standardised observation sheet. A questionnaire was used to determine student opinions on their training and/or simulation experience.

Summary of Results: Group A extracted the relevant task related information during the simulation and prioritised their job lists appropriately on significantly more occasions than Group B. Group A students also reported increased confidence in answering calls and list prioritisation. The majority of students from both groups advocated the inclusion of the training and/or simulation into the medical curriculum.

Discussion and Conclusions: Training in telephone communication and prioritisation significantly improves the subjective and objective ability of final-year medical students to prioritise jobs in a simulated on-call environment. This has important patient safety implications and demonstrates the benefits of including such training in the medical undergraduate curriculum.

Take-home Messages: o It is an important patient safety issue that doctors are competent and capable in the process of receiving handovers and prioritising resultant tasks; o Formal training in telephone communication and prioritisation significantly enhances this skill set in a simulated environment and is favourably received by final-year medical students; o Institutions should consider the addition of formal training in these skills to the undergraduate medical curriculum.

Relationships between simulation stress and performance in nursing and medical students: a pilot study

AUTHOR(S):

- Johannes Driessen, Royal Cornwall Hospitals Trust, UK (Presenter)
- Sanjeev Sahota, Royal Cornwall Hospitals Trust, UK
- Ryan Phillips, Royal Cornwall Hospitals Trust, UK

ABSTRACT

Background: Simulation of acutely unwell patients can be a stressful experience for medical and nursing students. Stressors can prompt beneficial coping behaviours, or drive anxiety and distress, depending on their quantity and intensity and, in turn, can affect learning outcomes. We investigated the relationship between perceptions of stress and qualitative and quantitative measures of performance, in order to inform the design of future simulation courses.

Summary of Work: A mixed group of nursing and medical students (n=10) were recruited to a six-week simulation course. Students completed pre- and post-course questionnaires, comprising one assessment of clinical knowledge and one self-assessment of skills, such as leadership and interdisciplinary team-working. Scoring across both papers was then assessed in the context of students self-reported stress scores before and after the course, using paired t-tests.

Summary of Results: Self-reported stress did not change significantly overall following the course (-13% p=0.44), with equal proportions describing an increase or decrease in stress. Students reporting similar stress scores pre- and post-course showed an average 52% (p<0.05) improvement in scoring on the clinical paper, whilst small, but non-significant changes were noted in other groups. Students reporting high levels of stress pre- and post- course showed less improvement (16% p=0.07, 15% p=0.13 respectively), compared to students reporting low stress (24% p=0.13, 25% p=0.06), although these results only approach significance. Students self-reporting moderate or stable stress levels also tended to score more highly in measures of confidence. Results were comparable between disciplines.

Discussion and Conclusions: This small study demonstrates a number of trends between self-reported stress and performance, although larger studies are required to determine their significance. In particular, students reporting low to moderate stress tended to outperform more stressed colleagues in clinical knowledge and self-reported confidence. Follow-up studies should consider how to modify training to optimise perceived stress.

Take-home Messages: Perceived stress in simulation appears to affect confidence and retention of clinical knowledge. There is a role, therefore, for optimising stress in order to better achieve learning outcomes. Further work is required to determine the significance of this relationship and to investigate methods of identifying and modulating stressors.

How does a virtual patient format influence medical students' approaches towards psychiatric patients? A liminal perspective

AUTHOR(S):

- Kamilla Pedersen, Centre for Health Sciences Education, Aarhus University, Denmark (Presenter)
- Anne Mette Morcke, Copenhagen Academy for Medical Education and Simulation at Rigshospitalet, Denmark
- Charlotte Paltved, Corporate HR, MidtSim, Central Denmark Region, Denmark
- Ole Mors, Psychiatric Research Unit, Aarhus University Hospital, Denmark
- Charlotte Ringsted, Centre for Health Sciences Education, Aarhus University, Denmark

ABSTRACT

Background: Little is known about how preparatory teaching formats influence medical students' attitudes and knowledge toward patients in clinical settings. The objective of this study was to explore the influence of a virtual patient format on medical students' patient approaches in their psychiatric clerkship.

Summary of Work: A virtual patient format on diagnostic interviewing skills, using video filmed simulated psychiatrists and patients, was facilitated in a preparatory lecture. The virtual patient format aimed at fostering critical reflection and discussion of how various patient approaches affect the diagnostic process. Our study was an explorative qualitative study using rich pictures, asking the students to draw their experiences in combination with interviews. We explored how the students' navigated insights from the virtual patient format during clerkship. The data was subject to thematic content analysis using anthropological classical liminal theory as a lens.

Summary of Results: Students actively involved in patient interviews demonstrated an improved focus on patient perspectives they related to the virtual patient format. Students who were passive observers of patient interviews focused on their own appearance and mimicked the simulated psychiatrist's in the virtual patient format to fit the situation at focus.

Discussion and Conclusions: Students experienced a variety of emotive stress similar to a liminal trickster experience when confronted with patients in the threshold to clerkship. The perceived support and encouragement from resident staff influenced the students' ability to approach and engage with patients. The study identified two different approaches in how the students' navigated insight from the virtual patient cases during patient interviews. Students who had active roles in their clerkship was found to adopt a patient-centered focus, but worked differently if the student was passive then causing a self-centered focus.

Take-home Messages: - Student engagement in learning seems highly influential on whether students adopt a patient-centered awareness or self-centered focus. – Lack of support and encouragement from a liminal ritual elder in the threshold to and integration with clerkship may undermine efforts to stimulate patient-centered awareness initiated with virtual patients in preparatory teaching formats.

What is the best virtual patient model? A focus group study

AUTHOR(S):

- **Andrzej Kononowicz, Jagiellonian University Medical College, Poland (Presenter)**
- Ada Frankowska, Jagiellonian University Medical College, Poland
- Malgorzata Sudacka, Jagiellonian University Medical College, Poland
- Stanislaw Górski, Jagiellonian University Medical College, Poland
- Inga Hege, University of Augsburg, Germany

ABSTRACT

Background: Much discussion in research revolves around the optimal model of virtual patients for effective learning. Should it be linear or branched; menu-controlled or navigated using natural language; introduced at the beginning or the end of the medical curriculum? In this qualitative study we asked students about their expectations for the optimal use of virtual patient systems at the faculty.

Summary of Work: Participants were nine (4 female and 5 male) medical students at Jagiellonian University in their fourth year of study. Students were presented with a short virtual patient scenario in the CASUS system currently in use at the university and asked about their expectations for a virtual patient system in the future. We audio recorded 48 minutes of focus group discussion. The transcript contained 8408 words in 370 participants' utterances and was coded using in vivo method (Saldaña, 2016). In the second cycle the codes were categorised hierarchically and where needed extended by new ones implied from the text to obtain a focused structure.

Summary of Results: The qualitative analysis of the text resulted in selecting 244 in vivo codes. The discussion revolved around five major themes: general opinion of the software (the thing of the future), two visions of how a virtual patient should look (the two ways), features to be improved, proposed 'implementation' in the curriculum and others.

Discussion and Conclusions: The general opinion of the current system expressed in the focus group was positive, but there were also critical voices demanding more autonomy in the scenarios. The opposing positive and negative feelings were partially reconciled in further discussion when two complementary visions of a virtual patient system emerged: a professor who leads and a role-playing game with no backward button located in different stages of the curriculum (e.g. second and fifth year).

Take-home Messages: The simple conclusion often overlooked in many discussions is that there is no best virtual patient model but instead a right match of a virtual patient model to the current needs in the curriculum.

Virtual Patients for training the trainers: Experiences from the medical teachers of tomorrow

AUTHOR(S):

- Eleni Dafli, Aristotle University of Thessaloniki, Greece (Presenter)
- Ioannis Fountoukidis, Aristotle University of Thessaloniki, Greece
- Panagiotis Bamidis, Aristotle University of Thessaloniki, Greece

ABSTRACT

Background: Virtual Patients (VPs) have been increasingly used in modern medical education, since there are plenty of evaluation results that demonstrate that they may improve cognitive and behavioral skills better than traditional methods do. However, their use is usually restricted to medical students and young doctors.

Summary of Work: The Medical School of Aristotle University of Thessaloniki has made remarkable efforts to improve the professional development of medical trainers. As part of this effort, VPs were incorporated in the 'training the trainers' program, so as to support the training process. The young trainers were then asked to evaluate this kind of VP use and suggest how these modern educational resources may guide personal and professional development not only of future doctors, but medical teachers as well. A 40 item web-based questionnaire, including Likert-type and open-ended questions was used for the evaluation.

Summary of Results: Eleven medical trainers attended the 'training the trainers' session and then evaluated the VP use within this educational framework. The results were very positive and encouraging and most of the attendees suggested the incorporation of VPs in the formal program of training the trainers for the future medical teachers.

Discussion and Conclusions: VPs can improve quality of training, not only at student level, but at medical educator level as well. Making training relevant through design and delivery by scenarios, and easily accessible at every place and any time, enhances the engagement of medical trainers.

Take-home Messages: The extension of VP use in the field of medical educators' training programs seems a promising method that may help in the professional development of the future medical teacher.

A pilot study of the obstacles and highlights performance of different training year physicians in difficult airway intubation training program - in a novel simulator

AUTHOR(S):

- Shu-Chen Liao, Chang Gung Memorial Hospital, Keelung, Taiwan (Presenter)
- Yu-Che Chang, Chang Gung Memorial Hospital, Linko, Taiwan
- Chung-Hsien Chaou, Chang Gung Memorial Hospital, Linko, Taiwan

ABSTRACT

Background: Endotracheal intubation is a complex psychomotor skill. Previously, we have only been able to evaluate success/failure of trainees' performances by the final result. Nowadays, new simulators are available, providing greater feedback. We conducted a training program using this technology to evaluate the intubation process of participants from different training years.

Summary of Work: Fifty-three trainees participated. Questionnaire investigation of their previous intubation experience was conducted. Three different intubation tools were applied on four difficulty levels of scenarios. Success rate, time of intubation, applied force, Cormack Lehane grade, and impulse force in each corresponding group were analyzed and compared on every practitioner.

Summary of Results: The success rate of lock jaw scenario has statistical significance across ranks. In difficult scenarios, less than one-third of young trainees operated successfully owing to them spending too much time getting a good laryngeal view. The obstacle for attending physicians in same scenarios was rushing, causing a greater impulse force.

Discussion and Conclusions: In the failed group, young trainees took a lot of time and force. The attending physicians did not show identical results. The possible reasons related facing the difficult situation, attending physicians know when to stop and ask for help to prevent iatrogenic injury based on their past experience. Years of training, difficult airway situation and tool selection affect the success rate. Facing difficult airway scenarios, young trainees should seek for help from higher-level physicians, who are recommended using video laryngoscope. In the same scenarios, residents and attending physicians reach out for help from anesthesiologists after one attempt of intubation.

Take-home Messages: Success rate in this study presented that both experience and intubating tools are crucial. Hence novice should seek for senior help properly. Seniors were recommended using video laryngoscope for intubation instead of direct laryngoscope. Juniors should practice more ordinarily for better outcome and more experience of figuring out stop-loss point.

A new innovation: flashlight visual field simulator: easier to understand the complex optic pathway, low cost and more fun

AUTHOR(S):

- Napat Thanakitjanont, Vachira Phuket Hospital Medical Education Center, Thailand (Presenter)
- Chanatipat Boonyok, Vachira Phuket Hospital Medical Education Center, Thailand
- Prapaporn Sotakul, Vachira Phuket Hospital Medical Education Center, Thailand
- Withita Jangiam, Vachira Phuket Hospital Medical Education Center, Thailand

ABSTRACT

Background: Visual field defects are common condition can be found in general practice and visual defect can also decrease quality of life, but it is difficult to understand how to localize the abnormality. As future physicians who may encounter patients with visual field defects in general practice, it is important for medical students to learn the science and clinical presentation behind vision loss. So we simulate optic pathway to be a simple model, which more fun and easier to understand in low cost (less than seven pounds).

Summary of Work: Model was simulated from easy materials such as glasses, corrugated cardboards and flashlights to be an optic pathway. Lesion can be cut off and showed on the scene. This simulator was used as instructional media. Data was collected in twenty 5th year medical student by a questionnaire which divided into 2 parts: first part is about understanding, six visual field defect questions were done, and the second part is satisfaction by ten scale compare lecture teaching style and using simulator, then the data was analyzed by descriptive statistics.

Summary of Results: 5th year medical student can correct six questions mean score was 5.45 (90.83%), level of satisfaction of lecture teaching style is 7.0 (70%), compare to flashlight visual field simulator 8.3 (83%). Reflection shows that stimulator being more attractive, more enjoyable and easier to understand than only lecture teaching style.

Discussion and Conclusions: Discussion: As a result, Medical students more satisfied learning by simulator than traditional lecturing, because lesion can easy to be cut off and show on the scene suddenly, so it is more understandable, and more enjoyable than imagination like lecturing. Conclusion: From complex pathway can become easier, more enjoyable, more illustrating by using visual field simulator, but it's just in only less than 7 pounds.

Take-home Messages: Visual field simulator can easy to make in low cost, so optic pathway isn't complicated anymore!

Simulation Technologies in Cardiopulmonary Resuscitation: From Basic Approach to Team Training

AUTHOR(S):

- Anton Vorobev, Surgut State University, Russia (Presenter)
- Dmitry Sukharev, Surgut State University, Russia
- Liudmila Kovalenko, Surgut State University, Russia
- Mesheryakov Vitaliy, Surgut State University, Russia

ABSTRACT

Background: Nowadays mastering of practical skills by students and graduate professionals using robots-simulators is an effective and non-alternative direction in clinical medicine.

Summary of Work: Cardiopulmonary resuscitation (CPR) of patients is one of the most sophisticated skill sets to be acquired in the study process, as well as to be applied in the real practice. At our University CPR skills learning is performed at three stages.

Summary of Results: On the first stage of the training undergraduate students learn basics of pathology in vital organs and systems of human body during clinical death, principles of emergency care and train practical skills of life support and reanimation on a basic CPR human simulator with electronic controller SHERPA (South Korea). This trainer allows students to practice basic skills of CPR and practice using automatic external defibrillator - extended reanimation. On the second stage, after passing clinical disciplines students get to practice CPR skills under objective assessment of correct implementation of CPR algorithms on an adult human simulator RODAM (South Korea). The trainer simulates self-sustained breathing with chest excursion, carotid arteries pulsation and pupillary light reflex. Using wireless connection with a laptop, an instructor is able to simultaneously evaluate real-time training process of a students' group. On the third stage CPR skills are practiced in the settings very close to real work of emergency service, when a team of professionals (medical doctor, assistant, nurse) perform reanimation activities on autonomous wireless robot of 6th generation 'Apollon' (USA-Canada).

Discussion and Conclusions: The key feature of the command training is that extended CPR is augmented with medical drugs administration followed by a consequent feedback. The continuous gradual training of medical professionals on the undergraduate stages (1-2) and the postgraduate stage (3) is aimed at CPR skills mastering excellence and prevention of new lethal cases in the real clinical practice.

Take-home Messages: The most effective is the step-by-step system for training specialists in CPR with the use of simulators of various degrees of complexity.

Teaching How to Save Lives: CPR Teaching Through Simulation and Multimedia Resources

AUTHOR(S):

- **Maíra Loesch, Pontifícia Universidade Católica do Paraná, Brazil (Presenter)**
- Camila Hartmann, Pontifícia Universidade Católica do Paraná, Brazil
- Jose Knopfholz, Pontifícia Universidade Católica do Paraná, Brazil
- Odenir Nadalin Junior, Pontifícia Universidade Católica do Paraná, Brazil
- Leonardo Bach Margraf, Pontifícia Universidade Católica do Paraná, Brazil
- Paulo Cesar Zimmermann Felchner, Pontifícia Universidade Católica do Paraná, Brazil

ABSTRACT

Background: The use of active methodologies in teaching aims to better prepare professionals for the needs of society. The Brazilian Curricular Guidelines for medical education advocates health education approaches focused on the student as the protagonist of the learning process. Since 2014, medical students from a university in Curitiba (Brazil) have been teaching cardiopulmonary resuscitation (CPR) to the community at an undergraduate fair using simulation techniques and pop culture video clips.

Summary of Work: Before the event, medical students were trained by professors in hands-only CPR steps. A fun and creative music video was produced to demonstrate the CPR, with a pop song parody, starring students and professors. Throughout the 3 days of event, more than 60 medical students took turns teaching the lay public. The aim of this work is to reflect on the uses of simulators and creative resources on teaching CPR steps for lay people by medical students.

Summary of Results: In the five editions of the fair, over 6400 lay people were trained. Using simulators and following the music video that set the rhythm for the maneuvers, they performed simulations every 15 minutes, while monitored by the students, supervised by professors. The students reported great satisfaction in teaching and learning. They also reported greater peer-to-peer integration and improved self-confidence in communication skills.

Discussion and Conclusions: Teaching lay people basic life-saving skills is a challenge. Simulators and multimedia resources have been proven to be effective teaching tools in this regard. In addition, when medical students participate in health education projects, they become protagonists of their training and agents of environmental transformation. Through CPR teaching and learning practices, students become more committed, develop communication and teaching skills, and develop a better understanding of their own learning process.

Take-home Messages: Health education and social responsibility are essential competences for a general practitioner, and should be encouraged during the undergraduate course. Intervention practices in which students take the active role are activities that develop these competences and promote increased autonomy and integration among students, professors and the community.

Implementing a standardized UHC Simulation for medical students

AUTHOR(S):

- **Tatiana Zebrova, International Federation of Medical Students' Associations (Presenter)**
- Giorgia Soldà, IFMSA, Italy
- Katja Čič, IFMSA
- Omnia El Omrani, IFMSA
- Idil Kina, IFMSA

ABSTRACT

Background: The International Federation of Medical Students' Associations' (IFMSA) constantly works and builds the capacity of its members on themes related to Global Health and Health Systems; these are often addressed in order to implement broader topics such as Universal Health Coverage, also amongst IFMSA Global Priorities for 2018/19. As there was no standardized and broadly assessed activity implemented within the association addressing this topic, since January 2019 a Small Working Group has been working on realizing one.

Summary of Work: IFMSA has developed a standardized simulation to introduce students to the topic of UHC and the importance of fair, accessible, affordable and high-quality medical care systems. This is a fictive game inspired by other activities realized by IFMSA and other health organizations. The aim of the game is to encourage students' reflection on healthcare accessibility and to implement it in their own home countries in order to raise more awareness about UHC amongst students around the world.

Summary of Results: In the simulation, the participants are divided into groups with different roles and actively interact with each other. They take part in two rounds with different settings, actions and options to choose from in order to experience two possible models of healthcare systems, with examples of positive and negative aspects of them. Reading material for the facilitators and handouts for the participants have also been created.

Discussion and Conclusions: The activity is currently in its experimental phase. IFMSA aims to have the test phase implementation during international and national events in the period March-August 2019. The impact of the activity will be measured through the pre and post assessment form. After the experimental phase is over, the simulation will be improved accordingly and shared widely for the use of IFMSA members.

Take-home Messages: UHC is amongst the main challenges and goals of nowadays society: IFMSA, in the process of shaping tomorrow health leaders, aims to raise awareness on this topic and to give students the knowledge and skills for them to be the part of the global process working to reach it.

The AURA Study: Assessing Usefulness of Virtual Reality Mobile Application in Flexible Videoscope Airway Training

AUTHOR(S):

- **Ying Wei Yau, National University Hospital, Singapore (Presenter)**
- Zisheng Li, National University Hospital, Singapore
- Mui Teng Chua, National University Hospital, Singapore
- Win Sen Kuan, National University Hospital, Singapore
- Gene Chan, National University Hospital, Singapore

ABSTRACT

Background: Flexible videoscope orotracheal intubation (FOI) is an important management option in predicted difficult airways. There is a significant learning curve to master this complex psychomotor skill. It is rarely performed in daily practice, yet emergency physicians are expected to execute the technique expertly during a crisis scenario. Conventional teaching commonly utilises low-fidelity manikins, which lack realism of live anatomy. Virtual reality (VR) technology may enhance the learning experience. We examined the effect of incorporating VR mobile application (Airway Ex) into FOI training in emergency medicine (EM).

Summary of Work: We conducted a randomized (1:1) controlled trial in the Emergency Department, stratified by seniority (non-EM-trained versus EM-trained physicians). All participants underwent conventional didactic teaching and low-fidelity simulation with trainer's demonstration and hands-on practice. Participants in the intervention group received an additional 30 minutes of self-directed learning using the mobile application. Primary outcome was time taken to visualisation of the vocal cords and endotracheal tube placement (i.e. successful intubation). Manipulation skill quality of the participants was graded using a previously-validated 5-point rating scale. Trainers and assessors were blinded.

Summary of Results: Forty-five physicians (20 non-EM-trained and 25 EM-trained physicians) were recruited. There was no overall difference in the time taken to visualize the vocal cords (median 13 seconds [interquartile range (IQR) 9-38] versus 12 seconds [IQR 8-22], $p=0.36$) and to successful intubation (median 48 seconds [IQR 41-69] versus 44 seconds [IQR 37-60], $p=0.23$) in the control and intervention groups.

Within the non-EM-trained strata, the intervention group took a shorter time to successful intubation (median 38.5 seconds [IQR 33-53] versus 49.5 seconds [IQR 43-62], $p=0.09$), although this result did not reach statistical significance. The intervention group also received significantly higher ratings of manipulative skill quality compared to the controls (overall: $p=0.04$; non-EM-trained strata: $p<0.01$).

Discussion and Conclusions: Integrating VR technology in FOI teaching enhanced the quality of skill acquired, particularly among the non-EM-trained physicians.

Take-home Messages: Junior doctors are more likely to benefit from the use of virtual reality technological aids in their emergency procedural skills training.

Nationwide implementation of the Non Invasive Prenatal Test for aneuploidy screening: Pre-post implementation evaluation of a blended learning for counselors

AUTHOR(S):

- Linda Martin, Amsterdam UMC, VUmc, AVAG, The Netherlands (Presenter)
- Janneke Gitsels-van der Wal, Amsterdam UMC, VUmc, Midwifery Science, The Netherlands
- Joyce Kors, Amsterdam UMC, VUmc School of Medical Sciences, The Netherlands
- Lidewij Henneman, Amsterdam UMC, VUmc, Community Genetics, The Netherlands

ABSTRACT

Background: In the Netherlands, the Non-Invasive-Prenatal-Test (NIPT) as first-tier screening for down-, edwards- or patausyndrome became nationwide available within a study context (TRIDENT-study) in April 2017. This has led to major changes in the field, including mandatory, continuing education for counselors (e.g. midwives, gynecologists, sonographers). This study explores results of the blended learning program for counselors with respect to counselors' knowledge about prenatal anomaly screening, and their educational needs.

Summary of Work: A blended learning for counselors comprised: a 4-hour face two face seminar, an e-learning and assessment of counselors knowledge, a training on counseling skills, counseling guideline, factsheets and a help-desk to ask questions after implementation of NIPT. Blended learning activities were offered during the study-period - between March and December 2017 - alongside NIPT implementation and still offered as continuing counselors' education. We achieved a pre-posttest cross-sectional online 35-item survey among all Dutch counselors. Multilevel regression analyses were performed to identify differences between effect of the blended-learning of counselors with different backgrounds (e.g. profession).

Summary of Results: Response rates were ~55% (N=1648) and ~31% (N=936) counselors respectively at first (To) and second (T1) measurement. Results indicate significantly increased knowledge between To and T1 (CI 95% 0.6-2.0); more than 75% of the counselors answered 16 versus 21 of 35 knowledge questions correctly respectively. Both at To and T1, gynecologists and sonographers answered more questions correctly than midwives. At T1, more than half of the counselors reported to have no additional educational needs. The top three of counselors' educational needs comprised general communication skills, counseling dilemma's, and knowledge about test-characteristics and test-results other than down-, edwards- or patausyndrome.

Discussion and Conclusions: The mandatory blended learning for counselors resulted in increasing knowledge about prenatal anomaly screening. However, improvement of counselors' knowledge is needed in some specific areas such as NIPT test characteristics, and findings other than down-, edwards- or patausyndrome. After the blended learning, counselors' educational needs mirrored these conclusions.

Take-home Messages: A mandatory blended learning for professionals alongside healthcare- implementations seems useful to improve knowledge and perceived competence. Although up to date (online) educational information resources are available, continuing face-to-face trainings seems even more valuable given counselors' needs for training of counseling skills.

Application of Face-to-Face Education and Online Courses on Palliative Care Education by Using Multimedia Teaching Materials

AUTHOR(S):

- Shao-Yu Hsu, Taipei City Hospital, Taiwan (Presenter)
- Sheng-Jean Huang, Taipei City Hospital, Taiwan
- Li-Lin Kuo, Taipei City Hospital, Taiwan

ABSTRACT

Background: Taipei City Hospital(TCH)has provided home-based palliative care by interdisciplinary health care professionals since 2015. TCH held training courses, such as OSCE, role-play based immersive courses, multimedia teaching courses, online courses, to enhance professional-patient communications and improve palliative care quality. This study aims to explore the effectiveness of using multimedia teaching materials in palliative care education between face-to-face education and online courses.

Summary of Work: We made two multimedia teaching materials with different learning objectives('Home-based Palliative Care at the EOL Phase' and 'Withdrawal of Life-Sustaining Treatment'), which were based on real stories. Case-based discussion education was conduct with the video by teaching attending physician and questionnaires were collected from the trainees after watching the video in face-to-face education. Furthermore, we also uploaded the multimedia teaching materials and questionnaires on E-learning platform, so that more health care professionals can learn by themselves during their free time. The questionnaires can be divided into four categories including the cognitive (self-competence), the experiential (emotional responses and self-referencing) and further intentions to provide home-based palliative care.

Summary of Results: Compared with face-to-face education, both videos have higher significant difference on trainees' self-competence by online courses ($p=.015$, $p=.000$, respectively). Compared with online courses, both videos have a significant difference in trainees' emotional responses ($p=.004$, $p=.018$, respectively) and further intentions to provide home-based palliative care($p=.000$, $p=.000$, respectively) through face-to-face education. However, there was no significant difference between trainees' self-referencing ($p=.377$, $p=.735$, respectively).

Discussion and Conclusions: This study shows that both multimedia teaching materials apply in palliative care education through face-to-face education and online courses have the same results. The trainees will reply to their self-referencing according to their real experiences. By watching multimedia teaching materials on E-learning platform, we consider that the trainees were self-complacent and can't trigger their emotional responses. Moreover, it also can't enhance their further intentions. On the contrary, through face-to-face education we consider the teaching attending physician plays an important role in the courses, that can influence trainees' emotional responses and further intentions to provide home-based palliative care through applying case-based discussion.

Take-home Messages: Education training in palliative care can be more effective by holding face-to-face training courses.

Using blended teaching methods to improve nursing staff cognition, affection, and skill of HSCT care in hematology unit

AUTHOR(S):

- Yen-Ni Sung, Taipei Veterans General Hospital, Taiwan (Presenter)
- Shih-Yun Chen, Taipei Veterans General Hospital, Taiwan
- Pei-Yu Liu, Taipei Veterans General Hospital, Taiwan
- I-Tien Lee, Taipei Veterans General Hospital, Taiwan

ABSTRACT

Background: In Taiwan, hematopoietic stem cell transplantation (HSCT) has been an important therapy to blood malignancies patients. There are 28% (n=17) Nursing Staff Post Graduate Year (NPGY) in our department in a medical center. Due to clinical observations, these new caregivers offered incomplete or incomprehensible care to pre-transplant patients.

Summary of Work: A self-designed Learning Needs Questionnaire was conducted to 17 NPGY. It showed over 58.8% NPGY thought that HSCT care was the hardest medical procedures. A total of 16 (94.1%) considered personal demonstration', verbal teaching (41.1%) and 'textbook (41.1%) made NPGY learn faster. A pre-test of HSCT care comprehensive questionnaire was administered to them, including cognition, affection and skills. Combining above results, a workshop was held. 17 NPGY were asked to watch a 19-min self-made teaching video before the workshop. In the 110-minute class, NPGY was assigned to two groups, they engaged in team-based learning activities such as group discussion and giving feedback, with Visiting Staff, nursing preceptors and social workers. Besides, demonstration technique of stem cell transfusion was done by a senior HSCT nurse. After workshop, they submitted a feedback questionnaire.

Summary of Results: The results from post-test questionnaires showed 1. An average cognition score increasing 16.8, 2. NPGY was able to perform HSCT care skills, and 3. They expressed the confidence that they could care for patients with HSCT. Furthermore, the flipped learning skill, self-made teaching video, team-based learning, and interdisciplinary cooperation teaching made all NPGY satisfied with the workshop.

Discussion and Conclusions: Compared to the pre-test, the score on conditioning regimen showed relatively lower scores (7.7). Exploring the reason may be more complicated for the chemotherapy protocols. Thus, NPGY were encouraged to watch the video and memorize continually after the workshop to enhance the understanding.

Take-home Messages: These teaching activities will continued to be held for new nurses. It can also be extended to nurses of other non-hematologic oncology wards such as pediatric oncology.

The Effectiveness of using Interactive E-book on nurses' learning motivation and knowledge of electrocardiogram interpretation

AUTHOR(S):

- Chien-Lin Kuo, National Taipei University of Nursing and Health Sciences, Taiwan (Presenter)
- Chien-Sheng Lin, Cheng Hsin Hospital, Taiwan
- Su-Fen Cheng, National Taipei University of Nursing and Health Sciences, Taiwan
- Ming-Zhong Li, National Taipei University of Nursing and Health Sciences, Taiwan

ABSTRACT

Background: Healthcare professionals are expected to have current knowledge of advanced cardiac life support (ACLS) to revive patients suffering cardiac arrest. The majority of the ACLS course consisted of didactic lecture with little student participation. In ACLS course, electrocardiograms (ECG) interpretation is often the most difficult part for nursing students and newly graduates. Electronic book (e-book) technologies have been shown to improve learning with the features of portability and efficiency. The purpose of this study was to evaluate the learning effects of using interactive e-books on nurses' ECG interpretation.

Summary of Work: This study used quasi-experiment research design. A purposive sample of 120 nurses in ACLS classes was assigned to the experimental group and the control group. In the unit of ECG interpretation, the experimental group went through the interactive e-book, while the control group received traditional PowerPoint lecture. The learning motivation and ECG knowledge were measured at three time points by questionnaires. After the class, a focus group interview was conducted to explore the learning experiences of learners.

Summary of Results: A paired t test indicated that posttest mean score of ECG knowledge and learning motivation was higher in both groups. The tutoring by using e-books or traditional lecture made no significant difference to the ECG knowledge. However, the experimental group reported higher level of learning motivation, compared with the control group. Moreover, the learners held positive attitudes towards the interactive e-book. They valued its features of motion graphs, sounds, notes, and quizzing which are helpful for their comprehension and memorizing.

Discussion and Conclusions: The interactive e-book not only increased nurses' ECG knowledge, but also improved their learning motivation. The learners were satisfied with the e-book and expressed it aroused their learning interests and guided self-learning. A well-designed interactive e-book could be used as an effective teaching tool to achieve a better individualized learning for nurses. The results could provide a reference for integrating information technology to ACLS training.

Take-home Messages: Interactive e-book can support mobile individualized learning. The well-designed e-books are effective tools in support of the classroom instruction in ACLS training.

An evaluation of a case-based e-learning module on non-accidental injury for medical students

AUTHOR(S):

- Niamh Ryan, University of Dundee, UK (Presenter)
- David Sadler, University of Dundee, UK

ABSTRACT

Background: Non-accidental injury (NAI) is an important paediatric issue with many harmful medical and psychological consequences. Although early identification may prevent these outcomes, cases are regularly missed by clinicians, often due to inadequate training. Improvements in NAI education in medical schools are essential to tackling this. E-learning is a well-established teaching method that is effective in many areas of medicine but there have been few studies in the field of NAI.

Summary of Work: An interactive, case-based e-learning module was designed for medical students, focusing on recognition and management of NAI in various clinical situations. It incorporates case-based scenarios, formative assessment and clinical photos of suspicious injuries. To determine its effectiveness, medical students were asked to complete the module, as well as pre- and post-module tests, each with questions on injury knowledge, recognition of NAI and management of NAI. Scores were analysed using t-testing, ANOVA, univariate and multivariate analyses.

Summary of Results: There was a statistically significant increase in mean score between the pre- (23.37/32) and post-module (25.55/32) tests. Mean recognition (77.63% to 85.84%) and management score (54.07% to 92.83%) also increased. Rather surprisingly, there was a decrease in injury knowledge score (79.91% to 60.37%). On multivariate analysis, various factors were found to be predictive of pre-module score, including year of study, previous identification of NAI, previous child protection training and confidence in identifying NAI. Factors found to be predictive of the change in score after module completion were previous training, year of study and previous identification of NAI.

Discussion and Conclusions: Case-based e-learning appears to effectively teach medical students how to recognise and manage NAI. It seems to be most useful in teaching topics related to clinical reasoning rather than theoretical knowledge. There was most benefit for students in lower years of study, who are likely to have less previous knowledge than those in higher years. Interestingly, those with previous child protection training also benefited more than those without. Further research is required to establish how it can be adapted to suit different students and to better teach knowledge of injuries.

Take-home Messages: Case-based e-learning is most effective in teaching areas of NAI focusing on clinical reasoning rather than theoretical knowledge.

Stronger together - Virtual University of Occupational Health Care supports specialist physician training

AUTHOR(S):

- Lena Selänne, University of Helsinki, Finland (Presenter)
- Heidi Furu, University of Helsinki, Finland
- Heli Koivisto, University of Oulu, Finland
- Heli Parviainen, Tampere University, Finland
- Marianne Rytönen, University of Eastern Finland, Finland

ABSTRACT

Background: The Virtual university of occupational health care is a collaboration network of five Finnish universities which offers education to physicians specializing in occupational health care and their specialist physicians trainers. It offers annually nearly 50 online and onsite courses and seminars. For a small and rare inhabited country like Finland and rather small university units of occupational health, the Virtual university has taken a crucial role in the training of specialists and supporting the trainers both pedagogically and substance-wise.

Summary of Work: To develop our processes, we conducted a questionnaire survey in 2018 for specializing physicians and their trainers. The aim of the survey was to get feedback on the activities in Virtual university, and especially whether students prefer onsite or online participation, and how trainers use the Virtual university with their specialist physicians.

Summary of Results: The survey received 102 responses. Three quarters of the respondents had attended courses within the Virtual university and majority of them were pleased with them. Both onsite and online education were desired and many appreciated the possibility to participate in live education online. On the contrary to the previous survey in 2014, the participants did not report lacking IT skills. Trainers have also found the Virtual university useful: most of them (73%) had used its materials in guidance. Trainers reviewed courses together with specialist physicians and used the content in planning guidance meetings.

Discussion and Conclusions: The respondents highlighted the satisfaction with the Virtual university: the contents of the training were mentioned as high quality and versatile. Online training was also seen to save resources (time and money) available for training. In addition to online teaching, personal guidance and regional training were regarded important as well. Based on the answers, we will organize the training further in a multifaceted way: online, local meetings, guided and self-study courses.

Take-home Messages: Stronger together - Finnish universities offer specialist physician training open-minded and virtually at the Virtual University of Occupational Health Care. The survey encourages training units to offer training both online and locally.

All in the Mix: The Use of Blended Learning for Trainee Anaesthetists

AUTHOR(S):

- David Marriott, University Hospitals of Leicester, UK (Presenter)
- Andrew Hughes, University Hospitals of Leicester, UK
- Abigail Fell, University Hospitals of Leicester, UK

ABSTRACT

Background: Blended learning utilises both traditional methods, such as lectures and seminars, and technology enhanced learning (TEL) solutions, such as video sharing, virtual learning environments and smart phone applications, to enable innovative teaching and learning that is not limited to geographical location. We explored how freely available technologies could be used to aid learning for trainee anaesthetists and how to best integrate them into traditional teaching practices.

Summary of Work: Resources were created specifically for the trainee anaesthetist including videos discussing an 'Anaesthetic Machine Check', 'Rapid Sequence Induction' and 'Securing the Paediatric Endotracheal Tube'. A Google Sites webpage linked to these resources was disseminated to learners via local trainee induction, workplace handbooks and QR codes. Local trainees also now complete a 1-day course exploring metacognition and learning strategies which includes an evaluation use of different approaches to learning, both traditional and TEL e.g. podcasts, videos, online learning packages and education articles. This enables candidates to appraise available resources for learning value.

Summary of Results: To date, the 'Anaesthesia Machine Check' video has been watched 13,700, 'Rapid Sequence Induction' 17,200 and 'Securing the Paediatric Endotracheal Tube' 800 times from learners in the UK, USA, Australia, Phillipines and Saudi Arabia. The Primary FRCA 1-day course has been delivered twice with positive feedback.

Discussion and Conclusions: The degree of utilisation, and global viewership, of our online resources has surprised us. The use of TEL is an effective education tool and our use of freely available technologies enables us to communicate complex principles to a wide audience. We have developed our local teaching events to incorporate not only TEL resources, but information to enable learners to make informed decisions about those resources in relation to their own learning. We are now beginning to objectively evaluate the efficacy of TEL and blended learning implementation locally. This will include success rates for formal assessments and faculty experience.

Take-home Messages: The use of freely available curated resources enables TEL to complement traditional teaching via use of videos, QR codes and online learning packages. Learners should be aware of pitfalls and benefits of TEL.

On-line learning improves contouring skills in radiotherapy. An ESTRO-FALCON-IAEA study

AUTHOR(S):

- **Jon Cacicedo, Cruces University Hospital, Spain (Presenter)**
- Jesper Eriksen, Dept of Experimental Clinical Oncology, Aarhus University Hospital, Aarhus, Denmark
- Arturo Navarro, Dept of Radiation Oncology, Instituto Catalan de Oncología, Barcelona, Spain
- Kirsten Hopkins, Applied Radiation Biology and Radiotherapy Section, Division of Human Health, IAEA, Vienna, Austria
- Eduardo Zubizarreta, Applied Radiation Biology and Radiotherapy Section, Division of Human Health, IAEA, Vienna, Austria
- Sofia Rivera, Dept of Radiation Oncology, Gustave Roussy, Villejuif, France

ABSTRACT

Background: Modern radiotherapy suffers from heterogeneity in defining target volumes (TV) and organs at risk (OAR) having a major impact on patient outcome. Interactive online learning has shown to reduce this heterogeneity immediately but the long-term effect is unknown. The aim of the present multicenter study was to evaluate the short- and long-term impact of online learning on heterogeneity in radiotherapy volume definition in centers from low- and middle-income countries (LMIC)

Summary of Work: Radiation Oncologists (RO) from 14 centers in 13 countries participated in an online learning program involving 3 tumor locations: head and neck, lung and cervix. Four delineations of TV and OAR per tumor site were asked to the participating RO in the FALCON-EduCase online system: one before the teaching period, two during the teaching period (at one week and one month) and finally a fourth six months after the teaching period. In total 4 delineations for each of the 3 cases were done over a period of one year. Participants were blind to the DICE index and pre-defined qualitative measures used as endpoints.

Summary of Results: Compliance to the whole program was >50% among the 60 RO. The majority (88%) used 3D radiotherapy routinely. For the head and neck part, significant increases were seen in homogeneity of contouring for both TV and OAR. DICE increased immediately during the teaching sessions and remained high six months after teaching ($p < 0.0001$ for the elective CTV and right parotid gland). Lung delineations showed the same trend towards an increase in DICE index for GTV primary tumor ($p = 0.0003$). For the cervical cancer part, significant increases were also seen in homogeneity of contouring for both TV and OAR except for sigmoid colon.

Discussion and Conclusions: Online teaching in LMIC seems feasible with an acceptable compliance to the learning program. The learning obtained on a short-term basis was shown to be sustainable one and six months after teaching but the benefit might decrease over time suggesting the need for continuous medical education in the field of contouring.

Take-home Messages: Online learning significantly improves the delineation skills of radiation oncologists in different tumor locations, which is considered a key point in multidisciplinary cancer treatment.

Undergraduate and residency integration mediated by telemedicine: An experience of the surgery and psychiatry units

AUTHOR(S):

- José Diniz Junior, Universidade federal do Rio Grande do Norte EBSEH, Brasil (Presenter)
- Emerson Arcoverde Nunes, Universidade federal do Rio Grande do Norte EBSEH, Brasil
- Igor Marreiros, Universidade federal do Rio Grande do Norte EBSEH, Brasil
- Rosiane Viana Zuza Diniz, Universidade federal do Rio Grande do Norte EBSEH, Brasil
- Ubirajara Caldas Leonardo Nogueira Junior, Universidade federal do Rio Grande do Norte EBSEH, Brasil

ABSTRACT

Background: Brazil is a continental country and according to the World Health Organization, it should invest in telemedicine and remote care to optimize health care. The Brazilian health system is unique consisting in primary, secondary and tertiary levels of care. The Rio Grande do Norte Federal University is the main scenario for health area education from undergraduate to postgraduate. Many patients are referred to high complexity level of care not ready for surgery or without surgical treatment need, nor psychiatric hospitalization, causing disorder in peoples lives and re-routing for correction of complementary exams for example. The purpose of this paper is to describe the integration of undergraduate and postgraduate courses mediated by the teleregulation of referenced cases to the tertiary hospital

Summary of Work: Bariatric surgery and psychiatry service, has the remote regulation requested by nurses, psychologists, doctors, nutritionists among other professionals. The presence of students (undergraduates or residents) with the regulation and care of these cases generates knowledge, skills and medical attitudes. Unlike the other Brazilian locations, telecardiology was not the starting point due to problems with integration of the local public health system.

Summary of Results: The Bariatric surgery had 1252 teleconsultations, being 131 of them including surgeries in 2018, with 100% of patients undergoing bariatric surgery in the teaching hospital with residents who have had the regulation made by telemedicine, internet and message texts or images. Psychiatry with more than 500 teleconsultations, helped family doctors with complex cases, avoiding inappropriate referrals and hospitalizations, reassuring the primary care as a cornerstone of the process of healthcare.

Discussion and Conclusions: These processes are based on confidentiality, privacy and competence of the experts involved though data security still an issue, and is where a robust and secure telemedicine system would be handfull. Telemedicine can be a point of integration of research and teaching in health care in both surgery and psychiatry.

Take-home Messages: Telemedicine can provide a great challenge in training, and if it is coordinated by an expert in the field, helping to integrate health education and care.

Blended learning: Students' Perception and Impact of Formative Assessment on Blackboard on the Final Marks in Endocrine Module

AUTHOR(S):

- Mukhtiar Baig, Faculty of Medicine, Rabigh, King Abdulaziz University, Jeddah, Saudi Arabia (Presenter)
- Zohair Gazzaz, Faculty of Medicine, Rabigh, King Abdulaziz University, Jeddah, Saudi Arabia
- Mohammad Farouq, Faculty of Medicine, Rabigh, King Abdulaziz University, Jeddah, Saudi Arabia

ABSTRACT

Background: To explore the medical students' perception regarding the use of Blackboard (Bb) and determine the impact of formative assessment on Bb on the final score in the endocrine module.

Summary of Work: This cross-sectional study was carried out at the Faculty of Medicine, Rabigh, King Abdulaziz University, Jeddah and three years data was collected in the endocrine module. The study guide, timetable, lecture PowerPoint slides, reference materials, and several questions in the discussion board were posted in the endocrine module. Several options of the BB such as discussion board, instant feedback, announcement, grade book, and tests and quizzes were used for the third-year medical students. In the last week of the module before the final exam, a formative assessment test comprised of 50 MCQs was posted on Bb each year then after the final exam, the impact of formative assessment was determined on the final marks in the module exam. All the students filled a questionnaire regarding their perception about the use of Bb. The ethical committee of the Faculty of Medicine, Rabigh, KAU, Jeddah approved this study.

Summary of Results: Overall, final exam scores were significantly higher as compared to the formative assessment ($p < 0.001$). Majority of the students' responded with agree and strongly agree for the use of Bb in the endocrine module as computers based assessment is easier than paper-pencil test, E-assessment enhanced my learning, I have no problem accessing Bb from home, I feel more comfortable posting my opinions on the discussion board rather than to speak up in class, I like the idea of having online exams, quizzes, class activities, using online learning tool has improved my technical skills, I become more confident in expressing my ideas using communication technologies such as email, chat, and discussion forum, and I am satisfied with the use of Bb in this module.

Discussion and Conclusions: The majority of the students liked this blended learning method, and the formative online assessment on Bb improved the students' performance in the final exam.

Take-home Messages: Blended learning is a better option as compared to traditional methods.

How to Jump from Conventional to Modern e-Learning System Without Having “Wounds”. A Student Point of View

AUTHOR(S):

- Andrei Dragos Cumpanas, Victor Babes University of Medicine and Pharmacy, Timisoara, Romania (Presenter)

ABSTRACT

Background: In 1450s, in Mainz, Germany, Gutenberg printed a book, an object that nowadays we find normal, but back in time was looked with skepticism. He started a revolution. A BIG jump. It wasn't without wounds, as no big jump ever is. 560s years later, we find ourselves in front of a BIG challenge. On one side there is a conventional learning, and it seems that on the other side there is E-learning. Virtually they are on the same side.

Summary of Work: Histology is a beautiful subject, but it is by far not easy. Imagine staying in front of a microscope, looking at a slide, knowing all the theory of what you should see. However, translating theoretical into practical knowledge is not that simple, especially for students. In comparison, close your eyes for a minute and imagine that you find yourself in an ultramodern computer room, where your teacher can show you and all your 40+ colleagues the same histological slide at the same time, making sure that you will never miss that cell or structure ever again.

Summary of Results: And how could you not love this way of teaching when the possibilities are endless. An extremely modern electronic system for a tech-loving generation. High resolution images that let you see far beyond optic microscopy. Time efficiency. Debate-like classes with tons of engaged learners. Creativity. Turning a simple, boring classroom into a rollercoaster ride where you aren't just a passive listener, but you are actually an active part of the learning process. In addition, as you go home, you can access an Internet page where you can review all the slides and information presented in class over and over again until you are comfortable with the subject.

Discussion and Conclusions: The abyss was big and taunting, but the hard work definitely paid off. We can do this at our own rhythm, our own pace, our own studying environment.

Take-home Messages: Why not turn your class into an E-class where 'E' doesn't just mean electronic, but also Exciting-Engaged learning?

E-learning attitudes and perspectives of medical students at Chulalongkorn University

AUTHOR(S):

- Chatuthanai Savigamin, Faculty of Medicine, Chulalongkorn University, Thailand (Presenter)
- Nattapat Anuduang, Faculty of Medicine, Chulalongkorn University, Thailand
- Natcha Anantakool, Faculty of Medicine, Chulalongkorn University, Thailand
- Sittisak Honsawek, Faculty of Medicine, Chulalongkorn University, Thailand

ABSTRACT

Background: This study aimed to evaluate medical students perception of the attitude and effectiveness of an e-learning resource developed to enhance the acquisition of traditional lecture-based learning.

Summary of Work: We designed a descriptive cross-sectional study of Thai first year medical students, using an online survey. Participants were 249 medical students completing their first semester of first year medical students as part of a six-year degree at the Faculty of Medicine, Chulalongkorn University. Participants completed a 25-question anonymous online survey after using the E-learning resource.

Summary of Results: Descriptive cross-sectional study showed that the most important objective for E-learning of the students was to be able to catch up to their learning in conventional classrooms (59.4%). The most common E-learning problem of the students is repetitive behavior of watching (49.2%) and self-control in their learning (37.3%). 93% of the students strongly agreed that E-learning was essential for reviewing their notes after class. 61.4% of the students disagreed that E-learning could discourage professor's intention to teach (34.5% is Strongly disagree, 26.9% is disagree). E-learning could accommodate the learner's need in traditional learning because of timing preference (66.7%), flexibility and convenience (80.3%), ease of access (71.5%), respectively. 43.4% of the students strongly agreed that E-learning made them more focus on the learning materials. 64.2% of the students strongly disagreed that E-learning could substitute the conventional learning. Our study suggested that minimum attendant in the class and attendant score could motivate students to participate in the classroom. Traditional one-way lecture should be reconsidered and transformed to other teaching methods.

Discussion and Conclusions: This study supports that the e-learning resource could be useful and effective. The combination of lectures with E-learning would be more beneficial than conventional lecture alone. E-learning should be further utilized in a blended learning environment to support face-to-face teaching in the class.

Take-home Messages: E-learning emerges as a viable alternative to supplement and support conventional lecture-based learning for medical students. Preference of E-learning's medical students could be used to transform the E-learning system for a better enhancement of medical student training.

A Model Workshop for Writing Systematic Review Protocols at Teaching Hospitals: The Final Report

AUTHOR(S):

- Yuki Kataoka, Hyogo Prefectural Amagasaki General Medical Center, Japan (Presenter)
- Hiraku Tsujimoto, Hyogo Prefectural Amagasaki General Medical Center, Japan
- Masahiro Bannno, Seichiry Hospital, Japan
- Yasushi Tsujimoto, Kyoritsu Hospital, Japan

ABSTRACT

Background: Systematic reviews (SR) play an important part of the five steps of evidence-based medicine. However, medical practitioners in Japan are unfamiliar with them because of the lack of undergraduate education. A workshop for creating systematic reviews is not common at teaching hospitals in Japan. The purpose of our project was to develop a model workshop for participants to acquire skills in creating high quality protocols of systematic reviews based on their clinical questions.

Summary of Work: We used an action research method to create this workshop and implemented it at nine teaching hospitals in Japan. The main participants were multi-occupation health care workers at each site. At first, two hospital doctors who had prior experience with systematic reviews gave interactive consecutive lectures, and by the end, four doctors were acting as instructors. To improve the program, we solicited reflection using participant questionnaires for each lecture and examined the quality of homework submitted by participants after each lecture.

Summary of Results: The project ran from April 2015 to Mar 2018. We developed a movie lecture series (<http://urx2.nu/OsCb>). The final program consisted of one offline and seven online flipped classrooms, which were used to write a part of protocol, as well as one off-line protocol presentation meeting by participants after six months. By using a flipped classroom, a web form, and an online conference system, four instructors were able to handle up to 64 participants. A total of 209 participants produced 414 research questions after the first session. Seventy-nine participants (38%) completed the workshop. They wrote 47 protocols adhering to Preferred Reporting Items for Systematic Review and Meta-Analysis Protocols, which is a reporting guideline of systematic review protocol. With instructors' help, they published three peer-reviewed articles and registered five Cochrane Review titles by December, 2018. One participant became a workshop instructor.

Discussion and Conclusions: We developed a model workshop for health care workers to conduct systematic reviews. Participants who completed the workshop acquired skills in creating systematic review protocols. Further research to improve participant motivation is necessary.

Take-home Messages: Clinician educators could use this labor-saving workshop for teaching health care workers how to write systematic review protocols.

Social Factors in Clinical Teachers' Learning into Practice Following Faculty Development Programs

AUTHOR(S):

- Szu-Han Wang, Chang Gung Memorial Hospital, Linkou Branch, Taiwan (Presenter)
- Ming-Ju Hsieh, Chang Gung Memorial Hospital, Linkou Branch, Taiwan
- Yin-Yu Chen, Chang Gung University, Taiwan
- Kou-Su Chen, Chang Gung Memorial Hospital, Linkou Branch, Taiwan
- Hui-Ling Lin, Chang Gung Memorial Hospital, Linkou Branch, Taiwan

ABSTRACT

Background: Faculty development is an essential component of every medical education institution. Although some clinical teachers translate their learning into practice, this is not always the case. This study aims to understand why learning does not always translate into practice using qualitative methodology underpinned by social cognitive self-regulation theory.

Summary of Work: One-to-one and group interviews were conducted with n=15 clinical teachers (medical doctors) from single medical center in Taiwan. All participants had previously engaged in at least one faculty development program. Data analysis was undertaken using thematic analysis: themes were developed inductively from the data and deductively using self-regulation theory.

Summary of Results: Our findings suggest that several social factors impact clinical teachers' translating learning into practice, including cultural differences, difficulties in feedback-giving and low-motivation. In terms of teachers' authority, the Confucianism culture in which the study was undertaken appeared to increase individuals' resistance to change, thus influencing feedback-giving.

Discussion and Conclusions: Our analysis identified that clinical teachers are highly impacted by social factors. Participants rarely gave feedback and failed to seek help when facing teaching problems. Often this was due to issues around cultural stigma relating to self-disclosure. Seeking new teaching methods was rare, reflecting that most participants were low-mastery-goal-oriented. Our research had found several social factors' influencing clinical teachers' willingness or ability to translate their learning into practice. Sometimes clinical teachers rarely give feedback and do not seek help when facing teaching problems due to cultural stigma relating to self-disclosure. Therefore, we suggest educational encounters adopt a tailored approach.

Take-home Messages: Several social factors impacted on how clinical teachers translated their learning into practice, including cultural differences, difficulties in feedback giving and absence of motivation. Sometimes clinical teachers rarely give feedback and do not seek help when facing teaching problems due to cultural stigmas relating to self-disclosure.

Faculty Development Activities for Biomedical Educators at Avalon University School of Medicine (AUSOM)

AUTHOR(S):

- Sateesh Babu Arja, Avalon University School of Medicine, Netherlands Antilles (Presenter)
- Sireesha Bala Arja, Avalon University School of Medicine, Netherlands Antilles
- Abraham Ratna Joseph Nayakanti, Avalon University School of Medicine, Netherlands Antilles
- Kumar Ponnusamy, Avalon University School of Medicine, Netherlands Antilles
- Simi Paramban, NMC Royal Womens Hospital, UAE

ABSTRACT

Background: The term continuing professional development encompasses competencies required to practice high-quality medicine including medical, ethical, managerial, personal, and social skills whereas continuing medical education refers to skills required to practice as a physician. The academic competencies for medical faculty include leadership, administration, teaching, curriculum development, and research. This study is intended to measure the outcomes of faculty development activities at AUSOM.

Summary of Work: At AUSOM, we took twelve biomedical educators as a unit and recruited them for different faculty development activities since 2015. Nine faculty members were enrolled and completed the ESME course offered by AMEE. Three faculty members enrolled and completed the ESME-assessments course offered by AMEE. Three faculty members enrolled and completed leadership course offered by AMEE. Additionally, one faculty member was enrolled in Masters in Health Professions Education, and he did workshops for other faculty members on Miller's learning Pyramid, Bloom's taxonomy, formative and summative assessment methods, blueprinting, MCQs item analysis, and standardized examination procedures.

Summary of Results: Faculties were able to apply the knowledge in their teaching practices. They were actively involved in curriculum development. The faculties implemented different types of teaching methods including small group discussions, PBL, and flipped classroom. They implemented different assessment methods. Faculty applied these principles in daily practice, but also they were able to write reflectively and apply to different fellowships. Five out of twelve faculties (40%) received the fellowship from Academy of Medical Educators. Two faculties received the associate fellowship offered by AMEE. One faculty member received the fellowship from higher education academy, UK and another faculty member received a senior fellowship from the higher education academy.

Discussion and Conclusions: Faculty development activities are rewarding, and the institutions should be ready to invest in such activities. Faculty should buy-in their time and participate in faculty development activities.

Take-home Messages: • The educational institution should be ready to invest resources in faculty development activities including teaching and assessment methods. • Faculty's time and readiness to involve in professional development activities is the critical factor for faculty development. • For larger institutions, the head of the department or chair of the department can take the responsibility and lead the faculty development activities.

Evaluating a top-class in medical teaching

AUTHOR(S):

- **Marjel van Dam, UMC Utrecht, The Netherlands (Presenter)**
- Gönül Dilaver, UMC Utrecht, The Netherlands
- Bert Arets, UMC Utrecht, The Netherlands
- Manon Burer, UMC Utrecht, The Netherlands

ABSTRACT

Background: The Teaching Scholar Program (TSP) was developed and set up in the University Medical Center Utrecht in 2013 as a two-year postgraduate program (20 ECTS) to provide teachers a broader and more academic insight in medical education and didactics. Every year 6 candidates meeting the eligibility criteria are admitted: doctors, educationalist, managers. They are expected to participate actively in the program, visit a medical education conference and perform and publish research in medical education. The learning goals of the TSP course are focused on expanding theoretical knowledge and performing medical education research. Moreover, we are also interested whether it enriches the participants' educational careers.

Summary of Work: To evaluate this program we composed a questionnaire concerning pre-, peri- and post-TSP educational activities of participants conform the by Kirkpatrick and Kirkpatrick (2006) proposed fields : reaction, learning, behavior and results. The diversity of the participants and their careers made it a challenge to pose the right questions for the answers we are looking for, especially on the four levels mentioned. All TSP participants from 2013 onwards were invited to complete the online questionnaire.

Summary of Results: During the conference we will present the outcome and effect of this scholar program on education and career of the participants.

Discussion and Conclusions: The assumption of honours programs for teachers is that it will enrich their education and boost their career. However, assumptions are potentially dangerous. Therefore, evaluation is key for understanding the effect. So far, evaluation was not part of this TSP program. This gave us the opportunity to evaluate the long-term effect of this program on the participants. Composing the right questionnaire to evaluate an educational program is challenging, but vital for further development of this program. The design of the questionnaire was based on literature and expertise of professor ten Cate and the authors, who developed several educational programs including evaluations. Common pitfalls in evaluations are the recency effect, the halo and horns effect and projection.

Take-home Messages: We consider evaluation an integral part of program development.

Transforming Clinicians into Leading Medical Educators: Outcomes from an Innovative Programme

AUTHOR(S):

- **Kate Seddon, Avon and Wiltshire Mental Health Partnership NHS Trust (AWP), UK (Presenter)**
- Harriet Greenstone, Avon and Wiltshire Mental Health Partnership NHS Trust, UK
- Laura Bennett, Avon and Wiltshire Mental Health Partnership NHS Trust, UK
- Stephen Arnott, Avon and Wiltshire Mental Health Partnership NHS Trust, UK
- Lise Paklet, Avon and Wiltshire Mental Health Partnership NHS Trust, UK
- Eva Bowditch, Avon and Wiltshire Mental Health Partnership NHS Trust, UK

ABSTRACT

Background: Junior doctors are major contributors to undergraduate medical education, though this is often through ad-hoc lectures or opportunistic clinical teaching and it is unusual for junior doctors to take on formal educational roles. The innovative regional ‘Junior Associate Tutor’ (JAT) programme was set up to give trainee psychiatrists the opportunity to develop as medical educators, through a formal recognised role, delivering and setting up teaching for Bristol University medical students.

Summary of Work: In August 2017 eight junior psychiatrists (Core Trainees) were appointed as ‘JATs’. JATs were offered monthly facilitated peer group supervision, support from the trust (AWP) Medical Education Department in developing education quality improvement projects (QIP), varied teaching opportunities, funding for medical education training and support in developing medical educator PDPs. The role was evaluated using detailed written feedback questionnaires as well as within peer group supervision.

Summary of Results: Starter questionnaires showed JATs anticipated that the role would aid their development of skills, network within medical education and to some extent have a role in influencing their organisation. The final feedback results showed that individual JATs reported developing an increased confidence in teaching, a greater sense of identity as educators and enhanced skills in quality improvement. One noted the ‘formal role made me feel more invested in teaching’. Several JATs presented their QIPs at national conferences, one won a prize for their Clinical Skills project, whilst another was subsequently appointed as a full time ‘senior clinical teaching fellow’.

Discussion and Conclusions: As well as promoting individual trainee development, the role had a positive impact on the development and delivery of undergraduate medical education across the trust. The role also influenced the Bristol University Medical School curriculum methodology, as two innovative projects created and developed by JATs were subsequently incorporated into the curriculum. A new cohort of JATs has been appointed in August 2018 with ongoing evaluation of the role.

Take-home Messages: 1. Developing specific educational roles encourages clinicians to develop skills and their identity as educators. 2. Investing in these clinicians results in improvements in practical delivery of teaching. 3. Junior staff can contribute to systemic improvements in undergraduate medical curriculum.

School of Junior Academics: The Case of Rīga Stradiņš University

AUTHOR(S):

- Nora Jansone-Ratinika, Rīga Stradiņš University, Latvia (Presenter)
- Raimonds Strods, Rīga Stradiņš University, Latvia

ABSTRACT

Background: According to legislation to carry out teaching at a HEI in Latvia - both Health Care and Social Science study programmes at RSU - no official acknowledgment of pedagogical education is requested, which explains the unequal entry level of pedagogical competencies. To strengthen the quality of the study process, an institutional decision to establish School of Junior Academics (SJA) has been made with an aim to support junior academics in leading, evaluating and improving the study process.

Summary of Work: To develop SJA, the needs of potential participants and management were identified, a research of field experience carried out and systematic literature review approved by field experts. The concept of SJA is based on Basic Programme Development Model (Seevers, Conklin, 2012) and in the process of implementation, an ongoing mix design research in which three-level quality assessment in various dimensions, containing junior academics', management, experts' of pedagogy and student feedback is carried out.

Summary of Results: SJA content covers: student-centred approach; vision of RSU development; organisation of the study process; development and implementation of study content; internal and external quality evaluation. 6 month studies are delivered in face-to-face, flipped classroom, blended and online learning. The school's content is enriched with supervision, networking with other HEI, e-journal club, direct observation, team building events to strengthen the junior academics' assurance of own competency. Dynamics of participants' growth will be reported on, reflecting competencies and increase of assurance of own pedagogical performance and authors' know-how about development and implementation of SJA.

Discussion and Conclusions: SJA will be meaningful if junior academics at school will: Create culture of collegiality and obtain common understanding of the institution's values; Co-operate with mentors and consultants from different levels; Understand and assimilate the academical, scientific and administrative dimensions of work; 4) Enrich understanding about higher education sector institutions, formation of network connection in everyday life; Strengthen competency to manage the process of teaching and learning; Evolve life-long learning as a form of professional development.

Take-home Messages: SJA helps junior academics to meaningfully start their career in HEI; Junior academics and management agree that strengthening pedagogical competency promotes academics' well-being and is the catalyst of study process quality improvement.

Perspectives of Academic Staff on the Roles of the Newly Appointed Teacher in Health Sciences

AUTHOR(S):

- Chantel van Wyk, University of the Free State, South Africa (Presenter)
- Gert J van Zyl, University of the Free State, South Africa

ABSTRACT

Background: Medical teachers wear many “hats” in the key roles they portray in the educational process. Faculty development initiatives can assist the newly appointed medical teacher to gradually obtain the necessary competencies required for these various roles. The aim of the study was to identify which of the roles to focus on first during centralised faculty specific training.

Summary of Work: An adaptation of the 12 roles of the medical teacher model framed by Harden and Crosby (2000) was used in this study. The research was quantitative. A questionnaire was used to obtain data from 256 academic staff members from a South African University. Staff had to indicate (on a four-point scale) their perception of the level of importance of each role with specific reference to training the newly appointed medical teacher. A 50% response rate was obtained.

Summary of Results: Academic staff considered the roles of a role model for students (99.2%), an information provider in the classroom (98.4%), facilitator of learning (97.6%) and assessor (97.6%) most important for the newly appointed teacher. The roles of curriculum planner and evaluator were deemed not important at all by 28.9% and 22.7% of academics.

Discussion and Conclusions: Centralised faculty development should focus on the, identified, most important roles first during training. However, a need for continued training and support including on-the-job training within departments as it pertains to the specific role/s of the newly appointed teacher was identified and is recommended.

Take-home Messages: In academia, as soon as you stop learning, you stop growing! Centralised faculty development initiatives to train the newly appointed medical teachers can get them off to a good start, but the ideal will be to have continued and lifelong support and development opportunities as it pertains to individual teachers in their specific roles.

A heuristic workshop improves emergency medicine physicians' ability to design and conduct effective bedside teaching rounds

AUTHOR(S):

- Jihai Liu, Department of Emergency Medicine, Peking Union Medical College Hospital, China (Presenter)
- Di Shi, Department of Emergency Medicine, Peking Union Medical College Hospital, China
- Li Li, ShenZhen Municipal Health Commission, China
- Jiangshan Wang, Department of Emergency Medicine, Peking Union Medical College Hospital, China

ABSTRACT

Background: Studies have shown the challenges of designing/conducting effective teaching rounds (TR) at the bedside, especially in the unique environment of emergency medicine (EM). In a tertiary EM center, we have developed a heuristic educational workshop for EM TR. This study aimed to evaluate the impact of the new workshop on the confidence and skills of EM physicians in TR.

Summary of Work: We offered open enrollment of the heuristic workshop in a large metropolitan area of China to any EM physicians interested in TR. We surveyed consent participants before and after the workshop regarding their confidence in design/conduct TR, along with the perceived challenges and benefits. We compared the before and after statistics using the McNemars test.

Summary of Results: Our workshop enrolled 64 EM (from 30 hospitals) attending physicians who were interested in improving teaching rounds in EM. 44/64 provided answers to both the pre and post-survey. Most participants were from third-tier academic centers (88%), age 36 or above (56%), with a master or doctoral degree (65%). After the training, participants reported an overwhelming improvement of confidence in designing TR (14% vs. 95%, $p < 0.001$), guiding TR discussion (25% vs. 98%, $p < 0.001$), naming the challenges of TR, identifying the suitable timing and conditions, and setting realistic goals. More than 80% reported a gain in multiple aspects of TR after the training. Participants also adopted a more positive attitude of TR regarding the benefit for patients (52% vs. 75%), and the benefit for trainee (77% vs. 98%).

Discussion and Conclusions: Our workshop which utilized simulation techniques and hands-on design was an effective method to quickly equip EM attending physicians with needed knowledge of designing and conducting TR in EM. We also found that the improved knowledge of TR may alleviate physicians off the concerns for the negative aspect of TR in EM, such as the conflict with clinical workflow, or lack of benefit for patients.

Take-home Messages: We have demonstrated that a short intensive workshop can significantly bridge the knowledge gaps of TR in the EM physicians.

Effectiveness of Examiner Training in Preparing Medical Students as Mock OSCE Examiners

AUTHOR(S):

- Jian Hui Koo, Lee Kong Chian School of Medicine, Singapore (Presenter)
- Kim Yao Ong, Lee Kong Chian School of Medicine, Singapore
- Yun Ting Yap, Lee Kong Chian School of Medicine, Singapore
- Ying Qi Goh, Lee Kong Chian School of Medicine, Singapore
- Sarah Hui Wen Neo, Lee Kong Chian School of Medicine, Singapore
- Kum Ying Tham, Lee Kong Chian School of Medicine, Singapore

ABSTRACT

Background: A common form of peer-assisted learning is the Mock Objective Structured Clinical Examination (MOSCE), where senior students perform the role of student-examiners to assess their juniors. The literature reveals no reports of student-examiner training programmes. This study evaluates a student-examiner training programme that prepares them to be effective examiners in a MOSCE.

Summary of Work: Three groups of student-examiners were recruited: (1) trained Year 3 (Y3)-examiners who completed an examiner training session conducted by an experienced doctor-trainer and examiner, (2) untrained Y3-examiners who did not undergo training and (3) Year 5 (final year, Y5) student-examiners who were controls; the assumption being that they have tacit knowledge and skills to be effective examiners. Each Y3-examiner was paired with a Y5-examiner to independently assess examinees using a structured mark scheme. The MOSCE had physical examination (PE) and history-taking (Hx) stations. The PE mark scheme consists of (i) examination steps and (ii) global scores; those for Hx consisted of (i) content, (ii) communication and (iii) global scores. Intraclass-correlations (ICC) and mean scores between Y3-examiners and Y5-examiners were calculated. Independent t-tests were used to calculate statistical significance, at $p \leq 0.05$.

Summary of Results: There were 12 trained and 23 untrained Y3-examiners who, with Y5-examiners, assessed 104 Year 2-examinees. There were 108 and 66 attempts for Hx and PE stations respectively. There is good correlation between total scores given by Y3-examiners and Y5-examiners for PE (ICC=0.840) and Hx (ICC=0.826). For PE, there is no significant difference in scores for both examination steps and global scores between trained Y3-examiners ($p=0.774$, $p=0.418$) and untrained Y3-examiners ($p=0.552$, $p=0.271$) when compared to Y5-examiners. For Hx, there is a significant difference in communication ($p=0.012$) and global ($p=0.024$) scores between trained and untrained Y3-examiners when compared to Y5-examiners. However for Hx content scores, there is no significant difference ($p=0.064$, $p=0.999$).

Discussion and Conclusions: For Year 2 MOSCE physical examination stations, Y3-examiners are effective even without training when a structured mark scheme is used. For history-taking stations, examiner training should continue and focus on assessment of examinees' communication skills and how to assign global scores.

Take-home Messages: In summary, there is a need for student OSCE-examiner training with a selective focus on history-taking stations.

How we implemented a train-the-trainer workshop for medical student engagement to develop a teaching ward program

AUTHOR(S):

- Ching Chung Lin, MacKay Memorial Hospital, Taiwan (Presenter)
- Chiu-Ping Kuo, MacKay Memorial Hospital, Taiwan
- Chia-Yuan Liu, MacKay Memorial Hospital, Taiwan
- Charles Jia-Yin Hou, MacKay Memorial Hospital, Taiwan
- Yih-Jer Wu, MacKay Memorial Hospital, Taiwan
- Hung-I Yeh, MacKay Memorial Hospital, Taiwan

ABSTRACT

Background: Student engagement needs a supportive hospital environment, active and collaborative learning, and good student faculty interaction. The objective of this study was to create and evaluate a train-the-trainer (TTT) workshop for internal medicine attending doctors to build a teaching team in a ward, improve their teaching and assessment skills, and set up a curriculum.

Summary of Work: The half-day TTT workshop introduced and practiced five domains: team management, curriculum development, teaching and learning practices, assessment practices, and clinical reasoning education for internal physician staffs. The effectiveness of the TTT was examined through self-evaluation questionnaires assessing the trainees' changes in knowledge, reactions to education materials, and overall satisfaction before and after the training and then three months later.

Summary of Results: Altogether, seven trainees and five teachers participated in the TTT workshop. The general satisfaction level was 4.4/5, and the scores of teachers' ability was 4.5/5. The average scores of participants' self-ability evaluations significantly immediately in all five domains improved after the TTT workshop, but only in the team-management domain did the trainees retain their improved competency scores three months later ($p < 0.01$).

Discussion and Conclusions: After this TTT workshop, the teaching staffs reached an agreement in which they created ultrasound and clinical reasoning teaching programs. The students' feedback indicated that that they were satisfied with the instruction in teaching, and they felt that residents can also be teachers. Our next TTT research will focus on continuing education for medical teaching staff.

Take-home Messages: TTT workshops can improve a faculty's short-term teaching skills, and establishing a teaching ward can affirm a hospital's supportive attitude toward education and enable students engage in hands-on learning.

Teacher's Wellness - a workshop combined with MBSR and mentoring skills for clinical teachers - what did we find?

AUTHOR(S):

- Pei-Chun Lin, Far Eastern Memorial Hospital, Taiwan (Presenter)
- Ya-Ting Yang, Far Eastern Memorial Hospital, Taiwan
- Yun Chen, Far Eastern Memorial Hospital, Taiwan

ABSTRACT

Background: Clinical teachers feel stress while dealing multiple roles in a teaching hospital, along with their clinical service, teaching, and research. Mentoring skill is one of the most stressful factors especially when supervise trainee in difficulty. We sought to develop a program to meet faculty needs and retrieve resilience.

Summary of Work: We implemented a one-day offsite workshop with two topics: (1) Mindfulness-Based-Stress-Reduction (MBSR), (2) mentoring strategies and tools for trainee in difficulty. We expected through this workshop could reduce teachers' stress and develop confidence and ability for mentoring as well. Questionnaire designed regarding teacher's stress and self-confidence in mentoring were collected.

Summary of Results: As a pilot, 40 clinical teachers from various specialties were assigned into 6 different groups, 92.5% are clinical teachers and 4 of them are playing three roles as clinical teacher, program supervisor and program director at the same time. Only 30% of participants have been approach MBSR or resilience program, and 40% received mentoring training before. Through using a pre and post-session questionnaire, teacher's self-confidence in mentoring skills have increase spectacularly in identifying related issues for trainee in difficulty, and obtaining the communication skills with trainee's other stakeholders (e.g. parents). Participants 100% agreed the workshop could help their resilience and understand the role and responsibilities as a mentor. Surprisingly teacher's wellness was recognized after this whole-day interactive mentorship. Providing further MBSR training (25.7%), or resilience programs (21.1%), or simulated situation for mentoring training (19.3%) were strongly suggested to sustain teacher's wellness and enhance mentor efficacy.

Discussion and Conclusions: We found MBSR training gave them a space to understand stress management and obtain resilience, coupled with the mentor skills and interactive mentorships were the key for teacher's wellness. All participants found this workshop entirely positive. Systemic approach to provide a wide variety faculty development programs including MBSR, mentoring skills and mentorships are mandatory to enhance teacher's wellness.

Take-home Messages: Effective faculty development programs to cultivate resilience and facilitate greater networking and mentorship among clinical teachers could enhance their wellness thus to fulfil faculty commitment with institutional mission and teaching professionalism.

Clinical Teachers' Translating Learning into Practice following Faculty Development Programs: A questionnaire study

AUTHOR(S):

- **Ming-Ju Hsieh, Chang Gung Memorial Hospital, Chang Gung University, Taiwan (Presenter)**
- Szu-Han Wang, Chang Gung Memorial Hospital, Taiwan
- Ying-Yu Chen, Chang Gung Memorial Hospital, Taiwan
- Hsu-Min Tseng, Chang Gung University, Taiwan
- Kou-Su Chen, Chang Gung Memorial Hospital, Chang Gung University, Taiwan
- Hui-Ling Lin, Chang Gung Memorial Hospital, Taiwan

ABSTRACT

Background: Faculty development is a crucial element of medical education institutions. Our previous research identified key issues around why clinical teachers' learning does not always translate into practice, guided by self-regulation theory. This study aims to develop a questionnaire for clinical teachers to understand more about this issue.

Summary of Work: Researchers developed the questionnaire with 72 items from previous qualitative study which than was modified to 35 items after a pilot test (n=25), the online survey issued to 933 clinical teachers by email from four teaching hospitals in Taiwan following their attendance at a faculty development program. Data analysis was done by SPSS.

Summary of Results: Respond rate is 40.52%(n=378). Exploratory factor analysis showed the theoretical themes of Goal Setting, Self-instruction, Balance between Teaching and Clinical Workload, and Self-Evaluation, as the same latent factor. Nurses were most likely to seek help when facing teaching activities problems which cannot solved by themselves, followed by other medical-related personnel, and lastly by doctors ($F(2,375)=30.100, P=.000$). They are more likely to adjust their teaching methods after intervention.

Discussion and Conclusions: We found that clinical teachers considered forethought, performance, and reflection in self-regulation as the same latent factor. Clinical teachers from different specialties demonstrate different preferences while teaching, with teaching methods being influenced by previous experience. This suggests that we may need to use different intervention strategies during faculty development for different specialties. Our study identified different types of medical-related personnel can be influenced by different factors during their clinical teaching practice. Furthermore, they revealed different thought processes and behaviors during their teaching process on. In the future, the questionnaire will be applied to another faculty development for understanding their mentality.

Take-home Messages: A questionnaire of clinical teachers' self-regulation was developed for understanding clinical teachers' translation after intervention. The result of exploratory factor analysis shows clinical teachers' mindset of self-regulation in teaching is differs from current theoretical constructs. Individuals from different professional groups demonstrate different preferences in clinical teaching.

A qualitative study of outpatient clinical teachers' pedagogical skills in the French part of Switzerland: a call for targeted training

AUTHOR(S):

- Marie-Claude Audétat, UDREM at UIGP, Faculty of Medicine, University of Geneva, Switzerland (Presenter)
- Johanna Sommer, UIGP, Faculty of Medicine, University of Geneva, Switzerland
- Virginie Muller-Juge, UIGP, Faculty of Medicine, University of Geneva, Switzerland
- Luc Côté, Faculty of Medicine, University of Laval, Canada
- Anne Catherine Pereira Miozzari, UIGP, Faculty of Medicine, University of Geneva, Switzerland

ABSTRACT

Background: Clinical teachers need to be able to combine clinical work and teaching by relying on solid pedagogical tools. A commitment towards a process of continuous training to evaluate the acquisition and use of the tools is of paramount importance. Observing clinical teachers in supervision combined with feedback represents an established model for encouraging efficient learning.

Summary of Work: A qualitative and descriptive analysis was carried out to assess the process and pedagogical content of the supervision of standardized students. We used a descriptive tool for peer review of clinical teaching skills developed by Sommer et al. as a conceptual framework to analyze the process and the content of 60 standardized supervision situations.

Summary of Results: Our results describe the analysis of the 60 supervisions carried out among 20 clinical teachers in the French-speaking part of Switzerland, with each clinical teacher having supervised students in three clinical situations. They present gaps in using clinical supervision as a pedagogical tool and still need to develop their teaching scripts to reinforce their pedagogical role.

Discussion and Conclusions: In general, clinical teachers are worried about creating a favorable learning environment for their students but they rarely integrated the structure of the supervisory process. Overall, clinical teachers feel relatively comfortable when it comes to the structure of clinical interview and in the supervision of the relationship with the patient, but the supervision of the clinical reasoning is deficient. These results will help pedagogical training programs adapt to the clinical teachers' needs. By acquiring teaching skills for clinical teachers through an innovative manner that highlights the positive and negative aspects of supervising, both in term of the process and the content used during supervision.

Take-home Messages: The observation of clinical supervisions show that clinical teachers need: -to develop their teaching skills, -to acquire a clear structure of supervision and -to reinforce their skills to teach clinical reasoning. This will help them experience positively their double "clinician and teacher" role and encourage them to surpass an implicit benevolent role model in their interactions with students.

Survey among students and residents at the Reims Faculty of Medicine leading to the “Clinical supervision in 300 seconds” program, a doctor’s toolbox for the supervision of students

AUTHOR(S):

- **Evan Gouy, Reims Faculty of Medicine, France (Presenter)**
- Mathias Brugel, Reims Faculty of Medicine, France
- Raquel Correia, Reims Faculty of Medicine, France / Germany
- Jean Hugues Salmon, Reims Faculty of Medicine, France
- Nathalie Bednarek-Weirauch, Reims Faculty of Medicine, France
- Guillaume Cadiot, Reims Faculty of Medicine, France

ABSTRACT

Background: Companionship is an important part of medical education in France. Indeed, from the first year and more particularly from the 4th year of the curriculum, students start their hospital internships and learn at the patients bedside with their seniors. In order to guide supervisors and optimize their teaching methods, we have launched a working group at the Faculty of Medicine in Reims on clinical supervision training. We decided to launch a one-minute preceptor training program under the name of “Clinical Supervision in 300s” Before we start, we made an inventory of the situation with residents and graduate students on their perception of clinical supervision.

Summary of Work: Two questionnaires were designed. The first for medical students assessed the perception of clinical supervision, students wishes teaching according to the type of department including the available resources. The second questionnaire for residents assessed the time available for teaching, the skills that were deemed necessary and sometimes missing. Finally, a question was asked whether learning teaching methods could be used with patients.

Summary of Results: We have collected 112 responses from medical students and 40 from residents. 83% of students considered that the primary supervisor is the resident far ahead others. Among the skills required, patience, skills for synthesis and caring came first. Among the residents, 75% considered themselves important actors in the students training but more than 50% wished to devote less time to teaching while being 40% who wanted to be more involved in this field. More than 50% would be willing to participate in pedagogical training knowing that these skills could be used with their patients.

Discussion and Conclusions: Residents are aware that they are essential cogs and they lack expertise in medical pedagogy. Interactivity and non-judgmental feedback are appreciated. We therefore felt it was essential to provide residents with a toolkit to support students in the time they can devote to them. We named this toolbox “clinical supervision in 300s”. Modalities and results will be presented at the meeting.

Take-home Messages: Give your students a voice, they will tell you what they need most!

Clinical supervision training project at the Faculty of Medicine in Reims: inventory of the situation before implementation

AUTHOR(S):

- **Mathias Brugel, Reims Faculty of Medicine, France (Presenter)**
- Evan Gouy, Reims Faculty of Medicine, France
- Raquel Correia, Reims Faculty of Medicine, France/Germany
- Jean Hugues Salmon, Reims Faculty of Medicine, France
- Nathalie Bednarek-Weirauch, Reims Faculty of Medicine, France
- Guillaume Cadiot, Reims Faculty of Medicine, France

ABSTRACT

Background: Companionship is an important part of medical education in France. Indeed, from the first year of the course, students start their hospital internships and learn at the patients bedside with their seniors. However, divided between clinical activity, research, management and their own professional development, supervisors must be guided to optimize their teaching methods. It is with this in mind that we have launched a working group at the Reims Faculty of Medicine on clinical supervision training. To begin, we wanted to make an inventory of the situation with residents and graduate students on their perception of clinical supervision.

Summary of Work: Two questionnaires were designed. The first was for students between 4th and 6th year. It assessed the perception of clinical supervision, students wishes teaching according to the type of department including the resources available. A second questionnaire was designed for residents. It assessed the time available for teaching, the skills that were deemed necessary and sometimes missing. Finally, a question was asked whether learning teaching methods could be used with patients. In both cases, a free comment area was present. The questionnaires were distributed by faculty mailing and social networks.

Summary of Results: We have collected 112 responses from medical students and 40 from residents. 83% of students considered that the primary supervisor is the resident far ahead others. Among the skills required, patience, spirit of synthesis and caring came first. Among the residents, 75% consider themselves an important actor in the training of students but more than 50% wish to devote less time to teaching while being 40% to want to be more involved in this field. More than 50% would be willing to participate in pedagogical training knowing that these skills could be used with their patients.

Discussion and Conclusions: The intern is an essential cog and he is aware of it. Interactivity with non-judgmental feedback is valued. There is a partial lack of knowledge in medical pedagogy. So, it seemed essential to us to provide interns with a toolbox to support students in the time they can devote to them.

Take-home Messages: With these results, inspired by the one minute supervisor, we created clinical supervision in 300s.

Exploring the performance and desired capabilities of model clinical teachers - Aligning with The Academy of Medical Educators' Professional Standards

AUTHOR(S):

- Jer-Chia Tsai, Kaohsiung Medical University Hospital, College of Medicine, Kaohsiung Medical University, Taiwan (Presenter)
- Chung-Sheng Lai, Kaohsiung Medical University Hospital, College of Medicine, Kaohsiung Medical University, Taiwan
- Peih-ying Lu, College of Humanities and Social Sciences, College of Medicine, Kaohsiung Medical University, Taiwan
- Jeng-Hsien Yen, Kaohsiung Medical University Hospital, College of Medicine, Kaohsiung Medical University, Taiwan
- Chee-Siong Lee, Kaohsiung Medical University Hospital, College of Medicine, Kaohsiung Medical University, Taiwan
- Chyi-Her Lin, E-Da Hospital, College of Medicine, I-Shou University, Taiwan, Taiwan

ABSTRACT

Background: Developing clinical teachers as medical educators is a key for quality assurance of clinical education. However, it is challenging to define and establish the capabilities of core values and teaching competencies for model clinical teachers. The UK Academy of Medical Educators (AOME)' Professional Standards provided the framework for the development and appraisal of medical educators. This study aims to explore how clinical teachers perceive their performance and desired capabilities as medical educators in aligning with AOME's standards.

Summary of Work: Individual interviews were conducted from 12 clinical teachers with 10.8±5.0 years of educational experiences at Kaohsiung Medical University Hospital. Qualitative thematic analysis was applied to extract the themes and categorize them to specific elements and levels in three domain of AOME's standards: (1) Designing and planning learning, (2) Teaching and facilitating learning, and (3) Assessment of learning.

Summary of Results: The themes of desired capabilities of model clinical teachers were identified and categorized based on AOME's domains. Domain one included "constructing course learning goals, employing the different teaching models and materials in meeting learners' needs, providing the simulation training and informal learning opportunities, and supporting the residents as teachers". Domain two included "guiding learners' self-directed learning approach and skills, fostering learners' growth mindset of trial and error, creating a learning environment with mutual respect among team members, providing timely, positive feedback, and opportunities for practice". Domain three included "applying assessment drives learning, encouraging learners' self-assessment, and designing department-specific assessment". Core values included "patient-centered care, collaborative learning, and supportive organizational culture".

Discussion and Conclusions: Results demonstrated that our clinical teachers aspire to embody the core values and teaching competencies that might be specific to local socio-cultural context but also align with AOME's standards, mostly to level 1 and 2 of three domains. There is room for advancing them to the higher levels of desired capabilities. Clinical teachers express the needs of organizational support for personal professional development and quality improvement of clinical learning environment.

Take-home Messages: Clinical teachers' self-reflection on their performance and desired capabilities as medical educators could discover their shared values and needs in meeting AOME's professional standards. Collaborative organizational culture and support are critical to better clinical teacher development.

Analysis of teaching doctor statue required by junior residents

AUTHOR(S):

- Yasuhiro Itsui, Department of Medical Education Research and Development, Tokyo Medical and Dental University, Japan (Presenter)
- Chikako Okawara, Graduate School of Health Sciences, Tokyo Medical and Dental University, Japan
- Eriko Okada, Department of Medical Education Research and Development, Tokyo Medical and Dental University, Japan
- Makoto Takahashi, Department of Medical Education Research and Development, Tokyo Medical and Dental University, Japan
- Yujiro Tanaka, Department of Medical Education Research and Development, Tokyo Medical and Dental University, Japan

ABSTRACT

Background: After our university hospital clinical training, at the end of the course junior residents are asked to state cards to thank any teaching doctor. It is to analyze gratitude contents from the contents of the description and to clarify the teaching doctor image to obtain.

Summary of Work: Objectives: In the end of March 2018 we gave my handwritten notes on the cards to express my gratitude to the teaching doctor at the training completion ceremony. Next, using the teaching doctor evaluation table (Kikukawa, Medical teacher 2017), 18 questions on teaching activity, role model, and accessibility were answered with five levels of Visual analog scale (VAS). Methods:1) We performed word frequency analysis and correspondence analysis based on cooccurrence relations of words using text mining method. We used Text Mining Studio 6.1.0 for analysis software. 2) We quantitatively evaluated teaching activity, role model and accessibility based on the VAS scale of the teaching doctor evaluation table.

Summary of Results: Results: We got an entry from 63 resident physicians, and there were 63 address teaching doctors. There were 37 cases (58.7%), 25 (39.7%) of the same, and 1 (0.6%) of the unknown, which were different between the resident's and teaching doctor's departments. In the word frequency analysis, words related to the attitude of teaching doctors, teaching, clinical training, initial clinical training, continued together, work attitude, polite, gentle and so on were also high in word frequency analysis. 2) There were 47 respondents in the teaching doctors evaluation table, teaching activity 4.68 ± 0.60 , role model 4.59 ± 0.64 , accessibility 4.79 ± 0.42 . Accessibility was significantly higher than the other two factors.

Discussion and Conclusions: Attitudes and guidance of the teaching doctor have become a factor determining the basic medical care skills and career path in the first year, and it was thought that the teaching doctor who is accessible is wanted by the resident.

Take-home Messages: The teaching doctor plays a role as master of basic medical care skills and role model, and is required from the interns with accessibility.

Teaching practices in health undergraduate programs: Two sides of the coin

AUTHOR(S):

- **Cristhian Perez, Universidad de Concepcion, Chile (Presenter)**
- Nancy Bastias, Universidad de Concepcion, Chile
- Giulietta Vaccarezza, Universidad San Sebastian, Chile
- Cesar Aguilar, Enfoque Emico, Chile
- Mary Jane Schilling, Universidad de Concepcion, Chile
- Josselinne Toirkens, Universidad Catolica de Temuco, Chile

ABSTRACT

Background: Teaching practice is a complex phenomenon that include the way in which teachers interpret learning situations, pedagogical training they receive, meanings that they attribute to learning process, teaching decisions they make and the way they behave in front of students.

Summary of Work: The objective of this work was to identify profiles of teachers in undergraduate health programs according to their pedagogical practices. This research was founded by CONICYT-FONDECYT 1190931. 290 teachers from undergraduate health programs were surveyed (64.45% were women). They answered Pedagogical Practices Questionnaire, Teaching Conceptions Questionnaire, Occupational Identity Questionnaire, Pedagogical Training Questionnaire and Teaching Engagement Questionnaire. Everyone of them participated in an informed consent.

Summary of Results: A hierarchical cluster analysis identified two teacher clusters considering all performed measurements. Then, a non-hierarchical cluster analysis assigned 120 teachers to cluster 1, which was labeled Low involvement teachers and 170 were assigned to cluster 2, which was labeled High involvement teacher. Cluster 2 obtained higher scores in every measurement.

Discussion and Conclusions: There are two teacher profiles. One of them is a little more frequent and it is characterized by more constructivist practices, higher teaching commitment, more frequent pedagogical training and an occupational identity more oriented to teaching.

Take-home Messages: Teaching practices have many sides and all of them are interrelated.

Interpretation of the professional identity of the medical educator as a member of an educational project

AUTHOR(S):

- Mildred Vanessa Lopez Cabrera, Tecnológico de Monterrey, School of Medicine and Health Sciences, Mexico (Presenter)
- Silvia Lizett Olivares Olivares, Tecnológico de Monterrey, School of Medicine and Health Sciences, Mexico
- Yolanda Heredia, Tecnológico de Monterrey, Mexico

ABSTRACT

Background: Besides to sharing knowledge, values, and attitudes, the members of a profession share the way of understanding themselves or perceive life; this is also known as professional identity. To achieve this, they acquire multiple roles, and responsibilities, and perform collaboratively, thus defining their professional culture. Medical educators are committed to the development of their students, are leaders on their disciplinary field, and have academic as well as clinical activities that demonstrate their commitment to the community.

Summary of Work: The objective of this study was to explore the concept of professional identity through the professional culture perceived by the medical educator. A qualitative method was implemented, using a grounded theory design with systematic procedures. A sample of 39 medical educators participated in structured interviews. After the transcription of their answers, a thematic content analysis was carried using the professional culture model: individualism, balkanized, collegiality per project, and extended collaboration.

Summary of Results: The analysis indicates that the identity of medical educators associates in 44% to individualism, 31% balkanized, 13% collegiality per project, and 13% extended collaboration.

Discussion and Conclusions: This concentration in the professional culture towards individuality and balkanized culture is evident in the approach that universities give to the individual responsibilities of teachers. For example, faculty members receive personal feedback of performance and economic incentives are based on evidence such as publications, awards, and results of the student's satisfaction surveys.

Take-home Messages: A transition is needed to work on collaborative activities with meaningful projects that allow medical educators to work together; this would make it possible to obtain a shared vision of what it means to be a medical educator.

Our experience with the development of a Teaching Quality Index, a tool to credit teachers for their educational achievements

AUTHOR(S):

- Levente Kiss, Semmelweis University, Teaching Center, Department of Physiology, Hungary (Presenter)
- Krasimir Kolev, Semmelweis University, Department of Medical Biochemistry, Hungary

ABSTRACT

Background: In 2016 the Dean of the Faculty of Medicine at the Semmelweis University initiated programmes to improve the quality assurance of teaching. These programmes subsequently led to a project aiming to develop a Teaching Quality Index (TQI) to acknowledge the importance of teaching and teachers as objectively as possible.

Summary of Work: The project team consisted of 20 university staff members (academic tenure and financial executive officers) and students. During several meetings the participants discussed the available options, surveyed the literature, analyzed the financial possibilities and through discussions the general scheme of the TQI started to take shape.

Summary of Results: The TQI is based on a ranking of the teachers within the institutions assigning an equal weight to several objective criteria for expert analysis of the educational work of the teachers and subjective on-the-spot student feedbacks. The TQI might be used for quality assurance programs and for financial rewards.

Discussion and Conclusions: The TQI represents one possible solution to provide a semi-objective ranking system based on teaching quality. It is not without its drawbacks. Various institutions may value different roles of the teacher and in its current form the TQI cannot be used to compare teaching quality across institutions. Assigning an index to the complex activities of teaching is a challenging task and it engages with a scale of values. Therefore the Faculty must clarify its core values in its mission statement and the assessment of teaching quality must stem from that. However, it is highly difficult to satisfy everyone with any given system.

Take-home Messages: In order to improve quality of teaching it is important to give due credit to the teaching process and reward those who are putting effort to their teaching activities. In order to develop a fair system stakeholders must agree on core values based on which teaching quality can be assessed.

Effective Evaluation of Faculty Work: Using Clinical teaching Walkthroughs

AUTHOR(S):

- **Ming-Chen Hsieh, Department of Medical Education, Buddhist Tzu Chi General Hospital, Hualien, Taiwan, Taiwan (Presenter)**
- Tsung-Ying Chen, Department of Medicine, College of Medicine, Tzu Chi University, Hualien, Taiwan
- Hsu-Chun Huang, Institute of Educational Administration and Evaluation, University of Taipei
Department of Education, Taiwan

ABSTRACT

Background: Effective faculty evaluation is complex and requires the use of multiple measures-formal and informal, traditional and authentic-as part of a reasonable evaluation. The purpose of this research is to determine the most fair, authentic, and reliable elements to include in a “Clinical teaching Walkthroughs”, specifically in the clinical environment.

Summary of Work: The instructors researchers used clinical teaching walkthrough observation forms to track, evaluate, and monitor clinical teacher’s performance. The data were collected electronically and then compiled to present a picture of the developing skills and expertise of the clinical teacher.

Summary of Results: The clinical teacher candidates reflected on the data and used the information to set goals for continued development of teacher dispositions.

Discussion and Conclusions: The faculty used the observable data to better evidence the teacher candidate dispositions through their actions and interactions with medical students.

Take-home Messages: Formative supervision allows stakeholder to monitor, assess, and systemically address teacher performance with the intent of improving their practice. This process in helping them develop clinical teacher’s awareness of teaching as a scholarly activity, engendering an enthusiasm for excellence in teaching that may have otherwise been ignored. The evaluation of clinical teaching thus becomes a rewarding process, not overload event.

Relationship between teaching performance and resident's academic achievement

AUTHOR(S):

- Liz Hamui, Facultad de Medicina, Universidad Nacional Autonoma de Mexico, Mexico (Presenter)
- Amilcar Alpuche, Facultad de Medicina, Universidad Nacional Autonoma de Mexico, Mexico
- Armando Ortiz, Facultad de Medicina, Universidad Nacional Autonoma de Mexico, Mexico
- Rogelio Chavolla, Facultad de Medicina, Universidad Nacional Autonoma de Mexico, Mexico
- Gerard Heinze, Facultad de Medicina, Universidad Nacional Autonoma de Mexico, Mexico
- German Fajardo, Facultad de Medicina, Universidad Nacional Autonoma de Mexico, Mexico

ABSTRACT

Background: Since 2014, the Postgraduate Studies Division of the Faculty of Medicine, National Autonomous University of Mexico, applies an online instrument to evaluate the performance of teaching competencies and identify the quality and development of the training process. The opinion of residents is gathered from 78 courses of the Unique Program of Medical Specialties.

Summary of Work: With 2017 data, we sought to predict the academic achievement, expressed in the scores of the annual exams, based on the opinion of the residents about their teacher's performance. 4293 residents at all levels and specialties participated in the survey. The SEVADEM online system was used to evaluate 1407 teachers.

Summary of Results: The generated models predict from 1 to 16% of the grade in a range of 72 to 80 of 100 possible score. The residents highlighted three attributes in the teacher: Personal Interaction (PI), Experience and Medical Knowledge (EMK), and Professional Ethics (PE). For 1st year, PI predicted scores between 70.6 and 80.8 in the exam; in year 2, in addition to the IP, the EMK stood out, forecasting grades from 69.1 to 81.9; in third and fourth year the PE also appeared and anticipated an academic performance of 71.6 to 82.7 and 72 to 82.6 respectively; finally, in the 5th year, the teachers professional authority was added, an attribute that predicted scores between 76.3 to 83.3.

Discussion and Conclusions: The academic performance in the annual exams is predicted in part by the opinion of the residents about their professors considering specific attributes in an evolutionary and qualitative development. According to the year of residence, they pass from the valuation of personal interaction with the teacher, to the appreciation of their medical experience and knowledge, up to the recognition of their ethic and professional authority.

Take-home Messages: According to the program's year, residents emphasize different teacher's attributes. Initially they value their constant presence, then their experience and medical knowledge, and in the last years residents recognize their professor's example as a professional besides their authority exercise.

Effect of Peer Observation on Evidence-Based Medicine Curriculum

AUTHOR(S):

- **Cheng-Tau Chen, Department of Pharmacy Practice, Tri Services General Hospital, Taiwan (Presenter)**
- Chiung-hsi Tien, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Ying-Jung Lai, Tri-Service General Hospital, Taiwan
- Chih-Wei Huang, Department of Pharmacy Practice, Tri-Service General Hospital, Taiwan
- I-Hsun Li, Department of Pharmacy Practice, Tri-Service General Hospital, Taiwan
- Cheng-Yi Cheng, Tri-Service General Hospital, National Defense Medical Center, Taiwan

ABSTRACT

Background: Peer observation is an integral part of faculty professional development and is widely used for research of teachers. It helps both the teachers and observers to enhance the quality of teaching to improve in student's outcome. Peer observation of evidence-based medicine (EBM) curriculum was initiated to improve the EBM teachers teaching quality. It involved peers providing feedback using a standardized tool with verbal and written comments.

Summary of Work: Forty-seven peer observation sessions were completed in five cycles of EBM curriculum within two years. The questionnaires provided by peers and EBM teachers were reviewed and analyzed to provide a deeper understanding of the feedback. The peers and EBM teachers conduct a brief meeting after each cycle of curriculum to go through the feedback and discuss ways of improvement.

Summary of Results: Ninety-four peer observers provided constructive feedback to forty-seven EBM teachers. Among all teachers, thirty-six of them have achieved the score of 90 and above in a summative scale of 100 in total, while the remaining fell between 80 and 90. The observers provided formative feedback about merits and defects, three each, to the teachers on how to improve their teaching. Most teachers reflected the feedbacks as helpful in specific areas for improvement. Some of the teachers expressed being stressed during the observation but still found it useful for the enhancement of their teaching. One-third of the observers expressed that they have learned from the senior teachers during the observation session.

Discussion and Conclusions: Most feedback described the merits as well preparation and positive teaching attitude of the teachers in the curriculum. The defects, however, suggested that the teachers may interact more with the audiences, and provide more examples of EBM clinical application. All teachers positively supported this peer observation for it offers improvement in teaching and enhances professional as well as personal growth.

Take-home Messages: Peer observation benefits both the teachers and observers with the opportunity to mutually enhance the quality of their teaching practice in the EBM curriculum.

Recharge activities preventing burnout in medical teachers

AUTHOR(S):

- Prawit Wannaro, Hatyai Hospital, Thailand (Presenter)
- Pairoj Boonluksiri, Hatyai Hospital, Thailand

ABSTRACT

Background: Burnout is common in medical teachers. It is a psychosocial phenomenon of chronic stress in work environment such as excessive pressure, conflicts. Finding risk factors and prevention should be considered to maintain a happy life.

Summary of Work: A cross-sectional survey was conducted in clinical teachers at HMEC by convenient sampling during September-October 2018. Data collections by online questionnaire were performed for personal characteristics, workload hours, and recharge activities which mean special activities whose output are susceptible to measurement based upon a specific workload such as medical service and education. Primary outcome was burnout assessed by Maslach Burnout Inventory (MBI) comprising of 7-item exhaustion, 7-item depersonalization and 8-item personal achievement. Burnout was defined as binary outcomes (low and moderate-high level) from each component. Data analysis was performed by multiple regression analysis.

Summary of Results: Response rate was 63% (82 of 130 teachers). All medical specialties were recruited. Mean age was 40 years old with 44% male. Recharge activities were 58.5% such as traveling abroad & all over the country, meditation retreats, running race, etc. Mean risk scores of burnout were 8.9/42 of exhaustion, 5.1/42 of depersonalization, and 29.6/48 of personal achievement. Prevalence of burnout was 13.4%. Most specialties were surgery (2.4%) and ob-gyn (2.4%). Preventing factors were adequate leisure & sleep, happy family background and recharge activities ($p=0.030$, 0.005 , 0.003 , and <0.001 respectively). On the contrary, risk factor was workload over 40 hours/week ($p=0.018$). By multiple analysis, workload hours (OR=4.69) and duration of clinical experience (OR=1.32) were potential risks. Meanwhile, recharge activity was an influential preventing factor (OR=0.04) which traveling abroad was most common.

Discussion and Conclusions: Prevalence of burnout in teachers varies from 9-23.8% depending on assessment tools. Burnout in this study is accordant with previous reports. Only 1 case is a high risk. Workload is an influential risk of burnout. Prevention was found that adequate sleep and recharge activity can reduce the level of depressive emotion.

Take-home Messages: Balancing heavy workloads and relaxation is essential to prevent burnout and promote a happy life. Recharge activity varying on his/her own favorite is one of helpful tools to release exhaustion.

The factors related to the burnout of the medical staff in tertiary care medical center

AUTHOR(S):

- Siriwut Kittiphonant, Vachira Phuket Hospital, Thailand (Presenter)
- Sujaree Sungngoen, Vachira Phuket Hospital, Thailand

ABSTRACT

Background: The staff are main factors in the training of qualified physicians. Each medical school and tertiary care center which is a provincial hospital has different conditions, various factors related to the teaching staff. This study is looking for the factors that affected to the teaching quantities. The study was conducted on 20 medical staff by compare to the teaching in the first year of work with previous year. Related factor, workload, students and courses, family and social support and environment to find the prevention of this burnout.

Summary of Work: A cross-sectional descriptive study was conducted in Vachira Phuket Medical Education Center staff who was teaching more than 2 years in 2018. Self-report questionnaires consisted of demographic data, partial Maslach Burnout Inventory (MBI) questionnaires and working related factor. This study were analyzed by descriptive statistics as frequency, percentage and mean.

Summary of Results: The medical staff were aged 35-45 years old. Duration of teaching are in the average 7.7 years (SD 4.49). This study revealed that the level of satisfaction score of workload are in average ($x=3.38$ SD 0.36), medical students and medical courses are in the average ($x=3.60$ SD 0.24), family and social are in the average too ($x=3.59$ SD 0.10). In working environment and private time is low ($x=2.8$ SD 0.23) and in professionalism is high ($x=4.36$ SD 0.09). In detail, low level satisfaction score in the medical record, facilities in the hospital, intern as colleague and private time, $x=2.33, 2.83, 3.00, 3.27$, respectively.

Discussion and Conclusions: Working as a medical professor for a long time associated with reducing the teaching time, especially lecture, teaching round and assignment feedbacks. Factors of burnout that are derived from enthusiasm for patient care, evaluation results, fatigue from medical records and disappointment in intern. Precipitating point were hospital facilities and lack of private time.

Take-home Messages: The instructor should arrange a new teaching style to promote more interesting and would be allowed them to be more enthusiastic in the learning. Executives should clearly divide workloads, and improve the hospital environment for the medical staff to reduce their stress.

Near-peers with benefits: a foundation doctor led revision course for medical students preparing for finals examinations

AUTHOR(S):

- William Dace, North Bristol NHS Trust, UK (Presenter)
- Ellen Haire, North Bristol NHS Trust, UK

ABSTRACT

Background: Near-peer led teaching is a growing aspect of medical education, beneficial to both teacher and student. Undertaking teaching is a requirement for UK foundation doctors. Many students see the foundation trainee as their most important clinical trainer. However, opportunities for formal foundation doctor teaching is variable, and UK foundation doctors do not routinely receive training on how to teach.

Summary of Work: The authors designed and implemented an exam-focused teaching course for medical students.

Aims: - To evaluate the impact of near-peer teaching on both students and teachers - To show the importance of feedback in improving medical education

Methods: - Motivated foundation doctors were selected as teachers. - Course 1 consisted of 10 sessions of didactic teaching and multiple choice questions (MCQs). Students provided feedback after each session. - A second course was implemented the following year. An end of Course 2 survey was completed by students and teachers.

Summary of Results: - In course 1, every student passed their finals. Feedback was positive; with teacher enthusiasm and the relaxed environment highlighted. Student feedback prompted addition of 2 extra sessions and inclusion of 15 MCQs with answer sheets, in Course 2.

- All students found Course 2 enjoyable, relevant, and MCQs useful for revision. 100% found teachers knowledgeable and enthusiastic.

- Teachers reported myriad reasons for teaching. 66% of teachers had no previous training in how to teach; the same 66% cited prior concerns about teaching.

Discussion and Conclusions: - All students found the course enjoyable and beneficial for their finals preparation.

- Foundation doctors are capable of delivering high-quality teaching, and recognise the benefits of teaching for personal development.

- The majority of participating teachers had prior concerns about teaching due to lack of formal training in how to teach.

Take-home Messages: - Near-peer led teaching is beneficial to students as it is more exam relevant and teachers are perceived as more approachable.

- For teachers it allows exposure to teaching at an early stage in their career, which is beneficial for personal development.

- More formal training in how to teach is required for UK junior doctors.

- Near-peer teaching should be widely introduced in medical education.

A Junior doctor-led revision programme for finals: what are the benefits?

AUTHOR(S):

- Katherine Francis, Great Western Hospital, Swindon, UK (Presenter)
- Helena Davies, Great Western Hospital, UK

ABSTRACT

Background: Junior doctors frequently teach informally on the wards. Medical students value this teaching and find the tutors approachable due to their recent graduation from medical school. Students can become overwhelmed revising for finals due to the large volume of material to revise. To focus their revision, a 10-week revision course was created with 30 hours of teaching. The course concentrated on the main specialties of finals, based on the curriculum.

Summary of Work: A 10-week evening teaching programme was created for the final year Bristol and Oxford medical students. Previous literature helped us design the course to enable productive and focused sessions. A 15-question pre-course questionnaire was devised to ascertain baseline data. The questionnaire was repeated after the course to quantify the improvement in attainment. Anonymous feedback was collected after each session using a QR code. Feedback was sent to the tutors for their own personal reflection of their teaching. The students and tutors were sent anonymous surveys after the programme to determine the benefits, downfalls and potential improvements of the teaching programme. This helped to generate a revision programme for future generations of students.

Summary of Results: Students improved in 13 out of 15 questions in the post-finals revision questionnaire. The average mark was 61% on the post-finals revision programme questionnaire compared to 38% on the pre-finals revision programme. Students would recommend the course to peers and tutors found teaching a valuable experience.

Discussion and Conclusions: Junior-doctor led teaching enables doctors to develop and establish their teaching early in their career. Feedback provided by students enabled tutors to reflect on their teaching method and process. Students find having junior doctors who have recently graduated comparable to consultant led teaching, however find the tutors more approachable as they are near-peers.

Take-home Messages: 1. Junior doctor-led teaching programmes can be mutually beneficial both for the tutors and the students. 2. Doctors value having the opportunity to teach and receive feedback in their early career, allowing them to develop the doctor as a teacher. 3. Students find junior doctors pitch the teaching at an appropriate level that allows them to learn in their zone of proximal development.

Teaching of Undergraduate Medical Students by Paediatric Trainees

AUTHOR(S):

- Emily Botcher, University Hospitals Coventry and Warwickshire, NHS Trust, UK (Presenter)
- Thomas Moore, University Hospitals Coventry and Warwick, UK
- Prakash Satodia, University Hospitals Coventry and Warwick, UK

ABSTRACT

Background: The new Paediatric curriculum (“Progress”) highlights a need for trainees to be involved in planning and delivering learning events. However there is little emphasis on delivering undergraduate teaching. Recent feedback from University of Warwick medical students completing their Child Health block at University Hospital, Coventry (UHCW) highlighted problems in the number, quality and timeliness of teaching sessions. Reasons ranged from lack of exposure to bedside teaching to the workload of consultants. They found benefit from sessions with junior doctors. We aimed to explore the experiences in undergraduate medical education of paediatric trainees currently working at UHCW and to discover the barriers that experienced when teaching medical students, with a view to improving the learning experience.

Summary of Work: A SurveyMonkey was distributed to paediatric trainees at UHCW via the departmental WhatsApp groups. Data pertaining to training grade, prior experience of Undergraduate Medical Education, and what perceived barriers to teaching was collected. Participants were also asked what would facilitate teaching.

Summary of Results: 13 trainees responded, varying from ST1 to ST6, with three clinical fellows in addition. All had taken part in bedside teaching with fewer than half contributing to lectures, tutorials, assessments, and case-based learning. The majority of respondents felt workload and lack of time were the main barriers to teaching, with a lack of understanding of the curriculum and a lack of opportunities being significant. Trainees felt protected time for teaching along with a better understanding of the student curriculum would help facilitate their teaching.

Discussion and Conclusions: In conclusion, trainees are keen to teach and for protected time as teachers to be included in their job plans as part of a teaching rota. Information regarding student curriculum and learning outcomes could be shared at induction. Health Education England/General Medical Council may therefore consider the implementation of mandatory weekly teaching sessions into trainees’ rotas.

Take-home Messages: Trainees are keen to teach; Heavy workload and a lack of opportunities are the main barriers.

Can't Teach, Won't Teach: improving doctors' teaching performance and development

AUTHOR(S):

- Dhanya Pillai, University Hospitals Coventry and Warwickshire, UK (Presenter)
- Arwa Meki, NHS, UK

ABSTRACT

Background: Good Medical Practice states doctors “should be prepared to contribute to teaching and training doctors and students”. Furthermore, substantial teaching experience is needed for specialty training applications. However, Medical Schools differ widely in provision of medical teacher training which influences junior doctors' teaching performance and development.

Summary of Work: The aim of this study was to determine the importance that doctors attach to the role of teaching, the relationship between confidence and involvement in different teaching roles, and how useful medical school was in developing that role. A cross-sectional study was conducted. A paper questionnaire was distributed to all 34 Foundation Year 1 trainees at University Hospital Coventry and Warwickshire. The questionnaire incorporated 5-point Likert scales, free text responses, and closed questions. Descriptive statistical analysis and linear regression were used.

Summary of Results: The response rate was 88%. Findings showed junior doctors are aware of the importance of their teaching role. There was a positive relationship between confidence in the various teaching roles and involvement in these. Doctors who felt medical school training was particularly useful in developing their teaching role felt more confident and were more involved in these various roles than doctors who found their medical school training not useful. Challenges in the development of a teaching role were: opportunities to teach, time, and knowledge. Structured opportunities to practice teaching and ways to increase knowledge on teaching skills were highlighted as ways to improve teaching performance.

Discussion and Conclusions: Developing high quality teaching medical professionals is vital in the clinical setting. This is reinforced by an emphasis on continuing professional development and inter-professional learning and working. Junior doctors are aware of the importance of their teaching role; however they encounter challenges affecting their confidence and involvement in the various teaching roles. Medical schools should incorporate medical teacher training into curricula and foundation training must ensure structured teaching opportunities to address this deficit and empower tomorrow's doctors.

Take-home Messages: To improve performance and development of doctors in their roles as teachers, medical school curricula and training programmes need to address and overcome the challenges reported in this study.

The Near Peer Mentor: Perspectives of Mentors and Mentees in Postgraduate Medical Education

AUTHOR(S):

- Matthew Aldridge, North Bristol NHS Trust, UK (Presenter)
- Thomas Cairns, North Bristol NHS Trust, UK
- Katherine Finucane, North Bristol NHS Trust, UK

ABSTRACT

Background: Mentoring for doctors is associated with improved physical and psychological health, better support and enhanced professional relationships.[1] The benefits of mentoring have been demonstrated for schemes with both dyad and peer-based structures,[2] with formalised arrangements and training for mentors associated with greater satisfaction.[2] This focus on welfare is particularly important given increased recognition of stress, anxiety and depression amongst doctors in training.[3]

Summary of Work: At North Bristol NHS Trust (NBNT) the Department of Postgraduate Medical Education have established a near-peer mentoring scheme for postgraduate year (PGY) 1-2 doctors. This scheme offers mentoring by volunteer PGY5+ doctors in training to any PGY1-2 doctors who request this for the duration of their placement at North Bristol NHS Trust. Training for volunteer mentors is provided on a regular basis by a senior consultant psychologist with extensive mentoring experience.

Summary of Results: Out of all PGY1-2 doctors at NBNT (n=107), 42 (39%) requested and have been allocated a PGY5+ mentor. Feedback from our scheme to date has been positive, with 71% of PGY1-2 mentees (response n=7) and 63% of PGY5+ mentors (response n=16) reporting overall benefits from participation. Mentees described improvements in work confidence (71%), career planning (86%) and support (86%). Mentors described increased knowledge about mentoring (88%), enhanced job satisfaction (75%) and greater insight into the training experiences of others (81%).

Discussion and Conclusions: We are encouraged by our early results and will continue to refine this scheme going forward. Our results demonstrate demand for mentoring amongst PGY1-2 doctors as well as demonstrating good satisfaction with our near-peer approach.

Take-home Messages: A near-peer mentoring scheme for PGY1-2 doctors is a well-received intervention with benefits to mentors as well as mentees. This approach could easily be adopted by other organisations.

Effectiveness of Resident-as-Teacher programmes in family medicine: A systematic review

AUTHOR(S):

- **Hervé Maisonneuve, Consultant, France (Presenter)**
- Raquel Correia, Faculté de Médecine Université de Reims Champagne ardennes, France
- Mathias Brugel, Faculté de Médecine Université de Reims Champagne ardennes, France
- Mikäel Lorient, Faculté de Médecine Université de Reims Champagne ardennes, France

ABSTRACT

Background: Research on Resident-as-Teacher programmes effectiveness should help to determine the optimal type of intervention, content, delivery, and duration. While RaT programmes appear to lead to changes in attitudes towards and perceptions of teaching, evidence of their effectiveness is insufficient due to the lack of rigorous study design. Assessing resident needs during each level of residency is essential to develop competency driven RaT programmes with the right content and proper assessment. In France, the resident has a new pedagogical role: to help and assist pregraduate medical students. Before implementing this objective, however, guided and clear instructions should be defined

Summary of Work: We performed a systematic review of Resident-as-Teacher (RaT) programmes in family practice and appraised their effectiveness. Our secondary objective was to suggest strategies according to the new teacher role of medical residents in France. We updated a 2008 systematic review of RaT programmes by searching five databases up to March 2018. We questioned French experts regarding the future implementation of the new resident role: to help and assist pre-graduate medical students that are part of the team where the resident is completing their internship training.

Summary of Results: We included one study and indicated that there is a lack of research on the effectiveness of RaT programmes. This well-designed study showed that feedback on resident teaching did not influence it. The eight conclusions of the previous systematic review remain unchanged, and the effectiveness of the RaT programmes still needs to be proven.

Discussion and Conclusions: The eight conclusions of the previous review remain unchanged, and the effectiveness of the RaT programmes still needs to be proven. This is mainly due to the lack of a proper outcome assessment, as well as of a rigorous study design. The nine French experts we questioned observed that the implementation of medical education needs to be improved in France. They confirmed that no plan currently exists to effectively prepare the new resident for their teaching roles.

Take-home Messages: RaT programmes should be better defined, and the lack of research showing their effectiveness needs to be addressed.

The effectiveness of “educational teams” for developing the teaching skills of senior residents

AUTHOR(S):

- Shunsuke Kosugi, Aso Iizuka Hospital, Japan (Presenter)
- Tadayuki Hashimoto, Hashimoto Municipal Hospital, Japan

ABSTRACT

Background: In our department, since 2017 we have been developing teams consisting of an attending physician, a senior resident, and two junior residents called “educational teams” which are focused on developing the teaching skills of senior residents as residents-as-teachers (RaTs). Two years have passed since the teams started, so we conducted a survey to identify the effectiveness of the teams for developing the teaching skills of senior residents. We developed teaching entrustable professional activities (EPAs) for residents and reported about it at AMEE 2018, and we have used it for this research.

Summary of Work: To clarify effectiveness, we created a questionnaire consisting of 14 questions about the effectiveness of the team in developing teaching skills from the perspective of the EPAs, and sent it to 8 survey respondents who had been part of an “educational team” within the past two years. The response rate was 87.5%.

Summary of Results: The overall perception that belonging to the team contributed to their own growth of teaching skills had a mean score of 3.57 (Likert scale 1-4). The responders felt the structure of the team had contributed the most to their growth because the team had a young attending physician who taught how to teach and also had a rule limiting the number of patients in their charge. They felt development in their teaching skills for 7 of 10 activities in the EPAs. The most popular activity they felt developed through the team was “Instruct residents in ward rounds”. The other 3 activities were not felt effective.

Discussion and Conclusions: The survey revealed that a team focused on developing teaching skills was effective for the growth of the teaching skills of senior residents. However, the team was not effective for learning 3 of the activities in the EPAs. The reason why they were not effective was that there was no chance to learn this content through the team, so another system is needed for teaching them.

Take-home Messages: Residents can develop their teaching skills through an “educational team”.

Enhancing the professional development of junior doctors during clinical teaching fellowships

AUTHOR(S):

- Jonathan Fox, Imperial College London, UK (Presenter)
- Laura Wynn-Lawrence, Imperial College London, UK
- Kathleen Leedham-Green, Imperial College London, UK
- Ann Chu, Imperial College London, UK

ABSTRACT

Background: Clinical Teaching Fellows(CTFs) have become an integral component of UK medical education faculty. These roles allow junior doctors to focus on developing as a teacher and participating in educational research. The potential opportunities for professional development are significant but there is great disparity between individual jobs. Clinical commitments, educational focus, research opportunities and specialty association all vary depending on the specific needs of individual faculties. In this study we aim to evaluate the educational opportunities that these CTF jobs provide to junior doctors. Anecdotal evidence suggests that these potential benefits include: completion of formal education qualifications; development of special interests; academic and research participation; experiential learning from teaching requirements; conference attendance and presentation of work; and creation of innovative teaching strategies.

Summary of Work: This evaluative study will comprise of an online questionnaire distributed to CTFs associated with Imperial College London. The survey will be sent via email to current CTFs and previous CTFs dating back to 2014(n=190). The initial survey has been piloted with current CTFs and will be distributed to the cohort in February 2019. The questionnaire will provide both quantitative and qualitative data which will allow statistical analysis and generate themes for discussion.

Summary of Results: The questionnaire has been designed to provide demographic data and to evaluate opportunities for professional development that CTFs have experienced. We will also explore how these opportunities have influenced further clinical, educational and academic career progression amongst previous CTFs. The evaluation data will also give feedback on areas of potential improvement.

Discussion and Conclusions: CTFs are an integral part of many UK education faculties but they also offer junior doctors' opportunities for professional development. We aim to use the experiences of CTFs to provide insight and initiate narratives for further discussion. Through this we can ensure junior doctors maximise the potential benefits they offer whilst providing an invaluable resource for faculties.

Take-home Messages: CTF jobs are now well established within UK education faculties but individual jobs vary. Teaching fellowships offer opportunities for both educational and clinical professional development. Understanding the opportunities CTFs experience will help maximise outcomes for junior doctors.

A structured and integrated paediatric near-peer learning programme (PaedsPALs) led by foundation year doctors for undergraduate students

AUTHOR(S):

- **Natasha G, Addenbrooke's Hospital, Cambridge, UK (Presenter)**
- Cristina Matei, Lister Hospital, UK
- Michelle Arora, Addenbrookes Hospital, UK
- Diana Wood, University of Cambridge, UK

ABSTRACT

Background: Many foundation year (FY) doctors are keen to develop a medical education interest, but are an underused resource due to time constraints, short rotations, lack of previous experience and lack of confidence in knowledge of the educational material. However, students value teaching from FY doctors and find it useful to complement consultant-led teaching. Near-peer teaching is a validated teaching model that is integrated into the curricula of many medical schools. We successfully developed a structured paediatric near-peer assisted learning (PaedsPALs) programme run by FY doctors for undergraduate students on paediatric rotations.

Summary of Work: We piloted PaedsPALs at a district general hospital, with students from two medical schools with similar course structures (Cambridge and UCL medical schools). We designed clear intended learning outcomes, which aligned to content and assessment. Case-based sessions were delivered by FY doctors to consolidate learning experiences during the attachment. We then designed and ran a formative mock-OSCE at the end of the placement. Quantitative and qualitative feedback was obtained from students and FY doctors using questionnaires.

Summary of Results: Through participating in PaedsPALs, FY doctors' confidence in delivering paediatric teaching increased by 40%. All FY doctors valued the exposure to medical education PaedsPALs provided, which increased their desire to get involved with further teaching. The programme also provided a supervised, enjoyable environment to gain their first teaching experiences and increase confidence in delivering further sessions, by helping them "pitch teaching to students of differing levels". Students enjoyed the programme, describing case-based sessions as "very interactive" and having a "great structure". They found the mock-OSCE "useful and enjoyable" and "a great way to round off a great placement".

Discussion and Conclusions: FY doctors find it challenging to get involved in teaching due to lack of time, knowledge of the specialty, and confidence in delivering teaching. This was overcome by providing FY doctors with structured teaching materials with clear learning outcomes, enabling the delivery of high quality teaching in a time efficient manner.

Take-home Messages: PaedsPALs facilitated FY doctors can gain exposure to teaching in a supportive environment and further piqued their interest in medical education.

Health Literacy - achieving better practices for patient-centered communication

AUTHOR(S):

- Tzu-I Tsai, National Yang-Ming University, Taiwan (Presenter)
- I-Ju Chen, National Yang-Ming University, Taiwan
- Wen-Ry Yu, Division of Family Medicine, Taipei City Hospital, Yangming Branch, Taiwan
- Shouu-Yih D. Lee, Department of Health Management and Policy, School of Public Health, University of Michigan, USA

ABSTRACT

Background: Patient-center communication represents the most important enabler of patient-centered care and has been identified as one of essential competencies for health care professionals. Despite communication skills has become an explicit component of medical education curricula, patients consistently report that their informational needs remain unmet. To better understand what essential communication skills should be taught for future healthcare professional to delivering patient-centered communication, the purpose of this study was to explore medical educators' reflections on teaching and identify the elements of effective curriculum design for teaching patient-centered communication.

Summary of Work: This qualitative study conducted 25 individual in-depth interviews with a wide range of educators and clinicians in various professional backgrounds, including medicine, nursing, dentistry, pharmacy, nutrition, communication, and health management in Taiwan.

Summary of Results: Directed content analysis was applied and emerged four major domains constituting best practice for patient-centered communication: students' characteristics, curriculum design, role modeling in medical education, and structural support.

Discussion and Conclusions: Our study reveals that teaching and assessing patient-centered communication remains a complex and underrepresented component of healthcare professions education in Taiwan. Health literacy as a core element of patient-centered communication training has emerged from different healthcare professional groups. Health literacy competence consists of a set of knowledge, attitude and skills the healthcare professionals required when encountering patients with low health literacy. Most healthcare profession programs did not cover health literacy in health communication curricula and the vital need for improved curriculum design. An added critical dimension is faculty understanding of the importance of health literacy for communication in medical encounter, and their commitment to helping students develop these skills.

Take-home Messages: Basic communication skills are insufficient to prepare healthcare professionals' patient-centered communication competence. Efforts to enhance teaching of patient-centered communication skills to health professionals likely will require the element of health literacy across the continuum of undergraduate, postgraduate and continuing education.

Physical activity knowledge, attitudes and behaviours of pre-clinical medical students in Australia

AUTHOR(S):

- Rhys Kelly, Deakin University - School of Medicine, Australia (Presenter)
- Sam Hoffmann, Deakin University - School of Exercise and Nutrition Sciences, Australia
- Shannon Sahlqvist, Deakin University - School of Exercise and Nutrition Sciences, Australia
- Peter Kremer, Deakin University - School of Exercise and Nutrition Sciences, Australia
- David Lipman, Deakin University - School of Medicine, Australia
- Scott McCoombe, Deakin University - School of Medicine, Australia

ABSTRACT

Background: Physical activity (PA) is important for chronic disease management, yet population PA levels in Australia, and globally, are low. Medical practitioners play an important role in promoting and prescribing PA as a preventative measure and treatment for chronic disease. Current and future doctors can provide patients with PA advice and counselling whilst role modelling appropriate behaviours. However, it is unclear if medical students currently receive adequate PA training in their medical training. Few studies have examined PA within Australian Medical Schools so our study aimed to investigate PA knowledge, attitudes and behaviours among current Australian medical students.

Summary of Work: A sample of 111 medical students from one Australian University completed an online questionnaire that captured data on demographics, PA knowledge and training, general attitudes towards PA, and personal PA habits. Data were summarised using descriptive statistics and differences assessed using ANOVA and chi-square tests.

Summary of Results: Most students had positive attitudes towards PA participation and curriculum inclusion, with the majority believing PA was important for their future careers. However, many were unsatisfied with their current education on the role of PA in the prevention and treatment of chronic disease, indicating gaps within current medical curricula. Students with high self-reported PA levels had a superior understanding of the current PA guidelines.

Discussion and Conclusions: The findings from this study established a baseline measure of medical students' PA knowledge, attitudes and behaviours, highlighting the need for integration of more PA education within the medical curriculum. In addition, continued support and encouragement for student engagement in PA is required in the crowded curriculum. This study provides a foundation to influence changes to existing Australian medical school curricula whilst showing evidence for future prospective studies to be undertaken. Additionally, it should provide evidence for medical students to incorporate PA into their future lives and clinical practice.

Take-home Messages: There is a clear role for the prescription of PA in treatment of chronic conditions as well as a desire by most medical students to participate and prescribe. This study shows a clear gap between this aspiration and what is currently included in Australian medical school curricula.

Public Health Exchanges for Students

AUTHOR(S):

- **Anna Herzeg, International Federation of Medical Students Associations (Presenter)**
- Katja Čič, International Federation of Medical Students Associations
- Omnia El Omrani, International Federation of Medical Students Associations
- Tatiana Zebrova, International Federation of Medical Students Associations
- Elina Osi, International Federation of Medical Students Associations

ABSTRACT

Background: In spite of how Public Health is a significant part of our health systems and health itself, it is broadly neglected in medical curricula worldwide. Hence, the International Federation of Medical Students' Associations (IFMSA) decided to launch Public Health Exchanges. They aim to offer student-driven and student-oriented learning opportunities in the field of Public Health in collaboration with stakeholders in the global/public health arena. Such programs will thoroughly empower healthcare students to take on future leadership roles in public health projects and advocacy management, in a culturally sensitive and community-oriented way.

Summary of Work: IFMSA started to actively work on Public Health Exchanges in 2017 and signed the first round of contracts in March 2018. We sought to achieve interprofessional collaboration and a sustainable platform for health science students interested in Public Health to go on an international exchange, with Regulations and Guidelines to ensure academic quality and longevity of such exchanges. We developed a standardized reporting system to make the perfect tuning to our program and increase credibility through honest statements from students who participated in the exchange program. Once reports are submitted, participants receive their certificate to ensure the implementation of the system.

Summary of Results: The first round of contracts led to the successful creation of 16 exchange opportunities that are being carried out in the year 2018/19. The exchanges allow for a wide range of settings relevant to One Health and different health-oriented institutions and have periodically been evaluated using our reporting system in terms of work done, theoretical education, exposure to public health issues and logbook efficacy.

Discussion and Conclusions: The outcomes of the evaluation process will be used to further enhance the concept of empowering students in the field by gaining expertise in practical Public Health work. We also aim to ensure facilitation of south-north collaboration and give students the opportunity to comprehensively understand epidemiological and health system differences.

Take-home Messages: Public Health remains lacking prioritization in our studies. Thus, IFMSA confirms the urgent need to equip our students with knowledge and skills to advocate for public health issues in their communities.

Interactive methods to teach and learn about violence against women

AUTHOR(S):

- **Vander Guimarães Silva, Faculdade de Medicina de Petrópolis, Brasil (Presenter)**
- Jessica Mussel Santos, Faculdade de Medicina de Petrópolis, Brasil
- Lais Desirré, Faculdade de Medicina de Petrópolis, Brasil
- Lukas Madeira, Faculdade de Medicina de Petrópolis, Brasil
- Julia Salgado, Faculdade de Medicina de Petrópolis, Brasil
- Karoline Altoé, Faculdade de Medicina de Petrópolis, Brasil

ABSTRACT

Background: Violence against women (VAW) is a serious and endemic problem in the world. Despite the legislation in force every two hours a woman is murdered in Brazil.

Summary of Work: In view of the need to adapt the curriculum of Medicine, working the content in a creative and interactive way, we chose to adopt an active learning methodology to approach the subject with students of the third year of Medicine course in the Gynecological and Obstetric Semiology discipline. We divided the students into groups, and asked them to produce videos of up to four minutes on the subject of violence against women. The students presented their videos and discussed the creative experience.

Summary of Results: 40 videos were produced on the different categories of VAW: physical, moral, sexual, patrimonial and psychological violence. These videos were presented during a session dedicated to the subject and were added to other forms of presentation: lectures with the use of PowerPoint, interviews with experts, drawings, dramatizations, etc.

Discussion and Conclusions: The use of an innovative methodology to teach learning a social and public health problem has moved closer to the language and the dynamic form of communication of the public in question. The students made observations about the methods used, their experiences in organizing the work, the sensations experienced and the knowledge learned from the researches carried out. During the presentations the other students made interventions and opined about what they saw and heard. The VAW was better understood and lived from the knowledge generated by the students themselves, which brought in a more dynamic and contemporary reading of the theme. We realized that the technique was well accepted and could be applied to other areas of medical education that demand greater sensitivity in the transmission of knowledge.

Take-home Messages: • VAW is a global problem • It is important to discuss VAW in medical schools • It is necessary to use a dynamic and current language to talk about the subject • The active methodological approach was able to sensitize students to such a sensitive topic • This methodology can be applied in other areas of knowledge in medical education.

Small group learning to aid broaching of lifestyle choices and advise with patients in the Physician Associate Programme

AUTHOR(S):

- Sajeel Din, Medical Education iBSc, Barts and the London, Queen Mary, University of London, UK (Presenter)

ABSTRACT

Background: In 2016/17 there were 617 thousand admissions in NHS hospitals where obesity was recorded as the primary or a secondary diagnosis. Research currently shows GPs, Nurses and Medical students feel unequipped in delivering lifestyle advice to make changes to obese patients. This is likely to also be a problem with Physician Associates (PA), who have only recently been added to a voluntary register curriculum that currently does not require PAs to recognise and manage patients with obesity. It is possible that the lack of awareness that PAs have in this field is because of the duration of their course, which is only two years. This theory has not been previously studied within the healthcare profession (HP) in the UK, and thus, merits further exploration.

Summary of Work: This study aims to highlight and explore current attitudes and knowledge in PA students in managing this group of patients. To aid this, a small group Peer Assisted Learning (PAL) session shall be used to further develop their knowledge and reveal gaps in this area of preventative medicine. Furthermore, highlight a different approach that can target these HPs with their increased flexibility in practice could be an immediate solution to a building problem.

Summary of Results: The analysis and result should reveal any gaps in the current taught curriculum regarding lifestyle advice. It explores current experience feelings and knowledge which may vary based on experience the PAs have previously had during their previous year of study.

Discussion and Conclusions: Following on from the lack of standard practice in delivering lifestyle advice to patients from other healthcare professions. PAs too experience difficulty in delivering this. The PAL session in an early addition to the current taught curriculum to aid PAs in managing this group of patients. Their current ability to not be able prescribe medication for any group of patients will allow them to further explore this area and encourage them to devise better methods and tailored advice to make changes to their lifestyle before this becomes a co-morbidity to them.

Take-home Messages: Development in curriculum for this to be delivered. Addressing current attitudes towards which HPs responsibility is this. Using PAL as an alternative.

Structure and agency: education for behavior change

AUTHOR(S):

- Richard Ayres, Plymouth Peninsula Schools of Medicine and Dentistry, UK (Presenter)
- Sam Regan de Bere, Plymouth Peninsula Schools of Medicine and Dentistry, UK

ABSTRACT

Background: There are new words entering the Medical Education Lexicon. “Health promotion” we know, but “wellness” is less familiar, “advocacy” definitely different and what about “empowerment”? In the UK the latest (2018) version of the General Medical Council “outcomes for graduates” these few words are transformative. The notion that the role of doctors includes promoting “wellness” just as much as dealing with illness, and that this requires “empowerment” and “advocacy” implies a sea change in what medical schools must teach. It greatly extends the “bio-psycho-social model that itself met a lot of resistance, but has for some time informed most modern medical school teaching.

Summary of Work: In the Peninsula Medical School in the SW of the UK, Population Health is a theme running through the curriculum. We have replaced a lecture on health promotion with an interactive session held in a rehabilitation project for people affected by substance misuse. The entire first year group now travels out from the safe confines of the university campus to Hamoaze House, a wonderful project sited in the neighbourhood of highest deprivation in Plymouth. The lecturer is replaced with service users of the project, who work with students in small groups. They are the true experts

Summary of Results: “this truly affirmed that a career in medicine is right for me.” “Within only minutes of being at Hamoaze House was I able to admire how well the staff worked not only with the service users but each other. It was inspirational” “I learned so much from..... some of the things that he had faced were just unimaginable to me, his story was just amazing”.

Discussion and Conclusions: Changing from knowing about “social determinants of health” to challenging inequality, from informing patients about ways to promote health to empowering them, and from empathy to advocacy arguably represents a paradigm shift in medicine. We report here on a curricula development that encompasses those principles and has empowered both students and patients.

Take-home Messages: We face a paradigm shift in how doctors react to social determinants of health; Medical education must respond to that challenge; People with complex needs who have achieved change are the experts.

Digital Health - a gap in medical education

AUTHOR(S):

- **Lina Mosch, European Medical Students' Association (Presenter)**
- Justinas Balčiūnas, European Medical Students Association, Germany
- Felix Machleid, Technical University of Munich, Germany
- Robert Kaczmarczyk, Technical University of Munich, Germany
- Doreen Johann, Humboldt University of Berlin, Germany
- Finn von Maltzahn, RWTH Aachen University, Germany

ABSTRACT

Background: The digitalization of healthcare is accompanied by high hopes and expectations aimed at improving the way health services are delivered. Central to this dynamic are questions about the role healthcare professionals are going to play and what competencies and skills will be required. To get a better understanding of these trends we assessed medical students' perceived knowledge and opinions towards eHealth, the status quo of implementing eHealth in medical education and their most pressing needs.

Summary of Work: We launched an online, anonymous, self-administered survey targeted towards medical students throughout Europe and received a total of 451 responses. The survey included both, quantitative and qualitative questions covering two major aspects: (i) students' opinions on eHealth in general and (ii) students' experiences with eHealth in medical education. Analysis of quantitative data was performed using statistical software R. Qualitative data was analyzed applying a grounded theory approach with inductive category formation using MAXQDA software.

Summary of Results: The majority of respondents see more or mainly advantages in the use of digital health. 53% of respondents evaluate their eHealth skills as poor or very poor. 40% feel prepared to work in the digitized healthcare system. Medical students see the reason for not feeling prepared is a lack of education, while 85 % agree or strongly agree to eHealth being more implemented in the medical curriculum.

Discussion and Conclusions: These results indicate a gap between an overall willingness of medical students to become key players in the digitalization of healthcare and a lack of education they receive by their faculties. Thus far, medical education in digital health does not address medical students' needs. To support healthcare professionals in becoming key players in the digital transformation of healthcare, the field of medical education needs to: (i) implement educational formats on eHealth into the curriculum and (ii) create platforms for medical faculties to exchange best practices on digital health education.

Take-home Messages: Today, medical education does not address students' needs regarding digital health. To prepare them for a digitalised healthcare system medical education has to implement educational formats on digital health into the curriculum.

Human Factors Training for Undergraduate Medical Students

AUTHOR(S):

- Aliyah Choudhary, NHS, UK (Presenter)
- Amit Chauhan, Good Hope Hospital, UK
- Hemant Ojha, Good Hope Hospital, UK

ABSTRACT

Background: Human factors refer to the relationships between human beings and the environment and systems with which they interact. Human factors training is well established in the fields of industry and aviation with rising prevalence in healthcare. Knowledge of human factors is imperative to reduce adverse events but training in Medicine is currently aimed at postgraduates with little or no integration in undergraduate curriculums.

Summary of Work: The aim was to assess awareness of human factors in final year medical students, deliver an introduction to human factors and evaluate the role of human factors training in the undergraduate curriculum. Thirty final year medical students were asked to attend one of two compulsory half-day workshops. The workshop incorporated several small-group activities including an interactive session on theory, comparison of healthcare and aviation videos and case-based discussions. Learners were asked to complete a pre-course questionnaire to ascertain their understanding of, interest in and ability to apply human factors. Responses to a post-course questionnaire were analysed for comparison.

Summary of Results: Prior to the session only 7% of students understood what human factors entail and the importance of human factors in healthcare. 0% of students had previous human factors training and 0% felt confident in their ability to implement human factors. 93% were not aware of barriers to human factors but 73% were interested in learning more about human factors in healthcare. Following the session 100% understood the importance of human factors in healthcare and barriers contributing to human error. 93% were confident in their ability to implement human factors after graduation. 100% enjoyed the session and 100% felt this was an important topic to cover in medical school.

Discussion and Conclusions: Human factors awareness in healthcare is crucial to improve patient safety by minimising human error. The undergraduates in this study had received no previous formal human factors training during medical school but found the human factors workshop enjoyable and advantageous in building knowledge and confidence to apply human factors to the clinical environment.

Take-home Messages: Human factors training should form a compulsory component of all undergraduate medical school curriculums.

Doctors & Crows: Exploring the Didactic Value of Literature and Metaphor in Forming a Better Understanding of the Grieving Process

AUTHOR(S):

- Oliver Hodge, University of Bristol, UK (Presenter)

ABSTRACT

Background: It is thought that many medical students and doctors feel inadequately prepared to care for grieving individuals, despite the contrary expectation or assumption. Whilst recognising grief to be a unique and highly personal experience, we may reasonably examine the supportive role of literature in the field of grief studies in medical education.

Summary of Work: This project uses Max Porter's triptych, *Grief is the Thing with Feathers*, to explore the value of literature, language and metaphor in bringing about a better understanding of the grieving process. Supported by Porter's own insights, which have been collected for the project, and accompanied by discussions of Kubler-Ross grief theory, the work asks whether there is such a role for literature in medical education.

Summary of Results: 1) Medical students generally feel unprepared to deal with the condition of grief in their patients. This, I have elucidated via surveys and questionnaires. 2) Grief studies is currently a minor or negligible part of the general medical school curriculum. 3) Literature and metaphor go some way to depicting the grieving process and initiating related conversations. 4) Integration of literature and metaphor into grief studies in the medical curriculum remains to be discussed. 5) An interview with award winning author Max Porter about the role of literature in medical education.

Discussion and Conclusions: What literature can offer, is not a total picture of grief (this is far beyond any medium), but a clearer sense of it; an insight into its depths and an eloquent portrayal of its characteristics. Following this, it is reasonable to conclude that there may be a didactic role for fiction literature in medical education, when it comes to forming a better understanding of the grieving process. How this could then be implemented is a welcome discussion that remains to be had.

Take-home Messages: 1) Medical students often report feelings of inadequacy in regards to their understanding of the grieving process and their ability to communicate with patients and other professionals about grief. 2) Integration of literature into medical curriculums, in the context of grief studies, could be a viable means of addressing the problem. This is the proactive discussion that should be had.

Validation and Application of an instrument to assess attitudes and difficulties of forensic science students confronting death during forensic practice

AUTHOR(S):

- Ileana Petra, National Autonomous University of Mexico, Mexico (Presenter)
- Mariana Fouilloux-Morales, National Autonomous University of Mexico, Mexico
- Jose-Antonio Talayero-Uriarte, National Autonomous University of Mexico, Mexico
- Maria-Teresa Cortes-Gutierrez, National Autonomous University of Mexico, Mexico

ABSTRACT

Background: The School of Forensic Science of the National Autonomous University of Mexico was created in 2013. Internationally, forensic research has focused on the technical aspects of the discipline, so there are very few publications on the way in which the students respond to death experiences during their forensic practice.

Summary of Work: This research assesses the reactions of students during the dissection of corpses. A Likert style instrument was developed and was first validated with 269 medical students, and was subjected to an analysis of reliability to determine the alpha de Cronbach and its Varimax rotation. Then it was applied 56 forensic science students.

Summary of Results: 38 items gave an Alpha of .732 and explained 47.7% of the total variance in six components: motivation, negative reactions, anxiety somatization, perceptions, aversion, and professional profile. 73% forensic students showed curiosity, 82% were not affected, 20% pointed out that it affected them occasionally and makes them consider how important the experience of life is.

Discussion and Conclusions: Over 70% regarded their practice in a positive way leaving 20 to 30% with doubts and conflicts. Most students believe that the forensic practice is acceptable from the start and it doesn't cause much fear or anxiety. However a low percentage of students do present some sort of emotional reaction. While the group under study is small, the results open an important field to explore the personality and emotions that these future forensic professionals. Because they have to confront death continually and therefore if it is necessary to offer appropriate, help to overcome these problems. The analysis of their needs and participation, could be included in their studies, and then offer them teachers who can act as tutors and follow them during their career.

Take-home Messages: (1) More studies must be done to analyze the way students confront death during their forensic practice; (2) Forensic students are prepared to confront their forensic practice. Moreover, a small group is not prepared for it and needs guidance.

The medical student's attitude toward the pioneer curriculum on palliative care

AUTHOR(S):

- Weerajit Thipprasert, Roiet Hospital Medical Education Center, Thailand (Presenter)
- Sucheera Amornmahaphun, Roiet Hospital Medical Education Center, Thailand
- Narongchai Sangsa, Roiet Hospital Medical Education Center, Thailand

ABSTRACT

Background: Thailand has just adopted a palliative care treatment. The approach will be further applied as a treatment for a patient within a community but there is still no curriculum available in a medical school. This research's result will contribute to curriculum development.

Summary of Work: The 27 of fifth-year medical students who had enrolled in palliative care class and covering lessons on 5 following topics; Concept and Assessment, Pain Management, Non-pain Symptom Management, Final Hours of Life and a Subcutaneous Drug Administration, Discharge Planning, Referral System and Home Care. The 14 of the students had experienced a case study while 13 had a ward round teaching under the supervision of a palliative care expertise doctor. All 27 students had experienced the home visit to the palliative care patients before taking the attitude survey.

Summary of Results: Most of the students strongly agreed that palliative care class is significant (mean=4.15, SD=0.82, p-value=0.973). The result showed that ranging from medium to most numbers of students want the faculty to add a palliative care into the curriculum (mean=3.81, SD=0.83, p-value=0.855). The most wanted teaching method are respectively as the following; lecture, ward round teaching, case study and home visit. The students who had experienced a case study had less understanding and confidence in giving patients' the treatment in palliative care than those who had ward round teaching. (mean=0.56, 95%CI=-0.97--0.14, p-value=0.010), (mean=0.53, 95%CI=-0.99--0.08, p-value=0.023) respectively. 74.1% of the students had ever seen the palliative care patients but never had a chance to give the treatment by themselves. After taking a palliative care home visit with an interdisciplinary team, the students had a positive attitude toward the home visit (mean=3.48, SD=0.57, p-value=0.867) while 85.2% will consider applying palliative care to treat the patients.

Discussion and Conclusions: The course on palliative care is significant. Most of the medical students want the faculty to include the course into the curriculum whereas the lecture methods are the most in favor. In order to create an effective learning process, various teaching methods must be used especially a ward round teaching. Home visiting increase the students positive attitude toward the palliative care and enhance them to apply the palliative care to the patients in the future.

Take-home Messages: There should be the course on palliative care in the medical school's curriculum in various methods which is same as the other subjects.

Review of a three-in-one palliative-care curriculum for junior medical students: First time in Taiwan

AUTHOR(S):

- Kuei-Yu Liu, National Taiwan University School of Medicine, Taiwan (Presenter)
- Li-Lin Kuo, Taipei City Hospital, Taiwan
- Sheng-Jean Huang, Taipei City Hospital, Taiwan

ABSTRACT

Background: Although comprehensive palliative-care training has been developing for decades among doctors and senior medical students in Taiwan, curriculum for junior students is still lacking. Since training is limited to classroom lectures only, students lack learning through clinical experiences. Besides, no evaluation of palliative-care training for junior medical students has been done so far.

Summary of Work: A three-in-one, student-centered course of palliative care including “lecture”, “simulation”, and “observation” was created for M1 students who had never experienced any palliative-care training. The length of the curriculum was 40 hours. In lectures, tutors introduced palliative care to students via presentations, videos, and experience sharing. Next, conversation simulation was given because students lacked experience of communicating with patients and their family. Finally, students led by medical teams began clinical shadowing in hospice wards, patients’ homes, and communities. Additionally, students interacted with patients and their family under professional supervision and instruction. In the end, a questionnaire with a written section was given to attending students to assess the outcome.

Summary of Results: In the questionnaire, there were 30 questions. In one of the questions, all 34 students gave a score from 1-10 to determine how well they could help a patient, and the average score was 6. The highest was 7, and the lowest was 1. Moreover, the questionnaire evaluated that 94% were “very satisfied” or “quite satisfied” with the course. Furthermore, 94% of the polled expressed gaining a better understanding of palliative care. In the written section, the top two suggestions were “additional simulated interaction and communication skills training” (15%) and “dialect learning” (12%).

Discussion and Conclusions: Our aim was to introduce palliative care to M1 students in various ways, and the high satisfaction rates reflect excellent approval. Furthermore, although without professional training, students quickly found their role in the team: “to comfort, always”. To some degree, written suggestions reflect insufficient training in interacting with patients and using patient-friendly language.

Take-home Messages: Through the three-in-one method, medical students’ early exposure to palliative-care education can be meaningful.

“I felt, at that moment, that I was betraying my ideals”: Emotional Responses of Residents when Taking Care of Patients at the End-of-Life

AUTHOR(S):

- **Heloísa Takasu Peres, State University of Campinas, Brazil (Presenter)**
- Marco Antonio De Carvalho Filho, State University of Campinas, Brazil
- Esther Helmich, University of Groningen, the Netherlands
- Diego Lima Ribeiro, State University of Campinas, Brazil

ABSTRACT

Background: Although the relevance of emotional responses for professional identity formation is widely recognized, the mechanisms by which emotions impact on professional development are still not fully understood. This lack of understanding risks making medical educators unable to prevent cynicism, lack of empathy and emotional distancing from taking over their residents’ souls. This study explores residents’ emotional reactions to positive and negative end-of-life care experiences.

Summary of Work: Residents from General Surgery, Internal Medicine and Emergency Medicine were invited to draw two Rich Pictures - visual tools enhancing data collection by capturing “hard to describe” factors. They drew situations in which they cared for patients at the end-of-life; one they considered positive and another they considered a negative experience. Afterwards, they were interviewed to explore the context of those situations, the conflicts involved, their emotional responses and the influence those experiences had on how they perceive themselves as doctors.

Summary of Results: The core of both positive and negative emotional responses was providing patient-centered care. Whenever residents had offered humanized care and respected their patients’ autonomy, wishes and dignity, positive emotions arose. When residents were uncomfortable with the devised therapeutic plan or witnessed patients suffering dysthanasia, they suffered negative emotions. Residents mentioned that “it is possible” to offer dignity and comfort to patients at the end-of-life, and aimed to always provide such care. Residents said they will think carefully before performing invasive procedures in patients, focus on the patient and not on the procedural aspect of care, and reflect on how to stand up for their opinion.

Discussion and Conclusions: Rich pictures, followed by a semi-structured interview, allowed the identification of emotional responses in end-of-life care situations. With those findings, we might be able to provide residents a space to direct this emotional drive into fruitful reflection, helping them internalize professional and humanistic values.

Take-home Messages: It can be assumed that, when provided with a space for guided reflection, both positive and negative experiences may provide fruitful insights about how to deal with the multiple challenges surrounding end-of-life care.

Validation of a skill-based team learning curriculum in workplace violence prevention for nursing students

AUTHOR(S):

- Fu-Li Chen, Fu Jen Catholic University, Taiwan (Presenter)
- Peter Y. Chen, Department of Psychology, Auburn University, USA
- Shy-Yang Chiou, Department of Leisure Industry and Health Promotion, National Ilan University, Taiwan
- Ting-Ya Kuo, Department of Public Health, Fu Jen Catholic University, Taiwan
- Tao-Hsin Tung, Cheng-Hsin General Hospital, Taiwan

ABSTRACT

Background: Workplace violence, faced by health care workers, is a severe occupational safety and health hazard, and has received global attentions in research and in practice. The aim of this study was to design, implement, and evaluate a skill-based team learning curriculum in workplace violence prevention for nursing students.

Summary of Work: 105 senior nursing students were invited to participate in a quasi-experimental study. Among them, 56 students in the treatment group received the training curriculum which included three sessions (1) 50-minutes lecture and team group discussion to illustrate the various workplace violence situations and effective violence prevention skills (e.g. communication, empathy and negotiation skills, problem solving skill, emotional managing skill), (2) 100-minute interactive skills training curriculum focusing on demonstration, role play, and rehearsal, (3) 50-minute feedback, and debriefing. The remaining 49 students in the control group received a self-learning violence prevention manual.

Summary of Results: The results for the GEE statistics indicated a significant time effect. The pretest-posttest and after the posttest results that treatment group showed significant improvement in preventive skills ($\beta=2.810$, $\beta=1.999$; $p<0.001$) and self-efficacy ($\beta=7.332$, $\beta=7.485$; $p<0.001$) compared to the control group

Discussion and Conclusions: The study showed integration of skill-based teamwork learning in nursing education provides an additional venue to prevent and reduce workplace violence. The findings suggest a potentially effective approach to prevent workplace violence by providing situational interactive and skill-based learning methods , particularly for senior nursing students or pre-service nurses.

Take-home Messages: The present study provided empirical evidence of the skill-based team learning training curriculum in workplace violence program for nursing students. The study demonstrates the feasibility of implementing the team learning curriculum for senior nursing students and pre-service nurses.

Medical Education and Preventive Medicine: A System Dynamics Approach

AUTHOR(S):

- Tiffany McClure, David Geffen School of Medicine at UCLA, USA (Presenter)
- Viktor Sigalov, David Geffen School of Medicine at UCLA, USA

ABSTRACT

Background: Ever since preventive medicine (PM) was recognized as a specialty in the US, inconsistencies in related content, training strategies, and outcomes persist across medical school curricula. While many aspects of preventive medicine were investigated from system dynamics perspectives, medical education was not, to our knowledge, part of these considerations.

Summary of Work: A broad literature search on PM with association to medical education was performed to identify key variables. Using Vensim software, a causal loop diagram (CLD) was designed to visualize the relationships between the identified variables and analyze feedbacks in the system as the cause of its behavior.

Summary of Results: The CLD demonstrated that education in PM is driven by need for preventive services, public perception of their value, and prevention-seeking behavior. Exponential growth in need for prevention outstrips preventive service capacity, resulting in increasing need in curative services and diversion of trained workforce from preventive to curative medicine.

Discussion and Conclusions: This study used system dynamics to explore the network of relationships between medical education and PM, and to analyze policies for optimization of these relationships. The model uncovered nonlinear connections between prevention-seeking behavior, reimbursement for preventive services, and both interest in academic research and quality of education in PM. While public health education is necessary for supporting prevention-seeking behavior, its wide implementation is limited by lack of dedicated resources. Proposed policies, including involvement of medical students in PM research and public health education, have the potential to increase utilization of preventive services and in turn, PM reimbursement while reducing factors of unhealthy lifestyle.

Take-home Messages: CLD modeling provides a platform for visualizing medical education and PM as a complex system with a distinct internal structure being a source of continuing challenges in PM. The CLD also allows developing and testing policies on changes in the structure of medical education for optimizing PM without prohibitive costs.

Improving Nutrition Education in Medical Schools: the ESPEN-NEMS project

AUTHOR(S):

- **Stephane Schneider, Gastroenterology and Nutrition, Centre Hospitalier Universitarie de Nice, France (Presenter)**
- Cristina Cuerda, ESPEN Nutrition Education in Medical Schools group, Spain
- André Van Gossum, Department of Gastroenterology and Nutritional Support, Hopital Erasme and Institut Bordet, Belgium
- Maurizio Muscaritoli, ESPEN Nutrition Education Study Group, Italy
- Matthias Pirlich, European Society for Clinical Nutrition and Metabolism (ESPEN), Germany
- Rocco Barazzoni, European Society for Clinical Nutrition and Metabolism, Italy
- Zeljko Krznic, European Society for Clinical Nutrition and Metabolism (ESPEN), Croatia

ABSTRACT

Background: Nutrition education is necessary in the training of healthcare professionals, including medical students. Nutrition-related disorders include a wide spectrum of modalities from undernutrition, obesity, to diet-related non-communicable diseases, that have a negative impact in the clinical outcome and increase disability in the people. Although different attempts have been done in the last decades to improve the academic curriculum in nutrition education for medical schools, recent surveys showed that the problem is far from being solved. The aim of this work is to improve the Nutrition Education in Medical Schools (NEMS), identifying a minimum curriculum knowledge in nutrition that serves to improve the training of the future doctors, and show how to solve the main barriers of its implementation in university centres.

Summary of Work: In 2017, the Nutrition Education Study Group (NESG) of the European Society for Clinical Nutrition and Metabolism (ESPEN), on behalf of the ESPEN Executive Committee, launched the NEMS Project and formed a core working group including members of ESPEN and representatives of several European Medical Schools (Brussels, Madrid, Nice, Rome and Zagreb). This group met in Brussels, on 19th July 2018 and decided to prepare a position paper on this topic.

Summary of Results: Five main learning objectives and 21 topics on human nutrition, within its three domains (basic, applied and clinical nutrition) were identified to be fulfilled at the end of training in all Medical Schools. The experts showed the following key factors for its implementation: establish a nutrition curriculum committee, use different models of integration of the contents in the curriculum (vertical and horizontal), have a multidisciplinary and experienced faculty, incorporate a variety of teaching models, and evaluate the programme periodically.

Discussion and Conclusions: Nutrition Education is deemed necessary and should be mandatory in all Medical Schools. The NEMS project aims at improving the current gap of knowledge and provides some clues for a successful implementation of the changes in the medical curriculum at university centres.

Take-home Messages: Nutrition education is necessary and should be mandatory in all Medical Schools. The NEMS Project aims at improving the gap of nutrition knowledge through a networking between ESPEN and the Medical Schools.

Investigation on the Requirement and Recognition of Medical Ethics Education for Hospital Staff

AUTHOR(S):

- Pei-Wei Wang, Taipei City Hospital, Taiwan (Presenter)
- Ting-Fang Chiu, Taipei City Hospital, Taiwan
- Li-Lin Kuo, Taipei City Hospital, Taiwan
- Lin-Yang Chi Chi, Taipei City Hospital, Taiwan
- Da-Chen Chu, Taipei City Hospital, Taiwan

ABSTRACT

Background: In recent years, the demand for effective medical education has increased due to changes in the social environment and the rising number of medical disputes in Taiwan. The objective of this research is to compare the perspectives of medical staffs' requirement and recognition of medical ethics education in 2009 and 2016.

Summary of Work: We have developed flipping classroom including multimedia case teaching videos and multi-disciplinary simulations to promote the interests of our hospital staff for teaching medical ethics since 2009. A self-administered questionnaire was designed to survey the effectiveness of medical ethics education. There are 19 items addressing topics such as the importance of medical ethics education, contribution to work and the suitable method to implement medical ethics education. There were five agreement ratings including very disagreed, disagreed, fair, agreed and very agreed.

Summary of Results: 522 and 336 completed questionnaires were collected from all level staffs at Taipei city hospital in 2009 and 2016 respectively. Both the respondents have a strong agreement about the importance of medical ethics education (94.05% Vs 97.2%) and contribution to future medical services (94.23% Vs 96.9%). More than ninety percent thought medical courses is helpful to make reasonable decisions when encountering medical ethics cases. Comparing with those in 2009, more have taken ethical course (84.5% Vs 79.19%) and law courses (59.2% Vs 49.68 %) at school in 2016. However, only half of them stated that medical ethics course is sufficient and two-thirds of physicians agreed that the number of credit hours specified in the medical ethics course is sufficient in 2016.

Discussion and Conclusions: Few studies involving medical ethics education in regional hospitals in Taiwan have been conducted and this survey provide current situation and needs. Only half of the post-graduated hospital staffs thought medical ethics education was sufficient in 2016. There are also a small number of doctors who believe that medical education does not help reduce medical disputes. Therefore, we still need to continue and improve medical ethics education and other measures such as increasing medical law courses is worth considering.

Take-home Messages: Medical ethics education is required to promote and increasing the course of medical law is worth considering in Taiwan.

Medical Law Teaching in Thai Medical Schools

AUTHOR(S):

- **Smith Kerdsin, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand (Presenter)**
- Piti Phloenchaiwanit, Chiangrai Prachanukroh Hospital, Thailand
- Chamaiporn Matthawarat, Phadungpanya School Tak, Thailand
- Worasit Charoensin, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand

ABSTRACT

Background: The medical law is essential in the medical curriculum because the doctors profession must be aware of the rights and responsibilities of patients by using the law as an element of service. According to WFME standard, Medical jurisprudence must be included in the core curriculum. But in reality, the medical staff usually neglects to teach the law. Therefore, this research aims to explore the teaching status of the medical law in the medical schools in Thailand.

Summary of Work: The questionnaires were distributed to 24 medical schools in Thailand. The expected participants were deans or vice-deans or instructor. Questionnaires were designed to obtain the participant data, the teaching status, supporting system (e.g. medical law expert, book and media) and the teaching problem.

Summary of Results: Most of the participants were instructors (57.6%) who have experiences in organization management and teaching at 1-10 years. For the teaching status on medical law, 50% of respondents reported setting the medical law into an elective course and only 8.3% reported setting in a core course. 71.5% of the medical schools were introducing the conference on a law for the doctor profession and 21.8% of medical schools were integration law issue to a medical practice round, especially obstetrics and gynecology rotation. The main problem of teach medical law is the lack of an expert, the complexity of medical law, and disinterest of medical staff.

Discussion and Conclusions: Medical schools in Thailand place less importance on law course for medical students and learning resource are limited. But, there are some activities to promote law learning effectively, such as conference or integration law with a medical round. Teleconference and study guides may be used to increase medical law knowledge in limited teaching resource hospital.

Take-home Messages: The medical council of Thailand should support the medical schools on the medical law by providing learning material and improving the accessibility of essential content.

Applying community-based learning (CBL) activity for Otorhinolaryngology curriculum

AUTHOR(S):

- Chonthicha Chit-ueaophat, Chaiyaphum Medical Education Center, Thailand (Presenter)
- Prangtip Kongsatree, Chaiyaphum Medical Education Center, Thailand
- Natthawan Suangtho, Chaiyaphum Medical Education Center, Thailand

ABSTRACT

Background: Integration of CBL to otorhinolaryngology curriculum by introducing hearing screening in the community could be beneficial. The aim of this study was to evaluate the impact of CBL on the learning skills of medical students during the otorhinolaryngology rotation.

Summary of Work: Twenty students were divided into two groups. One group participated in the hearing screening activity in a selected community (CBL group). Another group did not participate in the screening activity (non-CBL group). Clinical skills including ear examination and spot diagnosis were assessed during the objective structured clinical examination (OSCE) at the end of the rotation. Self-rating was done by selection on a 5-point Likert-type scale in the CBL group. Descriptive statistics and t-test were used as appropriate.

Summary of Results: Mean scores of the ear examination and the spot diagnosis in CBL group and non-CBL group were 6.70 ± 0.54 and 6.60 ± 0.52 , respectively (P -value=0.676) and 2.80 ± 1.67 and 1.60 ± 1.84 , respectively (P -value=0.146). The overall satisfaction mean score on the CBL activity was 4.4 out of 5. The mean score on the usefulness of CBL activity was 4.7 out of 5. The students believed that this activity improve their ear examination skills (mean score 4.5 out of 5) and provide them opportunities for community engagement (mean score 4.6 out of 5).

Discussion and Conclusions: There was no difference in the OSCE score between the CBL group and the non-CBL group, however the medical students in the CBL group self-reported that this teaching method was beneficial and enjoyable. They would prefer participating in this activity rather than only having a clinical experience in a hospital setting. The CBL activity could be a useful teaching strategy to improve the learning outcomes of medical students on otorhinolaryngology by fostering them to be an active learner, integrate the academic theory to real-world practice and to improve the teamwork skills.

Take-home Messages: The CBL strategy could be successfully incorporated into various subjects in medical schools. However, this teaching method need to be adjusted and modified as needed to provide the most valuable community learning experience to the students.

Building academic partnerships with community agencies in medical education: community agencies perspectives

AUTHOR(S):

- Nayereh Kaviani, School of Medicine, Griffith University, Australia (Presenter)
- Professor Mieke van Driel, Faculty of Medicine, University of Queensland, Australia

ABSTRACT

Background: The Griffith University MD curriculum provides opportunity for first year students to spend time in the community and develop skills in community health. The program is a partnership with community agencies involved in health promotion, Aboriginal and Torres Strait Islander health services/cross cultural experience, allied health services, and community care/social support. Through these partnerships students learn about the social determinants of health-an increasingly important topic in medical education. Social conditions such as employment, housing, and education, have a large influence on health and disease and students cannot obtain such knowledge through textbooks and lectures alone. The experience helps students identify social perspectives of health and disease, and social factors that impact health. They also learn about resources in the community and non-medical pathways to health, emphasising a more holistic approach to medicine. In addition, they might view community as a teaching resource and partner for future practice rather than just a placement site. The purpose of this study is to explore community agencies' perspectives of hosting medical students.

Summary of Work: We used quantitative and qualitative evaluation methods. A survey instrument for agency staff was administered online after completion of the placements. Data was de-identified for analysis and reported in aggregate form. For the quantitative evaluation component, all analyses will be reported in a descriptive way. For the qualitative evaluation component, thematic analysis method will be used to analyse responses.

Summary of Results: Preliminary analyses highlights that community agencies greatly appreciate continued partnership. They also report the types of contributions that students can provide through participation in small-scale support and education activities.

Discussion and Conclusions: The final analysis will provide ideas and suggestions that could offer opportunities for further development of this component of the MD curriculum and build stronger partnership with our community organisations. The findings illustrate how community-academic partnerships in medical education can be mutually beneficial.

Take-home Messages: Community agencies highly value their involvement in medical education through academic partnerships.

A study of correlation between grades and learning outcome achievement in Home Health Care (HHC), Family Medicine, Prapokklao Hospital, Thailand

AUTHOR(S):

- Kullawan Chaicharoenpong, Faculty of Family Medicine, Prapokklao Hospital, Thailand (Presenter)

ABSTRACT

Background: To accomplish optimal patient care, home visits after hospital discharge play an important role in the continuity of care, especially in long-term follow up cases and chronically ill patients. Medical Education Center, Prapokklao hospital (MED PPK) believed that Home Health Care (HHC) program help medical students to attain preferable physician characteristics which were defined by Faculty of Medicine, Chulalongkorn University as 12 medical learning outcomes. This study aimed to compare the learning outcome achievement among medical students with different grades.

Summary of Work: 31 fourth-year medical students taking a family medicine course at Prapokklao Hospital, Thailand, were classified into 2 groups using their accumulated grade point average (GPAX) of < 3.0 and ≥ 3.0 and were assigned to perform post-hospitalized home visits every 2 months for 8 months. Self-assessment questionnaires were given after finishing this HHC program to assess whether the students achieved 12 medical learning outcomes. The questionnaires were based on 1-5 scale, rating from least to most applicable of the course to the learning outcomes, respectively, and analyzed with SPSS statistics, version 19.

Summary of Results: There was not a statistically significant difference in the achievement of each medical learning outcome between groups of medical students with GPAX <3.0 and ≥ 3.0 at p-value less than .01 in this longitudinal HHC study.

Discussion and Conclusions: Home visits helped students to achieve medical learning outcomes unrelated to their grades. This might be explained by that home care required thorough consideration rather than intelligence. In addition, home visits could enhance discovery of further health care needs, leading to better patient understanding. The accumulated grade point average (GPAX) did not affect medical students' learning outcome acknowledgement in HHC.

Take-home Messages: Continuing of home health care can help medical students gain desirable physician characteristics and better patient understanding.

Do the medical skill and performance outcomes of medical students differ by type of training?

AUTHOR(S):

- Anchalee Buangoen, Songkhla hospital, Thailand (Presenter)

ABSTRACT

Background: Songkhla hospital medical education center (SK-MEC) has trained medical student called CPIRD (Collaborative project to increase production of rural doctor) that based on COME (community oriented medical education). Extern is the last year training medical student before transitioning to practice. Extern in SK-MEC has trained in general and community hospital that differ from university based medical school program. Previous studies had reported training experiences of training in university based were higher than community based. COME in practice of extern is real life experience trend to increase medical skill and performance. OSCE and MEQ examination by the center of medical school in Thailand is the assessment tool to evaluate medical skill. Performance outcome were evaluated by medical staff.

Summary of Work: Objective : To examine the differences of medical skill and performance outcomes between extern CPIRD and Non-CPIRD (university based medical school program). Method: This observational cohort study of 38 externs in SK-MEC, Thailand, between 1 January to 31 December 2017. 21 Externs CPIRD and 17 externs non-CPIRD performed OSCE and MEQ examination. Performance outcome was evaluated by medical staff at SK-MEC. Medical skill and performance outcomes were analyzed by Chi-square tests SPSS 17.0.

Summary of Results: No significant difference was observed between CPIRD and non-CPIRD trained extern in age (mean, 23.5 years vs 23.7 years), sex (female, 88.2 % vs 66.7%), clinical GPA (mean, 3.35 vs 3.35). Overall, a positive association between clinical GPA and OSCE, MEQ examination were found ($P < 0.001$), but no statistic significant correlation between clinical GPA and performance outcome were found for externs CPIRD and NON-CPIRD ($P = 0.345$). After matching, no significant difference in results of OSCE, MEQ examination, and performance outcome were found between CPIRD and non-CPIRD trained externs.

Discussion and Conclusions: Extern trained in CPIRD and non-CPIRD programs have distinct practice patterns. When compared within the same assessment tool by OSCE, MEQ examination and performance outcome, extern from both training backgrounds achieve similar medical skill and performance.

Take-home Messages: CPIRD (Collaborative project to increase production of rural doctor) of SK-MEC is one of COME program for training rural doctor that can achieve medical skill and performance outcome of medical student.

Benefits of Homestay in Community Engaged Medical Education for Undergraduate Medical Students in Thailand

AUTHOR(S):

- Ananya Chutimararat, MNST Medical Education Center, Thailand (Presenter)
- Sompong Karuna, MNST Medical Education Center, Thailand

ABSTRACT

Background: An increasing trend in clinical training is to send medical students to sites away from the tertiary academic medical centers. Immersion of the students within the community is one strategy to serve this trend. A training program of fourth-year medical students in community medicine rotation of MNST Medical Education Center with a homestay of 2 weeks with host families was implemented to place them at decentralized learning sites. So, this study was done to evaluate the benefits of homestay to provide a database towards improving a model for a training program.

Summary of Work: The participants in this study included 43 undergraduate fourth- through sixth-year medical students who had completed their homestay training. A self-administered questionnaire regarding the engagement between the students and host families, benefits of the homestay, and the curriculum was used as a data collection instrument. Focus group interviews with 30 host families were also done.

Summary of Results: The majority (95.4%) of the participants had moderate to high level engagement with their host families. More than half (66.7%) still keep in touch at least once a month within the past year. Out of 43 participants, almost half (48.8%) were personal health consultants for the host families. More than half reported that homestay with host families influenced their cultural learning, professional skill improvement, and motivation to practice in rural areas following graduation. They also recommended continuing the homestay program as a learning platform of community-engaged medical education (CEME). The host families were pleased to host the students and treated them as their own child. Moreover, the students shared many life events with the host families such as medical admission, religious ordination, wedding ceremonies, and funeral ceremonies.

Discussion and Conclusions: A homestay program provides an exclusive experience with the potential to engage medical students in the community to serve a significant role in a CEME program.

Take-home Messages: Homestay with local host families is useful for CEME.

Improving Teaching and Learning with Student Participation Scheme at the Maharaj Hospital Medical Education Center, Nakhon Si Thammarat, Thailand

AUTHOR(S):

- Patcharaporn Khajornwattanakul, Maharaj Nakhon Si Thammarat Hospital, Thailand (Presenter)
- Ananya Chutimarat, Maharaj Nakhon Si Thammarat Hospital, Thailand

ABSTRACT

Background: The Community and Family Medicine program for senior medical students at the Maharaj Hospital Medical Education Center was organized over a 4-week period. In the first week, lectures on community and family health were given, including practice sessions at the Chronic Diseases Clinic. Students also visited families with the Home Health Care unit and learned about primary care services at the Primary Care Cluster. During the last three weeks, students continued studies Primary Health Care Service system and practiced at community hospitals. The purpose of this research was to improve teaching and learning through a student-centered and student-directed design.

Summary of Work: Questionnaires and focus group interviews were conducted before the course for 23 senior medical students during the 2018 academic year. After completing the course, focus group interviews were used again and students' log books were analysed.

Summary of Results: Before the course 86.9% of students concluded that the duration of the course was appropriate. 95.8% suggested that the method of teaching in the first week could be improved, particularly with regards to field study and the primary care service system. Regular follow-up group discussions were recommended. Additionally, practice with the Chronic Diseases Unit should be increased in order to better integrate knowledge and practice. Students suggested that medium-sized community hospitals with good accommodation, information technology and senior clerkships should be provided for the final three weeks. Knowledge-sharing between students and staff before the course was also suggested. After completing the course, the study found that students were pleased with the program and were able to better comprehend the Primary Care Service System and provide medical care, including to chronic disease patients, using a family medicine approach.

Discussion and Conclusions: The study found that students could gain more and meet more course objectives if they designed their own course.

Take-home Messages: Results from this study can apply to other subjects.

Community Research of Undergraduate Medical Students: Sharing Experiences from Mae Fah Luang University (MFU), Chiangrai Province, Thailand

AUTHOR(S):

- Chitrlada Utaipiboon, School of Medicine, Mae Fah Luang University, Thailand (Presenter)
- Paween Tangchitpisut, School of Medicine, Mae Fah Luang University, Thailand
- Arnon Jumlongkul, School of Medicine, Mae Fah Luang University, Thailand
- Patcharin Pingmuangkaew, School of Medicine, Mae Fah Luang University, Thailand
- Waraporn Eoaskoon, School of Medicine, Mae Fah Luang University, Thailand
- Chaiyos Kunanusont, Bangkok Dusit Medical Service, Thailand

ABSTRACT

Background: School of Medicine, MFU aims to build excellent community physician of the Greater Mekong Sub-region. One aspect is the research capacity building among medical students. The 1st class enrolled 32 students since 2013 who will graduate in 2019. With good exposure to community hospitals, the majority of students (59/64, 92%) conducted community research studies.

Summary of Work: Four factors contributing to these education outcomes are: (i) Medical program with research courses during year 2-5 of the 6 year program; (ii) Multi-disciplinary experiences sharing by epidemiologists, biostatisticians, and medical staff; (iii) Funding support from the medical school including donation at the early phase; (iv) Collaboration with community, sub-district hospitals and health volunteers. Processes of Teaching and Learning are both in classroom and on-site at community level with tailored-made mentoring. Students learned and practiced through formulation of research questions, literature review, defining study objectives as well as study design, selecting study tools, implementing data collection, data analysis, and manuscript writing.

Summary of Results: As of 2018, 20 group work manuscripts and 64 individual research projects have been conducted. The preclinical (Year 3) projects were mostly conducted in the university and employed survey design. Almost all individual researches (Year 4-5) were conducted in the communities. Wide range of research questions regarding health topics and research design had been done. In addition to research, students also created 5 medical innovation, four were selected to be presented at the national level contest.

Discussion and Conclusions: Skills of critical thinking, creativity, communication, collaboration can be strengthened by participating in research. Furthermore, awareness on health system and health problems, health information system, public health policy, and human research ethics are essential for improving the quality of medical education and training.

Take-home Messages: Community research in medical education is crucial for promoting the skills of lifelong learning and preparing for the complexities of future working across different challenges as community physicians.

Task-based assignment in community curriculum as a educational tool for achieving real life professional doctor

AUTHOR(S):

- Narut Wongsakorn, Sawanpracharak Hospital, Thailand (Presenter)
- Chaowaphon Ittiphanitphong, Sawanpracharak Hospital, Thailand

ABSTRACT

Background: In Thailand, rational use of drugs still remain major health problem. Therefore, in teaching at a community hospital, medical students were assigned to increase public knowledge and teach rational use of drugs to solve the problems of drug abuse in the country. Purpose of this study were 1. Students can truly understand the problems of the countrys health system and 2. Students can practice using problem solving skills and team working in the their group.

Summary of Work: 32 medical students during their rotation at the community hospital will be responsible for providing knowledge on reasonably drug use in order to solve the major problems of the country. Medical students designed their own technique, presentations based on available information either online or offline. Pre and Post test using questionnaire was used to evaluate efficacy of educating people.

Summary of Results: 45 people, 16 male, 29 female, average age 44 years were included in this study. It was found that after giving educate to the public, there was a statistical significant increase in all three important aspects of rational drug use with paired t-test. ($p < 0.001$) Mean of indication for antibiotic use has increased from 4.8 ± 0.485 to 7.9 ± 0.463 . Mean of side effect and contraindication was increased from 4.1 ± 0.39 to 7.9 ± 0.29 . Mean of behavioral and life style modification was also increased from 3.0 ± 0.379 to 6.7 ± 0.284 .

Discussion and Conclusions: From the assignment medical students use cognitive, affective and psychomotor domains of learning to work together as a team. Solving problems by thinking, analyzing, brainstorming and using various techniques to educate people. Students build their own creating level of Bloom Taxonomy

Take-home Messages: Community based approach by solving real life problems can stimulate medical student to achieve top level of Bloom's taxonomy.

Home Visits as Interprofessional Learning Activity for Students in Primary Care

AUTHOR(S):

- Christina Olsson, Academic Primary Healthcare Centre, Sweden (Presenter)
- Stefano Torres Asenjo, Karolinska Institutet, Sweden
- Eva Toth-Pal, Karolinska Institutet, Sweden
- Cecilia Fridén, Karolinska Institutet, Sweden

ABSTRACT

Background: Interprofessional collaboration is known to improve patient safety, increase job satisfaction, and reduce stress among healthcare professionals. Students should already during their initial training experience interprofessional collaboration. The purpose of this project was to evaluate person-centered home visits as an interprofessional learning (IPL) activity for undergraduate students during clinical placements in primary healthcare.

Summary of Work: Students from different educational programs and supervisors from different professions participated in the learning activity. The students read a brief description of the patient history before the visit together with a supervisor. During the home visit, the students were responsible for history taking and for performing relevant assessments. Afterwards, the students made a joint care plan for the patient. Thereafter, a seminar took place where students and supervisors from the participating professions discussed the outcome and reflected on each other's professional roles. The students and the patients answered a questionnaire about the activity and the supervisors were interviewed in nine focus groups.

Summary of Results: Thirty interprofessional home visits were conducted, involving 109 students from six different healthcare professions. The students reported that they had gained insight into how different professions could collaborate. An increased understanding of teamwork as well as an understanding of the other professions' areas of competence was gained. All patients were satisfied with the visits and felt that they had been listened to, and treated with respect by the students. The interview analysis showed one overarching theme: Major organizational barriers to implement home visits as IPL method in primary care and three main categories: Perceptions of interprofessional collaboration in the clinic, Choosing the right patient for IP home visits and Prerequisites for IPL.

Discussion and Conclusions: The students and the patients were generally positive to the activity. However, there were barriers for implementing home visits in the context of reimbursement system and the high clinical workload on the supervisors. Interprofessional collaboration was not a routine in the supervisors' everyday clinical work.

Take-home Messages: The results of the study indicate that home visits could be used in primary healthcare settings to promote students IPL.

Community based medical camp as one of the best methodologies of community based educational learning to approach patient as educator

AUTHOR(S):

- Tuangprot Porapaktham, Sawanpracharuk Medical Educational Center, Thailand (Presenter)
- Chaowaphon Ittiphanitphong, Sawanpracharuk Hospital, Thailand

ABSTRACT

Background: Community based education is the important to improve medical student to be community oriented doctors and be professional physician. In Thailand has many methodology of community medical learning, one of its facility is Community based medical camp to get virtual medical experience.

Summary of Work: Purpose of this study is to demonstrate one of the best strategy of community based education to approach patient as educator. We enroll medical student, internist and medical specialist in Sawanpracharuk medical education center, Nakhonsawan, Thailand. This study took place in primary medical care. The community based medical camp has 4 stations consisting of history taking and physical examination until basic medical treatment station, basic cancer screening station, patient education station and patient doctor relationship enhancement station. For the last session of camp, we perform public benefit for example cleaning public rest room, cleaning primary medical care center. Then we use questionnaires from google form to integrate and evaluate data and impressive experience.

Summary of Results: Total enrolled case was medical student (65%), internist (25%), medical specialist (10%). They receive many advantages of community based medical camp consist of improving professional responsibility(77.3%), improving professional competent(72.7%), maintaining appropriate relation with patient(63.6%), improving patient confidentiality(59.1%), improving scientific knowledge(54.4 %), improving accessibility to health care(50%), improving quality of health care(40.9%), maintaining trust by managing conflict of interest(40.9%), distribution of finite resource(31.8%), honesty with patient(31.8%). The summarize, this study report that community based medical camp can improve medical professionalism(82.5%) by learning to approach patient as educator.

Discussion and Conclusions: We have many strategy to improving medical professionalism. Community based medical camp is one of the best methodology by receiving virtual medical experience and approach patient as educator in Medical educational center.

Take-home Messages: The more we access advance technology, the more we should approach to patient with empathy and humanity to be a professional physician which is part of global health care developing.

Early Exposition to General Practice for Second-Year Medical Students: An Opportunity to Discover Clinical Examination, Professionalism and the Roles of General Practitioners?

AUTHOR(S):

- **Sophie Sun, Collège Universitaire de Médecine Générale, Université de Lyon, France (Presenter)**
- **Sophie Pelloux, Collège Universitaire de Médecine Générale, Université de Lyon, France**
- Christine Maynié-François, Collège Universitaire de Médecine Générale, Université de Lyon, France
- Xavier Lainé, Collège Universitaire de Médecine Générale, Université de Lyon, France
- Caroline Tilikete, Collège Universitaire de Médecine Générale, Université de Lyon, France
- Gilles Rode, Collège Universitaire de Médecine Générale, Université de Lyon, France

ABSTRACT

Background: First internship with General Practitioners (GP) occurs between the fourth and sixth years in the curriculum of medical students in France. In 2018, the Faculty of Medicine of Lyon Est was the first to set up an internship with GPs for second-year students. Its objectives were to discover clinical examination, professionalism, and the roles of GPs. Our research question was: were the educational objectives of this internship achieved?

Summary of Work: Half of the second-year students of the Faculty of Medicine of Lyon Est completed an internship of 5 half-days with GPs during September 2018. The evaluation was built on Kirkpatrick's model. Satisfaction of students and of GPs was measured using Lickert scales (0 not at all satisfied to 5 very satisfied). A questionnaire assessed learning achievement: we asked students which parts of the clinical examination they could carry out themselves under supervision, and which topics related to professionalism and the roles of GPs they discussed with GPs.

Summary of Results: At the end of January 2019, of the 217 students who completed their internship with GPs, 47 responded and their median satisfaction score was 4. 43 students (91%) declared that this internship should continue to be offered. Of the 204 GPs who hosted second-year students, 120 responded and their median satisfaction score was 4. 88 physicians (73%) wished to continue to receive a second-year student. Students could perform part of the physical examination themselves for 44 of them (94%), and part of the clinical interview for 46 (98%). They had the opportunity to address at least one notion of professionalism (medical secrecy, responsibility, independence) for 46 of them (98%) and the roles of GPs for 45 of them (96%).

Discussion and Conclusions: Students and physicians were satisfied by this innovative internship. This on-going evaluation reveals that second-year students can discover clinical and professional skills during an early internship with GPs and encourages its perpetuation.

Take-home Messages: An early internship with GPs for second-year medical students is possible and well accepted by GPs and students. Students can discover clinical examination, professionalism and the roles of GPs.

What do medical students learn from Pediatrics family home visit? Mixed method

AUTHOR(S):

- Nawarat Aroonyadech, Sunprasitthiprasong Hospital, Thailand (Presenter)

ABSTRACT

Background: Family home visit is a didactic strategy allowing medical students to comprehend the health illness process in a biopsychosocial way. Our goal was to assess what they learned from family home visit in a part of social pediatrics.

Summary of Work: During a 12-week clinical rotation in Pediatrics, 5th year medical student at Sanprasitthiprasong Hospital are require to visit children with chronic illness which need continuing care at home. Data collection from 5 simple questions likert scale questionnaires and group interview. Content analysis was perform for data obtained from group interview. Student perception on difference aspects they learned from home visit were describe as percentage.

Summary of Results: Most of student rated the home visit worthwhile (97%). 85% reported home visit increase their capacity to apply medical knowledge with reality situation and also help them develop communication skill(83%). 88% felt home visit sensitized them to social commitment and more empathy. From analysis of students' interviews, they reported that home visit enhanced them clearly understand in reality situation and biopsychosocial aspect of patient , collaborate with multidisciplinary team and community, more emphasize in quality of family care-giving and increase motivation to do holistic care approach.

Discussion and Conclusions: Family home visit enhanced students learning in professionalism , community and holistic care and humanist and social profile as future healthcare professionals.

Take-home Messages: The home visit is essential for providing a learning experience in biopychosocial way and enhanced students learning in professionalism and humanist.

Medical student's perspective on home visiting program

AUTHOR(S):

- Bor-Yuan Tseng, School of Medicine, Buddhist Tzu Chi University, Taiwan (Presenter)
- Shao-Yin Chu, Department of Medical Education, Buddhist General Hospital, Taiwan

ABSTRACT

Background: A comprehensive medical education should include medical science and medical humanities. There are different ways cultivating medical student's humanitarian accomplishment all over the world. Home visiting program (HVP) was conducted to year one medical students (MS) at School of Medicine, Buddhist Tzu Chi University as part of humanity courses. This study present MS's perspectives on HVP.

Summary of Work: 56 first-year MS, age ranged from 18-33 years old, was divided into 10 groups. 5-6 MS of each group were supervised by three volunteer mentors who had constructed chronic relationship with socially vulnerable consented families to be visit. Three times of home visits were conducting in one semester. A 5-point Likert scale questionnaire including three dimensions of knowledge/skills/attitudes with 21 items was designed and completed by MS after the home visit. Cronbach's alpha (α) for the 21-items scale was 0.87 and content validity was tested based on expert views.

Summary of Results: The response rate was 59%. 75.8% of MS aware the minority population existing in the society after HVP. 51.5% and 44.5% of MS agree HVP can improve skills of communication and conduct holistic care respectively. 42.4% learned how to support and comforted others through volunteer mentoring. 57.5% consider HVP nurture good doctor-patient relationship in the future, and 42.4% felt the sense of accomplishment after helping others. 72.7% and 60.7% agree HVP promote empathy and respect for life respectively. Overall, only 63.7% MS satisfied HVP. Unsatisfactory rate was higher at MS aged less than 20 and those who comes from big city area (41.7% vs 25%, 45.8% vs 14.3%). For the 36.3% (12/33) unsatisfied students, 7 suggested HVP after senior.

Discussion and Conclusions: HVP not only lead medical students to a fuller understanding population of low social economic status and their suffering patients, but can also learn empathy, implementing holistic care and respect to every unique living style. Reasons for younger medical students not appreciating the humanity course need further clarification.

Take-home Messages: Home visit is still a good method to teach medical humanity. The optimal timing to implement may do more with less.

Influencing nursing students' perceptions of community care with curriculum-redesign

AUTHOR(S):

- **Margriet Iersel van, Amsterdam University of Applied Sciences, Netherlands (Presenter)**
- Corine Latour, Amsterdam University of Applied Sciences, Netherlands
- Rien de Vos, Academic Medical Center, Netherlands
- Paul Kirschner, Open University of the Netherlands, Netherlands
- Wilma Scholte op Reimer, Academic Medical Center, Netherlands

ABSTRACT

Background: In many Western countries, healthcare is changing from intramural care to caring for patients in their own homes. However, it is problematic that most nursing students orientate on a career in the hospital, which leads to increasing labour market shortages in community nursing. Providing students with a more community-orientated curriculum may help build more positive perceptions that lead to other career choices.

Summary of Work: The curriculum-redesign is based on research about first-year students' perceptions and placement preferences. First, a cross-sectional multicentre survey study with first-year students (n = 1058) was conducted using the SCOPE-scale (Scale on COmmunity care PErceptions). Second, a focus group study with students (n = 16) was performed to better understand the factors underlying students' perceptions.

Summary of Results: The findings of the survey confirm the hospital's popularity, as 71.2% prefer the hospital and only 5.4% choose community care, which is perceived as a 'low-status-field' with little care complexity and few challenges. The focus group study led to formulation of eight themes, namely (1) variety and diversity, (2) challenges, (3) improving peoples health, (4) collaboration, (5) role models, (6) patient- or environment-based perceptions, (7) self-efficacy, and (8) immediate vicinity. Students' perceptions of community care are at odds with what they consider important in professional practice.

Discussion and Conclusions: Students have clear ideas about what they think is attractive but their perceptions do not always appear to be realistic. They expect the hospital to possess all desired characteristics while community nursing is perceived as primarily elderly care and guidance in daily life. Many students have a limited view of what complex caregiving entails as they attribute this only to acute care involving technical skills.

Take-home Messages: Curriculum designers can more prominently highlight the complexity of community nursing in the theory, and patient cases can be presented that do not fit the stereotypical views commonly held. Also, it is important that students collaborate with mentors in the field with an appropriate level of education, who can act as a source of inspiration. This can potentially increase awareness of the fields opportunities and contribute to well-informed career decisions.

Visiting rural hospital as an inspiration tool during selection for rural doctors

AUTHOR(S):

- Araya Khaimook, Hatyai Hospital, Thailand (Presenter)

ABSTRACT

Background: Thailand still has a problem of shortage of rural doctors in some rural areas. One strategy to maintain rural doctors is to recruit medical students from local areas but not all students are familiar with rural hospitals.

Summary of Work: In 2019 student selection for medical students of Hatyai CPIRD and faculty of medicine, Prince of Songkla University. Forty students need to select from 64 high-school students that applied for medical students in TCAS1 (Thai University Center Admission System step 1, Portfolio). During two-day of selection process, all of students have opportunity to visit rural hospital and observe home health care system in the village for half day.

Summary of Results: At the reflection period after visiting rural hospital, students showed their understanding for need of rural health care system and clarify their future roles and moreover inspire them to be a rural doctor. In other hand some of them have decided not to be rural doctors

Discussion and Conclusions: Visiting rural hospital as a part of student selection can inspire students for their future roles and also help them make decision according to their preferences. Conclusion This innovative way of student selection makes it more vivid and more relevant to their near future contexts

Take-home Messages: Visiting rural hospital can inspire and help students understand more in their future roles.

Students' rural background and training in well-equipped rural teaching hospitals enhance intention to return to work in rural hometown

AUTHOR(S):

- Wasana Hongkan, Collaborative Project to Increase Production of Rural Doctors, Thailand (Presenter)
- Rongtiva Muenpa, Collaborative Project to Increase Production of Rural Doctors, Thailand
- Parinya Chamnan, Collaborative Project to Increase Production of Rural Doctors, Thailand

ABSTRACT

Background: Thailand's Collaborative Project to Increase Production of Rural Doctor (CPIRD) recruits students with the rural background and provides training in rural teaching hospitals. We studied students' main reasons for attending this rural recruitment project and their intention to work in rural areas. We also examined factors associated with the intention to work in rural areas.

Summary of Work: During the academic year 2017-2018, 1,349 fourth-sixth year students from 34 rural teaching hospitals under CPIRD responded to a questionnaire about their gender, year of medical study, size of teaching hospitals, a domicile of origin, parental occupation, family income and main reasons for choosing to attend the CPIRD rural medical schools as well as their attitudes towards rural job placement. Factors associated with student intention to work in rural areas were examined using exact probability test, t-test, and one-way ANOVA.

Summary of Results: Of 1,349 medical students, 809 (60%) were female, 914 (68%) had adequate family income, 519 (38%) had a domicile of origin in rural areas, 247 (18%) had either a mother or father being health professionals. The top three main reasons for choosing to attend the rural medical schools were intention to return to work in their hometown (32%), student recruitment being less competitive (18.5%) and pre-specified job placement in their home districts (15%). Medical students who had a domicile of origin in rural areas and trained in large-sized teaching hospitals had higher intention to work in rural hometown ($p=0.037$, and $p=0.010$ respectively). 1,283 (95%) medical students had favorable attitude towards rural placement after their graduation.

Discussion and Conclusions: Discussion: CPIRD's student recruitment strategy may help increase the number of rural doctors possibly through its students' positive attitude towards working in rural health services. Training in real-world rural health service systems might foster students' community-oriented competencies, which in turn enhance rural doctor retention. Conclusion: Recruitment of medical students with rural background and being trained in rural medical schools may enhance the likelihood that they would intend to start and remain working in rural health services.

Take-home Messages: Student rural background and early exposure to rural healthcare services essentially determine intention to work in rural underserved areas.

Rural community site visit: the essential step of student selection for rural medical program

AUTHOR(S):

- Supat Hasuwannakit, Hatyai Medical Education Center, Ministry of Public Health, Thailand (Presenter)

ABSTRACT

Background: Student recruitment for rural medical program is the essential step of prolonged retention in rural hospital. However, the students who apply for rural medical program in Thailand usually come from middle class families and live in urban area. So how can we set student selection process as a self-recognition activity and reassure them to be the rural doctors? Rural community site visit is the essential intervention for rural medical program student selection.

Summary of Work: In 2019, rural medical tract student selection of Hatyai Medical Education Center has the significant change from examination-based to portfolio-based admission. 63 students from 3 provinces applied in this admission process. 40 students were admitted. Only 30.2% of students have rural background. Half day rural site visit was set first day of three day selection process. After a short presentation of expected rural doctor role-model, students had 1/2 hour for the community hospital quick round and 2 hours visiting rural community and talking with poor families, then came back for reflection and writing self-reflection essay. The essay was also the tool for interviewer to select the students.

Summary of Results: The essay content analysis found that 30.2% were student first time visiting rural community, 42.1% of rural background students also get more understanding of rural context. For the essay first three key contents, 60.3% acknowledge the scarcity of doctor and inequity in rural area, 50.8% have inspiration to be a good rural doctor, and 38.1% have more understanding the expected role of rural doctor. However, one student decided to leave this program to be the dentist after visited rural community.

Discussion and Conclusions: Rural community site visit on student selection process is essential especially in setting of portfolio-based admission to acknowledge the students before decision to be the rural doctor.

Take-home Messages: Rural community visiting for rural medical program student selection can both reassure and inspire the students decision to be the rural doctor.

How to improve medical students' interest in rural area: Lessons from TAK

AUTHOR(S):

- Chaiyakit Udnan, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand (Presenter)
- Worasit Charoensin, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand
- Manoch Ouwuttipong, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand

ABSTRACT

Background: Somdejphrajaotaksin Maharaj Hospital Medical Education Center (TAK) is the small medical school in TAK province, under the administration of "Collaborative Project to Increase Production of Rural Doctor" (CPIRD) with "Naresuan University". TAK establish in 2004, start teaching on 2005 to present and can produced 120 doctors. Moreover, from the human resource data of CPIRD found medical students who graduate from TAK has retention in rural hospital 92% (110 doctors). It was the one in medical schools of Thailand that producing doctor to most stay in rural hospital. So, this research has objective to showed TAK model for improve medical student's interest in rural area.

Summary of Work: This study was qualitative research. Data collected by focus group discussion with 20 doctors, 5 nurses and 5 support staffs from TAK and in-depth interview from 5 alumni. Then presented results through description analysis.

Summary of Results: TAK has 7 strategies for improved medical student's interest in rural area includes: (1) Set vision, for support everyone understanding on school's goals. (2) Admission, selected only medical students from postgraduate system. (3) Role model, instructors will improve yourself to be the best role model. (4) Promote CPIRD identity, Instructors will support identity in subject as appropriate. (5) Using the rule for control, medical students will pay for a fine when don't working in rural hospital. (6) Support the training in community hospital, we will sent medical students to training in border hospital for learning rural context and (7) Sharing experience from alumni, for making inspiration to medical students.

Discussion and Conclusions: TAK model is 14 years' experience learning that reflected to be lessons and best choice. However, TAK should searching new strategies for maintenance standard and motivate to medical student's interest in rural area always.

Take-home Messages: TAK model is the best choice for small medical schools. So, Small medical school should apply some strategies for organizational development and improve medical student's interest in rural area.

- Jun Ye Lee, Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore
- Gayathri Devi Nadarajan, Emergency Medicine, Singapore General Hospital, Duke-NUS Medical School, Singapore

ABSTRACT

Background: In Singapore, there is limited understanding of the importance of inter-professional collaboration (IPC) among various healthcare professionals when delivering quality patient-centered care. This could be due to a lack of exposure to IPC as students. In December 2018, Project Aasha, a student-led team comprising physiotherapists, physiotherapy students, doctors, medical students and a sonographer, went to Bung (North-eastern Nepal) to conduct a clinic and education with the aim of improving healthcare through educating the Nepalese patients and healthcare assistants. This yearly trip also served as an exposure for medical and physiotherapy students to collaborate.

Summary of Work: The healthcare professionals and students worked together consistently pre-trip and during the trip. Pre-trip included planning the clinic's stations and flow and preparation of teaching materials for the locals. During the trip, a 2-day clinic was conducted, where medical, ultrasound and physiotherapy services were provided. Students facilitated the workflow by assisting healthcare professionals and observing and handling patient transfer between other professions. Medical and physiotherapy students collaborated to educate the local students on basic first aid and exercise. The students took turns to lead the team each day. Daily reflections and sharings were conducted. Post trip focus group interviews were conducted to determine the benefits of such IPC-associated medical trips to medical education.

Summary of Results: IPC was a recurring theme amongst students' reflections, supplemented by the importance of referrals and effective communication and support between healthcare professionals.

Discussion and Conclusions: Synergistic IPC can provide more sustainable care to patients. This was illustrated through physiotherapy interventions complementing medications in providing more sustainable and holistic care for villagers with chronic problems in Bung. IPC can aid in detecting and reducing medical oversights among healthcare professionals. Early exposure to IPC is pivotal in letting healthcare students better understand the limitations of each profession and appreciate the strengths of others. Ingraining this in healthcare students early is crucial in building a strong team to tackle the ever-changing healthcare needs. Integration of IPC into such trips enhance their effectiveness and student's understanding of it.

Take-home Messages: IPC can be integrated into healthcare education globally for early exposure of IPC amongst healthcare students.

The role of clinical pharmacist in assistant teaching of local anesthetic agents topic in medical students

AUTHOR(S):

- Isariya Pirokrat, Buriram Hospital, Thailand (Presenter)
- Patcharee Yimrattanabowon, Buriram Hospital, Thailand
- Wenika Pangvong, Buriram Hospital, Thailand
- Kittayaporn Chirat, Buriram Hospital, Thailand

ABSTRACT

Background: The clinical pharmacist is an integral member of multidisciplinary patients care team in the hospital. In anesthetic curricula for medical students, one of the most important learning modules is local anesthetic agents (LA) administration. However role and opportunity for assistant teaching in depth in pharmacotherapeutics topics to medical students are not yet exactly clear. Therefore, implementation of this teaching methods may enhance learning and augment student engagement.

Summary of Work: Local anesthetic agents were the essential topic in anesthesiology for 5th year medical students for 4 weeks rotation. The objective of learning and course contents included pharmacokinetics, pharmacodynamics of LA, anatomy of peripheral nerve and LA, local anesthetic systemic toxicity (LAST). The study session was 60 minutes in small groups with case-based scenarios and pre and post- test. The medical students were classified in to two groups of teaching A)conventional anesthesiologists teaching B) clinical pharmacist in assistant teaching. The knowledge scores outcomes between 2 groups were compared and measured by pre and post-test examination and student' satisfaction scores using t-test.

Summary of Results: Thirty of medical students were enrolled, 40.0% was male, mean grade point averages in clinical year were not different in both groups (3.25 ± 0.40 vs 3.28 ± 0.34 , $p = 0.82$). The mean post-test were 8.93 ± 0.99 in group A and 9.44 ± 0.50 in group B with significant different, $p < 0.05$. Also the mean paired t test of pre-post test were significant different ($p = 0.00$), especially in pharmacokinetics and pharmacodynamic of LA. But student' satisfaction score were 4.28 ± 0.61 and 4.33 ± 0.61 $p = 0.738$ with no significant different

Discussion and Conclusions: Clinical pharmacologist facilitates and successful achievement in assistant teaching of LA topic, moreover student evaluations and feedback were positive and acquisition of knowledge.

Take-home Messages: The clinical pharmacist instructions help medical students to enhance learning and understand multidisciplinary team working and reinforce the importance of clinical pharmacist role in clinics Clinical pharmacologist facilitates and successful achievement in assistant teaching of LA topic, moreover student evaluations and feedback were positive and acquisition of knowledge.

The effectiveness of Inter-Professional Education (IPE) Template: Evaluated by Kirkpatrick model

AUTHOR(S):

- Wei Fang Wang, National Cheng Kung University Hospital, College of Medicine, National Cheng Kung University, Taiwan (Presenter)
- Yin Sue Wang, National Cheng Kung University Hospital, College of Medicine, National Cheng Kung University, Taiwan
- Chiung Yu Chen, National Cheng Kung University Hospital, College of Medicine, National Cheng Kung University, Taiwan

ABSTRACT

Background: All health professionals should be educated to deliver client-centered care as members of an interdisciplinary team. Inter-professional Education (IPE) occurs to improve collaboration and the quality of care. In order to help clinical teachers guide trainees to improve the outcomes of IPE. We implement an IPE Template in the clinical training program. The purpose of this project is the evaluation of the effectiveness of IPE Template by Kirkpatrick's evaluation model.

Summary of Work: The IPE Template guide teaching from pre-conference briefing, case grand round, post-conference debriefing, to clinical application. For understanding the effectiveness of the implement IPE Template, we assess learners' course satisfaction, outcomes of knowledge, skills, and attitudes from pre-post IP conference and behavior changes of IPE milestones. The subjective of this project includes the 11 disciplinary trainees in a medical center in Taiwan. The study tool of reaction level is "IPE Perception Scale", learning level is "Effectiveness of Inter-professional Scale". The behavior change level is analyzed of milestones.

Summary of Results: 1. Reaction: The IPE satisfaction from trainee's response is 98%.The perception of Template, "help to understand IPP operating" is 4.83 (5-point scale). The difference of reaction of IPE between before and after implantation Template is significant ($p < .01$). 2. Learning: The outcomes of trainees are significant improvements in knowledge ($t = -12.874$, $p < .01$), attitude ($t = -13.444$, $p < .01$) and skill ($t = -10.755$, $p < .01$) with paired sample t-test. 3. Behavior: There are 6 milestones with significant improvement ($p < .05$) after attending IPE one month. The milestones include "clinical knowledge", "effective communication in inter-professional team", "professional and respectful interaction", "works within an inter-professional team", "recognizes system error and advocates for system improvement" and "identifies forces and practices cost-effective care".

Discussion and Conclusions: The clinical teachers are the key persons to guide trainees to approach IPP. This IPE Template is an important teaching strategy. It will be helpful in the future to develop the IPE teaching strategy and design microteaching. The results of this project are improved references, which look forward to designing a diversified IPP curriculum for trainees in order to improve the competence of inter-professional collaborative practice.

Take-home Messages: 1. IPE Template contributes to teaching and learning. 2. IPE Template has positive results from trainees.

How other disciplines influence team members during multi-disciplinary decision making

AUTHOR(S):

- Kumiko Yamaguchi, Tokyo Medical and Dental University, TMDU, Japan (Presenter)
- Nobutoshi Nawa, Tokyo Medical and Dental University, TMDU, Japan
- Chiharu Kawakami, St. Lukes International University/ Tokyo Medical and Dental University, TMDU, Japan
- Mina Nakagawa, Tokyo Medical and Dental University, TMDU, Japan
- Jun Tsuruta, Tokyo Medical and Dental University, TMDU, Japan
- Keiichi Akita, Tokyo Medical and Dental University, TMDU, Japan

ABSTRACT

Background: An aging society requires coordinated and collaborative care between medical, dental and other varied healthcare professionals. In a super aged society, the importance of home based care and/or regional medical care is increasing. Since students of our university have few opportunities to consider home based care, it is felt that adding a social workers perspective will deepen discussions.

Summary of Work: A total of 347 final-year students from eight health professions, including 108 medical students, participated in a two-day IPE program which included mixed-small-group discussions and lectures. As only a small number of students majoring in social work joined this program, 18 groups had the influence of social work majors, while 30 groups did not. Post-program, participants answered a questionnaire that asked, “Which healthcare professionals affected your decision making regarding patient care the most?” Of those who completed the questionnaire, 336 students answers were analyzed quantitatively, and 107 medical students answers were analyzed qualitatively.

Summary of Results: Among the eight disciplines that participated, the top three chosen by all students were Medicine (chosen by 22.9% of students), Nursing Science (22.9%), and Social Work (21.7%). The top three disciplines chosen by medical students were Social Work (33.6%), Nursing Science (29.9%), and Pharmacology (15.9%). Among students who had social work majors in their team, the top discipline was Social Work (68.9 %). Qualitative analyses revealed that students chose the team members who had different knowledge and skills.

Discussion and Conclusions: In previous studies, our IPE program helped students better understand other healthcare professionals work (Yamaguchi et al., AMEE2014), and the viewpoint of patient-centered care (Yamaguchi et al., AMEE2017). In this study, team members were influenced by contact with students of other healthcare professions who had various ideas differing from their own knowledge and skills.

Take-home Messages: Students were able to realize the importance of coordinated and collaborative care through mixed-small- group discussions consisting of multiple healthcare professionals. Including social work majors in the workshops could improve the IPE program in regard to improved patient-centered medicine.

What Happens When Words Become Action? Undergraduate and Graduate Students' Experiences in an Interprofessional Education Program at the Northern Ontario School of Medicine

AUTHOR(S):

- Gayle Adams-Carpin, Northern Ontario School of Medicine, Canada (Presenter)

ABSTRACT

Background: Interprofessional education (IPE) has been identified as a key learning strategy to enhance the ability of health and social care practitioners to work together to support collaborative patient care [World Health Organization (WHO, 2010)]. This poster presentation will provide a framework for the development of an IPE Program entitled “Interprofessional Education: Examining Collective Competence and Population Health in Northern Ontario”.

Summary of Work: The purpose of my poster presentation is to examine undergraduate and graduate students' experiences of IPE based on their involvement in an IPE Program. Students are involved in both academic and community based IPE.

Summary of Results: Program evaluation results will capture students anonymous written reflections examining their experiences of the IPE Program based on the Program objectives:
Examining roles and scope of practice of a variety of professions;
Analyze and experience how interprofessional competencies support effective client/patient/family/community centred care;
Cultivate an understanding of group processes and collective competence;
Gain an appreciation of how the social determinants of health influence well-being;
Increase knowledge of designing and delivering student interprofessional health promotion workshops with community non-profit organizations.

Discussion and Conclusions: Discussions will focus on 1) advancing understanding of an IPE curriculum that bridges classroom and interprofessional community placements and 2) exploring how interprofessional community engagement may support clinical reasoning and culturally sensitive health professionals.

Take-home Messages: Creating innovative, sustainable and culturally sensitive interprofessional educational models to support students and priority populations may contribute to healthcare transformation in the delivery of collaborative care.

A qualitative study on the impact of IPE in clinical clerkships on clinical educators

AUTHOR(S):

- **Mayumi Asahina, Chiba University School of Medicine, Japan (Presenter)**
- Narumi Ide, Graduate School of Nursing, Chiba University, Japan
- Izumi Usui, Graduate School of Nursing, Chiba University, Japan
- Shoichi Ito, Chiba University School of Medicine, Japan
- Ikuko Sakai, Graduate School of Nursing, Chiba University, Japan

ABSTRACT

Background: Interprofessional education (IPE) has been recognized internationally as an essential education strategy to prepare learners for the delivery of quality healthcare. However, there are still a limited number of programs in clinical clerkships. One of the reasons is that clinical educators have educated only students of their profession until now, they are afraid that their practice and educational activities will be hindered by implementing IPE.

Summary of Work: We conducted IPE in clinical clerkships(CC), twelve teams of medical, pharmaceutical and nursing students allocated in ten wards. To investigate the impacts of IPE in CC on clinical educators, we conducted semi-structured interviews on eight clinical educators of doctors, nurses, and pharmacists who were involved in student education. The contents of the interview were recorded, made into text data and analyzed qualitatively following an inductive approach.

Summary of Results: From the text data, 104 descriptions were extracted from the IPE s impact on clinical educators and classified into five categories and 19 subcategories. The contents of the five categories are: “Brush up of educators student education”, “Acquisition of new awareness about educators own practice and interprofessional practice”, “Promotion of interprofessional practice in current and future ward”, “Positive recognition of educators responses to educational outcome”, “No recognition of educator’s change”.

Discussion and Conclusions: Some educators described they did not have any impact from clinical IPE, while others had a favorable impression from educational outcomes and acquired new perceptions of their educational activities and daily practice. They described students learned more in-depth and active than in non-IPE clerkships. They devised ways of teaching more effective on multi-professional students. Also, they had expectations for the future interprofessional collaboration to go well in the hospital wards. IPE in CC not only changed the educational activities of educators but also changed the way of cooperation with interprofessional collaboration in their current practice.

Take-home Messages: IPE in CC increase CC educational outcomes and improve interprofessional teamwork among health professionals involved.

Experiential Learning “Healthy Aging” program for Interprofessional education (IPE): Challenges and Rewards

AUTHOR(S):

- Jyotsna Pandey, Central Michigan University College of Medicine, USA (Presenter)
- Susan Grettenberger, Central Michigan University, USA
- Allison Putnam, Central Michigan University, USA
- Laurie Bahlke, Central Michigan University, USA
- Andrea Beatty, Central Michigan University College of Medicine, USA

ABSTRACT

Background: Our challenge was to develop a community need based IPE program; developmentally appropriate for the learner level that linked learning activities to development of the AAMC defined competencies (Roles and responsibilities; teamwork; communication and values and ethics). The program’s educational strategies needed to be relationship focused integrating the learning continuum and applicable across practice settings; across professions; common for all professions; and outcome driven.

Summary of Work: We partnered with the local County Commission on Aging to develop an experiential learning “Healthy Aging” home visit for community dwelling seniors. The goals were to: 1) strengthen and build workforce capacity among medical and other health professionals by exposing students to older adult populations and increasing their capacity to engage, assess, treat, and understand older adults’ needs from social, functional, and medical perspective; and 2) ensure that older adults are able to “age in place” within their own homes by expanding access to and availability of preventative health care via the development and implementation of a community-integrated solutions.

Summary of Results: A 3 member team of an year 2 medical student, a health professions student (e.g. physician’s assistant, audiology, and speech language pathology, public health, physical therapy etc.) at different stages of training ranging from year 2 to graduate studies; and a final year social work student conduct in-home visits among older adults to assess fall risks, alcohol use disorders, loneliness and isolation issues, and oral health, with interventions to follow based on individual assessments.

Discussion and Conclusions: Students reported an understanding and respect of the role in healthcare of other professions. The community dwelling seniors reported a sense of pride to be part of the training experience for tomorrow’s health professionals.

Take-home Messages: This learning activity engaged the community in student education while the students learnt the value and workings of an IP environment to improve health outcomes for the elderly.

Patients' Role in Interprofessional Education in the Community

AUTHOR(S):

- E Nok Enoch Ng, Faculty of Medicine, The Chinese University of Hong Kong (Presenter)
- Vivian WY Lee, Faculty of Medicine, The Chinese University of Hong Kong
- Janita Chau, Faculty of Medicine, The Chinese University of Hong Kong
- Samuel Wong, Faculty of Medicine, The Chinese University of Hong Kong
- Paul Lai, College of Surgeons of Hong Kong
- Ann Lau, Faculty of Medicine, The Chinese University of Hong Kong

ABSTRACT

Background: To investigate whether providing inter-professional service learning to university students, and enhancing their involvement with elderly patients in the community can improve their geriatric care knowledge and understanding on patients' needs.

Summary of Work: We implemented the project in summer 2018. This inter-professional education (IPE) project involved 203 students of different disciplines across Faculty of Medicine and Department of Social Work in The Chinese University of Hong Kong. We organised 5 sessions of IPE training workshops and prepared 28 e-learning items for students to study about geriatric care, disease prevention, and communication with patients. In order to provide students with practical interactions with patients, we arranged 48 sessions of community outreach service and reached out to 3122 community-dwelling older patients. Students were assigned to carry out various duties during outreach service, such as conducting health interview, providing basic health check-up service, and giving health education to the patients. As a result, students could gain real world experiences on handling health enquiries from real patients and learned how to explain complicated medical information in layman's terms.

Summary of Results: We saw significant improvements toward students' geriatric care knowledge, satisfaction of interprofessional collaboration, and communication skills with older patients after the project. Students responded that they were more confident to explain health condition to patients. Furthermore, they appreciated this IPE learning experience as they got to serve with students of other disciplines and able to understand the physical and psychosocial needs of the patients through their direct interaction during outreach service.

Discussion and Conclusions: Patients play an important role in interprofessional service learning. They are helpful for the growth of healthcare students and the development of high quality patient care in the long run.

Take-home Messages: In parallel with providing health service, students can also learn valuable real world experience from patients and understand their needs. On the other hand, collaborating with peers from other healthcare professions can also broaden their prospectives in patient care.

Promoting student contribution at Interprofessional Education workshops - differences among eight health professions

AUTHOR(S):

- Chiharu Kawakami, St. Luke's International University, and Tokyo Medical and Dental University, Japan (Presenter)
- Kumiko Yamaguchi, Tokyo Medical and Dental University, Japan
- Nobutoshi Nawa, Tokyo Medical and Dental University, Japan
- Mina Nakagawa, Tokyo Medical and Dental University, Japan
- Jun Tsuruta, Tokyo Medical and Dental University, Japan
- Keiichi Akita, Tokyo Medical and Dental University, Japan

ABSTRACT

Background: An ageing society requires coordinated and collaborative care between nurses, doctors, and other healthcare professionals. Consequently, the undergraduate curricula of these professions should provide opportunities for students to gain the competencies necessary to provide such care. Thus, in 2012, we began organising a multidisciplinary Interprofessional Education (IPE) workshop for final year healthcare students. The present study was undertaken to investigate factors that influence student contribution at IPE workshops.

Summary of Work: Our university conducted an IPE workshop in 2018. About 340 final year students from eight health professions participated in a two-day case-based IPE workshop. A case containing systemic, oral, and social issues was prepared to promote active participation of all students in small, mixed-group discussions. All students completed post-participation questionnaires. A survey was conducted on the questionnaires, focusing on the following items: 1) a 1-8 rating of the workshop's contribution, 2) a 1-4 satisfaction rating, and 3) students' comments and reflections on the workshop (from students in programmes with contribution ratings in the lower tertile). Descriptive statistics and correlation analyses between contribution and satisfaction were performed on the quantitative data in items 1 and 2, while inductive qualitative analysis was conducted on item 3; both sets of data were convergent.

Summary of Results: The mean ratings for contribution and satisfaction were 5.50 and 3.74 points, respectively. The contribution and satisfaction ratings were positively correlated ($p < 0.01$). From the eight health professions, the highest contribution rating was among medical students (6.05 points). The professions with the lowest contribution points were medical technology (4.53 points) and oral health (4.70 points). The comments of medical students in the lowest tertile for contribution revealed a theme of 'inability of the leadership to advance discussion'. Additionally, analysis of comments from students with lower contribution ratings revealed 'a shortage of professional knowledge' and 'inability to demonstrate their own profession'.

Discussion and Conclusions: Results suggest a correlation between students' contribution and satisfaction, with differences between the eight healthcare professions. It is necessary to prepare programs that can demonstrate their expertise.

Take-home Messages: Expertise as a professional would be necessary for better learning at IPE.

Assessment of Functional Ability and Rehabilitation Course - Interprofessional Pilot

AUTHOR(S):

- Katri Salokangas, University of Eastern Finland, Finland (Presenter)
- Henna Saari, University of Eastern Finland, Finland
- Pekka Mäntyselkä, University of Eastern Finland, Finland

ABSTRACT

Background: Internationally it's considered increasingly important for social and health professionals to be able to do impressive work in interprofessional teams. Assessment of functional ability and composing of rehabilitation plan based on the international ICF classification can't, in practice, be achieved without an interprofessional process. Currently students in different fields (rehabilitation, medicine and social work) study separately in their own subjects without common study contents. The interprofessional pilot of The Assessment of Functional Ability and Rehabilitation Course aims to develop a course where collaborative studies in three different fields will provide better skills than currently for interprofessional functional ability and rehabilitation assessment in practical working life.

Summary of Work: The 6th annual course medical students, the 4th annual course rehabilitation students and the advanced students of social work will participate in the pilot, about 30 students from each field. The pilot is implemented in November 2019. Moodle is used as a network learning platform. Each field will write out its own intentions and common goals for interprofessional work will be formed together. The contents of the course include a network-based pre-learning material, an interprofessional rehabilitation meeting as a simulation training and learning assignments, which are an interprofessional rehabilitation plan and a learning diary.

Summary of Results: At the beginning and in the end of the course, students complete a valid RIPLS questionnaire (Readiness Towards Interprofessional Learning Scale) which measures the student's attitudes and readiness. The achievements of other learning objectives are measured by using a learning diary. There is also a possibility to compare rehabilitation plans if there is differences between the pilot group and the rest of the medical course students which do it without the interprofessional team.

Discussion and Conclusions: If the experiences of the pilot course are good, there is a plan to expand interprofessional learning for all medical students of the 6th annual course on this subject.

Take-home Messages: It's well recognized that there should be interprofessional learning already for the undergraduate students. It turns attitudes towards interprofessional working more positive. Functional ability assessment and rehabilitation plan composing are interprofessional also in real social and health care work.

A successful, enjoyable interprofessional education program for first-year healthcare students

AUTHOR(S):

- Ryota Asai, Nagoya University School of Medicine, Japan (Presenter)
- Mina Suematsu, Nagoya University Graduate School of Medicine, Japan
- Kentaro Okazaki, Nagoya University Graduate School of Medicine, Japan
- Noriyuki Takahashi, Nagoya University Graduate School of Medicine, Japan
- Masafumi Kuzuya, Nagoya University Graduate School of Medicine, Japan
- Wataru Ohashi, Aichi Medical University, Japan

ABSTRACT

Background: Recently, stepwise education for interprofessional education (IPE) has become increasingly important worldwide. Although various IPE programs have been implemented in several universities in Japan, most are lectures. Additionally, evaluations have not been effectively conducted. Therefore, we evaluated the effects of a new, one-day IPE program for first-year undergraduate students.

Summary of Work: The IPE program included 316 first-year healthcare students (108 medical and 208 pharmacy students, divided into 33 small groups of mixed professions). Each group played an interprofessional education game and discussed their reactions to a movie related to end-of-life care (Cinemeducation). We evaluated the effect of this program pre- and post-IPE using the Japanese version of the Interdisciplinary Education Perception Scale, which is reliable and validated (Suzuki et al. 2018) for three subscales: 1. self-esteem for their own profession, 2. cooperation with other professionals, and 3. fundamental ability of their own profession. A total of 15 items were scored on a six-point Likert scale.

Summary of Results: A comparison of pre- and post-IPE scores showed a significant increase in the total score of both medical and pharmacy students (pre-IPE: 70.56, 66.82; post-IPE: 72.40, 69.42, respectively). Overall, the score for “cooperation with other professionals” showed the maximum improvement. The pre-IPE score for “self-esteem for their own profession” was higher for medical students than for pharmacy students, but the post-IPE score in that area for pharmacy students showed higher improvement. There was no gender difference.

Discussion and Conclusions: As an important springboard for interprofessional socialization for novices, we implemented an enjoyable and familiar program using an interprofessional board game and a movie. The students shared the successful experience and their discussions considerably increased “cooperation with other professionals.” Through teamwork in this IPE program, pharmacy students could demonstrate their value and ability to medical students, which enhanced their self-esteem. Further IPE programs involving students of other healthcare professions should be introduced to a stepwise and systematic IPE curriculum.

Take-home Messages: A successful IPE program, which involves sharing experiences through enjoyable and familiar activities, is effective for first-year undergraduate students.

What barriers to medical-dental collaboration did health professions students find during their clinical education? A pilot study

AUTHOR(S):

- Rintaro Imafuku, Gifu University, Japan (Presenter)
- Ryoko Kubota, Asahi University School for Dental Hygienists, Japan
- Saeko Yamada, Asahi University School for Dental Hygienists, Japan

ABSTRACT

Background: “Mouth is the mirror of general health”. In a super-ageing society, effective medical-dental collaboration has become increasingly important for patient care, such as dysphagia rehabilitation and nutrition support. In developing interprofessional education (IPE) that covers oral and general healthcare, learners’ readiness for and attitude toward medical-dental collaboration need to be explored. This study aims at examining the attitude and awareness of health professions students about collaboration between medical and dental practice.

Summary of Work: Semi-structured interviews were conducted with 11 six-year medical and nine third-year dental hygiene students who experienced clinical clerkships in different institutions. A thematic analysis approach was employed to extract the key themes regarding barriers to medical-dental collaboration from the interview data.

Summary of Results: The medical and dental hygiene students generally acknowledged the importance of medical and dental collaboration for patient care. However, several barriers to collaboration were also perceived, including professional power and conceptual hierarchy, limited understanding of other professional roles and responsibilities, boundary-blurring, concerns regarding shared responsibility, differences in language and jargon, and lack of primary healthcare providers’ knowledge on oral health.

Discussion and Conclusions: Barriers to collaboration were perceived differently by different health professions students. For instance, professional power and hierarchy were emphasised more strongly by dental hygiene students. They tended to view themselves as being in a lower-level position in the ‘imagined’ hierarchy of interprofessional team. Their humble view resulted from their limited knowledge about general health and less responsibility for problems directly related to patient life and death. On the other hand, medical students had traditional perspectives of dental professions regarding dental care and did not understand fully what roles/responsibilities dental professionals assume in general healthcare due to very limited opportunity to interact with dental professionals during their clinical education. Therefore, we need to provide more opportunities in which students in medicine and dentistry learn together, particularly in their clinical education. These findings can be a springboard for future development of IPE to overcome the perceived barriers to collaboration.

Take-home Messages: Identifying the similarities and differences in attitudes toward interprofessional collaboration among learners is essential to planning and developing IPE.

Student reflections on inter-professional education: what students have learned?

AUTHOR(S):

- Chitkasaem Suwanrath, Prince of Songkla University, Thailand (Presenter)
- Thitima Suntharasaj, Prince of Songkla University, Thailand
- Pratyanan Thiangchanya, Prince of Songkla University, Thailand
- Nattasiri Thanawuth, Prince of Songkla University, Thailand

ABSTRACT

Background: The Inter-professional Education (IPE) for Patient Safety Course was set for the final-year of health sciences students, including the 6th year medical students, the 4th year nursing students and the 5th year pharmacy students. The students were divided into 40 groups with 12-13 students from 3 faculties in each group. Learning activities were comprised of a half-day workshop, project-based learning and presentation. The project-based learning was assigned for each group to identify patients' risks in the wards, focusing on medication safety and infection control as well as to propose how to solve the problems.

Summary of Work: After completing the course, each group was asked to submit a report with group reflection essays on their experience. The purpose of this study was to perform a qualitative analysis of student reflection essays, so as to evaluate what students have learned from their participation. A total of 40 student essays were analyzed using conventional content analysis.

Summary of Results: Qualitative analysis revealed 15 themes in the essays, which were categorized into 4 main themes: IPE program, patient-centered care, team and self. Students had a positive attitude to the program, particularly the project-based learning, as being helpful by improving their understanding of health care systems as well as their roles in future careers. Most students emphasized the influence of IPE on improvement in patient care. Teamwork enhanced their communication skills, respectful attitudes, understanding other professional roles and sharing on their experience. For the "self" category, students enhanced their professional learning, critical thinking and problem solving, situation awareness, social skill, creativity and management skills.

Discussion and Conclusions: We have learned from student reflections that a well-organized IPE course with project-based learning would help the students achieve an inter-professional core competency as well as other non-technical skills.

Take-home Messages: Reflective writing is an effective method to evaluate what students have learned from a project-based inter-professional education.

Differences in effects of interprofessional education workshops by students' discipline and gender among medical and dental students

AUTHOR(S):

- **Nobutoshi Nawa, Tokyo Medical and Dental University, Japan (Presenter)**
- Kumiko Yamaguchi, Tokyo Medical and Dental University, Japan
- Chiharu Kawakami, St. Lukes International University; Tokyo Medical and Dental University, Japan
- Mina Nakagawa, Tokyo Medical and Dental University, Japan
- Takeo Fujiwara, Tokyo Medical and Dental University, Japan
- Keiichi Akita, Tokyo Medical and Dental University, Japan

ABSTRACT

Background: Studies investigating whether effects of Interprofessional Education (IPE) workshops could vary by students' discipline and gender are scarce. This study's objectives were to assess associations between changes in students' answers concerning various factors of IPE and workshop satisfaction and to examine whether these associations could vary based on students' discipline and gender.

Summary of Work: Our university conducted an IPE workshop in 2013 with approximately 250 healthcare student participants. We limited our sample to 108 students from the schools of medicine and dentistry who attended the entire workshop and had complete information for each measure. Pre- and post-workshop questionnaires were requested of students containing multiple questions regarding various factors of IPE. After the session, all 108 students were asked open-ended questions concerning their experience in the IPE session. Multinomial logistic regression was used to determine associations between differences in score and workshop satisfaction. The responses to open-ended questions were analyzed qualitatively by an explanatory sequential design with deductive coding.

Summary of Results: Students score increases related to the necessity of the workshop, both in medical and dental, were related to overall workshop satisfaction. Analyses of comments revealed medical students tended to mention their own role in the interprofessional collaboration. In dental students, realizing the difference in perspective among different professions was positively associated with the workshop satisfaction (OR: 6.3, 95%CI: 1.7, 23.9). Also, they tended to use expressions such as "really new to me." Both male and female medical students found necessity, patient understanding, and the role of each profession was associated with satisfaction. Only in male students, understanding one's own role and limitations was associated with satisfaction. Comments from male students revealed the realization that they could discuss things outside of their discipline and make treatment decisions as a team instead of just referring patients to specialists.

Discussion and Conclusions: Factors contributing to workshop satisfaction varied by students' discipline and gender. This suggests understanding the differences in factors related to workshop satisfaction is important for tailoring the workshop for maximum effect.

Take-home Messages: Factors contributing to the satisfaction of the IPE workshop varied by students' discipline and gender.

Developing an interprofessional student learning collaboration using simulation to teach technical and human factors

AUTHOR(S):

- **Ato Ocansey, Education Academy, St Bartholomew's Hospital, UK (Presenter)**
- Valance Hughes, School of Health Sciences, City, University of London, UK
- Kaushiga Krishnathasan, Education Academy, UK
- Samantha Hughes, Education Academy, St Bartholomews Hospital. UK

ABSTRACT

Background: Interprofessional collaboration is essential to patient-centred safe clinical practice, with health professionals of all specialties hailing its importance. Simulation has become an increasingly common mechanism of enhancing performance of technical and non-technical skills. Despite its virtues being well known it remains a challenge to provide good quality inter-professional learning events during the student curricula.

Summary of Work: A pilot one-day inter-professional education course consisting of pre-license medical and nursing students from two institutions was developed. The faculty consisted of nurses and physicians with formal teaching qualifications from the two institutions. The focus for half the day was on human factors and team building exercise. The students were introduced through interprofessional team meetings through seminar-based instruction. The second half was spent participating in fifteen-minute role-played immersive simulations using standardised patients (actors) of acute medical emergencies where a collaborative approach was essential in managing the deteriorating patient. Each scenario consisted of participation from two nursing student and medical and learning objectives were assigned to respective curriculums. Structured feedback was given during a post event debrief. Student doctors and nurses concurrently discussed their experiences, management plans and their perceived roles in the workplace as well as reflecting on what they had observed in the future workplaces. Qualitative data was collected during structured debrief sessions and post-course focus groups and anonymous questionnaire, utilising a ten-point Likert scale.

Summary of Results: Nine final year nursing students and three final year medical students voluntarily participated in this course. Students demonstrated increased understanding of the role of their inter-professional colleagues (including communication, teamwork and role delineation). The collective students viewed the course as relevant for their future as practitioners. Participants also appreciated early explicit exposure to human factors and crisis resource management as well as clinical skills.

Discussion and Conclusions: We present a highly approved and active method of providing interpersonal collaborative learning, covering technical and non-technical skills. Hopefully these skills will be taken into the postgraduate workplace.

Take-home Messages: Shared inter-professional learning through simulation is a useful method of teaching technical and non-technical factors.

Same Role. Different Profession: A quasi-experimental study of an inter-professional prescribing masterclass featuring undergraduate medical students and nonmedical graduate prescribing students

AUTHOR(S):

- Alexandra Rolfe, University of Edinburgh, UK (Presenter)
- Alison Mackie, NHS Lothian Pharmacy, UK
- Ruth Paterson, Napier University, UK

ABSTRACT

Background: Prescribing is a high risk and complex skill that a number of health professionals can undertake. Errors are common, up to 11% of all prescriptions, and many are attributable to lack of communication and collaboration. This study evaluated an inter-professional educational intervention, designed to help learners gain skills in prescribing and collaborative practice, shown to improve quality of prescribing and patient safety.

Summary of Work: A quasi-experimental mixed methods study of a prescribing intervention for medical students, nurse and pharmacy prescribing students. The students worked together to formulate evidence-based prescriptions. A uni-professional group of medical students only acted as a control. Quantitative data were obtained using pre and post readiness for inter-professional learning (RIPLS) and self-efficacy scores and a final prescription was analysed for errors using the prescription quality index (PQI). Qualitative data, gained via free-text comments, was thematically analysed.

Summary of Results: Self-efficacy scores significantly increased in all the professions in the inter-professional group (medical student/nurse/pharmacist) compared to the uni-professional group ($P < 0.05$). RIPLS scores significantly increased for inter-professional medical students only ($P < 0.05$). There was no significant change in PQI scores between the groups. Thematic analysis suggested positive attitudes towards collaborative learning, increased understanding of other's roles and the benefit of teamwork on patient care.

Discussion and Conclusions: Students from different professions value learning in an inter-professional environment with improvements in self-efficacy and more positive attitudes and greater understanding of other's roles, suggesting IPE should be fully embedded into healthcare curriculum. However, no change in prescription quality between the groups was observed, an area which requires further research.

Take-home Messages: Inter-professional education can be a very valuable learning experience that helps with understanding of others roles and promotes teamwork and communication, especially if these overlap. However, it must be carefully planned and situated in the differing educational curricula to promote positive outcomes.

Simulation-Based ICU Bed-Side Rounding Required IPE Course for American Medical School Students

AUTHOR(S):

- Valeriy Kozmenko, USD SSOM, USA (Presenter)
- Jessica Simpkins, USD SSOM, USA
- Mark Beard, USD SSOM, USA
- Shane Schellpfeffer, USD SSOM, USA
- Karri Potter, USD SSOM, USA
- Michelle Schimelpfenig, USD SSOM, USA

ABSTRACT

Background: All healthcare providers are expected to be competent within the scopes of their specialty and proficient in teamwork. One of the highest priorities of healthcare education is to improve interprofessional education through activities in which students from two or more professions learn about, from, and with each other to enable effective collaboration and improve health outcomes. Fast paced low-capacity healthcare environments such as operating rooms and intensive care units necessitate providers be competent and efficient in working within interprofessional teams.

Summary of Work: We developed and are piloting an innovative, simulation-based ICU bed-side rounding course. The course contains both clinical and interprofessional components. The clinical aspect of the course provides a framework within which interprofessional education takes place. Prior to the activity, students receive didactic teaching and patients ICU chart. At the simulation center, an inter-professional group of students participates in the simulated ICU bed-side rounding. This activity involves students of different backgrounds educating one another about their scopes of practices, roles and responsibilities, strengths and limitations as well as treatment goals and associated challenges. This activity allows healthcare students to develop a shared mental model of patient care in the ICU, improve the clarity of their roles, and set realistic expectations with each other. Students IPE core competencies are assessed with a 360-degree assessment instrument.

Summary of Results: The course is currently in the implementation phase and data are being collected. By the time of the presentation, we will have the preliminary data to report.

Discussion and Conclusions: Modern healthcare providers are expected to display proficiency with interprofessional teamwork. This skill needs to be taught by academia, and it will likely be required teaching by the corresponding accrediting bodies. IPE courses need to be tailored to national and international IPE competencies and their effectiveness needs to be assessed with an outcome-based measure. ISBR-IPE course is an attempt to develop a standardized teaching methodology and assessment instrument that could be used in healthcare education.

Take-home Messages: There is a need in development of standardized teaching methodologies and outcome-based assessment instruments tailored to achieving national and international IPE competencies. USD SSOM ISBR-IPE course is one of the first attempts in that direction.

Modeling the effect of social interdependence in interprofessional collaborative learning

AUTHOR(S):

- Ikuo Shimizu, Shinshu University, Japan (Presenter)
- Tsuyoshi Tada, Shinshu University, Japan
- Teiji Kimura, Shinshu University, Japan
- Robbert Duvivier, University of Newcastle, Australia
- Cees van der Vleuten, Maastricht University, the Netherlands

ABSTRACT

Background: Interprofessional education (IPE) enables effective collaboration between multiple health professions for better health outcomes and becomes a popular educational model. In IPE, collaborative learning approaches are often used for that purpose. However, it is difficult to transfer the interprofessional working competency into an IPE program by collaborative learning effectively. How collaborative learning may induce this competency is still a debate. Social interdependence, comprised of boundary (group identity), means (role and task), and outcome (goal and rewards), may be a key dimension because it is not only a theoretical background of collaborative learning but also a paramount factor for interprofessional work. This study aims to clarify the relationships between learners' perceived social interdependence in collaborative learning and readiness of interprofessional learning.

Summary of Work: We asked fourth year health professions students undertaking a collaborative IPE class (n=259) to complete two questionnaires: the Japanese validated version of Readiness for Interprofessional Learning Scale (RIPLS) and Social Interdependence Scale in Collaborative Learning (SOCS; Shimizu et al., presented at AMEE 2018). Structural equation modeling was performed for analysis of the relationships among factors in these questionnaires.

Summary of Results: In total, 228 (88.0%) students completed all items of RIPLS and SOCS. The structural equation model provided a good fit; chi-square = 2.396 ($p = 0.302$), CMIN/df = 1.198, CFI = 0.999, RMSEA = 0.030, and TLI = 0.996. All path coefficients were significant but one (means → interprofessional collaboration; $p = 0.206$). Boundary and outcome interdependence positively predicted interprofessional collaboration and interprofessional identity, whereas means interdependence negatively predicted interprofessional identity.

Discussion and Conclusions: Outcome interdependence did not affect interprofessional identity. Furthermore, while tasks in collaborative learning should be realistic, such tasks in IPE may make learners' work specialized and decrease their interprofessional identity. This can be called an "IPE dilemma". This study has shown that the factors in social interdependence in collaborative learning lead to different association regarding readiness for interprofessional learning. To overcome the dilemma, we have to elaborate any IPE program for more positive social interdependence, especially boundary.

Take-home Messages: Some strategies which bind members as an entity may make IPE more effective, such as team building activities and debates among teams.

Retentive learning of closed-loop communication - a post simulation focus group interview study

AUTHOR(S):

- Sabine Nabecker, Department of Anaesthesiology and Pain Medicine, Bern University Hospital, University of Bern, Switzerland (Presenter)
- Joana Berger, Department of Anaesthesiology and Pain Medicine, Bern University Hospital, University of Bern, Switzerland
- Fabian Bürgi, Department of Anaesthesiology and Pain Medicine, Bern University Hospital, University of Bern, Switzerland
- Sören Huwendiek, Department of Assessment and Evaluation, Institute of Medical Education Bern, University of Bern, Switzerland
- Francis Ulmer, Department of Paediatric Intensive Care Medicine, Bern University Hospital, University of Bern, Switzerland
- Robert Greif, Department of Anaesthesiology and Pain Medicine, Bern University Hospital, University of Bern, Switzerland

ABSTRACT

Background: In-situ simulation trains human factors in medicine. The Bern University Hospital's Paediatric Intensive Care Unit (PICU), Switzerland, launched an interprofessional in-situ simulation in 2017 focusing on closed-loop communication (CLC). An observational before-and-after study measured application and sustained use of CLC in daily clinical practice of PICU-nurses. Answers to commands improved after simulation, and were sustained for a 3-month observation period, especially in critical, noisy, and stressful situations. Interviewing nurses, who participated in the previous simulation, this focus-group study investigated their thoughts, feelings and attitudes with the goal of deepening our knowledge about the learning of communication patterns during simulation, and which factors foster retention of competence.

Summary of Work: 10 nurses from the former simulation study agreed to participate in focus-group interviews about one year after. Video-recorded data was anonymised and transcribed. After member checking, we analysed the data qualitatively (MaxQDA2018; Standard-Version 18.1.1, VERBI Software, Berlin, Germany), and performed a thematic analysis (Braun 2006 77-101). We generated initial codes and collated them into properly named themes. At the conference, the final result and report of the thematic analysis will be presented.

Summary of Results: Most participants transferred the learnt communication skills from the simulation environment to their clinical daily life; specifically they closed the communication cycle by responding consciously if a "call-out" reached them. They highly valued the increased self-awareness of their communication habits with all the team members, not just with the nurses. Performed "Team-Time-Outs" (TTO) and observed CLC were considered fostering factors to improve their own communication skills. A "critical-mass effect" was described. As soon as most nurses completed the simulation, communication at the PICU improved observably. The study personnel was not an influencing factor on communication patterns.

Discussion and Conclusions: This focus group interview study revealed factors that contributed to increased and sustained use of CLC after interprofessional simulation. Awareness of the answering process and structured exchange (TTO) fostered their communication, and was seen to improve the PICU-team spirit and collaboration between physicians and nurses.

Take-home Messages: Interprofessional in-situ simulation improves closed-loop communication patterns in PICU clinical daily life.

Using the “Think-aloud” approach in Script Concordance Test to better assess Clinical Reasoning in medical students

AUTHOR(S):

- Michael SH Wan, University of Notre Dame, Australia (Presenter)
- Elina Tor, University of Notre Dame, Australia
- Judith N Hudson, Faculty of Health and Medical Sciences, University of Adelaide, Australia

ABSTRACT

Background: Script Concordance Testing (SCT) is a valid and reliable modality for assessing clinical reasoning. A clinical scenario is presented and students are asked to assess whether an additional information increases or decreases the probability/appropriateness of the diagnosis, investigation/management. The “think-aloud” approach could elicit the students’ response processes; i.e. clinical reasoning in answering each SCT question.

Summary of Work: Twelve and 11 SCT online questions were given to Year 3 & 4 students respectively as practice examinations. Students were asked to justify each answer. The answers were compared with the expert panel (n=15) and marked according to the classical SCT aggregated (weighted) scoring method. Immediately following the examination, students were given the modal answers and the experts’ clinical reasoning behind each decision; as immediate feedback. Students’ justifications were analysed and compared with experts’ reasoning to look at the concordance.

Summary of Results: The response rate was 62% (total 134 students). The mean score was 69% (2.5 S.D below the expert panel’s mean). Ninety three percent of students’ reasoning justification was concordant with the experts. Three percent had incorrect clinical reasoning even with a correct modal answer chosen.

Discussion and Conclusions: The students performed satisfactorily in the formative online practice environment. Most students demonstrated the correct clinical reasoning in deriving their response to SCT items. A few students (3%) used incorrect reasoning even when they had chosen the panellists’ modal answer. This suggests the plausible threat to SCT scores interpretation due to construct irrelevant variable. The think-aloud approach allows students to compare their clinical reasoning with that of the expert panel to further develop their reasoning skills. In the cases of incorrect responses; expert response explanations can provide formative feedback for learning. Analysing the think-aloud component of the SCT also allows the reasoning behind the student response process to be further assessed.

Take-home Messages: The use of SCT with a “think-aloud” approach can be a very useful assessment modality which provides rich information for learning.

What's in it for me? Students' Perspective on Relevance of Items in the National Medical Licensing Examinations in Germany

AUTHOR(S):

- Lucas Thieme, German Medical Students Association (bvmd e.V.), Germany (Presenter)
- Nikolas Psathakis, German Medical Students Association (bvmd e.V.), Germany
- Aurica Ritter, German Medical Students Association (bvmd e.V.), Germany
- Martin Hendelmeier, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Germany
- Jana Junger, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Germany

ABSTRACT

Background: The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy (IMPP) is responsible for the draft of state examinations in Germany and - together with health care professionals with long experience in medical education - develop the German state examinations in Medicine. One of the most important aims of the state examination is to assure that medical students are “fit for the first day” as health care professionals, fulfilling the CanMEDS Framework. As medical students are immediately affected and possible future medical teachers, their perspective on the relevance of items in the national medical licensing examinations in Germany is of concern.

Summary of Work: Overall, 60 medical students were trained at the IMPP concerning BLOOM-taxonomy, classification systems and interrater-training. Throughout this process from August 2018 until today, the medical students operated in working groups and evaluated 3133 items of 14 exams. Along this progress different sub-criteria were correlated with the subjective assessment of item relevance, e.g. ‘difficulty level’, ‘relevance of the item’s topic’, ‘topic taught in our own medical school’, ‘clinical relevance’, ‘item should be excluded in future’ and ‘vignette evaluation’.

Summary of Results: To show exemplary part of our results, a high clinical relevance correlates with a low intention of excluding the corresponding item ($r = -0,727$). We also ensured that the difficulty level of an item does not correlate with the intention to exclude it ($r = -0,004$). We have raised descriptive statistics of impact factors on exam items as well.

Discussion and Conclusions: Items with a high clinical relevance will remain in future medical exams while items with low clinical relevance will be eliminated. Thus, the evaluation results will be used to improve further medical state exams through changing criteria for item choice.

Take-home Messages: Taking into account the students’ perspective on the relevance of items in Germany’s national medical licensing examinations is important to improve upcoming state examinations. As assessment drives learning, this process can contribute to “fit for the first day” health care professionals.

An Investigation of Distractor Functionality on the International Foundations of Medicine Clinical Science Examination based on Low-stakes and High-Stakes Testing Contexts

AUTHOR(S):

- Raja Subhiyah, National Board of Medical Examiners, USA (Presenter)
- Carol Morrison, National Board of Medical Examiners, USA
- Craig Stevens, National Board of Medical Examiners, USA
- Beth Gallagher, National Board of Medical Examiners, USA
- Allison Kulesher, National Board of Medical Examiners, USA
- Brownie Anderson, National Board of Medical Examiners, USA

ABSTRACT

Background: Research suggests that three options (two distractors) are optimal for multiple choice questions in most cases. Additional distractors are typically selected by few examinees and are essentially nonfunctional. Raymond and Stevens argued that traditional definitions of a nonfunctional distractor may not be appropriate for medical education examinations designed to be mastery tests. They applied a new index for evaluating distractors that considers item difficulty and found that 34% of the items on a physician licensing examination had three functional distractors.

Summary of Work: This study extends the distractor research by applying traditional and new distractor indices to items from the International Foundations of Medicine (IFOM) Clinical Science Examination (CSE). All items with five options from one IFOM CSE English language form (n=116) were analyzed. Given that IFOM CSE is an international examination used for both low-stakes purposes such as benchmarking and curriculum evaluation and high-stakes purposes such as certification and residency selection, distractor functioning was examined for both testing contexts. The impact of eliminating distractors on test difficulty and score reliability was also investigated by eliminating the least popular distractor and by random distractor deletion.

Summary of Results: Regardless of which index was used to identify nonfunctioning distractors, the percentage of functioning distractors was considerably higher on IFOM CSE than the percentage reported in most previous studies and was higher when calculated based on high-stakes rather than low-stakes administrations. All four distractors were functional based on both indices for the high-stakes context and three distractors were functional for the low-stakes context. Both methods of eliminating distractors resulted in slightly easier tests with slightly less reliable scores.

Discussion and Conclusions: Although previous research shows that most items only have two functioning distractors, this study found that more distractors on IFOM CSE are functional. IFOM CSE is used by organizations and schools in many countries for a variety of purposes. Given its international population and different testing contexts, items with four or five options may be preferred for IFOM CSE.

Take-home Messages: Test development practices should be guided by the context in which the examination is administered.

A Collaborative Platform to Manage High Quality Assessment Items on a Large Scale

AUTHOR(S):

- Yan Jin, The Chinese University of Hong Kong, Hong Kong (Presenter)
- Shekhar Kumta, The Chinese University of Hong Kong, Hong Kong
- Ho Keung Ng, The Chinese University of Hong Kong, Hong Kong
- Paul B S Lai, The Chinese University of Hong Kong, Hong Kong
- Alex L. K. Yung, The Chinese University of Hong Kong, Hong Kong

ABSTRACT

Background: High Quality assessment items are desired in the many high stakes professional examinations that take place during each of the several years of undergraduate medical studies. Producing new assessment items, continuously, is certainly not an easy task for academic teachers, as well as practicing clinicians, particularly in the context of time-pressures, given their teaching, service and research commitments. Assessment items need to be developed, scrutinized, delivered and measured for their psychometric properties, before they could be considered as high quality. Assessment items not only need quality assurance but also need to be securely stored, and made available to various disciplines across the faculty.

Summary of Work: Faculty of Medicine, The Chinese University of Hong Kong (CUHK) has developed a multiplatform, to provide a standardized assessment item format for content experts to create assessment items and to review their performance by evaluating their psychometric performance data. This user-friendly multi-function interphase has powerful administrative features that enable users to classify items according to MeSH headings and user defined criteria, to deliver them across various disciplines, and to collaborate with other institutions for sharing items.

Summary of Results: This collaborative platform has been shared by 30 International medical schools. A multi-disciplinary assessment bank has a database of over 28,000 Items - each well classified according to Taxonomy, Discipline, Psychometrics amongst other parameters. Psychometric data on items used in examinations is continuously updated and enables the development of tests to suit desired learner characteristics. Office of Medical Education (OME) is a centralized resource office in Faculty of Medicine, CUHK. Item writing professionals facilitate quality items writing for teaching staff among faculty departments. An Item bank administrator in OME facilitates teaching staff and department administrators on managing individual departmental item bank via this platform.

Discussion and Conclusions: Faculty of Medicine, CUHK has maintained and utilized this platform to support assessments across the 6-year undergraduate curriculum. Each year more than 200 examinations involving 8000 assessments items are administered across 13 departments/divisions within the faculty.

Take-home Messages: A Centralized, user-friendly, multi-function and a robust platform is a practical and effective way for the security and maintenance of high quality assessment items, that could be shared locally or internationally.

Objective Structured Knowledge Assessment (OSKA) - a novel formative assessment tool

AUTHOR(S):

- Adam T Misky, Imperial College School of Medicine, UK (Presenter)
- Amir H Sam, Imperial College School of Medicine, UK
- Karim Meeran, Imperial College School of Medicine, UK

ABSTRACT

Background: The importance of asking questions to enhance teaching for medical professionals has been recognised in educational literature. The ability to articulate responses to clinical questions is a vital skill in the clinical environment. Increasing clinical service pressures have led to a decline in encounters where students are exposed to this style of learning. Assessment of medical students' ability to articulate responses to clinical questions is minimal in undergraduate examinations. We developed a formative assessment tool, the Objective Structured Knowledge Assessment (OSKA), where students are questioned on specific clinical topics and scenarios, and encouraged to articulate their thinking process.

Summary of Work: Students who attended the OSKA completed an anonymous questionnaire of 13 questions relating to student satisfaction, clinical and curricular relevance, and feedback compared to traditional clinical teaching immediately after the OSKA. Answers were collected using a five-point Likert scale. We examined the correlation between the students' performance in the OSKA, and single best answer (SBA) questions assessing the same clinical topics.

Summary of Results: 214 students took the OSKA, of which 125 students answered the questionnaire. 97.6% of students were very satisfied or satisfied with the quality of the session. 99.0% of students thought the topics discussed were clinically relevant. 79.2% of students felt more at ease and 84.8% felt more engaged by the session than available conventional clinical teaching. 82.4% of students felt the quality, and 85.6% of students felt the quantity of feedback received was better than feedback offered at available conventional clinical teaching sessions. Pearson correlation between the students' OSKA scores and SBA scores was 0.233 ($p < 0.001$).

Discussion and Conclusions: The OSKA enhanced the students' learning experience significantly. An overwhelming majority of students felt this session was in some respects superior to the available conventional clinical teaching, which remains the gold standard. The statistically significant weak correlation between OSKA and SBA scores suggests that the two tests are assessing different constructs.

Take-home Messages: The OSKA is an acceptable formative assessment tool, that can help enhance students' ability to articulate their answers in response to clinical questions.

Psychometric-evaluation-guided improvement in assessment quiz of a speciality department in undergraduate medical education at King Khalid University, Saudi Arabia

AUTHOR(S):

- **Ahmed Maqbul ALHadithi, College of Medicine, King Khalid University, Saudi Arabia (Presenter)**
- Abdulaziz Alamri, College of medicine, King Khalid university, Saudi Arabia
- Mohammad Tauheed Ahmad, College of medicine, King Khalid university, Saudi Arabia
- Bahaeldin Ahmed Hassan, College of Medicine, King Khalid university, Saudi Arabia
- Muhammad Abid Khan, College of Medicine, King Khalid university, Saudi Arabia

ABSTRACT

Background: Specialty subjects such as dermatology, anaesthesiology, psychiatry etc are generally not considered important by the undergraduate medical students as they have relatively lower weightage in the assessment grades. Hence many aspects of the teaching-learning exercise in such subjects suffer, affecting the outcome of medical education.

Summary of Work: Item analyses of all graded multiple-choice question-based quizzes is routinely conducted by the department of medical education at King Khalid University. Discrimination index, difficulty index, distractor index and K-20 values for all items are calculated and analysed. Based on the findings of the item-analyses, the course co-ordinators are provided detailed feedback of all the graded quizzes. Quizzes conducted by a specialty department (name not disclosed) for the student assessment for semester ending December 2017 fared poorly on most of the indices. Based on these findings, a detailed analysis of the results was conducted in meetings with co-ordinators and faculty members of the concerned subject. Faculty members were provided specialised trainings by the medical education department regarding how to construct high quality MCQs. Problems in content delivery were also identified and measures taken.

Summary of Results: Item analyses for the next semester (May 2018) showed some improvement. The item analysis of the quizzes was again performed at the end of the next semester (December 2018) and significant improvement in most of the item analysis indices was seen as compared to the first reading (December 2017). Acceptable questions improved from 16% to 61%, while the percentage of items with zero non-functioning distractors rose from 11% to 41%.

Discussion and Conclusions: Item analyses guide the faculty in improving the questions/items and removing the defective ones from the question bank. In our study, there was a significant improvement in the quality of the quizzes by undertaking the psychometric evaluation (item-analysis) guided measures.

Take-home Messages: Psychometric evaluation of MCQ quizzes provide a valuable opportunity to improve the quality of the quizzes and the overall teaching-learning process.

Know when to hold 'em: Answer changing behaviors in second year medical students

AUTHOR(S):

- Terrence Miller, Touro University Nevada College of Osteopathic Medicine, USA (Presenter)
- Kristina Lindquist, Touro University Nevada College of Osteopathic Medicine, USA

ABSTRACT

Background: We analyzed data from Examssoft computer-based exams to explore novel aspects of answer-changing behavior on medical school multiple-choice exams. We addressed the following: does the score improvement from changing answers outweigh the cost in extra time spent on the questions? Do students change answers before or after all questions have been addressed?

Summary of Work: Exam data for twenty second-year osteopathic medical students were analyzed. Students were evenly selected from top and bottom academic quartiles. Exams used for analysis were the academic year's first (198 questions), fifth (204), and tenth (235). Data included: number of questions changed from incorrect-to-correct, correct-to-incorrect, incorrect-to-incorrect; number changed before and after all questions had been viewed; average time spent on questions with changed answers compared to overall average time per question.

Summary of Results: 3.3% of answers were changed on average, with little variance between exams or quartiles. Net benefit on an exam varied from 0 to +2.3 correct responses per student. 15% to 34% of changed answers were incorrect-to-incorrect. Students across both quartiles and all exams made 23% to 43% of answer changes before all questions had been viewed. Among students in the top and bottom quartiles, time per question increased by 130 and 84 seconds, respectively, for questions with answer changes.

Discussion and Conclusions: Overall our students' exam scores were modestly increased as a result of the changed answers, corroborating reports by others. However, considerable additional time was spent on these questions. Reconsidering questions and changing answers during an exam increases the risk of not completing all exam questions. On a 400 question licensing exam such as COMLEX-USA Level 1, spending two additional minutes on 3% of the questions increases testing time by 24 minutes. The frequency of incorrect-to-incorrect changes indicates that students did not grasp material tested by the question, despite spending additional time.

Take-home Messages: When a student is indecisive concerning a question, the student should flag it and continue testing without returning to the question. After all questions have been answered, the student should return to flagged questions to reconsider answers. For these questions, students should also carefully consider answers initially discounted as obvious distractors.

Problematic Multiple Choice Questions: the students' view

AUTHOR(S):

- Isabel Neto, Faculty of Health Sciences, University of Beira Interior, Portugal (Presenter)
- Gonçalo Carneiro, Faculty of Health Sciences, University of Beira Interior, Portugal

ABSTRACT

Background: Tests with multiple choice questions are used in most medical schools to assess knowledge. It is difficult to construct good quality items and there are published articles and guidelines that can help teachers on their job. However, many times we see that these rules are not followed which can negatively influence students' performance and on the other hand favour those who doesn't know the content and have the ability to take advantage of errors and clues. Our aim was to know the perception of medical students about the negative influence of errors in the construction of MCQs on the way they answer and also their ability to give correct answers taking advantage of item flaws and suggestions.

Summary of Work: We conducted a survey to all medical students (N=946) where we used the guidelines of NBME Item Writing and asked about the negative influence of not using those guidelines in their performance. We also used examples of MCQs with more frequent construction errors where students were asked to guess the correct answer.

Summary of Results: 728 students answered the survey. Overall medical students have the perception that MCQs that don't follow the rules for their construction have a negative influence in their performance (74,7%). The more negative influences were the question being confuse (96,8%) and complicated distractors (95,2%). Inversely the factor that students consider to have no negative influence or little influence was the use of clinical vignettes or problems (54,8%), with a difference between students of pre-clinical (41,7%) and clinical (70,7%). About students' ability to answer questions with flaws and suggestions results show that they are less able to use convergence strategy (9,3%) but more able to take advantage of logical and grammatical clues (90,2%).

Discussion and Conclusions: Our results show that common errors in the construction of MCQs may have a high negative impact on students' performance and the use of clinical vignettes or problems may mitigate it. Students reveal that they may take advantage of those errors.

Take-home Messages: Good quality of MCQs are appreciated by medical students and makes assessment more fair.

Make a quiz, gain knowledge

AUTHOR(S):

- Watcharaphol Poonual, Uttaradit Hospital, Thailand (Presenter)
- Thidarat Pankaew, Uttaradit Hospital, Uttaradit Province, Thailand
- Waraporn Solosprom, Uttaradit Hospital, Thailand

ABSTRACT

Background: Making a quiz may enhance knowledge retention. However, scarce robust evidence is found in medical education. This study aimed to assess student understanding and knowledge retention through constructing three multiple choice questions.

Summary of Work: This is a qualitative and quantitative experimental study included 25 fourth-year medical students in Pediatric, and Obstetrics and Gynecology Clerkship. They were assigned to construct 3 multiple choice questions on diagnosis, management and prevention after a 2-hour lesson regarding pediatric tuberculosis. The questions were graded from 0 to 4 for their key information, correctness, and application. The students' performance was evaluated before, after, two weeks, and one months after the class.

Summary of Results: Of 75 student-constructed questions, 19, 34 and 22 quizzes were classified as high quality, borderline and low quality respectively. The student were accordingly classified into 3 groups by their total quiz score. Median scores of the 4 tests were 10, 15, 10 and 5 with the interquartile range: 10, 10, 20, and 20. There was no overall difference among the three groups. However, considering each question type and each assessment point, the high quality group for patient management questions exhibited a higher performance on the one month test than the others. The in-depth individual interviews showed that many students especially in Obstetrics & Gynecology Clerkship did not take the tests as seriously as the formal exam. Some student had problems understanding in class, and most students thought that all the tests only covered tuberculosis, so their answers were more likely to be related to tuberculosis only.

Discussion and Conclusions: Students gained knowledge retention through constructing high quality three multiple choice questions about patient management.

Take-home Messages: This experiment tested our hypothesis that if a student is able to construct a correct and meaningful question after lecture, they will gain knowledge and good retention because constructing questions applies learning skills such as reading, audiovisual, demonstration, and imaginative practice, specifically on patient management, this may be because patient management needs understanding rather than memorizing like diagnosis and prevention.

Inter-examiner variation between different professional groups

AUTHOR(S):

- Lauren Glen, University of Sheffield, UK (Presenter)

ABSTRACT

Background: At the University of Sheffield, second year medical students are assessed on six practical skills in the Initial Assessment of Clinical Skills in Simulation (IACSS). This involves the student simulating the clinical skills with the aid of a simulated patient (Patient as Educator) and anatomical models over a forty-eight-minute period. The clinical assessors are from a nursing or medical background, with a variety of experience in assessments. Previous research has focussed upon examiner backgrounds in terms of expert or non-expert rather than on the professional body. The aim of the study was to determine if there is a difference in failure rates of assessors from nursing backgrounds compared to assessors from medical backgrounds.

Summary of Work: Examiners were noted to be either from a nursing or a medical background and all mark sheets were collected retrospectively. The data was recorded into two spreadsheets: examiners from a nursing background and examiners from a medical background. For each skill, the percentage of students that failed was calculated. The failure rates of students assessed by examiners from a nursing background and examiners from a medical background were statistically analysed and compared to identify any significant differences at the level of $p=0.05$.

Summary of Results: Students assessed by examiners from a nursing background were more likely to fail in all skills. The analysis of failure rates between examiners from nursing and medical backgrounds demonstrated significant differences in two skill areas.

Discussion and Conclusions: The differences observed are likely to be multifactorial. These could include the examiner task familiarity, the examiner's assessment experience, the variation in assessment briefing, the variation in the use of the mark sheets and the lack of standardisation amongst the Patient as Educators. However, there is limited information available on these factors due to the retrospective collection of the data. From the data, it is possible to conclude that a review of the assessment is required to ensure students are competently and fairly assessed.

Take-home Messages: Examiners' professional background may cause inter-examiner variability and further exploration is required to ensure assessment reliability and validity.

Determining the best Modified Angoff variant to standard set a rating scale-based clinical examination

AUTHOR(S):

- Fun Gee Edward Chen, Yong Loo Lin School of Medicine, National University of Singapore, Singapore (Presenter)
- Gominda Ponnampereuma, Yong Loo Lin School of Medicine, National University of Singapore, Singapore
- Carolyn Chan Mei Fong, Yishun Polyclinic, National Healthcare Group Polyclinics, Singapore
- Dujeepa Samarasekera, Yong Loo Lin School of Medicine, National University of Singapore, Singapore

ABSTRACT

Background: When the number of candidates is small, the borderline group/regression method is not suitable to standard set a clinical examination. Hence, a method such as the Modified Angoff, the most widely used method in medical assessment, has to be used. Although how this method is used for checklists is well researched and documented, how it should be used for rating scale-based clinical assessments is not. This study is to compare two variants of the Modified Angoff method when standard setting rating scale-based Objective Structured Clinical Examinations (OSCEs) on community health (CH) and mental health (MH) in postgraduate nursing.

Summary of Work: In the first variant, the judges were requested to estimate the probability of a borderline candidate achieving the 'barely passing' rating point on each rating scale of a given station. In the second variant, the same judges were requested to estimate the probability of a borderline candidate achieving every rating point (i.e. not only the barely passing rating point) on each rating scale. A simple average and a weighted average across all the judges and rating items were used to calculate the pass mark for the first and the second variants, respectively. Pass mark and the number of judges needed to set a reliable standard in each variant were compared for both exams. Number of judges was calculated considering a root mean square error [RMSE] of 1.5%, using generalizability theory.

Summary of Results: Standards set by the first and the second variants were 44% and 55% for CH and 51% and 52% for MH, respectively. Five and four judges were required to set a standard with an RMSE of 1.5% for the first and second variants, respectively, for both CH and MH.

Discussion and Conclusions: The first variant produced lower and less reliable standards than the second variant in both the OSCEs.

Take-home Messages: Due to its favourable reliability, the second variant of the Modified Angoff method is recommended to set standards for a rating scale-based OSCE, especially if the number of judges is a limiting factor.

Student understanding and anxieties surrounding standard setting in summative assessment

AUTHOR(S):

- Sharon Sneddon, University of Glasgow, UK (Presenter)

ABSTRACT

Background: Assessment in medical education is high stakes and it is important we can identify students who are above the required standard. Within the undergraduate medical school at the University of Glasgow, we use the criterion referenced Modified Angoff method to standard set our written assessments. Assessment staff are trained and experienced in the process, however it is apparent that students remain uncertain around standard setting and this uncertainty can lead to anxiety and stress.

Summary of Work: The aim of this study was to capture students' perspectives on the standard setting process at the Undergraduate Medical School at the University of Glasgow. This study was carried out using by qualitative thematic analysis of focus group data from a cohort of year 2 students.

Summary of Results: The focus group was recorded, transcribed and coded and three main themes emerged. Fairness was the most frequently mentioned theme. Students want to be assured that we are setting standards fairly. There was a perception of unfairness that the pass mark was not revealed to students. This unknown was said to cause stress and anxiety amongst students at a time when stress levels and anxiety were already high. Students had limited knowledge of standard setting procedures with the medical school and a varied understanding of how a pass mark is set, with the consensus that the pass mark was set using a norm-referenced method. Students however, were confident that the medical school set the correct standard.

Discussion and Conclusions: It is evident from this study that students seem under-informed in standard setting processes. Students indicated they would be interested in learning more about the process. Giving more information and increasing transparency may help students in their learning journey and help relieve anxiety. Students wish to be involved in their learning, so we should encourage this where possible. Results from this study will inform the medical school assessment policy.

Take-home Messages: There is a lack of understanding and knowledge surrounding standard setting in medical students. Provision of more information regarding the process may lead to alleviation of anxiety in the assessment process.

Standard setting workshop with frame of reference training using simulated clinical encounters for a General Surgery Residency Faculty

AUTHOR(S):

- Saleem Ahmed Abdul Kareem, Tan Tock Seng Hospital, Singapore (Presenter)
- Kaushal Sanghvi, Tan Tock Seng Hospital, Singapore
- Terence Huey, Tan Tock Seng Hospital, Singapore
- Vishalkumar G Shelat, Tan Tock Seng Hospital, Singapore
- Sarah Lu, Tan Tock Seng Hospital, Singapore

ABSTRACT

Background: Learning-Needs-Analysis (LNA) for general surgical residency faculty revealed gaps in knowledge and confidence in use of Workplace-Based-Assessments (WBA) to assess residents. WBA done by faculty revealed variability in scoring among the various members due to differing standards and expectations.

Summary of Work: We conducted a standard-setting-workshop on WBA for the faculty of a General Surgical Residency Program based on LNA. A lecture was delivered to share with the faculty how different modalities of assessment maps back to ACGME-I competencies and how these scores help form a global assessment for the resident. Pre and post lecture, the faculty were asked to assess 2 simulated residents based on video clips showing the residents in different clinical settings. There was discussion among the faculty to understand the factors considered and assumptions that were made during the assessment. This discussion helped them develop a frame of reference and increased their awareness of surgical preference versus principle which helped calibrate the scores across extremes.

Summary of Results: 30 faculty members participated in the workshop. All except one were actively involved in using the TBA tool to assess residents. Majority of the participants (63.3%) have not participated in any assessor standardization workshop previously. 18 (60%) hesitate to give poor scores. 24 (80%) found the workshop useful. 18 (60%) felt the workshop would change how they administer the TBA in the future. Inter-rater reliability assessed using Krippendorff alpha pre-lecture and post-lecture was 0.20 and 0.28 respectively. Analysis of the qualitative feedback from the training session revealed the following themes 1) Awareness and appreciation of the variability in assessment standards across faculty members 2) Faculty's innate discomfort to fail learners 3) Importance of 'SMART' feedback.

Discussion and Conclusions: Majority of the faculty have no exposure to standard setting workshops and they value interventions to educate and empower them in use of assessment tools. Workshops may be a tool for programs to educate their faculty on the variability in assessment standards across the members and improve reliability of these tools.

Take-home Messages: Standard setting workshops helps the faculty in using assessment tools more effectively in residency programs and to improve their reliability in assessing residents.

Modified Angoff vs Hofstee: a comparison of two standard setting methods

AUTHOR(S):

- Carol Ditchfield, University of Glasgow, UK (Presenter)
- Sharon Sneddon, University of Glasgow, UK

ABSTRACT

Background: A number of different methods can be used to determine passing standards in written examinations. At the University of Glasgow Medical School, our standard setting policy for the undergraduate MBChB course is to use a Modified Angoff method with the Hofstee method used when passing rates deviate from expected. This study set out to compare the effect of these two methods on student pass rates in year 1 and 2 of the course using historical data.

Summary of Work: This study looked at data from 5 first sittings of summative written exams (each exam was sat by approximately 240 students). Angoff panels (6-10 judges) met in advance of each exam and the average Angoff score was determined following a discussion. The Hofstee analysis was calculated using the Angoff score ± 2 SD for the maximum and minimum pass mark boundaries. The minimum student fail rate was 0% and the maximum was 20% of the cohort. The percentage of the cohort who would fail the exam using these parallel methods was compared.

Summary of Results: For both years 1 and 2, the Modified Angoff pass mark was higher than the Hofstee pass mark resulting in a marginally higher fail rate across the 5 years analysed. The largest discrepancy between the two methods was seen in the academic years with the highest fail rates.

Discussion and Conclusions: On average, using the Modified Angoff method results in a higher pass mark compared to using the Hofstee method. This is consistent with other studies which have shown that there can be differences in pass rates depending on the method chosen although, the direction of the differences seen in these other studies are not always the same and may reflect the type of exam or individual variations in method. The results from our analysis will inform our own future assessment policy development.

Take-home Messages: There is a small difference in the pass mark when Modified Angoff and Hofstee methods are compared but the difference is more pronounced in terms of a higher fail rate using Modified Angoff when the overall failure rate is high.

Comparison of Standards Set for Written Exams by a Panel of Standard Setters Within a Medical School

AUTHOR(S):

- **Natalie Cope, Keele University, UK (Presenter)**
- Kirsty Hartley, Keele University, UK
- Stuart McBain, Keele University, UK

ABSTRACT

Background: It is known that within the UK there are differences in the pass marks attributed to the same set of questions by different medical schools. One of the reasons for this is the use of a range of standard setting methodology. Modified Angoff, modified Ebel, and modified Cohen's methods are often used to set the standard between schools. Given the time taken to undertake some of these methods, comparison of the pass marks derived for each method for the same questions within a school is rarely available.

Summary of Work: We have compared the pass marks derived for written (knowledge) papers using 3 recognised standard setting approaches. We compared the pass marks derived for the same items, using the same panel of standard setters, within a single medical school. Modified Angoff, modified Ebel and a modified Cohen methodology were compared.

Summary of Results: Comparison of the pass mark set for written exams reveals that the pass mark differs as a function of the method used. In addition, the relative order of the pass marks derived by each method differs for each year of the course; with not consistency in stringency of the score derived.

Discussion and Conclusions: Whilst there are differences in pass marks for the same questions between medical schools, here we present evidence that standards also vary within a medical school depending on the method selected. The main methods used by different medical schools have been compared, and whilst differences exist, it is not possible say that a given method always gives the lowest or highest pass mark.

Take-home Messages: In addition to differences in standards set between medical schools for the same questions, there are also differences between the methods used within the same medical school using the same panel of standard setters. In the future it will be important to determine the validity of each of the methods in identifying students who may be at risk of not being competent for practice at the end of their primary medical degree.

The Relationship between an Academic Index and IFOM Scores in Panama

AUTHOR(S):

- Raja Subhiyah, National Board of Medical Examiners, USA (Presenter)
- Enrique Mendoza, University of Panama, Panama
- Héctor Lezcano, University of Panama, Panama
- Carol Morrison, National Board of Medical Examiners, USA

ABSTRACT

Background: Although a lot of research has investigated relationships between various test-based measures of medical knowledge, there are fewer studies correlating academic indices that are not test-based to scores on tests. This study examines the correlation between a relatively subjective faculty evaluation of medical students and performance on a standardized test of clinical science in the University of Panama. The medical education system in Panama includes several assessment stages as the candidate progresses from medical school. As medical students graduate, faculty assesses their abilities at case management and academic achievement. These assessments are averaged into an Academic Index that summarizes faculty's estimate of the student's academic proficiency. After graduation, medical students take a certification examination to earn practice privileges in Panama. The examination used for this purpose is the International Foundations of Medicine (IFOM) examination developed by NBME. This is a standardized examination that yields equated scale scores that are placed on a universal scale such that scores from various administrations are equivalent.

Summary of Work: A sample of 120 medical students who were subjectively evaluated by faculty and subsequently took the IFOM was used to estimate the relationship between the two disparate measures. A linear regression analysis showed that performance on IFOM can be predicted from the Academic Index obtained from faculty.

Summary of Results: A brief summary of the results follows: R Sq F Sig. Regression .60 .36 67.3 .000. Academic Index explains around 36% of the variance in the IFOM scores, despite the fact that it is relatively a subjective measure. More detailed results will be included in the presentation.

Discussion and Conclusions: Although tests are more objective assessments of medical knowledge, faculty estimates may also be valuable in making these assessments.

Take-home Messages: Although tests are more objective assessments of medical knowledge, faculty estimates may also be valuable in making these assessments.

Translating collective portfolios into an exhibition: Assessment of first year undergraduate health professions students

AUTHOR(S):

- Susanna Hanekom, North-West University South Africa, South Africa (Presenter)
- Chrisna Ravyse, North-West University South Africa, South Africa

ABSTRACT

Background: A collective portfolio is a compendium of evidence and reflections from students to display results of specific learning and deemed an effective method of assessing personal and professional development, while gaining competencies as a group or individually. It encourages teamwork and train future professionals in problem-solving and decision-making.

Summary of Work: Normal pen and paper examinations were replaced with portfolio evidence of individual and group assignments. Portfolios contained reflective portions where students related their experiences and core learning from this process. One topic covered was presented as an exhibition relaying a health message. Portfolios and exhibitions were assessed with an analytic rubric and students used peer-assessment methods to ensure fair distribution of marks for group activities.

Summary of Results: Reflective portions from portfolios and course feedback assessment forms were used to assess the success of this approach. Students reported more cohesive learning experiences and deeper understanding of the value of foundation knowledge obtained from this subject. Individual sections of the rubric score were analysed and it indicated that knowledge was easily obtained but early problem-solving and decision-making skills were challenged. Over time these skills developed and matured and students' scores improved. Exhibitions were evaluated by external professionals and academia. Their feedback was analysed and indicated that students were more equipped and displayed better problem-solving skills. Reports indicated that this type of approach should be continued throughout their studies.

Discussion and Conclusions: This process resulted in deeper understanding of content and related into real-life applications which most students found an essential skill that cannot be taught in ordinary classroom settings. Growth displayed in portfolios qualifies the process as much more valuable than conveying of information only. External examiners confirmed that growth displayed in execution of knowledge during the exhibition indicated that transferal of these skills are currently lacking for entry level students. While access to information has become easier, educators should focus on practicing skills such as problem-solving, decision making and application which is increasingly needed in work places.

Take-home Messages: Portfolio assessment is a valuable approach to develop skills and self-responsibility in students.

Proactive AKT exam revision course

AUTHOR(S):

- Suzanne Bates, GP Education Unit Southampton, New Forest and Jersey, UK (Presenter)
- Nicola O'Shaughnessy, GP Education Unit Southampton, New Forest and Jersey, UK

ABSTRACT

Background: In training for general practice, the Applied Knowledge Test (AKT) forms one of three components of the final assessment and award (MRCGP). It is a computer-based, summative, knowledge test. Until now there hasn't been explicit support in the training curriculum for trainees preparing to take the AKT. This is unlike the other examined element of the MRCGP, the Clinical Skills Assessment (CSA), which is well covered. The aim of this work was to incorporate proactive preparation and support for the AKT to address the trainees' learning needs.

Summary of Work: We designed a two-part AKT preparation course to run three times a year, coinciding with each sitting of the AKT. The first part of the course focused on the format of the AKT and discussion around revision techniques and resources. This took place during the booking period for the exam giving candidates the opportunity to book the subsequent exam sitting following our session. The second part, two weeks before the exam, consisted of the group using a game-based learning platform to work through example questions and a 'mock' examination with individualised, detailed feedback and suggestions about where to focus their revision.

Summary of Results: Feedback from trainees showed that they found the course timely and relevant. In particular it helped them to 'benchmark' their performance with that of their peers. Comments included: 'very inspiring', and 'absolutely eye opening'. Early findings suggest that the mock exam results correlate with trainees' marks in the actual exam, and we are continuing to collect data to be able to undertake a statistically-driven analysis of this.

Discussion and Conclusions: Teaching has not previously provided targeted support for the AKT exam, and trainees can struggle to develop a revision strategy. Feedback from trainees has shown that they value this additional input to help focus their revision, and opportunity to share ideas and resources.

Take-home Messages: Proactive support can help trainees prepare for the AKT exam.

#7MM Posters - Simulation and Simulated Patients

Examining the Influence of Simulation Context on Learners' Post-Simulation Reflections: A Comparison Study using Think Alouds

AUTHOR(S):

- Abigail Konopasky, Uniformed Services University, USA (Presenter)
- Steven Durning, Uniformed Services University, USA
- Divya Ramani, Uniformed Services University, USA
- Megan Ohmer, Uniformed Services University, USA
- Anthony Artino, Uniformed Services University, USA
- Alexis Battista, Uniformed Services University, USA

ABSTRACT

Background: Research indicates that learners' experiences differ across simulation modalities and designs and there is a call for research to better understand learners' experiences in simulation to better inform instructional and curriculum design choices (Cook et al., 2011). This study uses "think-aloud" reflection (Ericsson & Simon 1998) to compare the impact of pre-recorded video cases and live scenario-based simulations on learners' reflections, asking: Does reflection as a learning tool differ across contexts? If so, how? What differences do think-aloud reflections reveal in learner experiences across contexts?

Summary of Work: Participants were 26 physicians in primary care or general surgery, assigned two cases in a video (VI) or live scenario (LS) condition, with identical case content and order. Participants were asked to "think aloud" while rewatching the pre-recorded simulation or watching their own performance (Ericsson & Simon 1998). Think-aloud transcriptions were coded for reconsiderations (practitioners questioning choices or thought processes) and (using linguistic software) for markers of self, cognitive processing, and affect (Tausczik & Pennebaker, 2010). LS and VI participants were then compared for differences in reconsideration and LIWC variables using t-tests or chi-square tests as appropriate.

Summary of Results: LS participants were significantly more likely to reconsider choices or thought processes ($[1, N = 52] = 9.63, p < .01$) compared to VI participants. LS participants used significantly more ($t = 3.5, p < .01$) self and ($t = 2.5, p < .05$) cognitive processing markers, with no significant difference in affective markers ($t = .7, p = .5$). Thus, LS participants spoke more from an "I" perspective about cognition (e.g., being "sure") and were similar to VI affectively.

Discussion and Conclusions: There were more and different kinds of reflections for LS participants, with a focus on the self's thoughts and choices, suggesting that differences in simulation context can influence learners' experiences and post-simulation reflection.

Take-home Messages: As one of the first inferential tests of varying simulation contexts, this study reveals important differences in how simulation context may influence learners reflection content. Moreover, this study suggests that think-aloud methodology can elicit a range of reflective experiences, so could augment guided reflection even without a faculty guide.

Using in-situ simulation (ISS) to identify latent safety threats (LST) on the Labour ward

AUTHOR(S):

- Ayesha Lodhia, St Mary's Hospital, UK (Presenter)
- Pippa Letchworth, St Marys Hospital, UK

ABSTRACT

Background: In-situ Simulation (ISS) is unique from off site simulation (OSS) in that it allows the team to problem-solve in their own clinical environment. Simulation focuses on non-technical skills that are vital for patient safety, however ISS has the added potential of making the clinical workplace safer by identifying and immediately rectifying latent safety threats (LST). The aim of this project was to evaluate the benefit of using ISS to identify LST during obstetric emergency simulation.

Summary of Work: Weekly high fidelity ISS was conducted on the labour ward of a central London teaching hospital using the "SimMom" simulator. Participants were made up of the multidisciplinary team (MDT) who work on the labour ward, obstetricians, midwives, midwifery support workers, anaesthetics, ODPs and students. The MDT simulation was pre-announced and consisted of 10 minute introduction and orientation, 15 minute simulation and 20-30 minute debrief. The debrief was lead by MDT educationalists all trained in debrief. LST were reported by the participants and recorded by the faculty. LST immediately rectifiable were addressed during the debrief otherwise they were highlighted to the clinical management.

Summary of Results: Over a 10 week period, 55 participants were recruited into 10 simulations. At least one LST was discovered during 7/10 (70%) of the sessions. LST were divided into categories with 4/7 (57%) related to orientation of emergency equipment, 1/7 (14%) due to lack of key-card access to clinical areas, 1/7(14%) due to stock not being replaced and 1/7 (14%) due to equipment placement. 85% of LST were immediately addressed

Discussion and Conclusions: ISS can be a valuable opportunity to uncover LST in the clinical working environment. The majority of these threats can be immediately rectified. High fidelity simulation has cost implications however the benefits of identifying latent errors could potentially still be garnered via low fidelity ISS.

Take-home Messages: ISS can be seen as part of the tools available to optimise patient safety in the clinical working environment through identifying and immediately resolving latent safety threats.

Simulation based teaching helps to break the Rookie Wall of junior interventional radiologist

AUTHOR(S):

- Fan Lian, the first affiliated hospital of Sun Yat-sen University, China (Presenter)
- Yu Wang, the first affiliated hospital of Sun Yat-sen University, China
- Yingzi Huang, the first affiliated hospital of Sun Yat-sen University, China
- Shaoting Feng, the first affiliated hospital of Sun Yat-sen University, China
- Suqing Yang, the first affiliated hospital of Sun Yat-sen University, China
- Ming Kuang, the first affiliated hospital of Sun Yat-sen University, China

ABSTRACT

Background: We use “Rookie wall” to describe a phenomenon most junior interventional radiologists would encounter when they study seldinger technique in the first few months, which manifest as disruption to the rapid progress even more practice is engaged. This study aims to access the possible reasons of Rookie wall and evaluate how simulation based teaching method improved the students’ clinical skills.

Summary of Work: A voluntary, anonymous questionnaire regarding the reasons of Rookie wall was distributed to the trainees and tutors. Extra simulation based teaching was offered to some of the trainees while others were only instructed with videos, lectures and bedside practice. Clinical skill performances were compared between them after the course. Students were also asked to complete a Likert scale-based survey regarding perceptions of the teaching method.

Summary of Results: The reasons of Rookie wall from the trainees’ point of view included lack of confidence, lack of doctor-patient communication, and lack of personalized guidance. The reasons of Rookie wall from the tutors’ point of view were lack of practice and lack of introspection of the trainees. Simulation-based training was associated with improvements of clinical performance. The students trained with simulation highly rated their experiences. The challenge of simulation based teaching were mostly faculty time, faculty expertise and structured approach.

Discussion and Conclusions: The different perspectives of the trainees and tutors regarding the reasons of Rookie wall could be a barrier of effective learning. The tutors need to create an individualized learning environment for the trainees. Traditional teaching methodology was not able to do so due to variable factors such as optimization of the use of the operating room or patient safety. High-fidelity simulation is more effective for improvement of clinical competence, where ethical or legal conflicts are avoided, and frequency of practice could be adapted to the learning needs of each students.

Take-home Messages: Rookie wall is a commonly seen but usually overlooked phenomenon. Simulation based teaching is a better way for seldinger technique teaching than traditional methods. It allows training of clinical skills as well as behavioral skills, which is particularly important in China.

Simulation in Healthcare: Manifestations of Anxiety and Motivation in a Medical Student Group

AUTHOR(S):

- **Maria Jacqueline Silva Ribeiro, Ceuma University, Brazil (Presenter)**
- Joana Kátya Veras Rodrigues Sampaio Nunes, Ceuma University, Brazil
- Priscylla de Oliveira Miranda de Oliveira Miranda, Ceuma University, Brazil
- Ana Carolina Carneiro Carneiro, Ceuma University, Brazil

ABSTRACT

Background: Simulation is an active teaching methodology that allows participants to develop their skills at different levels (cognitive, attitudinal and emotional) in a safe and controlled environment through scenarios that replicate real-life situations. The psychological high fidelity of scenarios is capable of triggering in participants the same psychological reactions that occur in real consultations, such as stress and anxiety that may interfere with staff performance.

Summary of Work: The objective of this study was to describe signs of anxiety, positive feelings and motivation of medical students during simulation activities. This is a descriptive study carried out with students from the 9th, 10th and 11th periods of Medicine at the university CEUMA, SAo Luã-s/MA - Brazil. Data was collected by questionnaire adapted from the Methodological Guide for Simulation in Nursing of the Federal University of Santa Catarina. Data was organized and analyzed using Bioestat 3.5 and Excel 2013.

Summary of Results: In the study period, 127 medical students answered the questionnaire, of which 122 were analyzed. Sixty percent of the sample was female, mean age was 26 years and 95% reported no previous experience with simulations. Regarding the manifestations of anxiety during simulation activities, 60% of the students reported always feeling anxious, 51% reported tension, 31% tachycardia, 30% fear and shame. Regarding positive feelings, 51% reported determination, 38% patience, 27% courage and 23% self-confidence. When analyzing students' motivations, 44% of them were inspired to participate in activities, 98% thought simulation made it possible to put theory into practice, and 97% found the method is important for practicing doctor/patient relations.

Discussion and Conclusions: It was concluded that in spite of the frequent manifestations of anxiety and tension during activities, students felt determined and motivated to participate in them, considering them important for fixation of theoretical knowledge.

Take-home Messages: Simulation activities trigger anxiety and tension just as much as in real consultations, so it is important to create a psychologically safe environment for the students. Although anxious, students felt motivated and considered the method important to put theory into practice and for practicing doctor-patient relation.

RapidSIM: Retaining educational value in compressed simulation

AUTHOR(S):

- Andrew McGucken, NHS GG&C, UK (Presenter)
- Jennifer Logan, NHS GG&C, UK
- Stuart Hitchison, NHS GG&C, UK

ABSTRACT

Background: The Queen Elizabeth University Hospital (QEUH), in Glasgow, has one of the most modern and well utilised simulation suites in Scotland. An innovative approach was required to provide 48 4th year undergraduates, undertaking a 10-week medical attachment, with a time effective, valuable simulation experience.

Summary of Work: We designed five simulation scenarios covering important clinical presentations commonly encountered by FY1 doctors. Simulations were designed to last 20 minutes (including 10 minutes for debrief). Simulation was medium fidelity using a Laerdal 'Simman' and basic monitoring. Students attended in groups of 2 or 3. GoSoapBox.com was used to anonymously survey student confidence pre- and post-simulation, in domains of A-E assessment, SBAR handover and assessment of specific presentations.

Summary of Results: Prior to the first simulation, 31% of students reported that they were at least 'moderately confident' in A-E assessment, this increased to 73% after simulation one and then to 80% following the final simulation. Before the first simulation, 25% of students felt 'not at all confident' in performing an SBAR handover; this fell to 8% following simulation one. Following simulation five, 100% of students felt at least 'somewhat confident' in this domain. Regarding a specific clinical scenario, 33% of students felt at least 'moderately confident' in assessing a patient with chest pain prior to simulation exposure; this rose to 100% following simulation.

Discussion and Conclusions: Our findings show an increase in student confidence in all domains surveyed following each individual simulation and over the course of five sessions. Increased confidence in technical skills was striking, with increased confidence in non-technical skills (such as SBAR) slightly more muted. Results may be limited by reduced post-simulation survey responses in comparison to pre-simulation. Survey responses, in general, decreased over time.

Take-home Messages: Compressed, medium fidelity simulation can be valuable in terms of increasing student confidence in technical and non-technical skills. This is relevant to educators in settings where time and resource are limited. Undergraduate students may lack confidence in using the well-recognised SBAR approach for handover. This should be an area of focus for educators.

Learning effects of tactile knowledge through palpation of diseased livers using a newly developed abdominal simulator

AUTHOR(S):

- **Kyoko Arai, School of Nursing, University of Shizuoka, Japan (Presenter)**
- Akemi Matsuura, School of Nursing, University of Shizuoka, Japan
- Minori Yamaguchi, School of Nursing, University of Shizuoka, Japan
- Tamerlan Babayev, School of Medicine, International University of Health and Welfare, Japan
- Kazunobu Ishikawa, School of Medicine, International University of Health and Welfare, Japan
- Takahiro Amano, School of Medicine, International University of Health and Welfare, Japan

ABSTRACT

Background: Traditional teaching of abdominal examination skills was performed by role-play or using simulated patients. However, students could not learn to appreciate the firmness, surface and shape of diseased organs until having the opportunity to palpate pathology in real patients. Therefore, we developed a novel abdominal examination simulator to address this gap. We subsequently performed a trial wherein we taught nursing students how to palpate diseased organs using our simulator and assessed whether they could acquire and maintain the tactile knowledge of diseased livers.

Summary of Work: We produced a torso of the abdominal wall and various organ inserts of the liver, spleen kidney, lymphoma in the inguinal area and myoma. The liver is able to simulate inspiratory and expiratory movements through the use of a respiratory motion control unit. The appropriate firmness of diseased organs was decided by seven professors of gastroenterology. Informed consent was acquired from 22 volunteer second-year nursing students who participated in the trial. We assessed students' ability to accurately identify liver pathology through tactile sensation alone and to what extent they retained their understanding at a two-month interval.

Summary of Results: Three novel abdominal simulators were prepared with settings of an enlarged normal liver, chronic hepatitis, and liver cirrhosis. First, students were taught to palpate the diseased livers. Students were then blindly challenged to palpate abdominal simulators with differing liver pathologies and record their findings on answer sheets, achieving a mean 78% accuracy. Two months later the same blind trial was repeated for this cohort, who then achieved a mean 66% accuracy. Fourteen students (63.6%) maintained or increased their score. Eight students (36.4%) did not improve. Ten students (45.5%) demonstrated full marks at the second trial.

Discussion and Conclusions: If we teach students to understand the firmness and shape of pathological livers using our abdominal examination simulator, students are able to develop and retain this tactile knowledge over time. In order to improve students' tactile knowledge of the diseased liver more effectively, repeated exposure is essential.

Take-home Messages: A novel physical simulator can effectively teach palpation skills and the tactile sensation of diseased organs.

Assess the trainees' ability after ACLS simulation training compared with the non-sim era

AUTHOR(S):

- Kalyanee Asanasak, MEC Songkhla Hospital, Thailand (Presenter)
- Sumalin Chumkot, MEC Songkhla Hospital, Thailand

ABSTRACT

Background: Simulation-based medical education with high fidelity has been proposed as the teaching method to improve participants skills and allow them to learn from error by linking to many educational theories such as constructivism, experiential learning, adult learning, social cognitive theory, human factor education, etc. But because of its high cost, need more technical expertise to monitor, operate and maintain the system. So to study the cost-effectiveness of the simulation lab is worth. This study aimed to relate the outcome of medical students and their improvements learning abilities after participate in ACLS simulation training.

Summary of Work: After 2 year of implementing ACLS simulation training for the 2 different classes of 6th-year medical students. Their learning outcome was measured by 1. The immediate satisfaction scores from the trainee and their ability to recognize the learning goal and objective. 2. 360-degree satisfactory evaluation about their performances. 3. Perform an exam 10 months later by OSCE and compare the scores with previous 5-year non-simulation training, by using pair t-test.

Summary of Results: the overall satisfaction from 360-degree evaluation was high. The students show much appreciate the exciting and hands-on experiences. But there are no significant difference in their learning ability detected by OSCE scores during the final exam at the end of the year.

Discussion and Conclusions: After introduced ACLS simulation training the immediate response from the medical students was terrific. They also feel being safe and gain more confidence to confront the realize situation. The response from peer, paramedic, and the team at the workplace are great. Thus that meet the adult learning theory but from this study, the scores from OSCE exam doesn't have any significant improvements both in the number of percentage of pass and failed and also the mean score. So to ensure the OSCE score, one might need more repeated practice.

Take-home Messages: ACLS simulation training is the examples that simulation training is better suited formative feedback and better served patient safety purposes.

Implementing high-fidelity simulation in interprofessional education leads to a better outcome: A case study in a tertiary hospital in northern Taiwan

AUTHOR(S):

- **Feng-Cheng Liu, Division of Rheumatology, Tri-Service General Hospital, Taiwan (Presenter)**
- Po-Kai Chan, School of Medicine, National Defense Medical Center, Taiwan
- Tung-Wei Kao, Department of Family Medicine, Tri-Service General Hospital, Taiwan
- Yaw-Wen Chang, Department of Family Medicine, Tri-Service General Hospital, Taiwan
- Ying-Jung Lai, Department of Teaching Office, Tri-Service General Hospital, Taiwan
- Li-Chen Lin, Department of Nursing, Tri-Service General Hospital, Taiwan, Taiwan

ABSTRACT

Background: Simulation is an effective teaching method for interprofessional education (IPE). At the end of July 2018, we conducted a high-fidelity simulation IPE, including scenario-simulated film, role-playing with a pre-writing script, interprofessional table exercise, and recording the patient's feedback videos, in the Tri-Service General Hospital in Taipei, Taiwan. This study aims to analyze the case and compared the outcome with other session holds in 2018.

Summary of Work: The participants were required to complete the Interdisciplinary Education Perception Scale (IEPS) and a 5-question quiz before and after the class via the online interactive app Zuvio. The data was then programmed in SPSS 20 for demographics, pair t-test, and Wilcoxon sign rank test. Professions, levels of the profession, previous IPE experience, clinical working experience, and gender were stratified for the outcome. The results were then compared with other sessions in 2018. The significance of 5% ($p < 0.05$) is adopted in this study.

Summary of Results: Totally 110 participants completed the real-time pre-post test. Based on the Kirkpatrick model, the level 1, 2a and 2b outcome of the July session showed the greatest average satisfaction (8.97/10), IEPS and quiz improvement rate (4.6% and 27.88%) compared with other months. After stratified with the demographics, the Nursing profession, males, previous IPE experience over 3 times and clinical working experience 2 to 4 years had better improvement.

Discussion and Conclusions: This case study shows the effectiveness of high-fidelity simulation IPE among the healthcare students. The quality response from the audience also affirms its value. Further implementation of high-fidelity simulation in IPE should be promoted to other teaching teams in TSGH to provide better IPE and patient care.

Take-home Messages: The high-fidelity simulation IPE in TSGH had a statistically significant positive impact on the audience compared with non-simulated courses based on our case study. More work should be focused on the promotion of implementation the simulation in IPE.

In situ simulation and its effects on patient outcomes: A systematic review

AUTHOR(S):

- Vsevolod S. Perelman, Faculty of Medicine, University of Toronto, Schwartz Reisman Emergency Centre, SimSinai Centre, Canada (Presenter)
- Daniel Goldshtein, SimSinai, Sinai Health System, Canada
- Cole Krensky, Faculty of Medicine, University of Toronto, Canada
- Sachin Doshi, Faculty of Medicine, University of Toronto, Canada

ABSTRACT

Background: Simulation-based education has been an increasingly applied teaching method with a growing body of supporting evidence. One such modality, in situ simulation-based training may be an important training modality to improve care delivery in high pressure situations. Previous reviews have shown that simulation-based education has positive effects on direct patient outcomes but have not demonstrated these findings with in situ simulation-based training. Other reviews acknowledged the need to further investigate in situ simulation as an educational modality to improve patient morbidity and mortality. We felt a more robust review of the up-to-date literature is warranted to identify the impact of in situ simulation training on direct patient outcomes.

Summary of Work: A combined search was conducted in PUBMED, OVID, WEB OF SCIENCE, CINAHL, SCOPUS, and EMBASE. 478 studies were screened with nine articles published between 2011 and 2017 meeting the inclusion criteria for analysis. Due to the potential variable study designs and methodologies (heterogeneity), a quantitative meta-analysis was not performed. Instead, a narrative synthesis analysis that evaluated effectiveness was conducted.

Summary of Results: This review selected eight prospective studies and one prospective-retrospective study. Three studies isolated in situ simulation as an experimental variable while the remaining studies implemented in situ programs as a component of larger quality improvement initiatives. Seven studies demonstrated a significant improvement in morbidity and/or mortality outcomes following integrated in situ simulation training.

Discussion and Conclusions: The present review discovered evidence in the literature that incorporation of in situ simulation training is statistically correlated with improved patient morbidity and mortality. However, supporting evidence remains limited by the number of studies and an array of confounding factors to grasp the true validity of the findings. To determine the true impact of in situ simulation either independently or as part of a larger training program, future research should make use of more isolating protocols with fewer confounding factors.

Take-home Messages: Existing literature, albeit limited, demonstrates that in situ training improves patient outcomes either in isolation or within a larger quality improvement program. However, existing evidence contains difficulties such as isolating the impact of in situ training from various potential confounding factors and potential for publication bias.

Simulation-based learning to improve skills and confidence in Pediatric Advanced Life Support (PALS) of final year medical students

AUTHOR(S):

- Pisprapa Noiming, Si Sa Ket Medical Education Center, Thailand (Presenter)

ABSTRACT

Background: PALS is the important knowledge and skills which requires continuous learning. Simulation training has been a novel way to deliver medical education. The aim of this study is to evaluate the role of simulation-based learning in development of skills, knowledge and confidence of PALS in medical students before graduation.

Summary of Work: Twenty-three final year medical students received 3 hours PALS workshop during pediatrics rotation. The students were divided into two groups. Thirteen students were assigned to review PALS guideline, practice and scenario from Computer-Based Learning (CBL group), whilst the remaining received PALS lecture with case discussion (Lecture group). Both groups spent two hours practicing scenario cases with high-fidelity simulators. Debriefing and self-skills assessment using OSCE checklists were done at the end of session. Multiple-choice testing was used to assess the knowledge along with using tools for confidence assessments during the last month before graduation.

Summary of Results: The CBL group had significantly higher OSCE checklist score than the lecture group (94% vs. 75%, $p < 0.001$). MCQ scores were not significantly different, however the CBL group had higher average scores than the lecture group (77% vs. 72%, $p = 0.359$). Before graduation, confidence assessment in the CBL group were higher the lecture group with statistical significance ($p < 0.001$). We also found that both groups were satisfied in learning with simulation.

Discussion and Conclusions: Learning and practicing PALS using simulation-based learning made students more interested. Computer-based learning for preparation of PALS workshop was more useful than lecture class since students were able to self-review without pressure from the instructors. Following the practice and repetitive reviews will help students gain more confidence. Conclusion: Simulation-based learning plays a very important role in developing practical skills and confidence in PALS. Computer-based learning allows students to reviewed guideline and practice as well as building more confidence before graduation.

Take-home Messages: Regular self-learning and practicing with modern technology is a key to develop of professionalism.

Stories of Success: Demonstrating Improved Performance in Junior Doctors after Simulation: A 12 Month Follow-up Study

AUTHOR(S):

- Nathan Oliver, NHS Lothian, UK (Presenter)
- Heather Stirling, NHS Lothian, UK

ABSTRACT

Background: Much of the credibility of immersive simulation rests on the assumption that simulation positively impacts clinical behaviour. Research has shown a positive relationship between simulation and the development of skills and confidence. Further research is required to demonstrate transfer of learning to the workplace, impact on patient outcomes and to demonstrate the longitudinal effects of behaviour change. In 2013, a simulation programme was set up for first year junior doctors, to respond to areas of the curriculum which they were finding hard to evidence. This programme consists of three sessions that run over the year, focusing on technical and non-technical elements of patient care. This study sought to look for what impact, if any, did the simulation programme have on the clinical performance and behaviour of first year junior doctors in NHS Lothian a year after they attended their first simulation teaching.

Summary of Work: This was a qualitative study utilising a narrative enquiry approach. Between 2013-2018, a questionnaire was sent to all junior doctors at completion of their first year of training. This asked them to describe two specific accounts of when they applied what they had learned during their simulation experience into their clinical setting. Questionnaires were coded and analysed using thematic analysis.

Summary of Results: 264 junior doctors completed questionnaires for a total of 528 narrative accounts for analysis. The narratives draw strong, contextualised links from what was learned in simulation to positive impacts on their performance. Five themes were identified: situational awareness, teamwork, communication, legal decision making, and the acute management of the unwell patient.

Discussion and Conclusions: The accounts in this study express a clear link between their experience in a simulation programme and their clinical performance, often months after the learning experience. Although the responses received in this study were subjective in nature, it is asserted that the large sample size and the 5 year span of data collection year add a level of validity in responding to the question at the centre of this enquiry.

Take-home Messages: Simulation has been seen to positively contribute directly to increased clinical performance, leading to the logical extension of impacting where it truly matters - safer patient care.

Mental Health Simulation for Paediatric Junior Doctors

AUTHOR(S):

- Olatokunbo Sanwo, East Kent Hospitals NHS Trust, UK (Presenter)
- Magali Dubus, East Kent Hospitals NHS Trust, UK

ABSTRACT

Background: In the 2017 Mental Health of Children and Young People in England Report, 15.4% of children presented to physical health specialists such as paediatricians regarding their mental health. An Australian survey found that over a 7-year period, childhood mental health presentations to Emergency Departments increased three times faster than physical health presentations, (Hisock et al, 2018). Paediatric junior doctors receive little formal training on the assessment or management of common mental health presentations. Despite advances in the use of simulation in medical education, simulation is used less in mental health (Attoe et al, 2016). Mental health simulation projects such as SWAMPI-CYP (Simulation Workshop at the Mental and Physical Interface in Children and Young People) have been introduced regionally, however local provision is sporadic.

Summary of Work: Scenarios based on teenagers with self-harm and eating disorders were developed. These scenarios were incorporated into the weekly paediatric in-situ simulation programme trust wide. Simulations were delivered by clinical teaching fellows and the simulation team, with subsequent debriefs. Participants and observers completed questionnaires assessing their confidence at managing children with acute mental health presentations before and after the simulation.

Summary of Results: Compared to beforehand, participants described increased confidence in history taking (28.6% vs 70%) and perceived ability to manage patients with mental health presentations (28.6% vs 42.9%) following the simulation. Qualitative feedback indicated a prior lack of knowledge of HEADSS assessment, and the recognised need to consider a psychosocial assessment in the context of mental health presentations.

Discussion and Conclusions: As the mental health needs of children and adolescents continue to rise, it is imperative to ensure that the medical staff assessing them have the required knowledge and confidence to do so. By developing programmes such as this, it is hoped that paediatricians will cultivate the necessary skills to appropriately assess and manage patients presenting with acute mental health concerns.

Take-home Messages: - Paediatricians are increasingly required to manage children with acute mental health presentations with minimal training. - Simulation based medical education may help paediatric junior doctors feel more confident in the assessment and management of these children - It is hoped this increased confidence will result in improved care of children with mental health presentations.

Freedom from toxic impact from cytotoxic drugs by using VR simulation during chemotherapeutic drug preparation

AUTHOR(S):

- **Mei-Fang Chou, Tri-Service General Hospital, Taiwan (Presenter)**
- Ya-Ting Liu, Tri-Service General Hospital, Taiwan
- Cheng-Chih Hsieh, Department of Pharmaceutical Management of Ministry of National Defense-Medical Affairs Bureau, Taiwan
- Tai-Lung Cha, Tri-Service General Hospital, Taiwan

ABSTRACT

Background: Chemotherapy drugs are defined as one of the majority of hazardous drugs by the National Institute for Occupational Safety and Health. Proper training programs should be implemented to assure safe of working staffs during their hazardous medication preparation, apart from the guarantee of the accuracy of final products. According to the theory of Andragogy, we utilized the novel virtual reality (VR) technology to create a student-oriented learning system for students to learn how to handle cytotoxic drugs during chemotherapeutic drug preparation.

Summary of Work: A 3D virtual environment which is highly similar to real clinical conditions was established by the VR technology. The learning processes were set up based on the clinical requests, conditions and the standard of procedures (SOP) of dispensing chemotherapies. In order to track the action of the student's hands and examine the amount of drugs which the student draws from the virtual vials/ampoules, a real syringe equipped with a sensing chip was developed and integrated into the VR system. 34 students of pharmacy school were enrolled to experience the VR learning system, and their learning achievements were evaluated based on the Kirkpatrick model.

Summary of Results: In summary, students averagely spent 15~20 minutes practicing the dispensing processes of a designed clinical query. According to the result of directly observed practical skills (DOPS), the concept and preparation skills of students were significantly improved after VR learning. Compared to that taught by senior qualified pharmacists, the VR learning system provided similar results of learning achievements. Moreover, the percentage of students who were fearful of chemotherapy was significantly decreased from 23% to zero. About 96.8% of students were satisfied with the VR learning system.

Discussion and Conclusions: For handling chemotherapy drugs, the VR learning model not only ensured safety for students during learning but also provided gamified learning program to stimulate the motivation of students. Our results concluded that the VR model provides learning content consistently and supports transferring knowledge effectively.

Take-home Messages: For handling cytotoxic medicine, VR technology not only invents an excellent model for a real experience but also improves the spirit and motivation of learning.

Using a High Fidelity Simulator to improve diagnosis and management of spontaneous tension pneumothorax by 6th-year medical students of a University-Affiliated Medical School, Thailand

AUTHOR(S):

- Woraphot Lueangchiranothai, Lampang Hospital, Thailand (Presenter)
- Ravin Sony, Lampang Hospital, Thailand

ABSTRACT

Background: Spontaneous tension pneumothorax (STP) is a life-threatening condition which requires prompt diagnosis and emergency management. Essential skills needed for diagnosing and treating STP include needle thoracocentesis (NT), needle decompression (ND), and intercostal chest drainage (ICD). However, medical students are currently unable to practice adequately as cases are opportunistic. In 2018, Lampang Medical Education Center launched the use of a high fidelity simulator (HFS) for students to practice NT, ND, and ICD.

Summary of Work: Twenty-one 6th-year medical students were given a scenario of an HFS patient with acute dyspnea, involving exacerbation of COPD with STP. A pulmonologist and a nurse were available to facilitate the session. Each student was asked to perform a physical examination and decide on proper management. A standard checklist was applied to evaluate the students' performances for each procedure. At the end of the session, the instructor summarized the case and showed the procedure of choice for each situation and how to perform it, followed by group discussion.

Summary of Results: Of 21 students, 9 (42.8%) failed to perform NT and thus couldn't detect STP in the HFS. Among the other 12 who could diagnose STP, 5 managed to perform ND. All 12 students managed to perform ICD. However, none of the students performed ND or ICD in a high-quality manner. Students' reflections about the reasons for lacking these skills were: 1) no experience in caring for patients with STP in practice; and 2) no practical session to perform these procedures.

Discussion and Conclusions: Results demonstrated that management of STP remains a missing skill in medical students. More than 40% of students missed the diagnosis of STP, while poor procedural skills in performing both ND and ICD were noticed among those who could detect STP. This gap highlights the benefits of using HFS to assess and acquire the essential skills required in diagnosing and managing STP. This information encourages the use of HFS to assist teaching the management of patients with STP in the future.

Take-home Messages: HFS is a useful tool to assess and improve medical students' practical skills in the management of STP.

Experience of Simulated Patient Program in International Medical University: Lecturers', Students' and Patients' View

AUTHOR(S):

- Goh Lay Khim, International Medical University (IMU), Malaysia (Presenter)
- Yee Bit Lian, Open University Malaysia, Malaysia

ABSTRACT

Background: Simulated Patient (SP) is defined as a layperson that simulates to portray the role of a patient with health-related conditions. International Medical University (IMU) has been utilizing SP for more than 10 years for teaching sessions and simulation activities as well as Objective Structured Clinical Examination (OSCE). Due to a series of complex interaction within the SP program yet to be explored, the aim of the study was to explore the experience of lecturer, student and SPs towards the SP program in IMU.

Summary of Work: Total of 17 participants recruited for 6 interviews, including both focused group and one-to-one interview session with the inclusion criteria. The interviewer used a list of guide question to explore both the positive and negative experiences. Manual transcribing and coding technique was used for data analysis, while Qualitative Data Analysis (QDA) was used for data management and additional analysis.

Summary of Results: There were three themes have been emerged for each group of participants. The themes for the lecturer group were SP resemble a real patient, The making of scenario, and SP feedback; while the themes have emerged from the students group were Simulated patient as an effective learning tool, Fairness, and Feedback from simulated patient; whereas Effective learning session, Motivation and Preparation prior class were the themes were emerged from the SP group.

Discussion and Conclusions: Lecturers valued the SPs' contribution if only the SP is able to resemble a real patient and able to demonstrate effective feedback skills. Similarly, student perceived that SP as an effective learning tool if only the SP able to portray as a real patient and able to provided effective SP feedback. Moreover, standardization of the SP role portrayal and SP feedback influenced the fairness along the students' journey. While, SPs expressed that lecturers, SPs and students influenced a successful SP-based simulation session.

Take-home Messages: Training is the key to this study. Training of role portrayal using the four-stage model which is helpful in improving the realistic portraying of the role and standardized SP performance, followed by training SP in giving constructive feedback.

Residents delivering bad news in Anaesthesiology - Exploring the experience, efficacy and cost-effectiveness of the use Standardised Patients and Peer Role Play

AUTHOR(S):

- Ambika Paramasivan, National University Hospital, Singapore (Presenter)

ABSTRACT

Background: Delivering bad news is a difficult task for the anaesthetist and one that is important to address in residency.

Summary of Work: Residents went through didactic teaching on communication skills and later were assigned to receive communication training either with standardised patients (SP) or peer role play (RP). Anonymised pre- and post-questionnaires were filled by the residents detailing their experience. An independent assessor blinded to the study hypothesis rated the residents' performance using a standardised plus-delta assessment form as a measure of effectiveness of either methods. In our study additionally, corresponding costs were assessed as man-hours resulting from the hours of work of SP, RP and tutors in order to generate the incremental cost-effectiveness ratio (ICER) for the use of SP against the use of RP.

Summary of Results: There was improvement in the self-reported knowledge and comfort level in communicating bad news after the sessions. The intervention was highly rated, especially the encounters with standardised patients, observations of others and the debriefing process. The mean performance scores were 63.3% (RP group) and 74.3% (SP group) attributing advantage to the SP group. Costs however were slighter greater in the SP group (18 man-hours) versus (12 man-hours) in the RP group. This resulted in an incremental cost-effectiveness ratio of 0.54.

Discussion and Conclusions: Medical education using multiple standardised patient scenarios is a successful model for increasing an anaesthetic resident's self-reported comfort, knowledge as well as performance in responding to difficult clinical communication tasks. However, the slight advantage conferred by the use of peer role play in terms of cost-effectiveness should be taken into consideration in future planning.

Take-home Messages: The successful experience and use of standardised patients should be balanced against the marginally better cost-effectiveness of peer role play in planning residency teaching sessions for delivery of bad news.

Needs assessment for Training Nursing students to be Standardized Patients: Perspectives of Standardized Patients

AUTHOR(S):

- Su-Fen Cheng, National Taipei University of Nursing and Health Sciences, Taiwan (Presenter)
- Hao-Yu Chen, Center for Education in Medical Simulation, Taipei Medical University, Taiwan
- Wen-Hsi Chiu, Mackay Junior College of Medicine, Nursing and Management, Taiwan
- Mei-Chun Chen, National Tainan Junior College of Nursing, Taiwan
- Min-Shu Wang, Mackay Memorial Hospital, Taiwan
- Chu-Yu Huang, Cedarville University, USA

ABSTRACT

Background: Objective Structure Clinical Examination (OSCE) has been used in nursing education to evaluate nursing students' competencies of practice prior to graduation. Due to limited budget and resources, nursing faculty tend to use nursing students as standardized patients (SP) in OSCE. Most nursing faculty received training on how to design OSCE, however, they lack experiences in training SP. It is crucial to understand the experiences of the SPs in order to develop an effective training materials. Thus, the purpose of this study was to conduct a needs assessment from the perspectives of trained SPs for developing materials to train nursing students to serve as SPs.

Summary of Work: This descriptive qualitative research study used semi-structured in-depth interviews for data collection. A total of 19 SPs participated in the interviews. The SPs were asked to share their experiences as a SP, the challenges encountered as a SP, and the training needs for nursing students. An interview guide was used for the interview process. The Collazzi's method of data analysis was used to extract themes and sub-themes.

Summary of Results: Four major themes were extracted from the interviews, including recognition of the contribution to health-related professional education, core contents for SP training, limitations of current SP training programs, needs to develop digitally based training materials, and establishment of a SP training student organization across various universities/colleges.

Discussion and Conclusions: The findings of this study provide an insight into development of SP training materials or modules for nursing programs. Digitally based training materials and establishment of a SP training student organization across various universities/colleges are strongly recommended since it allows for resources sharing across institutions, and may benefit universities/colleges with limited budgets and resources. Future studies are suggested to focus on development of a checklist to critically evaluate effectiveness of SP training materials.

Take-home Messages: The audiences will be able to understand how to design a SP training course for nursing students.

Can simulated patients evaluate the students' performance in procedural skills in OSCE?

AUTHOR(S):

- Predrag Bjelogrić, University of St Andrews, School of Medicine, UK (Presenter)
- Anita Laidlaw, University of St Andrews, School of Medicine, UK

ABSTRACT

Background: The main and important role of simulated patients (SP) in OSCEs is to play/act as a patients. In addition, in an OSCE the SP can also assess students' performance. Research suggests that SPs can assess the performance of the examinee more reliably during well-defined technical skills such as history taking and clinical examination rather than on social skills such as empathy and teamwork¹. We recently piloted SP assessment in a procedural skill (blood pressure measurement) in a formative OSCE amongst first year medical students. The aim of this study was to determine whether SP assessment would impact upon the cut point for an OSCE station, and whether SP and clinical assessor marks were closely associated.

Summary of Work: 160 first year medical students participated in a four station formative OSCE in December 2018. In the blood pressure measuring station the simulated patients were asked to respond to two questions on a 5-point Likert scale (strongly agree - strongly disagree): This student made me feel confident and I am satisfied with this overall encounter. The questions combined were weighted as 10% of the overall mark for this station, with the other 90% of marks allocated by faculty clinical assessor. Station cut points with and without the SP scores were calculated using borderline regression and SP and clinical assessor scores were analysed by Pearson correlation (double tailed).

Summary of Results: Inclusion of SP scores made no significant change to the overall cut point score for the station. There were significant positive correlations between the clinical assessors scores and the scores for the two SP questions for the station, (confidence $R=.289$, $n=160$, $P<0.001$, satisfied $R=.254$, $n=160$, $P=0.001$). There was also a significant positive correlation of SP marks with total OSCE score (confidence $R=.222$, $n=160$, $P=0.005$, satisfied $R=.304$, $n=160$, $P<0.001$).

Discussion and Conclusions: In this small pilot study, we confirmed that SPs can contribute to assessor marks in this procedural skill. It is planned to assess the introduction of SP scoring in clinical as well as procedural skills stations.

Take-home Messages: We encourage clinical centres to routinely include SP as a markers of the student performances in addition to professional faculty assessors.

Applying standardized patients in hybrid simulation in team training: 11 years of experience

AUTHOR(S):

- **Min Shu Wang, Mackay Memorial Hospital, Taiwan (Presenter)**
- Ching-Chung Lin, Mackay Memorial Hospital, Taiwan
- Ming Zhong Lee, National Taipei University of Nursing and Health Science, Taiwan
- Yih-Jer Wu, Mackay Medical College, Taiwan
- I Yeh Hung, Mackay Memorial Hospital, Taiwan

ABSTRACT

Background: We have been using high-Fidelity Simulation and standardized patients in hybrid simulation in Team training for 11 years. Learner-centered learning objectives and cross-disciplinary team training have become a routine exercises in teaching hospitals. For SP in clinical situation drills, our medical education is based on patient safety and learner-centered simulation. We also focus on multiple learning goals institution and practice results sharing.

Summary of Work: In order to increase the new staff's and cross-disciplinary team clinical's resilience ability, we provide TRM workshop of teachers, application of high-fidelity Simulation with standardized patients for Routine training in various categories. The training objects include UGY, PGY Physicians, psychiatric patients with high-risk disease training and training for the situation of infant sudden death.

Summary of Results: With the total amount of 10,906 trainee were trained during the period of 2008 to 2018. PGY doctors and the respiratory therapists training were the top two most to use our training. The Department of Emergency and Internal Medicine SBE combined with resident physicians has been routinely trained. The teaching plans include acute and severe simulation teaching, anesthesia simulation training, team training, drug allergy, arrhythmia, and death before the hospital. These training increase staff's both confidence and satisfaction up to 80%-100% and to avoid medical mistakes.

Discussion and Conclusions: Applying both High-fidelity Simulation and situational-training SP may inspire clinical medical workers interest, message delivery, and feedback-providing skills, and discover the unit's deficiency for further improvement, in order to improve the medical quality and reduce errors. From the training results, actively request course and new situational lesson plans, had made us become a learner-centered services. Conclusions: Promoting SP with immersive situational learning, Cross-disciplinary education increases learning interest, not only reduces the anxiety of new staffs but also improves communication skills of students. This training helps the immersive learning of all categories and advances the integrity of the lesson plans. The students think it's more lively and interesting than traditional learning.

Establishing the Principles of De-roling in Simulated Patient practice: a focus group study

AUTHOR(S):

- Gabriel Tan, Lee Kong Chian School of Medicine, Singapore (Presenter)
- Diana Andrea Barron, Lee Kong Chian School of Medicine, Singapore
- Tanya Tierney, Lee Kong Chian School of Medicine, Singapore

ABSTRACT

Background: Simulated patients (SPs) are people who role-play in simulated clinical encounters. Realistic portrayal of patient's experiences requires physical and emotional vulnerability. SPs describe experiencing fatigue, pain, or even adopting emotions and behaviours from the character portrayed. De-roling, i.e. denying the character and returning to self-identity and reality, has been advocated as part of formal SP methodology to protect SPs' well-being.

Summary of Work: Our study aims to derive themes surrounding: (i) de-roling strategies used by SPs who volunteer at the Lee Kong Chian School of Medicine (LKC Medicine), (ii) what SPs believe about de-roling and its purpose, and (iii) what factors help and hinder SPs' de-roling. Our five focus groups comprised 23 SPs in LKC Medicine's SP programme. We included SPs with (a) 6 or (b) 1 year of SP practice, or (c) previously played mental health roles, or (d) whose responses in a previously-conducted SPs' well-being survey concern de-roling. Thematic analysis using an inductive-realist approach was conducted on the transcripts of the five focus groups.

Summary of Results: Four inter-related themes were developed to answer the research question: (i) "De-roling and Well-being", how role-play causes adverse psychological effects that de-roling can help prevent, (ii) "Practices of De-roling", how SPs' de-roling practices follow patterns; (iii) "Relationships" and (iv) "Self-versus-Role", how external factors, attributes of self and the character portrayed affect one's ability to de-role.

Discussion and Conclusions: Our study defends the notion that de-roling protects SPs' well-being, and supports literature demonstrating positive effects of therapeutic interviewer interaction and negative effects of the examination setting on SPs' de-roling. We also demonstrated new insights about the importance of building an "SP family" in de-roling and the broad interrelatedness between external factors, self-versus-role factors and the SP's choice of de-roling strategy.

Take-home Messages: Firstly, future SP training should emphasise de-roling methodology and the many strategies SPs can use. Second, schools are encouraged to build a cohesive "SP family" as it facilitates conversation, sharing and reflection between SPs, helping them de-role. Thirdly, SPs should consider de-roling strategies throughout role-play to ensure that they successfully de-role afterwards

#7NN Meet the Experts – MedEdPublish Editorial Team

Date of Session Tuesday, 27 August 2019

Time of Session: 1015-1200

Location of Session: Suite E, Level 0

Editorial Team:

- Richard Hays, MedEdPublish Editor
- Trevor Gibbs, MedEdPublish Associate Editor
- Ken Masters, MedEdPublish Associate Editor
- Kerrie McKay, MedEdPublish Administrator
- Claire Macrae, AMEE Education Officer
- Joanne Greer, MedEdPublish Technical Support

Summary:

MedEdPublish is AMEE's open-access, post publication peer-reviewed journal www.mededpublish.org. Papers on medical and health professions education are published after a light-touch review to ensure they meet appropriate standards. All papers receive a DOI. After publication papers are reviewed and given a star rating both by the MedEdPublish panel of reviewers and the education community.

Richard Hays, Editor of MedEdPublish, and other members of the Editorial Team would be pleased to meet you to answer any questions as to how you can get involved, both by publishing in MedEdPublish and by reviewing published papers.

#8A Symposia

Date of Presentation: Tuesday, 27 August 2019

Time of Presentation: 1400-1530

Location of Presentation: Hall A, Level 2

Universal Health Education Coverage - Health and Education for the Global Community

Presenters:

- Nick Bass, East London NHS Foundation Trust, London, UK
- Jibril Handuleh, Amoud University, Borama, Somaliland
- Ming-Jung Ho, Georgetown University, Washington DC, USA
- Ruti Stashefsky-Margalit, Technion, Haifa, Israel
- Manuel Mendes Costa, University of Minho, Braga, Portugal

Summary of theme and why it is important: Much of medical education is conducted, published, presented at conferences and shared among wealthy countries with a marked publication bias towards a handful of countries and resources and innovations largely confined to high and middle-income countries.

The greatest health needs are concentrated in low income countries but beyond a handful of delegates these countries are largely left out of conferences and publications rarely cover their educational needs or activity.

There is a wealth of educational activity, innovation and resourcefulness occurring in such settings, often out of sheer necessity, which remains invisible to many other resource poor countries and also richer ones. However, those of us who work with partners in such countries are aware of such learning and innovation which is beginning to spread across so-called South-South networks and also starting to be adopted and adapted in richer countries (so-called Reverse Innovation). Such learning is harder to access but can be invaluable and more appropriate in many parts of the world and can be just as valid as that developed in higher resource countries.

We would hope that anyone who values medical education would wish to learn from anyone who is advancing this regardless of the difficulties of access and communication. There is a large body of essential learning which is overlooked and which can be invaluable to all of us.

Who should participate in the symposium? Anyone with a wide interest in medical education and a willingness to value good work regardless of where it takes place

What will they gain from participating?

- A better understanding of why education is vital to the health and wellbeing of all.
- A better understanding of some of the examples of reverse innovation developed in resource-poor settings but of wider benefit to others.
- An appreciation of the need to make medical education – as an essential underpinning of health – an aspiration in terms of Universal Coverage every bit as much as direct health delivery

#8B Symposia

Date of Presentation: Tuesday, 27 August 2019

Time of Presentation: 1400-1530

Location of Presentation: Hall C, Level 2

Cost and value in medical education

Presenters:

- Martin G. Tolsgaard, University of Copenhagen, Denmark
- David A. Cook, Mayo Clinic, USA
- Steven Maloney, Monash University, Australia
- Jennifer Cleland, University of Aberdeen, UK

Summary of theme and why it is important: The global cost of medical education surmounts to more than 80 billion Euros annually. However, despite the massive cost of medical education, little is known about how to optimize the return on investment. In other words, how can we ensure that medical education delivers maximum educational value for any given spend?

Building on the concepts examined in a recent AMEE Guide, the presenters will review opportunities and limitations regarding the study of cost and value in health professions education.

The challenge of context in the study of cost will be specifically considered, along with the potential role of theory and conceptual frameworks as bridges enabling research findings to generalize across contexts. They will also describe several cost evaluation designs, and explore practical issues regarding the conduct, interpretation, and application of these evaluations and their results.

Finally, the presenters will engage the audience in identifying how to improve the future study of cost and value in medical education, and how such research can be used for the benefit of all health professions educators.

Who should participate in the symposium? Everyone with an interest in the design, delivery and evaluation of health professions education will benefit from engaging in this discussion, including education leaders, teachers, administrators, researchers, and students. Essentially everyone with a stake in training health professionals should participate, and thereby learn more about key concepts and controversies in the measurement and application of cost and value in education.

What will they gain from participating? Participants in this symposium will benefit by learning about the conduct and interpretation of research in the study of cost and value in medical education. In particular, they will gain insights into the limitations and practical challenges of cost research, and gain a basic understanding of how to conceptualize cost and value in medical education.

#8C Symposia

Date of Presentation: Tuesday, 27 August 2019

Time of Presentation: 1400-1530

The Scope of Faculty Development: How Conceptual Frameworks Can Inform Educational Practices and Program Evaluation

Organised by the AMEE Faculty Development Committee:

- Ivan Silver (moderator), University of Toronto, Canada
- Clare Morris, Queen Mary University, London, UK
- Karen Leslie, University of Toronto, Canada
- Olanrewaju Sorinola, University of Warwick, UK
- Diana Dolmans, Maastricht University, The Netherlands

Summary of theme and why it is important: Faculty development activities have moved beyond their historical origins in higher education, where the focus was on helping individuals develop their teaching practices. Faculty developers now work with individuals, teams and organisations. They generally support the development of teaching and educational practices, with an increasing emphasis on building educational leadership and research capacity. Furthermore, they have moved their work beyond the walls of the academy, from workshop to the workplace.

We would argue that alongside these visible changes, there has been a parallel broadening of the conceptual frameworks that inform faculty development programmes and activities. These frameworks help to guide faculty development practices and frame programme evaluation. This symposium aims to shine a light on some of these conceptual frameworks, making them visible through international faculty development case studies. We will also provide participants with opportunities to consider how these frameworks might be used in their faculty development work.

Who should participate in the symposium? The symposium is relevant for teachers, educators, leaders, managers, researchers, and scholars interested in faculty development or continuing professional development.

What will they gain from participating? Participants will gain an opportunity to: think about the scope of faculty development, get new insights into diverse approaches to faculty development activities, consider some of the conceptual frameworks that can inform our work as faculty developers, educators, scholars and researchers, and discuss how these approaches can be applied in practice.

#8D Short Communications - Teaching and Learning - Games

The X-games. Improving students' motivation and learning in radiology education by serious gaming

AUTHOR(S):

- **Marieke van der Schaaf, University Medical Center Utrecht, The Netherlands (Presenter)**
- Anouk van der Gijp, University Medical Center Utrecht, The Netherlands
- Josephine Huige, University Medical Center Utrecht, The Netherlands
- Cecile Ravesloot, University Medical Center Utrecht, The Netherlands
- Christian Mol, University Medical Center Utrecht, The Netherlands
- Koen Vincken, University Medical Center Utrecht, The Netherlands

ABSTRACT

Background: Interpreting medical images for diagnosing diseases is a complex skill and can avoid patients' harm. Developing image interpretation skills requires deliberate practice: intensive training focused on specific tasks, with feedback and possibilities for repetition and refinement. Serious gaming can facilitate this through gaming elements (e.g. immediate feedback, competition) that stimulate both motivation and learning activities. The aim of this study is to investigate medical students' motivation and learning activities for radiology education. The research question is: What is the effect of game elements on the motivation and learning activities of medical students for radiology education?

Summary of Work: A randomized counter balanced measures design was used. Three treatments were applied: all students first prepared radiology education based on a booklet with addition of online images (treatment 1). Next, they followed an interactive online e-learning module with feedback and suggestions for practice (treatment 2) as well as an online game (treatment 3), though in a different order. 223 second year medical students of a Dutch school for medical education participated. Motivation and learning activities during treatments were evaluated with a validated questionnaire (n = 202, Cronbachs alpha .91). After treatment 1 (booklet), the students were randomized into two groups (A and B), based on their degree of motivation during treatment 1. Group A started with treatment 2 followed by 3, and group B started with 3 followed by 2. The motivation and learning activities of the students within the treatments was compared with a mixed-design ANOVA.

Summary of Results: The game elements significantly impacted students' performance, $F(1, 185) = 6.34, p < 0.05$, with a significant interaction effect between groups and game elements. Group A (e-learning module before game) scored at average higher than group B. Game elements did not impact students' completion of the task, $F(1, 184) = 0.09, p = 0.76$.

Discussion and Conclusions: A serious game for radiology education for students does not increase training intensity, but can increase performance of trainees.

Take-home Messages: Preparation of radiology education by means of a serious game can improve medical students' learning activities in radiology.

OB-GYN-4 model: an intra-curricular activity contributes to 7 essential life skills development

AUTHOR(S):

- Pornnapa Suriyachai, Medical Education Center Phayao Hospital, Thailand (Presenter)

ABSTRACT

Background: Intra-curricular activities mostly help students develop clinical skills while extracurricular activities play a big part in contributing essential life skills development. OB-GYN-4 model has been created and aimed at contributing 7 essential life skills development (analytical thinking, problem solving, public speaking, teamwork, leadership, goal setting, time management and prioritization) besides gaining knowledge.

Summary of Work: OB-GYN-4 model is multi-game show based learning activity that imitates various game shows in Thailand: 4by4 family game, Hollywood game night Thailand as in-class learning activity. It was implemented for 4th year medical students at medical education center Phayao hospital. We selected game shows which have rules that can stimulate 7 essential life skills development. One game show may stimulate only one skill or more. Then we carefully matched it with obstetric & gynecologic topics (pelvic pain, contraception, fetal monitoring, Norplant) and created questions in the game shows by using content in each topic. In classroom, 11 students were divided into 2 groups and competed against each other on game shows after studied on their own outside classroom.

Summary of Results: 7 essential life skills self-evaluations were measured by using numerical rating scale before and after class. By using OB-GYN-4 model, after class teamwork was in a first rank (mean 8.6). Different mean scores were 5.8, 5.5, 5.1, 6.1, 5.6, 6.3, 6.1, 6.6 respectively. All skills were significantly increased ($p < 0.05$) and prioritization had biggest increased. It helped students significantly gain knowledge according to learning objective (mean 7.7) more than other learning methods (mean 5) ($p < 0.05$). In short interview, students commented that OB-GYN-4 model made them enjoy and interest in the topics.

Discussion and Conclusions: Key component of OB-GYN-4 model are group competition and rules of game shows. Teamwork was mostly being promoted because of group competition and prioritization had biggest increased because normally it was seldom contributed in intra-curricular activities but we promoted it by rules of game shows. So intra-curricular activities can contribute essential life skills development as well as extracurricular activities.

Take-home Messages: We can create intra-curricular activities which contribute to essential life skills development and clinical skills.

#8D Short Communications - Teaching and Learning - Games

When is the best time to use a serious game in undergraduate medical education? Findings from a prospective study

AUTHOR(S):

- Nikolai Schuelper, University Medical Centre Göttingen, Germany (Presenter)
- Insa Frisch, University Medical Centre Göttingen, Germany
- Angelina Middeke, University Medical Centre Göttingen, Germany
- Sven Anders, University Medical Centre Hamburg-Eppendorf, Germany
- Tobias Raupach, University Medical Centre Göttingen, Germany

ABSTRACT

Background: Serious games (SG) are increasingly being used in undergraduate medical education in order to augment teaching on a number of topics including clinical reasoning (CR). However, it is unclear at which point within the curriculum these games can be used most effectively.

Summary of Work: The undergraduate medical curriculum at Göttingen University Medical Centre consists of a two-year pre-clinical and a four-year clinical phase. Students take a module ('module 1') on cardiorespiratory diseases and their treatment at the beginning of the fourth year. Halfway through their fifth year they attend a repetition module ('module 2') where cardiorespiratory diseases are revisited from a presenting complaint perspective. In summer term 2017 we invited students attending these two modules to play six 90-minute sessions of a serious game simulating an accident & emergency department. In weeks 2 and 6, student performance with regard to CR in three virtual patient cases (pulmonary embolism, hypertensive crisis, NSTEMI) was assessed by analysing game logfiles recording each student's activity while playing the game. Changes in performance scores between student cohorts were assessed by an ANOVA.

Summary of Results: A total of 114 students (module 1: n=80; module 2: n=34) provided complete data at week 2 and week 6. Overall logfile scores increased from 57.4+/-1.3 to 65.1+/-1.4% in module 1 and from 57.9+/-2.2 to 66.5+/-2.2% in module 2, respectively (p for time <0.001; p for interaction 0.700). A more detailed analysis revealed that the increase was driven by improvement in performance related to patient management (d=0.93) but not history taking.

Discussion and Conclusions: We were surprised to find that the initial performance of students was similar in both modules, despite module 2 being a repetition module. The point within the curriculum at which the serious game was used did not predict learning outcome. The results suggest that CR teaching needs to be enhanced between the fourth and the fifth year at our institution. More advanced students benefited equally well from using the game than less advanced students.

Take-home Messages: During the clinical phase of undergraduate medical education, a serious game aimed at training CR competence is effective, irrespective of student level.

#8D Short Communications - Teaching and Learning - Games

Gamification of Medical Education: A Systematic Review

AUTHOR(S):

- **Anne van Gaalen, Universitair Medisch Centrum Groningen, the Netherlands (Presenter)**
- Jasperina Brouwer, Rijksuniversiteit Groningen, the Netherlands
- Johanna Schönrock-Adema, Universitair Medisch Centrum Groningen, the Netherlands
- Debbie Jaarsma, Universitair Medisch Centrum Groningen, the Netherlands
- Janniko Georgiadis, Universitair Medisch Centrum Groningen, the Netherlands

ABSTRACT

Background: Gamification refers to the use of game-elements in a non-gaming context. Game-elements such as points, leaderboards, achievements or badges are implemented into educational contexts with the intention to raise engagement and motivation of students. However, currently, literature is lacking a systematic overview focusing on gamification in medical education. Therefore, we performed a systematic review investigating studies on gamification guided by three principal questions. What theoretical models drive the design of gamification in medical education? Which motives are used to apply game-elements? What is the empirical evidence for the effect of gamification in medical education?

Summary of Work: We conducted a systematic review in accordance with the guidelines of the Associations for Medical Education in Europe (AMEE). We searched in eight databases on terms on gamification and medical education. We excluded serious games.

Summary of Results: Out of 5044 identified articles, 44 were eligible for analysis. The majority (n=36) did not apply any theoretical framework. Six different motives for using gamification could be identified. On average two game-elements (range 1-4) were identified in each study. Only eight studies investigated gamification to a control group of which four were investigating simulations and competition. All studies showed a positive effect.

Discussion and Conclusions: This systematic review is the first to examine gamification in medical education as a separate identity from serious games. Despite a considerable amount of studies investigating gamification and the high satisfaction rates generally reported by the subjects that were included in them, results clearly indicate that most studies lack a solid empirical basis.

Take-home Messages: Applying gamification in medical education provide high satisfaction in students. Gamification seems to mediate but not necessarily moderate learning via the enhancement of motivation. Researcher investigating gamification should focus more on theoretical framework instead of only practicality.

ABSTRACT

Background: Serious games can be used to train clinical reasoning (CR). However, only few studies have used outcomes beyond student satisfaction, and most of the published evidence is based on short-term follow-up. This study assessed retention of CR competence in undergraduate medical students 1.5 years after using a serious game.

Summary of Work: We developed and validated a serious game simulating an accident & emergency department [1]. In summer 2017, fourth-year medical students participated in six 90-minute sessions of playing the game (intervention group). In the second and sixth session, student performance on three virtual patient cases was assessed by analysing game logfiles capturing student activity. In winter 2018/19, students played another session, and their performance was compared to students in the same year of undergraduate education who knew how to play the game but had not been exposed to the content (control group).

Summary of Results: Out of 80 eligible students in the intervention group, 58 were followed up. During the initial training phase, the overall percent scores for all three patient cases increased from 57.4+/-1.3% to 65.1+/-1.4% ($p < 0.001$; Cohen's $d = 0.93$). At 1.5-year follow-up, they scored 65.8+/-1.2%. Compared to the control group ($n = 42$ out of 46 eligible students) who scored 60.1+/-1.4%, students in the intervention group achieved significantly higher scores ($p = 0.003$; $d = 0.62$).

Discussion and Conclusions: The considerable difference observed between previously exposed and unexposed students suggests a long-term effect of using the game although retention of specific cases rather than general principles might partially account for this effect. A major strength of the analysis is the comparison with students who were at the same level of education and had been exposed to the same curriculum, the only difference being that they had not used the game before. Conclusion: Using a serious game aimed at training clinical reasoning had a long-term effect on student performance. Future research needs to determine whether the effect is case-specific.

Take-home Messages: This study provides evidence of a long-term effect of using a serious game in undergraduate medical education.

Escape games as educational content to teach communication and knowledge sharing skills to first-year medical students

AUTHOR(S):

- **Yoshikazu Asada, Jichi Medical University, Japan (Presenter)**
- Yoshitaka Maeda, Jichi Medical University, Japan
- Yoshihiko Suzuki, Jichi Medical University, Japan
- Hiroshi Kawahira, Jichi Medical University, Japan
- Kazuya Atsumi, Jichi Medical University, Japan
- Motoshi Kikuchi, Jichi Medical University, Japan

ABSTRACT

Background: Scott Nicholson defines escape games as 'live-action team-based games where players discover clues, solve puzzles, and accomplish tasks in one or more rooms in order to accomplish a specific goal (usually escaping from the room) in a limited amount of time.' This study aims to reveal the possibility of using escape games to teach communication and knowledge sharing to first-year medical students.

Summary of Work: The class was conducted using the following schedule: (1) introduction (5 minutes); (2) the escape game (30 minutes); (3) showing the answer and preparing feedback (10 minutes); (4) group discussions (20 minutes); and (5) sharing ideas (5 minutes). Since the games typically require 60 minutes for completion, the actual time allotted for solving tasks was insufficient. Thus, instructors provided some hints during the game. The topics of discussion were as follows: (1) how to communicate with other group members; (2) how to divide roles within the group; and (3) comparison of escape games with other situations, such as a clinical setting. After the class, students submitted a written assignment about their reflections concerning the class. An optional questionnaire to evaluate the class was also provided.

Summary of Results: A total of 121 students (20 groups) attended the class. More than half the groups had the correct answer, but no group had the 'secret' answer. The results of the questionnaire showed that although there was insufficient time, the difficulties were moderate because enough hints were provided. Some interesting opinions were gathered from the written assignments, such as 'leadership and time management are important for solving puzzles and actual medical team collaboration' and 'the game used attractive means to teach difficult and dull contents.'

Discussion and Conclusions: Only knowledge-based tasks were used in this game. Some literature mentioned adding skill-based tasks, such as simulations. Although first-year students are not familiar with difficult procedures, such as endovascular ones, some simple tasks, such as hands-only CPR, would be usable. However, since the object of the class was to learn communication and knowledge sharing, skill-based tasks might not be suitable.

Take-home Messages: **Escape games have the possibility of teaching communication, knowledge sharing, and group dynamics to medical students.**

A case study of experiential learning in quality improvement: delving deeper into assumptions of project-based learning

AUTHOR(S):

- **Joanne Goldman, University of Toronto, Toronto, Canada (Presenter)**
- Ayelet Kuper, University of Toronto, Toronto, Canada

ABSTRACT

Introduction: The use of an experiential learning approach in quality improvement (QI) education has been strongly endorsed over the past twenty years and has come to be viewed as the optimal way of teaching QI. Experiential learning in QI education is widely operationalized by engaging learners in developing and executing a QI project. This type of learning can result in improvements in knowledge and, at times, care processes. However, QI project-based learning has been demonstrated to have challenges at the learner, program and organization levels. Uncertainty remains regarding the optimal ways to deliver training to maximize the learning and project outcomes of experiential learning in QI. Shifting the focus of QI education research to conceptualize and examine the realities of project-based learning in complex workplaces would deepen our understanding of the diverse factors that affect experiential learning processes and outcomes. To address this gap, we conducted a case study of QI education with a focus on project-based learning across three QI continuing education programs. This study aimed to explore individuals' experiences of QI project-based learning and professional and organizational factors that influence learning and project experiences.

Methods: An interpretive qualitative case study methodology (Stake, 2000) was used to examine the experience of project-based learning in three QI continuing education programs: a university Masters, a university Certificate, and a hospital Fellowship program. Case study methodology allows for an in-depth exploration of a phenomenon as situated within a complex social, cultural and political context. In an interpretive approach, researchers are sensitized towards participants' perceptions and experiences, including shared and divergent understandings and behaviours (Caronna, 2010; Stake, 2000). Data collection consisted of 58 interviews with participants, course directors, and organizational stakeholders; 135 hours of in-class observations; and relevant documents. Content and comparative analysis approaches were used. The evolving coding framework and themes were informed by a conventional approach, being derived directly from the data, as well as by a directed approach, being informed by relevant health professions education research (e.g. curriculum development, mentorship and experiential learning).

Results: The findings provide insight to five key factors that influenced participants' experiences of project-based learning. These were: 1. Variable emphasis on learning versus project objectives and resulting benefits, tensions and consequences; 2. Challenges with integrating the QI project into the curriculum timeline; 3. Variability in project coaching; 4. Participants' variable access to resources and influence over QI project given their professional roles; 5. The influence of the workplace environment on project success.

Discussion and Conclusion: The findings from this study point towards two possible future directions. The first involves commitment to invest in the factors identified in this study that influence experiential learning and to their complex interactions. The second requires an openness to questioning project-based learning and exploration of alternative models of QI learning, such as case-based or simulation approaches, when a project-based learning approach might not be feasible or optimal. Similar to experiential learning in the clinical context, project-based learning in QI in the health systems context, a relatively young field, will require further research using diverse methodological

and theoretical approaches to learn how best to deliver experiential QI training, and to consider the role of other approaches to QI education.

Making a lecture stick: The effects of spaced instruction on knowledge retention in medical education

AUTHOR(S):

- Marjolein Versteeg, LUMC, Leiden, the Netherlands (Presenter)
- Marnix Timmer, LUMC, Leiden, the Netherlands
- Paul Steendijk, LUMC, Leiden, the Netherlands

ABSTRACT

Introduction: Medical students suffer from the persistent problem of forgetfulness, resulting in poor retention of medical knowledge and skills needed to become qualified health professionals¹. This challenging issue may be resolved by implementing spaced learning in the medical curriculum. The spacing effect is one of the most robust phenomena in the science of learning. It establishes increased knowledge retention by repeating the to-be-learned information using temporal intervals, i.e. spacing the learning sessions. Spaced learning activities are already finding their way into (online) testing and simulation training, but the instructional phase seems to be overlooked. This is remarkable as one of the most commonly used teaching method to transfer knowledge is lecturing, in which a large volume of information is covered without interruption, resulting in poor retention. Guided by the need for instructional designs that enhance learners' knowledge retention, we designed a spaced learning lecture based on psychological and neuroscientific literature². Our aim was to investigate the efficacy of spaced learning in the instructional phase in medical education.

Methods: In this study, second-year medical students (N = 149) were randomly allocated to either the spaced lecture group or a control group. The spaced lecture consisted of three 15-min instructional sessions, separated by 5-minute breaks with distractor activities. Repetition of the material was established by including a summary of the preceding information after each break. The control group received the exact same lecture, but without the breaks, thereby resembling a traditional lecture. A pre-post design was used, measuring students' baseline knowledge prior to the lectures (t = -14 days) and their knowledge retention one week after the lectures (t = 8 days).

Results: The retention test ($\alpha = 0.74$) was performed by a total of 107 students (Spaced: n = 61, Control: n = 46). The average score on the retention test was not significantly different between the spaced lecture group (33.8±13.6%) and the control group (31.8±12.9%) after controlling for students' baseline-test performance (F(1,104) = 0.55, p = 0.458). Students' narrative comments showed that the experimental lecture format was well-received, and subjectively benefitted students' attention-span and engagement.

Discussion & Conclusion: This study was the first to implement spaced instruction in a medical lecture setting. Although, we were unable to show increased knowledge retention after a spaced lecture, we suggest that future research should focus on the development of instructional designs that contain elements of spacing and repetition to facilitate learning. Based on our findings combined with existing psychological theories and neuroscientific hypotheses, we provide recommendations for researchers and educators regarding the timing of intervening breaks, retrieval gaps and number of repetitions. Ultimately, we aim for optimized spaced learning designs in the medical curriculum that help to educate health professionals with a solid knowledge base.

Exploring the undergraduate dental students' views of collaborative learning in the clinical learning environment

AUTHOR(S):

- Anna Dargue, University Hospitals Bristol NHS Foundation Trust, Bristol, UK (Presenter)

ABSTRACT

Introduction: Undergraduate dental students in the UK work together in pairs when treating patients as part of their clinical training. Collaborative learning is described as working together with shared effort and responsibility for a task.¹ Very few studies have explored the students' views of paired collaborative learning for clinical skills in the clinical setting, and only one study was found that was relevant to Dentistry. This study had limited depth due to its design.² Across the UK there are increased student numbers and finite resources available for dental clinical teaching. Local course evaluations over several years had given conflicting results on students' views of working in pairs. Thus, this study aimed to explore the dental students' perspectives of collaborative clinical working and identify whether any improvements could be made to the clinical learning environment. Ethical approval was obtained.

Methods: I used a constructivist, interpretivist inductive methodology with a phenomenological basis to understand the students' experiences and views of working in pairs. I chose stratified purposeful sampling to illustrate characteristics across the different years. Eight students from three clinical years recorded three audio-diaries using Gibbs reflective cycle as a guide, reflecting on their experiences of collaborative learning with peers. This was followed by individual semi-structured interviews. The diary-interview method was chosen to provide greater depth and clarity, and allowed investigation of individual beliefs. Inductive thematic analysis was performed on the data.

Results: Students had a mostly positive view of working in collaborative partnerships. Three main themes were identified around the focus of effective collaborative partnerships. These themes related to individual characteristics, relationships and learning.

Discussion: The students identified that effective collaborative learning partnerships used active, experiential and observational learning.

Positive aspects of collaborating with a student partner were feeling supported in their relationships, so creating a safe learning environment where they were comfortable asking questions. They also valued the emotional support that working with other students gave, and this helped them cope with pressure. They highlighted the development of friendships in healthy partnerships that made them feel they belonged. This increased trust and familiarity allowed for more effective feedback.

Working with a variety of partners was seen as positive and contributed to learning non-technical skills. A technique of 'benchmarking', comparing their knowledge and skills with those of a peer, was described by students when paired and was used in a constructive manner.

Negatives of collaborative learning related to interpersonal difficulties and led to students feeling unsupported in the clinical environment. This created a barrier to learning. Students also highlighted feeling frustrated in the assistant role and this increased as they become more experienced. Correspondingly they noted that observational learning provided lesser quality learning than experiential.

Conclusion: The study demonstrated the significance of social interaction and collaboration with peers to be a vital part of the clinical learning experience. Peers are seen to have an important effect on each other's learning in positive and negative ways.

Suggested improvements arising from this study are the use of ground rules for effective student partnerships and to promote a safe clinical learning environment. Students need to understand the value of the assistant role which staff can further encourage and support.

On the same page? The relationship between teamwork within clinical teaching teams and the experienced learning climate of their residents

AUTHOR(S):

- Iris Jansen, Amsterdam UMC, Amsterdam, The Netherlands (Presenter)
- Milou Silkens, Amsterdam UMC, Amsterdam, The Netherlands
- Renée Stalmeijer, Maastricht University, Maastricht, The Netherlands
- Kiki Lombarts, Amsterdam UMC, Amsterdam, The Netherlands

ABSTRACT

Introduction: Supportive learning climates are key to ensure high quality residency training and patient care (Silkens, et. al., 2016). Clinical teachers play an important role in creating and maintaining these climates. Efforts aimed at strengthening the role of clinical teachers have mainly focused on their teaching skills and supervisory styles. Recently, the perspective that clinical teaching is not just an individual effort, but a team effort, has been proposed. As a result, the concept of clinical teaching teams was introduced and used to describe how teaching teams collaborate to fulfil educational tasks and activities (Slootweg, et. al., 2014). However, the level of teamwork within these teams varies and might influence the resulting learning climate within a given department. The learning climate consists of three discrete facets: affective, cognitive and instrumental. Identifying the association between teamwork quality and specific learning climate facets could provide more insight into ways in which the postgraduate learning environment can be improved. Therefore we posed the following research questions: (1) To what extent is teamwork quality within teaching teams associated with the residents' experienced learning climate, and more specifically (2) with the affective, cognitive and instrumental facets of the learning climate?

Methods: This study included clinical departments that used two validated questionnaires in the period from January 2014 through May 2017. The TeamQ questionnaire evaluated teamwork quality of clinical teachers within a teaching team. The Dutch Residency Educational Climate Test (D-RECT) questionnaire evaluated residents' experienced learning climate. Both questionnaires were administered through a web-based system. Associations were analysed using multilevel models and multivariate general linear models.

Results: In total, evaluations of 47 teaching teams and 400 residents within 16 hospitals were included in this study. Teamwork quality was positively associated with the overall residents' learning climate ($b = 0.33$; 95% CI = 0.06 – 0.60) as well as with the affective ($b = 0.50$; 95% CI = 0.06 - 0.94) and instrumental ($b = 0.42$; 95% CI = 0.11 - 0.74) learning climate facet. The results on the cognitive domain were non-significant ($b = 0.35$; 95% CI = -0.07 – 0.77).

Discussion & Conclusions: Teamwork quality of teaching teams was positively associated with residents' perceptions of the overall learning climate as well as with the affective and instrumental learning climate facets. This implies that social relationships between teaching teams and residents (affective facet) as well as structure and hierarchy (instrumental facet) benefit from the quality of teamwork. The association between teamwork and the cognitive learning climate facet was not significant which might be explained by this facet's orientation at the residents' own responsibility. Our results suggest improving the postgraduate learning climate can be reached through promotion of teamwork within clinical teaching teams. This resonates with studies emphasising the importance of creating teaching communities to enhance residency training. Future research could widen the lens to include the role of other health professionals on residency training.

A Scoping Review on The influence of prior performance information on ratings of present performance: Implications for learner handover

AUTHOR(S):

- Susan Humphrey-Murto, University of Ottawa, Ottawa, Canada (Presenter)
- Aaron LeBlanc, University of Ottawa, Ottawa, Canada
- Claire Touchie, Medical Council of Canada, Ottawa, Canada
- Debra Pugh, University of Ottawa, Ottawa, Canada
- Timothy J. Wood, University of Ottawa, Ottawa, Canada
- Lindsay Cowley, University of Ottawa, Ottawa, Canada
- Tammy Shaw, University of Ottawa, Ottawa, Canada

ABSTRACT

Introduction: The system of training at many medical schools and at the postgraduate level is fragmented and organized in blocks through which trainees rotate. In a competency-based medical education (CBME) framework, however, assessment and feedback should be continuous. Since longitudinal supervision is often not possible, sharing information about the learner across rotations may enable more efficient and effective tailoring of the educational experience. Learner handover (LH), also called forward feeding, is defined as the sharing of information about learners between faculty supervisors involved in their education. Although many faculty and learners favor the practice, others have expressed concerns that LH may cause stigmatization leading to bias of future assessments.(1) Does the literature support these concerns? There is little information in the medical education literature, but the psychology literature is replete with studies surrounding the potential for bias.(2) When a rater is provided with knowledge of prior performance the following context effects may occur: bias toward the direction of the prior performance level (i.e., assimilation effect), bias away from the direction of the prior performance level (i.e., contrast effect), or no effect whatsoever. These prior performance context effects are undoubtedly relevant to LH. The purpose of this review was to summarize key concepts across disciplines surrounding the influence of prior performance information (PPI) on subsequent ratings.

Methods: Using the Arksey and O'Malley framework, a scoping review was completed to systematically select and summarize the literature from multiple cross-discipline databases. Inclusion criteria were selected to represent PPI relevant to LH; namely, the information must be indirect (i.e. from an external source) and within-subject (i.e. the information is about the same person as the target performance). Using the OVID platform, we searched OVID MEDLINE, including Epub Ahead of Print, In-Process & Other Non-Indexed Citations, Embase, ERIC, PsycINFO, ABI/INFORM (ProQuest) and Business Source Complete (Ebsco) from 1970- January 2018. Since this topic was noted to be very dispersed in the literature and was indexed inconsistently, we added a snowballing-type review and an author search for 16 key authors. A data extraction form was used, and study results were combined using quantitative and thematic analyses.

Results: Of 24,442 records initially identified, 24 studies met inclusion criteria. Research settings included students rating teachers (n=8), job performance evaluations (n=9), employment interviews (n=2), sports (n=2), music assessments (n=2), and teachers evaluating students (n=1). Most studies revealed an assimilation effect (i.e., when compared to no PPI, raters exposed to negative or positive PPI scored the same target performances lower or higher respectively). Factors observed to modify this effect included (1) knowledge of poor (negative) PPI were associated with larger effect sizes than those corresponding with knowledge of good (positive) PPI; (2) general standards for performance provided to raters led to greater assimilation than specific standards; (3) increasing processing demands on the rater increased context effects; (4) increasing rater motivation reduced assimilation; (5) rater expertise and training revealed mixed results.

Conclusions: When raters are provided with indirect (external) prior performance information about an individual, an assimilation bias was demonstrated across multiple settings. It is not clear if these findings are generalizable to the medical education milieu, but these results should be considered by educators in the context of learner handover.

Patient involvement in health professionals' education: A meta-narrative review

AUTHOR(S):

- Paula Rowland, University of Toronto, Toronto, Canada (Presenter)
- Melanie Anderson, University of Toronto, Toronto, Canada
- Arno K Kumagai, University of Toronto, Toronto, Canada
- Sarah McMillan, University Health Network, Toronto, Canada
- Vijay Sandhu, University of Toronto, Toronto, Canada
- Sylvia Langlois, University of Toronto, Toronto, Canada

ABSTRACT

Introduction: More than 100 years ago, William Osler inspired educators to consider health professions education (HPE) as intricately reliant on patients. Since that time, patient involvement in HPE has taken on many different meanings. The result is a disparate body of literature that is challenging to search, making it difficult to determine how to continue to build knowledge in the field. To address this problem, we conducted a review of the literature on patient involvement in HPE using a meta-narrative review (MNR) approach. The aim of this review was to synthesize how questions of patient involvement in HPE have been considered across various research traditions and over time.

Methods: MNR is a form of knowledge synthesis concerned with exploring the history, guiding assumptions, and key findings that exist within disparate research traditions comprising a scholarly field. Procedures for this study followed the guidelines published by RAMESES and evolved through three main phases: collecting the archive, analysis, and interpreting intersections between higher order concepts. The search process and resulting analytical procedures were informed through ongoing consultations with an expert advisory council. Sources included in the review included primary studies, review articles, conceptual pieces, and editorials related to patient involvement in health professions education. We excluded from our search articles that were solely concerned with patient involvement in clinical care and were not explicitly linked and/or theorized in relation to learning or education. To manage the scope of the review, we excluded sources that were concerned with patient involvement in patient education. Our final archive included 295 sources for analysis.

Results: In this paper, we focus on three meta-narratives of patient involvement in HPE. These meta-narratives refer to coherent ways of thinking in which patients are constructed in particular ways, specific rationales for patient involvement are offered, and different research traditions are put to use in the field. We labelled these three meta-narratives in terms of their main areas of concern: (1) democratization of health professions education, (2) creation and maintenance of reproducible learning and assessment practices, and (3) developing social understandings of learning in care contexts.

Discussion: Attending to the intersections between these three meta-narratives, we focus on a core concept in patient involvement in HPE: the notion of "active patient engagement". In our analysis, we came to understand three different ways in which the "active patient" was conceptualized: politically, instrumentally, and theoretically. These different constructions of "active patient engagement" lend themselves to different program designs, scholarly traditions, and possible debates.

Conclusion: Patient involvement in HPE is being performed in multiple ways simultaneously. The outcomes of these performances invariably differ, as does their potential for unintended consequences. For example, where patient involvement performs as a political exercise, questions of patient voice, representation, and representativeness become relevant, but accountabilities to learners along the principles of transparent assessment practices and equitable learning opportunities may be less visible. When patient involvement performs as an instrumental endeavour, accountabilities to learners may be more explicitly addressed, but unintended and unexplored paternalism towards patients may persist. Future research into patient involvement in HPE may not be best served by asking "does this work?", but instead by asking "what work does this patient involvement do?", "for whom?", and "how will we know?".

Educational implications of clinical service divisions: a Bakhtinian analysis

AUTHOR(S):

- Clare Whitehead, University of Manitoba, Winnipeg, Canada (Presenter)
- Brett Schrewe, The University of British Columbia, Victoria, Canada
- Jeffrey Hyman, University of Manitoba, Winnipeg, Canada
- Ayelet Kuper, University of Toronto, Toronto, Canada

ABSTRACT

Introduction: Delivering compassionate, person-centred care is at the heart of medical practice. Specific learning contexts, including different residency rotations, may shape how trainees learn to provide such care. At our study site, patients are admitted to one of three general paediatrics services depending on where they live and whether their primary care provider is a paediatrician. While Services B and C primarily admit children who either live in the urban centre where the hospital is located or in communities in the south of the province, Service A admits patients who come to hospital from remote and isolated communities in northern Canada. Most of these are Indigenous communities with no road access or running water, high costs of living, and overcrowded substandard housing. In this project we sought to examine what the separation of patients into inpatient services based on their socio-demographics might be teaching paediatric residents about the delivery of effective person-centred care.

Methods: The theoretical framework for this project derives from the work of Russian linguist and literary theorist Mikhail Bakhtin. We drew on Bakhtin's concepts of dialogue and monologue, including the finalization that results from monologic interactions. Bakhtin describes finalization as an idea becoming fixed, such that it can no longer be challenged or questioned, often resulting in a person being portrayed without nuances to distinguish them from broad societal ideas about their identity. Our methodology was an instrumental case study with three embedded units (Services A/B/C). We iteratively gathered data via semi-structured interviews with current paediatric residents, focusing on their experiences interacting with patients and families on the three inpatient services. We coded and analyzed the interview transcripts using Bakhtin's concepts as a theoretical lens, seeking to understand how trainees described patients and families on each service and how this shaped the care they had learned to provide. The subset of findings in this abstract focuses on one of these services (Service A), with the other two services acting as comparators.

Results: We found that paediatric residents quickly learn to finalize patients and families admitted to Service A, describing them as a homogeneous group. Their families are described as being physically absent from the hospital; disengaged from their child's care; and not understanding what is happening in hospital. This finalization has negative consequences for effective communication (which is often not seen as possible) and for advocacy for systems change (at the hospital or within the broader system). Residents articulate being aware of, and indeed deeply troubled by, this finalization and its implications. They do not believe that it is a desired outcome of their educational program, but they also do not know how to move beyond it within the constraints of their hospital setting.

Discussion & Conclusions: The system for dividing up inpatients into the three different general paediatrics services at this children's hospital in Canada was developed based on historical factors. This project identifies the resulting finalization of patients and families on one specific service, leading to troubling implications for education, resident wellbeing, and ultimately patient care. Our analysis has implications for

understanding structural barriers to person-centred care in clinical contexts and points to potential educational interventions to mitigate their effects.

ABSTRACT

Introduction: Traditionally the patient-healthcare professional relationship was paternalistic, in which the professional made the decisions on behalf of the client. There has been a paradigm shift away from this type of encounter toward a more patient-centered care, in which the patient is more empowered, informed, and autonomous. We know that there is room for improvement in the way professionals facilitate patient's empowerment and autonomy during consultation. Autonomy supportive consultation is theoretically based on the Self-determination Theory, a general theory of human motivation. By satisfaction of three fundamental psychological needs: autonomy, competence and relatedness professionals could facilitate more autonomous forms of self-regulation of health among patients (Ng et al, 2012). The aim of this review is to determine how contextual factors support or hinder the development of an autonomy-supportive climate and identify the factors which influence the mechanisms to support a patient's autonomy before, during and after decisionmaking in consultations and the outcomes.

Methods: We conducted a systematic review of the literature using the realist synthesis method guided by RAMESES guideline (Wong et al, 2013). A realist review allowed us to analyze heterogeneous evidence to understand an underlying mechanism. The data are analyzed using the model of context, mechanism and outcome. Literature searches were performed by an experienced information specialist in Pubmed, Embase, PsycINFO and Cinahl. These databases were searched using a combination of the following keywords and synonyms: Autonomy, Support, Consultation/communication and Intervention. The titles and abstracts of the articles were screened independently for inclusion by two authors. Second two authors assessed the full texts of the remaining articles for inclusion. The focus was on empirical studies involving autonomy support of clients or patients in an individual interaction in a healthcare setting. Any disagreement was discussed and resolved through consensus. Data extraction, analysis and synthesis was finalized with the full research team.

Results: Out of 2200 articles which were found through the search, 16 met the inclusion criteria. Five of these articles investigated the provider perspective and 11 articles used the patient perspective. We first filtered the context factors and found that the work organization, the attitude and competence of a professional are important factors for creating an autonomy-supportive climate during a consultation. As mechanisms we found overarching factors and ones which were important before, during and after the decision-making. The most crucial overarching factor was knowing the client. During the decision-making process respectful interaction on rational and emotional issues was important. Two relevant patients outcomes we found were higher perceived decision satisfaction and higher compliance for treatment or behavior change.

Discussion & Conclusions: Healthcare providers like to give information but hardly provide autonomy support during consultation. In this review we found that to realize an autonomy-supportive climate the attitude and competence of professionals play a crucial role. To facilitate the transition to become a more autonomy-supportive professional,

training is required. Based on the new insights generated into context and mechanisms of autonomy support we intend to develop a framework for training.

An innovative concept model for on-call simulation training: 'Bleep test: Doc On Call'

AUTHOR(S):

- Swati Parida, University Hospitals Leicester Trust, UK (Presenter)
- Kishan Patel, University Hospital Leicester trust, UK
- Daniel Gill, University Hospitals Leicester Trust, UK

ABSTRACT

Over 40% Of UK medical school graduates feel unprepared for starting foundation training; specifically being on-call, management of acute clinical situations, prescribing, clinical prioritisation and time management.¹ Across all medical schools, students feel that they would benefit from on-call simulation being integrated into the formal medical school curriculum.²

To aid the transition between final year medical students and foundation doctors working on-call shifts independently, we designed and implemented an immersive simulation programme for (post finals) final year medical students at the University Of Leicester. The aims were to provide medical students the opportunity to practice giving and receiving handover, responding to bleeps, task prioritisation, prescribing, medical telephone discussions, assessing acutely unwell patients, formulating management plans independently and familiarising themselves with the logistics of medical on call shifts.

Each 3 hour session consisted of 5 final year medical students being handed bleeps and being bleeped to attend to common on-call scenarios across a large University teaching hospital site; involving simulated patients and tutors examining them. Scenarios included common presentations and ward jobs such as patient with hyperkalaemia, prescribing warfarin, prescribing fluids for acute kidney injury, postoperative analgesia and sepsis stations. Students were able to phone a 'mock switchboard' allowing them to speak to seniors as in a real shift. Students received a handover before 'their shift' and were expected to handover sick patients afterwards. They then receive personalised one-to-one feedback regarding their performance and tips for on-call shifts.

Primary outcomes measured to assess the efficacy of our programme were overall on-call confidence, managing acutely unwell patients, giving and receiving handovers, telephone discussions with other disciplines, task prioritisation, time management, escalating sick patient appropriately. These were measured qualitatively with pre and post-confidence questionnaires. Additionally we followed up the students once they had commenced foundation training to assess the impact of our programme on their postgraduate practice. In this poster, we present our initial pilot model and the subsequent feedback-driven process leading to our successful high-fidelity on-call simulation programme.

Beyond Statistics: an innovative staff student project challenging black stereotypes

AUTHOR(S):

- **Bankolu Alo, St. George's University of London, UK (Presenter)**
- Valentina Abi Osman, St. George's University of London, UK
- Adrian Crawford, St. George's University of London, UK
- Margot Turner, St. George's University of London, UK

ABSTRACT

A Black Minority Ethnic (BME) student differential attainment gap has been identified in North American and European universities for over 20 years. This is a complex multi-factorial issue. However, some research has identified the impact of negative stereotyping, and black students have highlighted a lack of role models available, as well as an absence of black perspectives in course material.

St George's, like other universities, has identified that there is a BME attainment gap and the literature has shown Black Caribbean students and Black African students have the highest gap at 26%. Universities have a legal obligation to address this issue but are often struggling to get beyond the statistics. We created a joint staff student project to highlight positive role models in health and medicine. We want to do a short visual presentation on our project to use and create art work to celebrate the contribution of Black Caribbean people to the NHS. We have documented our journey in creating canvasses to celebrate the achievements of Black Caribbean pioneers in health and science. We want this to be an ever-growing resource that can move around the university encouraging more people to share their families' histories.

We hope this work will challenge the defaulted white-centric reverence often seen in our university spaces and provide a nuanced historical context often missing in our medical schools, which will encourage future black doctors, healthcare workers and scientists. In qualitative evaluation, so far BME students have said this project has filled a gap and made them feel more represented and respected.

Different Ways of Knowing: Teaching Visual Wisdom With Art

AUTHOR(S):

- Christine Todd, Southern Illinois University School of Medicine, USA (Presenter)

ABSTRACT

I have been showing art to medical trainees for 15 years, as a method of increasing their ability to intuit narrative meaning from what they see. Although many students have no background in the humanities, they can appreciate that learning to look and describe with mindfulness and care is a useful doctoring skill. In the process of developing visual literacy, however, students also learn lessons about the power of non-verbal communication, discover how rigorous description can lead to epiphanies of understanding, develop a non-technical vocabulary for expressing emotion, and broaden their cultural and historical backgrounds. Spending time in the presence of great art puts us in direct touch with our humanity, an experience I would like to replicate by showing the works of art I use in my workshops while sharing the insights my students have had while examining them.

Benefits of Student-Driven Wellness Choices Versus Mandated Wellness Programs in a Medical School Setting

AUTHOR(S):

- Robert Hage, St. George's University, Grenada (Presenter)
- Kristen Santana, St. George's University, Grenada
- Shauna Maty, St. George's University, Grenada

ABSTRACT

At conferences frequently heard buzzwords include empathy, wellness, burnout, suicide prevention, and resilience. Increased rates of depression, burnout, and even unprofessional behaviors in medical students have been directly linked to a lack of coping mechanisms. Given the pervasive nature of these traits, schools are motivated to create programs promoting wellness and wellbeing. However, cultivating student engagement in mandatory well-being activities can be particularly difficult.

Most strategies applied to promote wellness in the medical curriculum attempt to create awareness and address the stressors commonly experienced by medical students. Common methods include lecture-based presentations, workshops, and online modules. Medical students find the mandatory nature and regimented structure yielding mediocre results. These sessions lack the perceived control and autonomous decision making that generate long-term compliance and neglect wellness of the body and spirit. In order to address this problem, students and faculty members collaborated in creating a well-being selective that encourages autonomous decision making and perceived control by applying a small points reward system towards students obtaining one credit on their transcript.

The overarching goal of the selective is to inspire long-term habits and healthy coping mechanisms surrounding mind, body, and spiritual well-being. Perceived control is the major determinant of compliance, therefore the selective is structured around providing numerous activities students can choose to participate in throughout the duration of their medical school experience. Participation with this program is fostered through the use of a small points reward system with the goal of long term retention, similar to a loyalty card rewards system.

With the expanded implementation and promotion of the well-being selective, students will become increasingly engaged given the choice of a variety of activities in conjunction with the proposed small points reward system. These activities will enrich their physical and spiritual wellness, thereby instilling positive, sustainable behavioral change that will augment their medical education. These students will leave the selective with the tools to cope with a high-stress profession and effective outlets that curate a well-adjusted, empathetic medical student. Looking to the future of healthcare, these well-being skills will improve physician-patient relationships and engender positive patient outcomes.

A Dose of Reality: The Cure for the Profession of Pharmacy?

AUTHOR(S):

- Amanda Chichester, University of Rhode Island, USA (Presenter)
- Clinton Oscar Chichester III, University of Rhode Island, USA

ABSTRACT

In the United States, the role and responsibilities of the pharmacist has expanded well beyond the community setting. Despite limited practice experience, new pharmacy graduates become active members of the healthcare team caring for patients with complex medical needs. To prepare graduates for the rigor of professional practice, programs and faculty need to reevaluate and revise both content and method of delivery to optimize outcomes. A curriculum designed to develop professional identity will produce adaptable, humanistic professionals who deeply care for their patients and community. We have designed and integrated a developmental-focused high-fidelity simulation (HPS) curriculum that places dual emphasis on application of knowledge as well as ongoing discussion and reflection of the individual motivations, beliefs and behaviors that influence professional practice and patient outcomes. This presentation will demonstrate the power of a well-designed HPS curriculum that prepares Doctor of Pharmacy students for a dynamic and rapidly evolving profession.

360 degree Theatre Induction

AUTHOR(S):

- Junaid Fukuta, University of Bristol, UK (Presenter)

ABSTRACT

Introduction: The operating theatre is a unique learning environment for medical students however, it has been reported to be an uncomfortable environment for students due to feelings of intimidation. To alleviate these feelings studies have shown that students appreciate the concept of having a theatre induction. Whilst physical inductions of operating theatres do occur they are rarely formally done for medical students. We wanted to generate an e-learning tool to help with medical students transitioning into operating theatres. We decided to utilise a 360-degree camera which places the viewer 'within' that environment through the use of their own smartphones.

Method: We generated a 360-degree video filmed from a first-person perspective utilising a specially adapted video harness. It was scripted to outline the main concepts of theatre etiquette, the WHO checklist and a run through of the roles of the different theatre staff. This was uploaded to a video sharing website and shown to 34 medical students prior to the start of their first clinical placement. It was delivered in a single teaching session utilising the students' own phones to allow full immersion into the scenario. It was evaluated by scoring their factual knowledge of theatre environments as well as their confidence change prior to and post watching the video. These were then analysed using Student's t-test.

Results: The students' knowledge scores were 38% prior and 78% post watching the 360 degree ($p < 0.01$). Confidence scores were 4.3/10 prior and 6.1 post watching the video ($p < 0.01$).

Conclusions: To the best of our knowledge this is the first time that 360-degree videos have been used to help in medical student inductions. The positive results highlight the potential that this technology could have for induction programmes by placing the viewer directly into that new environment.

Co-production: would it work for workplace-based assessment redesign?

AUTHOR(S):

- Raghdah Al-Bualy, Oman Medical Specialty Board, Oman (Presenter)
- Marjan Govaerts, Maastricht University, The Netherlands
- Sylvia Heeneman, Maastricht University, The Netherlands

ABSTRACT

If you've been following workplace-based assessment research, you must have noticed that recent literature has revealed negative perceptions towards workplace-based assessments (WBA) and its implementation. This is due to multiple reasons one of which may be due to the lack of involvement of key stakeholders in its design. Being involved in postgraduate medical education, we notice that many times, educational innovations are created by one group and implementation is carried out by another. Hence, there may be a slight disconnect between the designers and the implementers (whoever this group may include). Other times, we notice that educational innovations implementation follow a top-down approach, leaving those involved unengaged and without a sense of ownership for the process.

Being embedded in healthcare practice, WBA programs must account for and incorporate the complexity of rapidly changing healthcare systems. Therefore, use of service models, such as co-production, has been recently proposed as a possible way to optimize stakeholder engagement and thus implementation of workplace-based learning and assessment.

In this PechaKucha, we will explore the utility of a co-production model for innovating medical education assessments in postgraduate education. More specifically, the change laboratory (CL) method is used to explore the impact of co-production on the redesign and implementation of WBA as well as on its key stakeholders. We will share our experience so far with co-creating WBA in the postgraduate medical education setting. The ultimate goal of our project is to support participants in redesigning their work resulting in an expansive learning cycle grounded in cultural historical activity theory (CHAT). By the end of the pechakucha, you will hear why we've selected this approach, how we've done it, challenges faced, lessons learned and tips to implement a similar approach in postgraduate medical education design.

A teaching course 'Experience of a diabetic patient' based on the partnership of a teaching patient and medical doctor

AUTHOR(S):

- Lucile Wahl, Faculty of medicine, Université de Lyon, France (Presenter)
- Audrey Chaumier, Faculty of medicine Lyon Est, Université de Lyon, France
- Nicolas Lechopier, Faculty of medicine Lyon Est, Université de Lyon, France
- Philippe Moulin, Faculty of medicine Lyon Est, Université de Lyon, France
- Gilles Rode, Faculty of medicine Lyon Est, Université de Lyon, France
- Alain Moreau, Faculty of medicine Lyon Est, Université de Lyon, France

ABSTRACT

Background: Teaching patient centered approach (PCA) is a key issue in medical studies. The faculty of medicine in Lyon organized a two hours course intended for medical students in the fourth year. It involved a diabetic patient and a doctor (endocrinologist or general practitioner), working together as teachers. The aims were to show the students the value of hearing the patients' experience of living with a chronic disease, such as diabetes, and develop their communication skills. The course started with a brainstorming. Students discussed why and what doctors should explore during a consultation, and how they should listen to the patient. Then, they were encouraged to explore the teacher-patient's (TP) experience of diabetes, applying the communication skills they had previously identified. The objective of our study was to evaluate the students' satisfaction about this course.

Summary of Work: We conducted a descriptive quantitative study with a qualitative insight. The students answered questionnaires containing Likert and open-ended questions. We conducted a statistic analysis, combined with a qualitative thematical analysis by three researchers.

Summary of Results: 205 students out of 396 answered the questionnaire. After this course, 85% were convinced that exploring the experience of a patient with a chronic disease is helpful. They appreciated being able to talk freely with the TP outside the usual context of the medical relationship. For 79%, it helped them develop their communication skills, especially their empathic attitude. 91% of the students found that the presence of a doctor and a patient gave complementary perspectives on care. Nevertheless, they sometimes found that the TP felt uneasy during the class. Some students considered the TP 'too good' and suggested they could learn more from patients having trouble controlling their disease.

Discussion and Conclusions: The positive perception of this course by students is in line with the results of educational programs with TPs in France and abroad. Discussing the profile and recruitment of TPs, and the relevance of a specific pedagogical training for TPs seems important. This study encourages the implication of TP in the medical studies.

Take-home Messages: TPs help students to learn communication skills and give a new perspective on care.

Empowering adolescent patients in undergraduate medical education

AUTHOR(S):

- Jonathan Darling, Leeds Institute of Medical Education (LIME), School of Medicine, University of Leeds, UK (Presenter)
- Rebecca Bardgett, Bradford Teaching Hospitals NHS Foundation Trust, UK
- Nicola Kime, Leeds Beckett University, UK

ABSTRACT

Background: Adolescent patients (AP) with chronic health conditions (CHCs) often spend extended periods as inpatients, and contribute to medical education through clinician-led bedside teaching. There is little literature exploring AP perceptions of this role, but increasing recognition that young people should be involved in issues affecting them.

Summary of Work: Our aims were: to empower APs through participatory action research, to understand their perspectives on interactions with medical students, including acceptability, practicality and consent; to facilitate their input into the development of an adolescent consultation tool (ACT) to improve undergraduate medical students' AP consultation skills. We recruited 8 APs aged with CHCs (with appropriate ethical approval and consent) through purposive sampling. All had experience of repeated admissions and involvement with undergraduate medical teaching in the ward environment. Their experience and perceptions were explored through audio-recorded semi-structured interviews lasting 20-30 minutes in 2013.

Summary of Results: Successive interviews were conducted until data saturation was achieved. Interviews were recorded, transcribed and analysed by young adult researchers using a thematic analysis approach. The ACT was developed from five key interview themes identified: behaviours; communication and getting to know the patient as a person; respect; choice about student visits and empowerment and positive effect. Themes will be illustrated with quotations.

Discussion and Conclusions: The first three themes form the main ACT domains. The remaining two themes optimise the involvement of APs. Positive interactions are promoted by: preparation for the encounter; allowing patient choice; demonstrating respect; and using appropriate non-verbal and verbal communication skills. APs want to be involved in the medical education process: empowering them to do so can be profoundly positive both for them and for medical students.

Take-home Messages: A key message from our research is the desire for choice. APs want a say in who sees them, timing and location, and number of visits. We need to move the locus of control from the clinician teachers to the APs, so empowering them within the education process. Their wealth of experience can contribute to improved student education, better AP consultation skills, and improved patient care.

Seeing is believing: role of dermatology patient educators in undergraduate medical education

AUTHOR(S):

- **Maulina Sharma, University of Nottingham, UK (Presenter)**
- Matthew Scorer, University Hospitals of Derby & Burton NHS Foundation Trust, UK
- Ruth Murphy, University of Nottingham, UK
- Gillian Doody, University of Nottingham, UK

ABSTRACT

Background: Skin diseases are the 4th leading cause of non-fatal disability on a global level. Essential medical training in dermatology would help reduce the socio-economic burden of skin diseases through high quality care. In a specialty with significant visual and psychological impact, patient volunteers with skin diseases can play a valuable role as educators for medical student teaching.

Summary of Work: At our medical school, fourth year medical students undergo a 2 week dermatology attachment which includes 3 patient educator clinics. Students in groups of 3-4 rotate between four stations with volunteer patients. Students have 15-20 minutes per station to take a history, perform a physical examination, and discuss the impact of the condition on patient's quality of life. Skin conditions include core-curriculum learning outcomes and range from chronic conditions like eczema, psoriasis and vitiligo to treated skin cancers. Facilitation and formative assessment is provided by a postgraduate dermatology trainee or consultant. Students receive immediate feedback on history taking, physical examination and communication skills. Patient educators also provide student feedback on appropriate display of professionalism, indicating values and behaviours experienced from a patient perspective. Student reflection on assessing a patient with skin disease can also contribute to logbook portfolio assessment. The session is evaluated via an anonymised student feedback and a numeric rating scale for global assessment.

Summary of Results: Student feedback (n=203) has been found to be exceptional for patient educator sessions with mean score of 8.8/10 for the year 2017-18. Qualitative themes from student feedback included practising clinical and professional skills in a 'safe environment', exposure to a wide range of skin disorders, recognising physical signs, gaining insight on the psychological impact and stigma associated with skin disease, and standardisation of stations allowing for time-bound preparedness for summative clinical assessments.

Discussion and Conclusions: Patient educators in dermatology have been a valuable teaching resource for medical students. Students perceive the sessions to be helpful in developing their clinical reasoning skills. The shared experience of patient educators helps students reflect on the socio-economic and psychological impact of skin disease and how these may be addressed.

Take-home Messages: Patient educators in dermatology encourage development of a holistic approach to patient care amongst medical students.

Making a difference: practical insights from co-production with diverse patients and communities

AUTHOR(S):

- Sam Regan de Bere, Peninsula Medical School, UK (Presenter)
- Richard Ayres, Peninsula Medical School, UK

ABSTRACT

Background: Medical education literature highlights that diversity in patient and public representation (PPI) is a challenge that is rarely met in either education or research initiatives. Drawing on PPI evidence bases and our own research, we developed a pedagogy for co-production which recognises i) the requirement for different types and levels of engagement for different curriculum activities and learning outcomes ii) the importance of representation and ensuring diversity of patients and groups, and iii) the role of co-production in establishing ongoing evaluation and a rigorous evidence base.

Summary of Work: We used innovative methods to identify, recruit and work in partnership with a range of partners, including those with protected characteristics, hard-to-reach groups and vulnerable communities. We adopted a management model based on rhizomatic growth, whereby co-production does not conform to traditional linear or arboreal modes of project development, but rather accommodates the latent, unexpected and often serendipitous process of working together.

Summary of Results: Our work resulted in: i) replacing ad-hoc PPI with strategies and systems of co-production; ii) a move from classroom based activity to student experience of real patient pathways and wider health environments; iii) challenging silo-working in favour of multi-professional (health professions) and multi-agency (services/organisations) learning; iii) increased representation diverse health and lifestyle experiences in governance as well as teaching, iv) empowerment of all individuals involved, and v) appreciation of collaborative work with academic disciplines such as art, business and geography.

Discussion and Conclusions: In addition to experiential learning for the faculty, we witnessed some very practical benefits, not only to our students but also to patients and local communities. This included crucial learning and skills development to support complex capabilities for ensuring patient safety and quality improvement, dealing with complexity and uncertainty, safeguarding vulnerable patients, communication and interpersonal skills, and co-produced health promotion and illness prevention.

Take-home Messages: Co-production in medical education brings complexity to already dynamic systems, and partnership with diverse and hard to reach groups requires appropriately responsive faculty management. Our own experience continues to provide useful insights, strategies and techniques for those seeking to engage patients and communities in their own curricula and outreach programmes.

Patient educators lead and model social change - Youth facilitators teach students in the health professions about transition to adulthood for youth with childhood onset disabilities

AUTHOR(S):

- Darlene Hubley, Holland Bloorview Kids Rehabilitation Hospital, Canada (Presenter)
- Melissa Thorne, Holland Bloorview Kids Rehabilitation Hospital, Canada
- Desiree Da Costa, Holland Bloorview Kids Rehabilitation Hospital, Canada
- Dolly Menna-Dack, Holland Bloorview Kids Rehabilitation Hospital, Canada

ABSTRACT

Background: Holland Bloorview Kids Rehabilitation Hospital has an organizational strategy that aims to lead and model social change by including the insight of people with disabilities to guide clinical, research and educational activities. Building on a strong foundation of youth engagement, new leadership and employment opportunities at the hospital were created in the form of a youth facilitator role for youth with childhood onset disabilities. In addition to influencing clinical care and research the youth facilitators embraced the opportunity to create new curriculum for students in the health professions on the topic of transition for youth to adulthood within the health care system.

Summary of Work: Informative and interactive interprofessional education sessions, co-created and co-facilitated by the youth facilitators (patient educators) have been developed and are being offered in both clinical and academic settings. Youth facilitators and students share tips for relating and collaborating with youth and identify the skills that health care practitioners need to support youth at the time of transition. In addition to sharing their lived experience, the youth facilitators also talk about their role and express their dedication to helping other young people with disabilities.

Summary of Results: Program evaluation efforts will include learner perspectives on the interprofessional education activity through survey as well as impact of the curriculum development and delivery experience from the point of view of the patient educators (youth facilitators) and other key stakeholders (senior leaders and mentors) through interviewing.

Discussion and Conclusions: Patients are keen to share their lived experience and organizational strategy and resources can support an enhanced role of patient as educator. Success in the role can be enriched through mentorship and faculty development. Youth who embrace the patient as educator role can influence the next generation of health care providers.

Take-home Messages: Strong foundations of youth engagement aligned with a spirit of innovation, mentorship and faculty development can lead to success for youth in the patient as educator role creating an environment where students in the health professions have an opportunity to see youth with disabilities in a new role and value their expertise.

Patient feedback in patient-centered communication skills training for medical students

AUTHOR(S):

- **Anne Marie Rieffestahl, CAMES - Copenhagen Academy for Medical Education and Simulation, Denmark (Presenter)**
- Hanne O. Mogensen, University of Copenhagen, Denmark
- Susanne Reventlow, University of Copenhagen, Denmark
- Anne Mette Morcke, CAMES - Copenhagen Academy for Medical Education and Simulation, Denmark

ABSTRACT

Background: Face-to-face feedback in medical education has primarily focused on faculty and simulated patients as feedback sources. Patient feedback is increasingly recognized as an important aspect of medical students' training and formative assessment, but little is known about its role and impact. The aim of this study is to explore: 1) What patients with chronic conditions emphasize in their feedback to students, and 2) How students respond to this feedback and what impact it has on their development of skills in patient-centered communication.

Summary of Work: This qualitative study involved observation of a patient-centered communication skills course for medical students in their 4th year (of 6 years), and video-recordings of communication training sessions, including direct patient feedback. 21 patient-student encounters were video-recorded, and feedback sessions were transcribed. Emergent themes were identified through multiple readings and inductive coding.

Summary of Results: In their feedback, patients emphasize feelings of trust and security, as well as assessments of credibility. Patients express to students that they perceive communication as trustworthy when student doctors present some authority, assuring them that they can handle the patient's medical condition, but also listen and respond to the patient's concerns and challenges in everyday life. The students view feedback from patients as spontaneous, honest and authentic. However, they also express feelings of insecurity about their interactions and communication with patients due to the variable needs and preferences conveyed in their feedback. Overall, our preliminary results indicate that patient feedback is more complex than traditional feedback. This complexity presents a challenge, but also provides opportunities for reflection which support the development of patient-centered skills.

Discussion and Conclusions: Patient feedback in communication skills training generates awareness of the emotional complexity of patient-doctor communication. Patients with chronic conditions provide rich and authentic feedback by sharing emotional issues, related to long-term interactions with the healthcare system. Patients' diverse experiences and perspectives present a challenge to communication training, which can support the development of patient-centeredness.

Take-home Messages: Feedback from real patients in communication skills training provides the students with valuable perspectives, which can extend their learning and promote the acquisition of patient-centered communication skills.

Do Direct Observation Tools Generate High Quality Narrative Feedback? Lessons from the Psychopharmacotherapy-Structured Observation Tool

AUTHOR(S):

- John Young, Donald and Barbara Zucker School of Medicine at Hofstra/Northwell, USA (Presenter)
- Patricia O'Sullivan, UCSF School of Medicine, USA
- Rebekah Sugarman, Zucker School of Medicine at Hofstra/Northwell, USA
- Eric Holmboe, ACGME, USA

ABSTRACT

Background: Performance assessment based on direct observation has become increasingly important. While many direct observation tools include both rating scales and space for narrative comments, research has largely focused on the quantitative scores generated by the rating scales. Much less is known about the quality of the comments and their relationship to the quantitative scores. This presentation explores these questions via analysis of the comments from the Pharmacotherapy-Structured Clinical Observation (P-SCO) tool, a direct observation tool that facilitates assessment of a medication management visit.

Summary of Work: 601 P-SCOs were completed over four academic years in an outpatient psychiatry clinic. 25% of the completed P-SCOs from each academic year were randomly selected. To assess quality, comments were coded for valence (reinforcing or corrective), behavioral specificity, and content. To assess the relationship between comments and scores, the authors calculated the frequency with which a high or low checklist score was accompanied by a comment with the same content and valence as well as the frequency with which a reinforcing or corrective comment was accompanied by a high or low check-list score.

Summary of Results: 91% of the comments were behaviorally specific. 60% were reinforcing, 40% corrective. 8 themes were identified, including two constructs not adequately represented by the checklist. 7% of the low and high checklist scores were associated with a comment of the same valence and content. Only 50% of the overall comments were associated with a checklist score of the same valence and content.

Discussion and Conclusions: The P-SCO, as our exemplar, generated written comments that were based on direct observation, behaviorally specific, clinically relevant, with a balance of corrective and reinforcing feedback - all attributes associated with effective written assessment. Narrative comments both expanded on checklist scores and contributed new content.

Take-home Messages: A direct observation tool such as the P-SCO generates high quality written comments. Narrative comments complement the quantitative scores and should be included in direct observation tools. Moreover, thematic coding of comments can improve the content validity of a checklist and identify weakness in the curriculum.

An Innovative and Comprehensive Workplace Based Assessment Framework for Australian General Practice

AUTHOR(S):

- Jill Benson, GPEX, Australia (Presenter)
- Lambert Schuwirth, Prideaux Centre for Research in Health Professionals Education, Australia
- Emily Kirkpatrick, GPEX, Australia
- Shaun Prentice, GPEX, Australia
- Taryn Elliott, GPEX, Australia

ABSTRACT

Background: Work-place based assessments (WBAs) are now accepted as useful and acceptable formative, summative and programmatic assessments in most medical education contexts. They aim to assess the peak of Miller's pyramid, that the trainee 'does' what they are expected to do in a safe and competent manner. But do they really achieve this?

Summary of Work: In order to answer this question, the Royal Australian College of General Practitioners funded a national Education Research Grant through GPEX, the South Australian General Practice (GP) training organisation, in collaboration with the Prideaux Centre at Flinders University, and the GP Training Organisations in every state of Australia. The GPEX team developed a multi-faceted research project consisting of: a 3-cycle hermeneutic literature review with 4 coders; focus groups and interviews with supervisors, registrars and medical educators in every state, on their opinions and experience of WBAs; data collection about how WBAs are performed in each state with analysis using a relational data-base management tool; and 3 nested research projects using quantitative and qualitative data collection on the use of Entrustable Professional Activities, Direct Observation Visits by clinical teachers, and the process of 'flagging' registrars with subsequent remediation, and whether this impacts on exam results.

Summary of Results: A WBA framework was developed from the research project, recommending the tools and activities that are more likely to be successful. This includes use in different General Practice contexts (eg rural and remote) and for a variety of purposes such as formative, summative, programmatic and remediation.

Discussion and Conclusions: Recommendations for implementation include: what, who, how, when, where of WBA tools; the training of the assessors and trainees; the support from the training organisation; the relationships between the assessor, the registrar, the tool and the training organisation; and the processes and systems that need to be in place.

Take-home Messages: This evidence-based, innovative and comprehensive WBA framework is not only relevant in Australian General Practice but has the flexibility to be applied across multiple contexts.

How students and specialists appreciate the Mini-Clinical Evaluation Exercise (Mini-CEX) in Indonesian clerkships

AUTHOR(S):

- Yoyo Suhoyo, Faculty of Medicine, Public Health and Nursing, Universitas Gadjah Mada, Indonesia (Presenter)

ABSTRACT

Background: Cultural differences might challenge the acceptance of the implementation of assessment formats that are developed in other countries. Acceptance of assessment formats is essential for its effectiveness; therefore, we explored the views of students and specialists on the practicability and impact on learning of these formats. This study was conducted to explore Indonesian students' and specialists' appreciation of the implementation of the Mini-Clinical Evaluation Exercise (Mini-CEX) in Indonesian clerkships.

Summary of Work: This study was conducted at the Universitas Gadjah Mada, Indonesia. Participants were 52 students and 21 specialists in neurology and 78 students and 50 specialists in internal medicine. They were asked to complete a 19-item questionnaire that covered the characteristics of the mini-CEX such as observation and feedback, its practicability, and the impact on learning and professional development. We used a Mann-Whitney U test to analyse the data.

Summary of Results: In total, 124 students (46 from neurology and 78 from internal medicine) and 38 specialists (13 from neurology and 25 from internal medicine) participated in this study. Students and specialists were positive about the practicability of the mini-CEX and the impact of this assessment format on learning and on professional development. The Mann-Whitney U test showed that there were no significant differences between students' and specialists' opinions on the mini-CEX, except for 2 items: specialists' appreciation of direct observation (mean rank=93.16) was statistically significantly higher than students' appreciation of it (mean rank=77.93; $z=2.065$; $p<0.05$), but students' appreciation of the item that students' past mini-CEX results affected their recent mini-CEX outcomes (mean rank=85.29) was significantly higher than specialists' appreciation of it (mean rank=69.12; $z=2.140$; $p<0.05$).

Discussion and Conclusions: Students and specialists were positive about the mini-CEX in Indonesian clerkships, although it was developed and validated in another culture. We found only small differences between their appreciations, which could be explained by the patterns of specialist-student interaction in Indonesian culture as large power distance and low individualism country.

Take-home Messages: Culture is not necessarily an obstacle when implementing educational principles stemming from countries with a different culture. We just need to take into account the characteristics of the local culture.

How do postgraduate surgeons-in-training learn through the use of workplace-based assessment?

AUTHOR(S):

- Arpan Tahim, UCL, UK (Presenter)
- Deborah Gill, UCL, UK
- Jeff Bezemer, UCL, UK

ABSTRACT

Background: Existing research on workplace-based assessment (WBA) in surgical education has focused on their outcomes (for example, how well a learner performs) and user perception (such as, how participants feel about it). There is limited understanding of what actually happens during WBAs and therefore no empirical basis for explaining either outcomes, users' perceptions, or their impact on learning. Recently it has been proposed that re-imagining WBA practices as intricate, real-time, social phenomena may be a more appropriate way to interpret these complicated interactions. Taking this socio-cultural view may help us understand the context, content and process of the WBA and help explore what use learners make of them in their education.

Summary of Work: This study explores the nature of workplace-based assessment in UK postgraduate surgical training, through a socio-cultural lens, in relation to the following questions; i) What does a WBA look like in situ, in the context of surgical education, ii) What does a surgeon-in-training identify has having learnt from a particular WBA, and iii) How do these learners respond to it in their future practice? Data was generated from a cohort of surgeons-in-training using video-recording of in situ WBA events, the learner's formal WBA reports, and through reflexive interviews conducted with the learner.

Summary of Results: Video-ethnographic and -reflexive techniques were used to explore the these workplace learning phenomena through a socio-cultural lens in order to examine the unique context, content, process and impact of these events.

Discussion and Conclusions: Viewing WBAs through a socio-cultural lens provides new understandings of their function as a surgical educational tool, which could improve their future use. More broadly, the complex learning needs that surgery shares with other professions should not go unrecognised. In fact, surgical education could represent an important 'telling case' to explore workplace learning and assessment in greater detail. Insights gained could improve education practice and shed light on the potential of assessment in the wider workplace.

Take-home Messages: WBAs are unique and individual experiences and may be better suited to interpretation through socio-cultural learning theories.

Practical Strategies for Evaluating and Improving the Content of a Workplace-based Observational Assessment

AUTHOR(S):

- **Mark Raymond National Board of Medical Examiners, USA (Presenter)**
- Melissa Margolis, National Board of Medical Examiners, USA
- Brian Clauser, National Board of Medical Examiners, USA
- Marcia Winward, National Board of Medical Examiners, USA
- Alan Schwartz, UIC Department of Medical Education, USA
- Carol Carraccio, American Board of Pediatrics, USA
- Patricia Hicks, University of Pennsylvania, USA

ABSTRACT

Background: Observing and documenting the performance of medical trainees in the clinical workplace allows for collecting important evidence about competence in critical domains. Unfortunately, the resulting data often are subjective and unreliable because the instruments used to collect these behavioral data typically do not go through the robust development and revision process that is common for professionally developed tests. The present research addresses this problem by describing practical approaches that can be used to evaluate (and ultimately improve) the quality of observational assessment instruments.

Summary of Work: Three different observational assessment instruments were used to collect data on 258 first-year Pediatrics residents from 10 United States Pediatrics residency programs. A total of 2,591 instruments were completed by Faculty, Residents, Nurses, and other members of the healthcare team. Statistical (descriptive, correlational, and generalizability) analyses were used to evaluate item and instrument performance.

Summary of Results: Results indicated that (1) observers often did not use the full response scale; (2) some items did not perform well either because they were highly correlated with other items or had near zero correlations with other items; and (3) reliability varied considerably across observer groups (.76 for residents, .66 for faculty).

Discussion and Conclusions: The quality of an assessment instrument is directly related to confidence in the outcomes. This practical approach to instrument evaluation allowed for identification of items that did not perform well and informed revisions (i.e., scale changes, revision or deletion of items that were unrelated or too closely related to other items) that will improve instrument quality and by extension will increase confidence in the resulting data.

Take-home Messages: Data collected via observational assessment in the authentic clinical environment can provide important evidence about the competence of medical trainees. The present research demonstrates that relatively simple statistical procedures can be used to guide evaluation of item and instrument performance. This has the potential to substantially improve the reliability of scores from observational assessment instruments.

Who's Watching? Bedside Observation and Feedback Practices in Internal Medicine

AUTHOR(S):

- Michael Wang, McMaster University, Canada (Presenter)
- Kristyne Onizuka, McMaster University, Canada
- Christopher Foster, Western University, Canada
- Ramy Khalil, Queens University, Canada
- Daniel Brandt Vegas, McMaster University, Canada

ABSTRACT

Background: Opportunities to perform work-based assessments (WBAs) frequently occur during bedside teaching (BST). However, observation and feedback practices at the bedside are not well documented in the literature. Our objective was to assess the current use of bedside teaching, observation, and feedback during internal medicine rotations.

Summary of Work: We conducted a longitudinal survey study at five academic-affiliated hospitals associated with McMaster University. Medical students and residents completing inpatient internal medicine ward rotations between October 2017 and May 2018 were included. Survey items were constructed around three themes - bedside teaching, direct observation of bedside skills, and subsequent feedback. The survey encompassed bedside experiences over the past one week. We quantified the frequency of observation and feedback by the type of clinical skill, and utilized a 5-point Likert scale to measure the overall perceived quality of feedback.

Summary of Results: The response rate was 63% (n = 192/304). Learners received BST on 4 patients each week, and was often led predominantly by senior residents (43% of respondents). One-fifth of respondents reported receiving no BST, while a quarter reported receiving no direct observation. Bedside assessment of discharge planning and history taking occurred least frequently, with three-quarters of respondents (75% and 78%, respectively) reporting no observations. When observation of history taking and discharge planning occurred, feedback was provided to less than half of learners (44% and 42%, respectively). Attending physicians offered feedback more regularly than senior residents (p = 0.003), though there was no difference in its perceived quality.

Discussion and Conclusions: Direct observation at the bedside remains infrequent and inconsistently delivered. Ensuring routine feedback delivery after observation remains a challenge. Observation of history taking was particularly neglected, despite its importance in forming accurate diagnoses. Residents often led bedside teaching, and may provide a similar quality of feedback to learners compared to attending physicians.

Take-home Messages: Bedside observation and feedback remain under-utilized tools for learner assessment. Low rates of assessment were particularly noted for several core clinical skills, including history taking. Training programs transitioning towards CBME should focus on ensuring adequate opportunities for direct observation and feedback of these skills.

Supervisor Training in a Global Arena: Increasing international access to high quality faculty development

AUTHOR(S):

- Veena Rodrigues, Norwich Medical School, UK (Presenter)
- Emily Player, Norwich Medical School, UK

ABSTRACT

Background: Within the UK, the General Medical Council (GMC) requires named supervisors of postgraduate medical trainees to be formally recognized and approved for this purpose. This has led to the development of a variety of face to face, online or blended learning programmes for supervisors in the UK. While such training programmes exist in high income countries, in many low-middle income countries, faculty development might not receive high priority. In Spring 2015, we developed a two-week, massive open online course (MOOC) on the FutureLearn platform aimed at postgraduate medical supervisors within the UK. The course focuses on two areas that supervisors find challenging - providing feedback effectively to learners, and identifying/managing the learner in difficulty.

Summary of Work: The initial course advertising led to several enquiries from non-medical healthcare professionals within the UK, as well as medical professionals outside the UK. In an effort to make this high quality learning available to a wider audience, the course educators reviewed the content and delivery, and tweaked it to make it relevant for these new audiences without detracting from the original vision.

Summary of Results: Of the 20,630 learners from over 140 countries registered for the course to date, 37% were from the UK. Of the remaining 63% the largest number were from USA, Canada, Australia, Mexico, the Middle East (Egypt, Saudi Arabia), Asia (India, Pakistan) and China. Learner feedback obtained via pre- and post-course surveys and course discussion boards indicated that the courses were attractive, easy to use, affordable and valued highly by the health professional learners irrespective of country, discipline, or medical specialty.

Discussion and Conclusions: We were able to extend the accessibility of a high quality MOOC to healthcare professionals within and outside the UK. Learners were able to interact with international peers and learn from each other in an engaging, inter-professional learning environment. The success of this course and learner demand led to the creation of three additional MOOCs for supervisors in 2017.

Take-home Messages: MOOCs can provide engaging faculty development without boundaries. Inter-professional and social learning are highly valued in an international setting.

Tips and tricks of opening an AMEE International Networking Centre: Lessons to be learned

AUTHOR(S):

- Sofia Belogubova, Sechenov University, Russia (Presenter)
- Andrey Svistunov, Sechenov University, Russia
- Trevor Gibbs, AMEE
- Irina Markovina, Sechenov University, Russia
- Zalim Balkizov, GEOTAR-Media, Russia

ABSTRACT

Background: The quality of medical education is directly related to the quality of future healthcare. Throughout the globe, there is lack of standardisation of healthcare education and widespread inequality and inequity in faculty development.

Summary of Work: The Russian AMEE International Networking Centre of Medical Education was opened on May 15th 2018 in the Sechenov University, Moscow. The main goal of the Centre is to assist in continuous professional development of the faculty, and implement modern education and teaching methods, based upon a needs-led and context specific formulation of courses. Since opening, more than 70 faculty members from the Sechenov and other 15 partner-universities from all over Russia have taken part in specific courses. Evaluation has been positive, with faculty gaining and subsequently implementing newer methods of teaching and learning.

Summary of Results: To date we have learned 5 important steps within the office development - our A to E steps: 1. Assessing the learning environment: A suitable learning environment with adequate resources is essential to maintain high level learning. 2. Building an effective team-approach: Effective qualities within the team include leadership, delegation, self-discipline, proficiency in English, and be of a supportive nature. 3. Communicate with involved Institutions: The Networking Centre needs to be intrinsically connected to and work with Institutional boundaries as much as possible with effective communication involving purpose and outcomes, as well as being needs-led. 4. Define the priority areas for faculty development: Based upon context, country-specific and regional community needs, organised in a feasible manner. 5. Execute/Elucidate an agreed and shared future road map: Create a shared and clear vision for the future.

Discussion and Conclusions: As the expansion of scientific knowledge and the problem of information overload are that we faced up with, the needs to train students in how to learn more efficiently and faculty in how to teach more effectively becomes an essential component of any medical and healthcare school. Following these 5 steps you will ease the faculty development process.

Take-home Messages: These 5 essential steps will be expanded upon during the delivery of the paper.

Perception of a blended course as a tool for continuous improvement: Experience of Private University San Juan Bautista from Peru

AUTHOR(S):

- Alberto Casas, Universidad Privada San Juan Bautista, Peru (Presenter)

ABSTRACT

Background: The Faculty of Health Sciences of the private university San Juan Bautista from Peru has six professional schools: Medicine, Psychology, Nursing, Medical Technology, Stomatology and Veterinary, and has three decentralized headquarters located in the cities of Lima, Chincha and Ica. When performing the professor diagnosis 2017 areas for improvement were found, in order to provide professors with the appropriate tools to generate a training program that will feature the provision of courses in a blended mode using as a virtual platform Classroom and would be offered during the annual academic periods twice per year.

Summary of Work: This report evaluates the level of satisfaction of the course on research projects, scientific writing and essays, which reached an attendance of 156 professors (from different categories), among the six professional schools of the Faculty of Health sciences of decentralized locations. Of those registered, 106 fulfilled the requirements of approval of the course (attendance and obtain minimum approving note), which presented their integrative works, consisting in the analysis of the scientific article: 'Knowledge, attitudes, and practices on infection Control measures in Stomatology students in Lima, Peru', detailing the parts of the article, characteristics of good writing of an introduction, materials and methods, results and bibliography. Considering the problematic areas relating to the use of virtual platforms previously, a tutorial video was implemented created by the faculty, which explained in four simple steps the entrance to this virtual classroom as well as its management.

Summary of Results: The final survey showed us that 98.3% agreed with the content of the course, 99.1% found the trainer helpful, 91.8% found the support tools helpful and the level of satisfaction was 96.4%.

Discussion and Conclusions: The modality allowed the interaction between the expert trainer and the professors for the virtual forums and the consultations about the course and the integrating work. This experience motivates teachers to use virtual tools for future training and teaching.

Take-home Messages: The use of communication technologies provides a means for ongoing improvement for professors.

Pathways to Professional Excellence through a Digital Learning Hub

AUTHOR(S):

- Karen Hills, PAEA, USA (Presenter)
- Amanda Gunter, PAEA, USA
- Justine Mitchell, PAEA, USA
- Sara Fletcher, PAEA, USA

ABSTRACT

Background: This presentation describes an innovative digital learning hub based on a comprehensive faculty development plan. The hub was launched to PA program faculty at Physician Assistant Education Association's (PAEA) Education Forum held in October 2018 as part of PAEA's greater faculty development vision. The hub utilizes an interactive PAEA Learning website as the 'front door' to a host of curated materials geared toward the newest faculty member to longstanding experienced ones. It allows for learning communities to develop around specific content areas of interest and expertise as well as years of experience and faculty roles.

Summary of Work: Using a learning on demand system called Edcast, faculty can access resources that are organized into channels where each channel has multiple layers of content. Using a curriculum map as our guide, we've worked with LinkedIn Learning and other content providers to identify and map their content to our topics and educator competencies.

Summary of Results: As a result of the initial launch at Forum, 450 out of the 950 present faculty activated their accounts. As of early 2019, this number has risen to over 550 activated accounts. The most visited channels include assessment, clinical education, and 2018 Education Forum.

Discussion and Conclusions: Phase 1 of our launch has been successful. Phase 2 goals include ensuring professional learning communities are formed and that content is integrated with other Association programming. Phase 3 will integrate event registration for workshops, Forum, and regional education meetings. Faculty use of the portal lends itself to research initiatives and informs the work of the Association going forward. As the digital learning hub becomes more integrated into the work of PAEA, it will align with future efforts to build out a continuum of faculty development initiatives to support medical educators across the lifespan of their careers.

Take-home Messages: Technology can provide real-time faculty development to meet faculty professional development needs and enhance in-person connections with continued methods for sharing information. This model is replicable to others and provides a sound framework to build upon as professional requirements grow and change throughout one's professional career.

New Faculty Development Curriculum for Junior Faculty

AUTHOR(S):

- **Manjula Gowrishankar, Department of Pediatrics, Faculty of Medicine and Dentistry, University of Alberta, Canada (Presenter)**
- Mark Belletrutti, Department of Pediatrics, Faculty of Medicine and Dentistry, University of Alberta, Canada
- Michael Hawkes, Department of Pediatrics, Faculty of Medicine and Dentistry, University of Alberta, Canada
- Karen Forbes, Department of Pediatrics, Faculty of Medicine and Dentistry, University of Alberta, Canada
- Elizabeth Rosolowsky, Department of Pediatrics, Faculty of Medicine and Dentistry, University of Alberta, Canada
- Alvaro Osornio-Vargas, Department of Pediatrics, Faculty of Medicine and Dentistry, University of Alberta, Canada

ABSTRACT

Background: Assistant Professors (AP) face many challenges in achieving their career goals including timely promotion. They are expected to perform multiple tasks (clinical service, teaching, research, administration) for which they may be ill-prepared, yet the evaluations of these form the basis of their promotion. Also, they may be new to the environment, have incomplete understanding of policies/procedures that govern these evaluative methods and not have formed connections/network. They may be overwhelmed with day-to-day activities (patient care, electronic charting, etc) and changes in administrative policies and expectations.

Summary of Work: Our departmental faculty development committee conducted a needs-assessment survey of all (30) AP anonymously and also gathered information from the Chair and promotion committee. We developed a 20-month curriculum and provided it throughout 2 years as 2-hour workshops. Written feedback obtained at the end of each workshop facilitated ongoing curriculum updates.

Summary of Results: Survey response rate was 100%: 65% completed >85%, 10% <15% of the questions. As a result, we developed a curriculum covering teaching, research, clinical and administration as well as dossier and annual report preparation, mentorship, wellbeing and leadership-skills. We started with 29 registrants: 1 never attended, 3 moved and 3 promoted. During the first and second years, 6 and 7 new AP joined respectively. Attendance rate was 70-95%. Ratings ranged from 4.2-4.8/5. Narrative comments were highly positive and those who were promoted or anticipated promotion reported that this curriculum was beneficial. AP also reported that they developed collaborations and became familiar with each other and their work due to workshop participation.

Discussion and Conclusions: Our program is multifaceted and focused on as many aspects as possible for growth and development of AP at our institution. It is continuing to be well received and appears to be making a meaningful difference. Preliminary data suggests that our curriculum is assisting AP in achieving their career goals. Such curriculum needs to be delivered on an ongoing basis. Follow-up data will be collected to determine if this trend continues and translates into identifiable achievements.

Take-home Messages: AP in any institution will benefit from a well-planned and delivered faculty development curriculum. This requires institutional recognition of the need and champions to execute.

The GMC revalidation knowledge test - summary of data

AUTHOR(S):

- Alison Sturrock, UCL Medical School, UK (Presenter)
- Asta Medisauskaite, UCL Medical School, UK
- Leila Mehdizadeh, UCL Medical School, UK
- Paul Crampton, UCL Medical School, UK

ABSTRACT

Background: In 2012, the GMC introduced revalidation to ensure all doctors met core standards on a five yearly basis. There are a number of doctors who wish to revalidate despite not having a designated body or responsible officer. To help provide evidence that these doctors have met core standards, these doctors are required to take a 'revalidation knowledge test' which is designed by UCL on behalf of the GMC. This test is composed of a 120 item single best answer paper and is available in 12 different specialties.

Summary of Work: Between November 2016 and January 2019, more than 200 doctors registered and paid to take this test however only 154 doctors actually sat the revalidation knowledge test. We will analyse the data in terms of sex, ethnicity, PMQ and age. We will also investigate what percentage of doctors that did not attend the examination remain on the register with a licence to practise.

Summary of Results: Previous data has shown that doctors aged 70 and above scored significantly lower than doctors who were younger than 60 and doctors who were 60-70 also performed significantly worse than younger doctors. There were also significant differences in test performance depending on where in the world a doctor had trained. There has also always been a high rate of doctors who register and pay for this assessment but do not attend on the day of the examination.

Discussion and Conclusions: We will update the data to include all doctors who have taken a revalidation knowledge test up to January 2019. As above we will analyse this in terms age, sex, PMQ, and ethnicity and specialty. We will also discuss the outcomes of the doctors who did not attend this assessment.

Take-home Messages: The GMC revalidation knowledge test is a novel assessment designed to help identify which doctors are fit to revalidate despite not having a designated body or responsible officer. This test has been shown to produce a range of scores that helps guide these decisions. The themes that appear to predict scores include age and place of medical qualification.

Doctors' experiences, attitudes, and beliefs about the regulation of professional competence: a scoping review

AUTHOR(S):

- **Anel Wiese, Medical Education Unit, University College Cork, Ireland (Presenter)**
- Emer Galvin, Medical Education Unit, University College Cork, Ireland
- Irina Korotchkova, Medical Education Unit, University College Cork, Ireland
- Deirdre Bennett, Medical Education Unit, University College Cork, Ireland

ABSTRACT

Background: Programmes of regulation of professional competence (RPC) aim to support doctors in developing and maintaining good professional practice throughout their professional lives. Doctors' attitudes towards RPC, their beliefs about its objectives and effectiveness, and their experiences of trying to meet its requirements can impact meaningful engagement with this process. We conducted a scoping review to map the empirical literature in this area, to summarise the key findings and to identify gaps for future research.

Summary of Work: Scoping review is a method used to map the literature available on a topic comprehensively. Our review was informed by Arksey and O'Malley, and Levac's methodological frameworks (1, 2). Using relevant terms, we systematically searched electronic databases, RPC policy documents and reports, and used backward and forward citation tracking to identify empirical papers describing doctors' attitudes, beliefs and experiences of RPC. A data extraction tool was developed to record relevant information.

Summary of Results: We screened 4716 empirical papers and included 91 for review. Most of the literature was from the United Kingdom and the United States of America. We mapped how research on this topic was conducted in these jurisdictions. We also identified gaps in the literature relating to, for example, lack of representativeness of all medical specialties and their related scopes of practice when researching doctors experiences, attitudes, and beliefs about RPC. The thematic analysis revealed themes relating to the barriers and facilitators to meaningful engagement with RPC, motivating factors for participation in RPC and the perceived impact of RPC on practice and learning.

Discussion and Conclusions: The results of this review will be of value to those tasked with the design and implementation of RPC programmes, helping them to maximise doctors' commitment and engagement, and to researchers, pointing to areas that would benefit from further enquiry.

Take-home Messages: Internationally existing RPC programmes are evolving, new programmes are being initiated, and many jurisdictions do not yet have programmes in place. This review offers an opportunity for learning across diverse programmes and from the experiences of established programmes.

Doctors' attitudes to, beliefs about, experiences of, and suggested improvements for regulation of professional competence

AUTHOR(S):

- Emer Galvin, University College Cork, Ireland (Presenter)
- Anél Wiese, University College Cork, Ireland
- Janet O'Farrell, Irish Medical Council, Ireland
- Jantze Cotter, Irish Medical Council, Ireland
- Deirdre Bennett, University College Cork, Ireland

ABSTRACT

Background: In recent decades, regulation of professional competence (RPC) has been implemented internationally, with the aim of supporting doctors to maintain good professional practice, and enhancing patient safety and care. Despite these goals, it is a highly contested area. In Ireland, RPC was introduced in 2011. Engagement of doctors with the process has been challenging. There have been limited large scale studies of doctors' experiences and perceptions of RPC. Understanding the attitudes and experiences of doctors in regards to RPC is essential for those who oversee and operationalise the process, in order to enhance doctors' engagement and compliance. Hence, the study aimed to explore doctors' attitudes to, beliefs about, experiences of, and suggested improvements of RPC in Ireland.

Summary of Work: A questionnaire was specifically designed for this study. To map areas of relevance for inclusion in the questionnaire, a focus group was held with doctors to explore the topic. Piloting was undertaken, and following the necessary edits, the questionnaire was finalised. The survey comprised Likert-scaled items and free-text questions relating to the research question. A link to the survey was embedded in the Medical Council's 2018 annual retention of registration process for doctors (N = 13,093). The data was analysed using SPSS.

Summary of Results: 5379 doctors responded to the survey. The majority of participants believed that RPC encouraged them to reflect more on their professional development and continually learn and keep up to date. Despite these beliefs, participants identified important barriers to their participation in RPC including lack of protected time, expense, and dissatisfaction with the quality of CPD activities. Suggestions for improvement included the provision of online activities, quality improvement initiatives, and flexibility in the annual requirements.

Discussion and Conclusions: Findings from the study revealed some discrepancies between doctors' beliefs about the value of RPC and their compliance with the process. The study demonstrated that compliance cannot be interpreted as belief in the value of RPC and may mask negative attitudes and experiences.

Take-home Messages: By better understanding how these factors shape attitudes and behaviour towards RPC consideration can be given to solutions which can help to shift prevailing attitudes towards one that embraces competence assurance and lifelong learning.

Attitudes, benefits and barriers to participating in mandatory continuing professional development scheme in doctors in Ireland

AUTHOR(S):

- **Holly Hanlon, Royal College of Physicians of Ireland, Ireland (Presenter)**
- Lucia Prihodova, Royal College of Physicians of Ireland, Ireland
- Thelma Russel, Royal College of Physicians of Ireland, Ireland
- Deirdre Donegan, Royal College of Physicians of Ireland, Ireland
- Ann O'Shaughnessy, Royal College of Physicians of Ireland, Ireland
- Hilary Hoey, Royal College of Physicians of Ireland, Ireland

ABSTRACT

Background: For doctors, a formal mandatory system of continuous professional development (CPD) in the form of Professional Competence Schemes (PCS) was introduced in Ireland in 2011, with Royal College of Physicians of Ireland (RCPI) as the largest PCS facilitator with 11 PCS schemes for over 4000 doctors. This study explored attitudes, perceived benefits and barriers to participation in PCS in order to improve CPD engagement in the future.

Summary of Work: 4350 doctors who registered in RCPI PCS in 2017/18 were invited to complete an anonymous online survey exploring their attitudes, perceived benefits and barriers in participating in PCS. Descriptive statistics and ANOVA were used to analyse the data.

Summary of Results: Of the 1408 (32% of participants) who responded (49.8% male, 50.2% female), 70% met all PCS requirements in 2017/18, 18% did not and a further 15% were new entrants to the scheme. Overall, 79.5% had positive views on participation in PCS, with those meeting requirements having significantly more positive attitude than the other two groups ($F=18.15$, $p<0.001$). The positive impact of PCS was reported predominantly in patient care related skills: patient care (81%), patient safety (81%), clinical skills (70.8%). The main challenges included difficulty accessing quality CPD activities (26%), fit between activities and formal PCS categories (24%), time to record (23.6%) and to attend (22.1%) CPD activities. Those who met PCS requirements reported significantly fewer barriers compared to both groups, however no differences were observed in terms of perceived benefits of PCS participation.

Discussion and Conclusions: The findings indicate that while doctors in Ireland value CPD and perceive various benefits from their participation, they also experience various barriers in meeting PCS requirement. This was particularly observed in doctors who have recently joined the PCS who did not meet their requirements. Nonetheless, all doctors attributed multiple benefits of taking part in PCS, especially in relation to improving patient care.

Take-home Messages: Doctors in Ireland view participation in mandatory CPD as positive and beneficial, however they also encounter multiple barriers, possibly preventing them of deriving full value from their CPD engagement.

Examining associations between data utilization for practice improvement and lifelong learning

AUTHOR(S):

- Sanjeev Sockalingam, Centre for Addiction and Mental Health; University Health Network; University of Toronto, Canada (Presenter)
- Rebecca Charow, University Health Network, Canada
- Walter Tavares, University Health Network; University of Toronto, Canada
- Ivan Silver, Centre for Addiction and Mental Health; University of Toronto, Canada
- Craig Campbell, Royal College of Physicians and Surgeons of Canada, Canada
- David Wiljer, University Health Network; University of Toronto; Centre for Addiction and Mental Health, Canada

ABSTRACT

Background: Personalized performance data can inform the selection of educational strategies for advancing healthcare professional competence. However, performance data is not widely used to guide learning in practice, even when available. The purpose of this study was to what individual-level factors influence clinician engagement with clinical data for continued professional development (CPD) purposes to drive practice change.

Summary of Work: An iteratively developed and field-tested survey was distributed to General Surgeons (GS), Radiation Oncologists (RO), and Psychiatrists (Psy) through their respective national societies' via email and annual conferences in 2017. The survey domains included physicians' practice context, orientation to CPD using the Jefferson Scale for Lifelong Learning (JeffSPLL) and data use for learning. Linear regression was used to model the relationship between the outcome variable frequency of data use and independent predictors of continuous learning to improving practice.

Summary of Results: A total of 305 practicing physicians (GS=49, RO=53 and Psy=203) participated in this study. Most respondents used data for practice improvement (n=177, 61.7%; GS=27, 9.4%; RO=35; 12.2%; Psy=115, 40.1%) and had high orientation to lifelong learning (JeffSPLL mean scores: GS=45.1; RO=43.5; Psy=47.4, Max=56). Linear regression analysis identified significant predictors of data use in practice being: frequency of assessing learning needs, helpfulness of data to improve practice, and frequency to develop learning plans. Together, these predictors explained 42.9% of the variance in physician's orientation towards to integrating accessible data into practice ($r^2=0.429$, $p<0.001$).

Discussion and Conclusions: This study illustrates that the greater perceived utility of data in practice and reflection on learning needs is associated with higher practice data use. Orientation to lifelong learning was not a significant predictor of data use. The results underscore the importance of understanding system level and organizational culture in influencing data-informed learning in practice. The results will be situated in a phase two qualitative analysis to explore these trends in more depth.

Take-home Messages: Despite the value of performance data for structuring CPD, orientation to lifelong learning does not sufficiently explain health professionals' inclination towards data-related LLL activities. Identifying barriers at the organizational and system levels are important to inform data-driven CPD.

Flexible interprofessional learning using virtual patients

AUTHOR(S):

- Samuel Edelbring, Örebro universitet, Sweden (Presenter)
- Susanna Sandelius, Karolinska Institutet, Sweden
- Jessica Norberg, Karolinska University Hospital, Sweden
- Eva Broberger, Karolinska Institutet, Sweden
- Desiree Wiegleb Edström, Örebro university, Sweden

ABSTRACT

Background: The undergraduate education should prepare for collaborative competence and understandings of different perspectives on patient care. However, interprofessional education (IPE) faces challenges in organizing common learning activities for students from different study programs due to different schedules and campuses. Virtual patients (VPs) can supplement to IPE strategies in providing flexible learning activities. Yet, there is little knowledge on using VPs in IPE settings.

Summary of Work: Four VPs were used by second year nursing and third year medical students who joined in a common interprofessional assignment in pairs or triads. The students' perceptions of authenticity, relevance and levels of medical, nursing and patient perspectives was measured on a five-graded rating scale. The content of the collaborative assignment texts was analyzed (n=23 groups from the second cohort).

Summary of Results: Eighty-six percent met online and 14% face-to-face for the collaborative assignment (n=201 in two consecutive cohorts/terms). The reason for online meetings were mostly flexibility. Many expressed, however, a preference for an organized physical meeting. Eighty-nine percent of the students perceived the VPs as being authentic and 79% as relevant for their studies. The medical perspective was more salient than the nursing perspective in the VPs. The patient perspective was perceived higher in nursing students (median 4) than medical students (median 3, p=0.001). The strongest interprofessional aspect in reflective texts was roles and responsibilities reflecting an increased understanding of each other's roles and perspectives. There were many reactions on how the VP activity was integrated in relation to the course content and schedule.

Discussion and Conclusions: Students' mixed reactions towards self-regulated IPL activity reveals that there is potential in using VPs in conjunction to a self-regulated IPL meeting. The VPs themselves functioned well, and it was feasible for students to meet online. However, the benefit depends largely on how questions are designed for students to discuss and how the alignment to other course content is perceived.

Take-home Messages: Virtual patients present potential for meaningful interprofessional education activities. An online IPE encounter need a structured framework and VPs need to align to intended learning outcomes and other course content.

The role of epistemic activities on diagnostic outcomes in medical students' learning with two different virtual patient case formats

AUTHOR(S):

- Pablo Schöffner, Institut für Didaktik und Ausbildungsforschung in der Medizin am Klinikum der LMU München, Germany (Presenter)
- Elisabeth Bauer, Lehrstuhl für Empirische Pädagogik und Pädagogische Psychologie an der LMU München, Germany
- Claudia Schulz, Technische Universität Darmstadt UKP, Germany
- Iryna Gurevych, Technische Universität Darmstadt UKP, Germany
- Martin Fischer, Institut für Didaktik und Ausbildungsforschung in der Medizin am Klinikum der LMU München, Germany
- Jan Kieseewetter, Institut für Didaktik und Ausbildungsforschung in der Medizin am Klinikum der LMU München, Germany

ABSTRACT

Background: Development of medical students' clinical reasoning is a key task for medical schools. Virtual patients (VPs) have been found to help students learn. During the diagnostic process, students are often asked to reflect upon their reasoning. Thus far, the relationship of these reflections with the diagnostic outcomes has not been investigated. Recently, epistemic activities have been proposed as a way to investigate reasoning processes. In our study we investigated which epistemic activities are crucial for diagnostic outcomes in VPs.

Summary of Work: In our study N =142 medical students worked on eight VPs in two VP case formats (whole case N=71 and serial-cue N=71). After entering a final diagnosis they were asked to provide a reflection on their clinical reasoning. In a stepwise multivariate multiple regression, the coded EAs were used to explain variance in diagnostic accuracy (correct/incorrect diagnosis), time-on-task (first information until submission of diagnosis), knowledge gain (difference between pre- and posttest of a key-feature test).

Summary of Results: Regression showed that drawing conclusions was significantly related to diagnostic accuracy ($p=.02$; $B=-.21$; $\eta^2=.04$). Further, regression showed a significant interaction between the serial-cue VP case format and drawing conclusions ($p=.016$, $B=-.03$, $\eta^2=.04$). For the time-on-task serial-cue VP case format and hypothesis generation interacted significantly ($p=.04$, $B=-69.1$, $\eta^2=.03$). We found no significant relationships of evidence generation(EG) and evidence evaluation(EE) on diagnostic outcomes.

Discussion and Conclusions: With the current study we found that indeed students' clinical reasoning processes relate to diagnostic outcomes. Especially, drawing conclusions seems to have an impact on diagnostic accuracy. Yet, the correlation is negative, so the fewer conclusions were drawn, the more often they were associated with the correct diagnoses. Further, other EAs were not related to the diagnostic outcomes. Both these findings might indicate that the structuring of VPs in learning environments can also have an adverse effect on intuitive reasoning.

Take-home Messages: 1. Drawing conclusions is the central EA for diagnostic accuracy; 2. EE and EG seem to perform a minor role; 3. Time-on-task serial-cue VP case format and hypothesis generation interacted significantly; 4. VP formats play an important role for the reflection processes.

Students' interaction and learning when working with an interprofessional virtual patient model in primary healthcare

AUTHOR(S):

- Carrie Tran, Karolinska Institutet, Sweden (Presenter)
- Helena Salminen, Karolinska Institutet, Sweden
- Eva Toth-Pal, Karolinska Institutet, Sweden
- Solvig Ekblad, Karolinska Institutet, Sweden
- Uno Fors, Stockholm University, Sweden
- Päivi Kaila, Karolinska Institutet, Sweden

ABSTRACT

Background: The interprofessional Virtual Patient (VP) model consists of a repeated four-stage learning cycle (didactic inventory, concrete experience, teacher's comments and reflection/clinical reasoning). A description of the VP model has been presented previously. The aim of the present study was to investigate students' interactions in each learning cycle when working with the interprofessional VP model.

Summary of Work: A total of 38 students were video-recorded in ten sessions when working with the interprofessional VP model. There were 2-5 students in each group from two to four different study programmes. Each group was interviewed after the test session.

Summary of Results: Preliminary findings show that the VP model increased interaction between the students in each learning cycle. In didactic inventory the students had to formulate their own learning goals, but they also discussed verbally their previous experiences about collaboration with different health professions spontaneously. After watching the short videos (the concrete experience cycle) they also asked each other specific questions on issues belonging to the other professions in the virtual patient case. In the next cycle the students discussed the teachers' comments (preformulated) from their own professions' perspectives. The students were asked to reflect on the collaboration between different professions before and after each short video. The students found the reflections and discussions to contribute most to their learning.

Discussion and Conclusions: The students appreciated the short videos and found them illustrative and inspiring. They read comments and other important information which made a base for their discussions. This kind of learning activities may result in greater retention of the new knowledge as it was acquired with many different methods such as interactive interprofessional discussions, formulating own learning goals and watching film clips and getting feedback from the teachers' comments. Conclusions The VP model seemed to be a good facilitator for interaction between students from different study programmes and can be a suitable tool to enhance learning in interprofessional education.

Take-home Messages: An interprofessional VP model may contribute to prepare students for future teamwork and collaboration after graduation, which need to be studied in more details and during long term in the future.

Feasibility and utility of an immersive 360-video simulation of stressful clinical events to enhance self-efficacy

AUTHOR(S):

- Steve Gallagher, Dunedin School of Medicine, University of Otago, New Zealand (Presenter)
- Shakeel Mohammed, Dunedin School of Medicine, University of Otago, New Zealand
- Phil Blyth, Otago Medical School, University of Otago, New Zealand
- Tehmina Gladman, University of Otago, New Zealand

ABSTRACT

Background: Medical students and early-career doctors are trained to deal with stressful clinical events, such as managing a deteriorating patient, but typically have low self-efficacy for these situations. Previous research has demonstrated that high-fidelity simulation and virtual world training environments that elicit a sense of presence in the virtual environment can influence both knowledge and confidence to manage these events, but financial and logistic challenges can limit access to these opportunities. Immersive 360 video provides an opportunity to produce high-fidelity virtual simulations at reduced cost, but research assessing the feasibility of this approach and its impact on cognitive factors that influence performance such as stress and self-efficacy is limited.

Summary of Work: We assessed the feasibility of developing 360 video-based simulation of a stressful clinical event as an education tool for senior medical students. With input from emergency medicine clinicians, we considered a number of possible clinical scenarios, and ultimately developed a scenario in which a patient unexpectedly suffers a seizure while in hospital, while under the observation of the participant. The scenario was filmed and developed into an interactive branching scenario using game development software by a novice developer, and a short self-efficacy measure was developed and piloted.

Summary of Results: Over a 10-week period, we were able to develop and pilot a VR simulation. The final simulation was piloted with a small group of senior medical students using an HTC-Vive VR headset. Preliminary data suggests that participants experience a sense of presence and heightened emotions during the simulation, and that self-efficacy can be influenced by the experience.

Discussion and Conclusions: Initial results justify further research in this area. In particular, a more thorough investigation of the specific impact on self-efficacy, and how simulations can be developed to promote self-efficacy for clinical emergencies is warranted.

Take-home Messages: We demonstrated that it is feasible to rapidly produce a short, interactive VR scenario using 360-video with a small in-house team at low cost, and that this approach has value in simulation-based medical education.

New insights into analysing virtual patient data

AUTHOR(S):

- Tomi Ylä-Soininmäki, University of Helsinki, Finland (Presenter)
- Tuomas Lumikari, University of Helsinki, Finland
- Eeva Pyörälä, University of Helsinki, Finland

ABSTRACT

Background: Growing literature refers that virtual patients (VPs) provide a learning resource to develop students' clinical reasoning. Clinical reasoning refers to the ability to critically analyse patient's symptoms, signs, laboratory results and imaging to determine a diagnosis and appropriate treatment (Eva 2004). In 2018, a virtual patient application was developed by two medical students to stimulate the students' self-directed learning. The aim of this study was to analyze the VP data to obtain detailed information about how the students' clinical reasoning procedure advanced.

Summary of Work: We used the data collected among voluntary fifth year medical students using the VP application in 2018. They interviewed and examined VPs, ordered tests, defined diagnoses using ICD-10 and prescribed treatment accordingly. We analysed and visualized how the students performed the most important tasks (e.g. asking the relevant questions, ordering the relevant lab tests) in three VP scenarios to identify homogenous patterns solving the VP cases.

Summary of Results: In 2018, 40 out of 60 students participated in the study. Their ages ranged between 23 and 32 and they had 2-7 months of clinical working-life experience. The symptoms of diabetic ketoacidosis were rapidly recognised and the most relevant tasks chosen throughout the process. In the Kawasaki disease, the diagnostic process started hesitantly but after recognising key signs, an increasingly bigger portion of performed tasks were relevant. The scabies scenario was straightforward and rapidly solved, but many students made several irrelevant actions. On further analysis, we found that the key action correlating with the correct diagnosis on Kawasaki disease scenario was ordering 'erythrocyte sedimenting rate', with ordering-rate of 11/13 vs 0/6 ($p=0.001$) on those who got the correct vs incorrect diagnosis respectively.

Discussion and Conclusions: The analysis and visualization of the students' choices were used to recognize the patterns of students' diagnostic approach in different scenarios. This information helps improve the VP scenarios and find the right focus in teaching and learning clinical reasoning.

Take-home Messages: The detailed analysis of the VP data provides important information for developing teaching and learning clinical skills and improving the VP scenarios.

Role of Faculty Revisited in the Era of AI driven Teaching and Learning

AUTHOR(S):

- Smriti Pathak, Imperial College London, UK (Presenter)
- Redante Mendoza, Nanyang Technological University, Singapore
- Paul Gagnon, Nanyang Technological University, Singapore
- Nabil Zary, Mohammed Bin Rashid University of Medicine and Health Sciences, UAE

ABSTRACT

Background: We each learn differently. Traditionally, medical educators in university faculty have been focussed on what we teach (curriculum content) versus how we teach (curriculum delivery). The latter has become relevant with the fast-paced expansion of data (patient variables and scientific knowledge) and thus the need for doctors who are critical thinkers capable of interpreting large datasets. In clinical practice, 'the see one, do one' dictum involves applying learnt concepts in real life but this is often constrained by patient needs, time pressures and group teaching. Hence, the personalisation of medical education in the form of Artificial Intelligence (AI) assisted Digital Virtual Patients (DVP) promises the learner experiential clinical learning outside of the classroom; and offers faculty opportunities to monitor and interrogate the developing critical thinking of learners prior to contact with real-life patients.

Summary of Work: The development of the DVP has involved partnering of a faculty content expert with data scientists to construct domain intuitive structuring of clinical assessment in a way that develops clinical reasoning in real-life scenarios with cross-cutting themes.

Summary of Results: The roles of the faculty include: 1) guidance on diverse cases to engage students; 2) construction of cases to aid in the organisation of concept maps across curriculum themes; 3) identification of crucial time points to interrogate student decision-making along the clinical reasoning pathway; 4) creation of reusable models that can be employed by data scientists; and 5) prediction models of student feedback which can then be built on by AI and iteratively honed using student answers.

Discussion and Conclusions: Faculty-data scientist partnership requires clarity of mission and formulation of DVP approaches prior to the integration of AI. Future challenges include how best to: 1) pitch case complexity appropriate to individual learner profiles; and 2) assess, feedback and amend the course maps of both expert and novice students.

Take-home Messages: Faculty engagement with data scientists in the construction of DVPs enables a self-directed learning platform to bridge the gap between biomedical science and clinical practice. In turn, this aids the development of deeper learning, pattern recognition and problem-solving skills essential to future healthcare team-leaders.

Re-envisioning Exams: NBME's Effort on Wellness (RENEW) project

AUTHOR(S):

- Miguel Paniagua, National Board of Medical Examiners (NBME), USA (Presenter)
- Liselotte Dyrbye, Mayo Clinic, USA
- Karen Hauer, University of California at San Francisco, USA
- Steve Lieberman, University of Arizona, USA
- Hanin Rashid, Robert Wood Johnson Medical School, Rutgers University, USA
- Kimberly Templeton, University of Kansas, USA

ABSTRACT

Background: Burnout starts in medical school and persists through all levels of training. In the U.S. and elsewhere, it may be more the rule than the exception and affects physician health and therefore patient care. The solutions to date focus on coping with rigors rather than affecting systematic change and predictive models of burnout have yet to be fully developed, particularly related to high-stakes medical school examinations. Despite its explicitly-stated purpose as a minimum competency licensure examination, the 3-digit score for the USMLE clinical knowledge examinations, particularly step 1 are widely-utilized by graduate medical education programs in the U.S. to screen and rank applicants for residency positions, a reported significant stressor for medical students.

Summary of Work: The NBME seeks to understand the role high-stakes exams such as United States Licensing Examination (USMLE) play in affecting medical student wellness. Alongside other U.S. healthcare professional organizations that are also currently addressing this issue, we hope to contribute to a better functioning healthcare system. We convened a summit of leaders in the field and from the house of medicine to develop and execute a research agenda, whose preliminary results will be presented.

Summary of Results: From a deliberative process, U.S. experts prioritized four of nine research questions: What is the relationship between student well-being and examination performance? How do self-care activities relate to stress and examination performance? What contributes to stress among medical students, and what strategies do students use to mitigate stress? What is relationship between perceptions of USMLE's purpose and meaning students attach to USMLE and student wellness Study design, sources of data and subsequent findings will be presented.

Discussion and Conclusions: From this research and expert engagement, we have developed an action plan that we believe will inform policy, research and development. Preliminary research results will be presented.

Take-home Messages: By partnering with collaborating U.S. organizations and expert faculty to conduct research and produce meaningful scholarship, we have begun to enlist support for actionable interventions that might promote wellness amongst learners and trainees in the context of high stakes exams in the United States.

Academic Environment and Mindfulness Interventions predict Wellness among Medical Students

AUTHOR(S):

- Hector Eduardo Velasco, Touro University California, USA (Presenter)
- Athena Lin, Touro University California, USA
- Yasmin Bains, Touro University California, USA

ABSTRACT

Background: Medical education and practice may lead to unhealthy behaviors and attitudes that may result in poor academic performance and early and future professional burnout among medical students and practitioners. Touro University College of Osteopathic Medicine (TUCOM) developed the Wellness, Academic Achievement, Resilience and Mindfulness program (WARM) to improve student wellness and academic performance and address the current medical burnout trends.

Summary of Work: WARM includes four assessment instruments; namely: 1) Health-Promoting Lifestyle Profile II; 2) Johns Hopkins Learning Environment Scale; 3) Perceived Stress Scale; and 4) Five Facet Mindfulness Questionnaire. Data were collected anonymously during 2016 and 2017 using surveys implemented in Qualtrics among first and second year medical students. Data analyses were conducted using Stata V15 using the Mann-Whitney test to assess differences in WARM scores. Also, we conducted multivariable linear regression to assess Stress, Mindfulness and Academic environment as predictors of Wellness. Statistical significance was set at $p < 0.05$. This project received institutional IRB approval.

Summary of Results: Response rates were between 50% and 60% for each cohort. Baseline results were obtained using descriptive statistics for future comparisons. There were no statistically differences in WARM scores between first and second year students. Multivariable linear regression showed that student Wellness was predicted by Academic Environment ($\beta = 0.73$, 95% CI 0.58, 0.88) and Mindfulness ($\beta = 0.64$, 95% CI 0.34, 0.94) scores.

Discussion and Conclusions: After two years of implementation of WARM, there are no differences in WARM scores between first and second year students and first year students do not show statistically significant improved scores as second years. However, Wellness scores were significantly predicted by Academic Environment and Mindfulness, which can be used to inform curricular strategies aiming at improving Wellness among medical students.

Take-home Messages: Improvement of academic environment, including curricular strategies, study methods, mentoring, student satisfaction and faculty development are all part of a comprehensive approach to medical student Wellness, which is key to academic performance. Implementing these strategies early in the curriculum and overall management of the medical academic program to enhance the student experience should help develop burnout-prevention skills among future graduate and practitioners.

Comparison of face-to-face and online mindfulness interventions among healthcare professional students in Finland: A randomized controlled trial

AUTHOR(S):

- Saara Repo, University of Helsinki, Faculty of Medicine, Finland (Presenter)
- Marko Elovainio, University of Helsinki, Faculty of Medicine, Finland
- Eeva Pyörälä, University of Helsinki, Faculty of Medicine, Finland
- Marianne Holopainen, University of Helsinki, Faculty of Medicine, Finland
- Panajiota Räsänen, University of Jyväskylä, Finland
- Tiina Paunio, University of Helsinki, Faculty of Medicine, Finland

ABSTRACT

Background: Previous studies have shown that both face-to-face and online mindfulness training reduces stress and enhances well-being in undergraduate students (Galante et al. 2018, Spijkerman et al. 2015). The evidence concerning the effectiveness of mindfulness interventions among medical students is mixed. The aim of this study was to test whether two types of mindfulness interventions, face-to-face training and internet-based training could enhance the students' well-being.

Summary of Work: A randomized controlled trial in undergraduate students was conducted at the University of Helsinki. We divided the voluntary students into three groups 1) control group (n=40), 2) face-to-face training group (n=40) and 3) internet-based training group (n=22). The potential well-being outcomes were measured three times, at the baseline, post-intervention and after a four months follow-up using the CORE-OM34 and its five domains (well-being, symptoms, functioning, risk, non-risk). The study protocol was registered in ClinicalTrials.gov.

Summary of Results: We recruited 102 students (74 female, 26 male and two other) from all the five study programmes of the faculty. In the baseline, 28 % of the participants experienced quite a lot or a lot of stress. Eight-week interventions were conducted in October and November in 2018. In the face-to-face group 95 % and the internet-based group 81 % completed the course. Nearly all (97%) of the face-to-face group and the internet-based group (93%) would recommend the course for others. The longer term effect will be examined by comparing the CORE-OM34 results after the intervention and in a follow up after four months (April 2019).

Discussion and Conclusions: Participants were very committed to both interventions and experienced them useful. Our study-design contains not only immediate but also the follow-up outcomes of the intervention. Based on these results, the Faculty will decide whether the students will be offered mindfulness courses in future and what type of training would be the most suitable.

Take-home Messages: Stress levels among the students of healthcare professions are high. Our intervention study on the two types of mindfulness courses provides valuable information for those who are at the outset of developing stress management training for students.

Support cell for medical students

AUTHOR(S):

- Myriam Dergham, Faculté de Médecine Jacques Lisfranc - Saint Priest en Jarez, France (Presenter)
- Catherine Massoubre, Faculty of Medicine Jacques Lisfranc, France

ABSTRACT

Background: The psycho-social risks of medical students have been the subject of national and international studies, which have highlighted several risk factors. In 2016, a questionnaire on the mental health of young people and future doctors showed that 66.2% of young and future doctors suffered from anxiety - compared to 26.1% in the general population; 27.7% were depressed - compared to 10.1%; and 23.7% have suicidal thoughts - compared to 4% of young people aged 20-30. Besides, 738 respondents had reportedly already attempted suicide.

Summary of Work: To respond concretely to these alarming figures, the Faculty of Medicine of Saint Etienne chose to react by creating a support cell. The support cell was opened in January 2017, initiated by Professor Catherine Massoubre, hospital practitioner of psychiatry and pedagogy assessor at the Medicine Faculty of Saint-Etienne. The cell, composed of three professors, is open to all students in the Faculty of Medicine. Students can directly request an appointment, via an e-mail address, managed by the three professors. Each request is confidential. The students can also be referred to the cell by the teachers or doctors they work with. The aim is to guide the student towards the structures that can best help them: psychiatrist, psychologist, addiction centre, social worker, etc. When the problem concerns the practice at the hospital, the head of the department or unit can be contacted.

Summary of Results: More than 8% of the students have already used the cell, from the first year to the end of their internship.

Discussion and Conclusions: This support cell is widely used. It shows that it is essential to have such a structure, although, the support cell is time consuming for the people who manage it. Other means of help exist: in Limoges, Tours and Paris, a teacher-student interface office has been set up ; in Amiens, an association for student mental health has been created.

Take-home Messages: Many students suffer from anxiety disorders, moreover, some of them have suicidal thoughts. The results show that it was a necessity to create such a structure, all French medical schools should to set up a support cell to help the students along their studies.

Perception of self-medication among medical students in Saint-Etienne: quantitative study by self-questionnaire

AUTHOR(S):

- Sébastien Bruel, Department of General Practice, Jean Monnet University, St Etienne, France (Presenter)
- Sophie Tissot, Department of General Practice, Jean Monnet University, France
- Jean Noël Bally, Department of General Practice, Jean Monnet University, France

ABSTRACT

Background: Self-medication is a widespread practice in our society, leading to autonomous health management. According to an IPSOS study in 2015, 91% of French people felt able to manage simple health problems. This phenomenon has been poorly studied among medical students. The objective was to study the point of view of Saint-Etienne medical students on self-medication through the acquisition of medical knowledge and the right to prescribe.

Summary of Work: A cross-sectional, monocentric, descriptive, self-administered, anonymous observational study was conducted from March 9, 2018 to May 2, 2018 with 1382 Saint-Etienne medical students from the 2nd year of medical school to the last year of residency. For this study, paracetamol, ibuprofen, homeopathy and herbal medicine were arbitrarily excluded.

Summary of Results: The participation rate was 40.7% or 563 usable responses. The mean age was 24.1 years (standard deviation = 3.4) with 65.5% of women. The self-medication rate was 79.8% for all promotions combined and was higher among residents than among medical students from the 2nd year to the 6th year of medical school: $p < 0.001$. While almost all participants thought that self-medication in the general population was a risky practice (93%), they considered their own self-medication responsible (90.4%). The main reason for self-medication given by residents was sufficient medical knowledge, while medical students mainly mentioned lack of time. The perception of health care management among self-medicated participants was identical to worse than the general population, while participants who did not practice self-medication perceived their health care as identical to better ($p = 0.037$). Almost half of the respondents who described their care as less good were residents at the end of their residency. The majority of respondents were opposed to the prohibition of self-prescribing (88.2%): self-medicated participants were more opposed than others (OR = 2.94; IC95 = 1.83-4.73).

Discussion and Conclusions: Faced with the self-medication of medical students, the question of a greater involvement of occupational medicine as well as academic medicine arises.

Take-home Messages: The self-medication rate was 79.8%. Participants thought that self-medication was responsible. Almost half of the respondents who described their care as less good were residents at the end of their residency.

An innovative model for mental health care and educational support in Brazilian medical education context: Personal Development Planning (PDP) Framework

AUTHOR(S):

- **Fernanda Mayer, Pontifícia Universidade Católica do Paraná, Brazil (Presenter)**
- Jean Tafarel, Pontifícia Universidade Católica do Paraná, Brazil
- Leonardo Margraf, Pontifícia Universidade Católica do Paraná, Brazil
- Odenir Júnior, Pontifícia Universidade Católica do Paraná, Brazil
- José Knopfholz, Pontifícia Universidade Católica do Paraná, Brazil
- Lidia Moura, Pontifícia Universidade Católica do Paraná, Brazil

ABSTRACT

Background: The prevalence of mental health problems among medical students have significant proportions worldwide. The spirit of time (germ. Zeitgeist) is to 'Act' in favor of health promotion.

Summary of Work: Conception of a PDP-Framework in a Brazilian Medical School based on medical students' needs and curriculum reform. PDP definition and model were based on QAA Guidance Document (2009). The PDP-Framework received approval from the rector of the University, and was endorsed by the students' representations. PDP-Framework were included in the Course Pedagogic Project and shared with academic community. The implementation of the PDP was planned to initiate in the first-semester of the medical program in 2018.

Summary of Results: The main issues of the medical students were lack of time for extra-curricular activities, lack of mental health care and educational support. Based on these results we performed a curricular reform that reduced the hours of curricular activities in 30% and conceived the PDP-Framework. Our model was to embedded PDP into mainstream curriculum as a subject discipline one hour per week in tutorial groups of ten students, facilitated by two psychologists and one doctor specialist in all years of the medical program. We defined two main competences that foresee transitional skills, self-regulation, self-care, professionalism, resilience and personal, educational and career planning. Learning outcomes were defined for each semester. The PDP privileges active methods of learning based on the process of reflection. Assessment of student performance includes formative and summative manner with questionnaires, reflective writing, ePortfolio and feedback. The PDP evaluation will be based on Kirkpatrick's Model.

Discussion and Conclusions: Evidence on interventions in educational environment for promotion of medical students' mental health is limited and quality of the studies is generally low. Partial results of a national survey on support models for medical students in Brazil point to three mains models: psychopedagogical, mental health care and mentoring; optional and parallel to curriculum. The PDP-Model embebbed into mainsteam curriculum in all years of the course seems to be a new concept of mental-health care and educational support for medical students in Brazil.

Take-home Messages: Personal Development Planning framework seems to be innovative in the context of Brazilian medical education.

Humanism in Asian Medical Education - A Scoping Review

AUTHOR(S):

- **Shi Qi Zhu, National University Health System - Department of Family Medicine, Singapore (Presenter)**
- Ying Pin Toh, National University Health System - Department of Family Medicine, Singapore
- Victor Weng Keong Loh, National University Health System - Department of Family Medicine, Singapore
- Ryan Kye Feng Yap, National University of Singapore - Yong Loo Lin School of Medicine, Singapore
- Samuel Yong Siang Lim, National University of Singapore - Yong Loo Lin School of Medicine, Singapore

ABSTRACT

Background: Instilling humanistic values in medical training lies at the heart of equipping physicians in the art of medicine. In recent years, the growing body of work on this subject has defined and integrated humanism into medical education in Western countries. Given the enduring strands of humanism in Asia, this study aims to understand how humanism in the Asian sociocultural context has been and may be integrated into medical education in Asia.

Summary of Work: Arksey and O'Malley's approach to scoping reviews was used to guide the study protocol. Databases PubMed, ERIC, EMBASE, and others were searched for articles on humanism and medical education in Asia. Final articles were selected based on agreed upon selection criteria. Open coding and thematic analysis were performed.

Summary of Results: 306 abstracts were retrieved, 78 full-text articles were analysed and 48 articles were included. Thematic analysis revealed 6 themes pertaining to the definition of humanism in Asian medical education, barriers to humanism education in Asia, recommendations for future development, current methods of teaching, stage of medical training at which humanism education is introduced, and methods of assessments.

Discussion and Conclusions: Themes highlighted in this review show that there is increasing recognition amongst Asian medical educators for the importance of inculcating humanistic values into medical training. Current literature on teaching humanism in Asia is coloured by Asian cultural values which emphasize self-discipline, teamwork, morality and the importance of community. However, there is a lack of standardized methods of education and a lack of validated assessment tools.

Take-home Messages: The integration of humanism into medical education in Asian medical schools is an important area which deserves further research and ongoing discussion. However, training in humanism is not clearly defined nor currently well studied in Asian countries and further research needs to be carried out to develop culturally relevant, effective training methods and validated assessment tools.

Integrating health economics teaching in Family Medicine: a case study from Thailand

AUTHOR(S):

- Win Techakehakij, Lampang Hospital, Thailand (Presenter)

ABSTRACT

Background: Concerns about integrating cost consciousness into the medical curriculum in family medicine have been raised to promote efficiency in clinical practice. A standardized list of questions has been prepared for medical students at Lampang Hospital as a guide to retrieve personal and family contexts of each patient at the out-patient department. However, there are still no structured questions to assist students in obtaining information relating to costs and efficiency, which could assist in making clinical decisions efficiently.

Summary of Work: A health economist and a family physician collaborated to agree a set of questions to gather economic-related information of patients, which are: 1) all drugs and laboratory investigations the patient was prescribed at that out-patient visit and their respective costs; and 2) direct non-medical costs (DNMc) for the patient and informal caregivers such as transportation and productivity loss. The questions were integrated into the standardized list for 4th- and 5th-year medical students in the family medicine rotation, together with room for discussion about the impact of economic information on the patients' care plan. At the end of the rotation, students were asked to fill in a questionnaire to reveal their attitudes towards this intervention, using a 5-point Likert scale, ranging from Strongly disagree to Strongly agree'.

Summary of Results: From 71 students, 87.3% stated that knowing the drug costs made them interested in choosing the most efficient way of treatment; 91.5% reported that knowing laboratory costs encourages them to order only investigations that are necessary; 90.1% agreed that knowing the costs of drugs and investigations encourages them to inquire about patients' health insurances; and 88.7% indicated that knowing DNMc encourages students to establish patients' follow-up plans that help minimize their economic burden.

Discussion and Conclusions: Integrating the inquiry about the costs of drugs and investigations, appears to encourage students to find the most efficient way of treatment. Additionally, information about DNMc promotes students' critical thinking to reduce the financial barrier of patients to healthcare access, which could potentially improve treatment effectiveness.

Take-home Messages: Integrating cost information inquiries in family medicine is an effective intervention to promote efficiency concern among students.

Role of lifestyle Medicine in Medical School Curriculum

AUTHOR(S):

- Chaya Prasad, Western University of Health Sciences, USA (Presenter)
- Edward Barnes, Western University of Health Sciences, USA

ABSTRACT

Background: Western countries are facing a new killer. Chronic diseases are draining medical resources and are now a cause of premature death in these countries. Physicians need to understand the role of Lifestyle medicine and impart this message to their patients, in order to prevent and reverse chronic medical conditions. Up to 80 % of chronic medical conditions and premature deaths can be prevented and treated with appropriate lifestyle changes. We have implemented a lifestyle medicine track in our medical school curriculum.

Summary of Work: The lifestyle medicine track director, at the Western University of Health Sciences, California, chooses 17 qualified students per year, with an aggregate of 68 students in the 4 year medical school curriculum. Students are mandated to complete online courses on happiness, attend sessions of culinary medicine, attend presentations by experts in the field of lifestyle medicine and are also encouraged to participate in research projects related to lifestyle medicine. Topics of discussion included role of physical activity, nutrition, sleep, stress, and lifestyle coaching and counseling.

Summary of Results: Students participated in 2 culinary medicine sessions, wherein they received hands on training on healthy cooking styles. They listened to experts on the topics of sleep, nutrition, exercise, and wellness. In addition students completed an online module on happiness. Students learnt to work in groups on research projects. They were also involved in mentoring junior students. This pairing was helpful in the completion of projects. Graduating 4th year students completed their capstone projects including true research projects, projects in the form of art, poetry, and their experiences about lifestyle medicine as they observed in their clinical rotations. Projects were presented to all Lifestyle medicine track students. Session on motivational interviewing was well received, in preparation for their clinical rotations.

Discussion and Conclusions: Lifestyle medicine may be the answer to chronic medical conditions that is on the rise in western countries. Students need to be educated about the role of healthy lifestyles in the prevention and treatment of chronic conditions. Students can then use the information to help themselves and their patients.

Take-home Messages: Lifestyle medicine track should be part of the medical school curriculum.

Implementation and Evaluation of Emergency Ultrasound Training in a Swiss Medical School

AUTHOR(S):

- **Andrea Meienberg, University Hospital Basel, Switzerland (Presenter)**
- Silke Biller, University Basel, Switzerland
- Matthias Benz, University Hospital Basel, Switzerland
- Joachim Hohmann, Kantonsspital Winterthur, Switzerland
- Roland Bingisser, University Hospital Basel, Switzerland
- Gilbert Krähenbühl, University Hospital Basel, Switzerland

ABSTRACT

Background: Point-of-care ultrasound (POCUS) is an important tool to clinicians supporting clinical decision-making. Teaching of POCUS to undergraduate students is a novelty in Europe, and mandatory emergency ultrasound training (EUST) was only recently implemented at the University of Basel. This is the first overview on the EUST content, structure, and evaluation in Switzerland.

Summary of Work: Curriculum development: An expert task force defined content, structure, quality assessment, and evaluation of the EUST. Evaluation: Post training assessment was performed using a seven-point Likert scale online tool, ranging from 1 (not true at all) to 7 (entirely true). Overall rating used Swiss school grades from 1 (insufficient) to 6 (excellent). Results were given as mean and standard deviation (SD). Qualitative feedback by students and tutors was sought regarding feasibility.

Summary of Results: Curriculum development: The EUST was implemented in 2018 in year 4. The curriculum consisted of an online theoretical introduction in basics ultrasound skills, followed by two four-hour trainings in e-FAST, ultrasound-guided procedures, 2-point compression ultrasound, and evaluation of gallbladder, kidneys, urinary tract, and abdominal aorta. Practical training was performed in groups of 20 students and 4 tutors (2 accredited physician tutors; 2 trained student tutors). A skills lab was set up for self-directed learning. Evaluation: 178 students participated the first EUST. 68 (38%) participants completed the survey. Mean overall rating was 5.1 of 6 (SD0.4). Competence of student tutors was 5.8 of 7 (SD1.1); Competence of accredited tutors was 6.4 of 7 (SD1). Rating of the duration of training was 2.1 of 7 (SD1.5). Rating of own competence to perform ultrasound examinations independently was 3.3 (SD 1.7).

Discussion and Conclusions: The newly implemented undergraduate EUST is feasible and highly accepted. Students deemed additional trainings and skills lab time necessary according to qualitative feedback. This is in line with low ratings regarding duration of training and competence. The trained student tutors were rated to be a valuable support by physician tutors and students. They contributed half of the 320 teaching hours

Take-home Messages: Undergraduate EUST is feasible. However further training opportunities must be established to achieve acceptable clinical skills.

Development of Statistical Literacy and Scientific Reasoning & Argumentation Skills in Medical Doctors

AUTHOR(S):

- **Markus Berndt, University Hospital of LMU Munich, Institute for Medical Education, Munich, Germany (Presenter)**
- Felicitas Schmidt, University Hospital of LMU Munich, Institute for Medical Education, Munich, Germany
- Jan Zottmann, University Hospital of LMU Munich, Institute for Medical Education, Munich, Germany
- Maximilian Sailer, Ludwig-Maximilians-Universität München, Chair of Education and Educational Psychology, Munich, Germany
- Martin Fischer, University Hospital of LMU Munich, Institute for Medical Education, Munich, Germany

ABSTRACT

Background: Statistical literacy of medical doctors, i.e. the ability to use and understand statistical numbers, is an essential prerequisite for risk estimation and risk communication (Nelson et al. 2008). Together with scientific reasoning and argumentation skills (SRA; Fischer et al., 2014), statistical literacy provides the basis for evidence-based practice. Several studies suggest that both skills are underdeveloped in medical students, but better developed in medical doctors (Gaissmaier & Gigerenzer, 2008; Gigerenzer, 2010).

Summary of Work: The aim of the present study was to investigate the development of these skills in medical doctors. Together with biographical information, data was gathered on statistical literacy (max. score 40) and SRA skills (evidence evaluation and drawing conclusions, max. score 204) from N = 33 medical doctors in Germany (17 female, 16 male, mean age M = 40.06, SD 9.49).

Summary of Results: Analysis showed average scores in statistical literacy of M = 27.76 (SD = 6.92) and SRA skills of M = 106.27 (SD = 21.53). Significantly more participants indicated to have acquired scientific competencies after their studies in an autodidactic manner (M = 4.88, SD = 1.07) rather than during their studies (M = 2.32, SD = 1.52; $t(1,32) = -5.291$, $p < .001$) or in extracurricular activities (M = 2.80, SD = 1.72; $t(1,32) = 4.673$, $p < .001$). The number of scientific publications predicted the performance in statistical literacy ($\hat{\rho}^2 = .058^*$, $R\hat{A}^2 = .125$; $F(1,32) = 4.446$, $p = .043$; $r(33) = .354^*$). Having completed a doctoral thesis did neither influence the scoring in statistical literacy, nor SRA skills.

Discussion and Conclusions: Biographical data suggests that skills development relates mainly to autodidactic learning activities outside of formal medical education. Involvement in research and publication activities is a positive predictor for statistical literacy. However, having only completed a doctoral thesis had no significant effect on statistical literacy or SRA skills. This might indicate a lack of scientific independence and responsibilities during doctoral work.

Take-home Messages: Medical curricula should include active involvement in research, and overall, the development of statistical literacy and SRA skills needs to be systematically fostered during medical education.

An Evaluation Study of the Bioethics Curriculum of an Undergraduate Medical Program

AUTHOR(S):

- Anita Allana, The Aga Khan University, Pakistan (Presenter)
- Kulsoom Ghias, The Aga Khan University, Pakistan
- Syeda Kauser Ali, The College of Physicians and Surgeons Pakistan, Pakistan

ABSTRACT

Background: Professionalism and ethical behavior is essential to be a good physician. To inculcate relevant knowledge, skills and attitudes in medical students, bioethics is a longitudinal component of undergraduate curriculum at a private medical college in Karachi, Pakistan. The most recent iteration of the bioethics curriculum has been in place for over 5 years.

Summary of Work: We designed a study to evaluate student achievement, appropriateness of subject matter and effectiveness of instructional methods in the existing bioethics curriculum. Mixed methods approach was utilized to gather data. Focus group discussions (FGDs) and document review were primary methods for data gathering for qualitative phase and a self-administered questionnaire was used for collection of quantitative data.

Summary of Results: Students who had been through the bioethics course and faculty who had facilitated, planned and observed the sessions found the curriculum contents to be relevant, informative and appropriate as per the learning objectives. The multi-modal instructional methods (such as movies, short videos, case analysis, panel discussions, workshops, etc.) used were found to be effective and engaging. Small group teaching, interactive and shorter sessions were preferable for increasing engagement and fostering discussion. Large class format lectures were less effective. Bioethics teaching was perceived to have contributed significantly to personal and professional development of learners in terms of reasoning, critical thinking and problem solving skills. Students felt that the curriculum could be further strengthened through better integration in clinical years, addressing the disconnect between theory and practice, ensuring role modelling and providing opportunities for application in clinical settings.

Discussion and Conclusions: Student perceptions regarding contribution of bioethics to their personal and professional development changed as they progressed through the five-year undergraduate program. They could better appreciate the impact of learning on their ethical positioning and decision making; however, they stated a disconnect from theory to practice due to limited role modelling. Lessons learnt are useful for improving the existing curriculum and can be utilized by other medical schools for development and improvement of bioethics curricula.

Take-home Messages: Bioethics teaching promotes ethical decision making among medical students.

Introduction to Patient Care - An Innovative Learning Experience for Year 4 Medical Students commencing Clinical Placements

AUTHOR(S):

- **Kate Leech, University of Edinburgh, Medical School, UK (Presenter)**
- Vicki McCorkell, University of Edinburgh, Medical School, UK
- Janet Skinner, University of Edinburgh, Medical School, UK
- Jennifer Tocher, University of Edinburgh, Nursing School, UK
- Kirsty Egan, University of Edinburgh, Medical School, UK

ABSTRACT

Background: Medical Students at Edinburgh Medical School enter the hospital clinical area on a regular basis for the first time in their 4th year. Prior to this, students will have undertaken a year of intercalated studies, often taking them away from the clinical setting. During Year 4 students have a 2 week TEAM placement where they work as part of the interdisciplinary team, taking on the role of a Clinical Support Worker. Many of the students have little practical experience and the clinical environment can seem daunting. Our aim was to make this transition less formidable through our innovative teaching session.

Summary of Work: During the first introductory week, the whole student year receive a coordinated programme of lectures encompassing the relevant information for their subsequent placements. As preparation for clinical placements we designed a teaching session in a simulated ward environment introducing an inter-professional element where nursing students took on the role of charge nurse and helped facilitate aspects of patient care. Medical students had the opportunity to role play both as patient and carer carrying out patient care tasks such as feeding and teeth brushing. As a result of this role play session they also revised key practical skills helping to prepare for their TEAM and other clinical placements.

Summary of Results: Students embraced the challenge of the various tasks. The feedback received indicated this session helped them feel more confident in various clinical skills and gave insight into providing personal care to a patient, thus encouraging empathy with patients.

Discussion and Conclusions: Putting the student into the patient's shoes can be a powerful teaching tool, allowing students to empathise with their patient's situation. Essential revision of skills being placed more in context allowed students to experience some of the challenges of team work and patient care in a safe environment.

Take-home Messages: Teaching can change a learner's perspective when creative thinking is applied.

Mind the gap - Helping medical students bridge the gap between their theoretical courses and clinical practice. Contribution of a video-based approach

AUTHOR(S):

- Felicitas Beger, Medical Student, Université Catholique De Louvain, Belgium (Presenter)
- Franck Verschuren, Emergency Department, Université Catholique de Louvain, Belgium
- Marie-Claire Van Nes, Medical Education Unit, Université Catholique de Louvain, Belgium

ABSTRACT

Background: The transition from student to junior doctor has always been a challenge. Many undergraduates argue that teaching is too theoretical, and feel unprepared for their first shifts. This video-based approach tries to bridge the gap and increase preparedness for clinical practice. It is based on the Entrustable Professional Activities (EPAs) for undergraduate students defined by our university. The videos may be considered as a threshold concept related to clinical reasoning.

Summary of Work: Final year medical students used seven videos to prepare for the emergency medicine part of their final exam. Each video focused on the management of a common symptom and was associated with assessment questions to engage the students in an active learning process. A survey questionnaire of 16 questions was used to evaluate the quality of the videos. The Likert-type questions underwent semi-quantitative analysis and immersion/crystallisation analysis was used for the open questions and comments.

Summary of Results: 152 students answered the questionnaire (response rate: 34%). The qualitative analysis of the questionnaire crystallised twelve key concepts from the students' comments. Sixty-one percent of students found the videos very useful for their personal learning outcomes. The quality of learning was probably improved as they reported that the knowledge stayed in their long-term memory. Cases shown in the videos were frequently encountered in the workplace. Students said they were able to deal with these situations in a more structured way. The videos allowed for demystification of clinical tasks that often seem scary to young doctors. Students reported decreased stress and increased autonomy.

Discussion and Conclusions: According to the students the videos had a positive impact on their transition from theoretical to clinical work. This first evaluation of the learning-videos encourages us to pursue the project and set up new videos, incorporating the students' suggestions. While the first seven videos were teacher-induced, the new ones will be trainee oriented, ensuring an increased focus on what is important to students and junior doctors. Additionally we'll be adding a forum for discussion and background literature for each case.

Take-home Messages: An e-learning approach to ease the transition into clinical practice can be beneficial.

The U&Me Near to Peer Junior Medical Staff Mentoring Program

AUTHOR(S):

- Louisa Ng, University of Melbourne, Australia (Presenter)
- Lynne Denby, (previously) Royal Melbourne Hospital, Australia

ABSTRACT

Background: Transition from a medical student to internship can be challenging. A slightly more experienced peer group can provide additional mentoring support during this crucial time.

Summary of Work: Royal Melbourne Hospital (RMH) employs 80 interns annually. Most continue working at RMH the following year and are therefore ideally placed to become peer mentors for the incoming interns. 40 'U&Me' Mentors (2 mentees each) were selected based on non-technical skills. They participated in professional development workshops over 6 months: 1) Introduction; 2) Understanding Personality Types 3) Emotional Intelligence 4) Teaching on the Run. The program was evaluated after 12 months through mixed methods.

Summary of Results: For the purposes of this abstract, only the experiences of the mentors have been included. 25 of 40 responded to the evaluation questionnaire. All had had contact with their mentee mostly through text messages, e-mail and face-to-face meetings. Most (n=18, 72%) had had occasional contact, some had frequent contact (n=4, 16%). Mentee enquiries ranged from logistical tasks (day to day tasks, navigating the system) to seeking emotional support (allaying fears or concerns). 18 (72%) were confident that the mentee/mentor relationship would continue. 23 (92%) felt they had gained and/or strengthened skills through the program - of these, the most frequently cited were, counselling and debriefing skills (n=18, 72%), communication skills (n=15, 60%) and active listening skills (n=13, 16%). "I began the role knowing that this is not about career mentoring nor a ... (supervisory) relationship. My understanding is that this is about advocacy, about having a relationship, and about sharing experiences. What I didn't expect was how powerful and meaningful these relationships and experience sharing can mean to someone starting out anew in a large and often impersonal environment. The mentoring process gives both mentor and mentee an opportunity to normalise their own experiences." Mentor

Discussion and Conclusions: A peer support program is a valuable additional support during a time of transition and the professional development of mentors is a key factor to success.

Take-home Messages: A peer support program with trained mentors should be considered especially during transitions.

The Learner Education Handover - Lessons Learned from the Beta-Test

AUTHOR(S):

- Aliya Kassam, University of Calgary, Canada (Presenter)
- Leslie Nickell, University of Toronto, Canada
- Glen Bandiera, University of Toronto, Canada

ABSTRACT

Background: Improved communication about learners, between undergraduate medical education (UGME) and postgraduate medical education (PGME) programs, may ease the transition for trainees. Knowing more about learner needs may enable PGME programs to create individualized learning plans, to optimize resident function and success. With key stakeholders across Canada, the Learner Education Handover (LEH) was developed to share information provided by both the learner and the UGME program related to learner needs. The purpose of this beta-test study of the LEH was to determine its utility, value and feasibility.

Summary of Work: The LEH beta-test comprised three phases of data collection. Phase 1: Unidentifiable medical student participants completed their portion of the LEH. Learners in need (LIN) and learners without identified needs (LWIN) were identified from this data. A pool of learner profiles were selected from the two groups. Phase 2: Undergraduate Medical Education (UGME) Deans received 20 randomly selected student completed sections. UGME deans were asked to complete their sections of the LEH based on previous experience with similar learner profiles. Phase 3: Postgraduate Medical Education (PGME) Deans received, 'fictitious' compilations of completed LEH forms for review. All three groups of participants completed a survey addressing the content and process of the LEH form.

Summary of Results: Fifty-two medical students from six medical schools participated in Phase 1. A total of (N=65) surveys were completed across the 3 phases of data collection. The majority of respondents thought the LEH was feasible, learner-centered and adds value. Themes from participants included potential privacy concerns, the need for consistent definitions, clarity of scope, more emphasis on student strengths and reliability of learner insight.

Discussion and Conclusions: Beta-test outcomes led to revisions to the LEH that focus on potential future learner needs (rather than past events in medical school), enhanced strengths of the learner and ability to trigger a proactive, private conversation with a designated PG staff, for more in-depth transitional planning.

Take-home Messages: 1) The LEH is useful, feasible and of value to help ease the transition from medical school to residency. 2) Key stakeholders must continue to inform and support the LEH for implementation across Canada.

Preparedness for practice affects how medical undergraduates regard themselves as medical professionals, teamwork ability, and cognitive flexibility

AUTHOR(S):

- Chung-Hsien Chaou, Chang Gung Medical Education Research Center, Taiwan (Presenter)
- Shiuan-Ruey Yu, Chang Gung Medical Education Research Center, Taiwan
- Hsu-Min Tseng, Chang Gung Medical Education Research Center, Taiwan
- Lynn Monrouxe, Chang Gung Medical Education Research Center, Taiwan
- Yu-Che Chang, Chang Gung Medical Education Research Center, Taiwan

ABSTRACT

Background: Medical schools prepare undergraduates for clinical practice. Clinical competencies are built up gradually and continuously. Literature suggests that new graduates are often unprepared for independent practice. This study aims to validate a Chinese version of preparedness for practice questionnaire (PHPQ) and to investigate the effect of preparedness on various maturation indicators.

Summary of Work: The original eight-domain English-version PHPQ was translated into Chinese and back-translated for expert panel discussion. Eight domains comprised interpersonal skills, confidence, collaboration, management, science, prevention, holistic-care, and self-directed learning. Reliability and validity was checked by Chronbach's alpha and confirmatory factor analysis (CFA), respectively. Participants were divided into higher and lower preparedness groups according to PHPQ results and compared for: professional identity, teamwork ability, cognitive flexibility.

Summary of Results: A total of 129 final-year clerks (55% males) participated the study. Overall Cronbach's alpha is 0.94. A satisfactory goodness of fit data was yield for the CFA with a CMIN/DF of 2.02. Higher preparedness was identified for the domains of self-directed learning and prevention; lower preparedness for interpersonal skills and patient management skills. Higher levels of preparedness are associated with stronger professional identity ($p < 0.001$), teamwork ability ($p < 0.001$), cognitive flexibility ($p < 0.05$).

Discussion and Conclusions: The Chinese version of PHPQ showed good reliability and validity. Preparedness for practice was associated with how learners feel about themselves as doctors and how well they were integrated in medical teamworking. Hospital multi-professional practice and real-patient decision-making should be emphasized during the transition from classroom didactic teaching to clinical work-placed learning.

Take-home Messages: The Chinese version of PHPQ is valid and reliable. Undergraduates were more prepared for self-directed learning, but less prepared for interpersonal and patient management skill in the study cohort. Preparedness for practice is closely associated with how medical undergraduates regard themselves as medical professionals, teamwork ability, and cognitive flexibility.

First Night-on Call (FNOC): Establishing a Community of Practice and Culture of Patient Safety for Incoming Interns

AUTHOR(S):

- Adina Kalet, New York University School of Medicine, USA (Presenter)
- Kinga Elias, New York University School of Medicine, USA
- Jeff Manko, New York University School of Medicine, USA
- Grace Ng, New York University School of Medicine, USA
- Thomas Riles, New York University School of Medicine, USA
- Sondra Zabar, New York University School of Medicine, USA

ABSTRACT

Background: We implemented an authentic, immersive First Night-onCall (FNOC) simulation to ensure that new interns are ready to address common patient safety issues on 'Day 1'. The objectives of this simulation were to support transitioning trainees, cultivate a culture of safety, and create a community of practice - all in service of preparing new interns and establishing expectations of high-quality patient care.

Summary of Work: FNOC included pre-work, immersive simulation, debriefing. In 4-hours, new interns, in groups, were challenged to: conduct an ethical informed consent, evaluate a decompensating patient and activate a rapid response team, recognize a mislabeled blood culture bottle and other common patient safety hazards, conduct an effective handoff, participate in patient safety rounds, and a faculty-led debrief. Learners completed a pre-program, retrospective pre-post assessment, and are completing a program evaluation six-months later. Standardized-Patients and Standardized-Nurses completed behaviorally-anchored checklists for each case. This study is part of our IRB-approved GME Registry.

Summary of Results: 200 incoming interns from 11 clinical disciplines completed FNOC. While 36% (n=72) reported having witnessed a medical error, only 25% (n=50) reported any formal patient safety training. During FNOC, 68% of groups (n=47) called a rapid response team and 19% contacted the senior resident for the decompensating patient; 53% of groups (n=46) recognized the label error for the blood cultures; 44% of groups (n=47) ensured patient privacy when obtaining informed consent. Post FNOC, more than 92% (n=173) of interns reported increased comfort in speaking to a supervisor, escalating a situation, and reporting a medical error. Almost all interns (n=173) agreed/strongly agreed FNOC was an effective (92%), fun (91%), and engaging (92%) way to learn patient safety. Out of the 86% of interns who completed the pre-program, over 85% agreed that the online modules increased readiness-for-internship. Our institutional AHRQ Culture of Safety Survey also shows improvement trends in the culture.

Discussion and Conclusions: A large-scale experiential patient safety simulation-based curriculum is a feasible and effective approach to engage learners, helps build a community of practice, and enhances patient safety culture and outcomes.

Take-home Messages: Experiential patient safety orientation for new interns can have a lasting impact.

How Identity Matters: A Qualitative Study of Perceptions of Interprofessional Feedback in Diabetology Training

AUTHOR(S):

- Katrin Feller, University Hospital of Bern, Switzerland (Presenter)
- Christoph Berendonk, Institute for Medical Education, University of Bern, Switzerland

ABSTRACT

Background: Little is known about receptiveness to interprofessional feedback in a postgraduate setting. This study explores, in light of social identity theory, the perceptions of residents, senior physicians and allied health care professionals regarding interprofessional feedback in the context of workplace-based assessment.

Summary of Work: Residents in diabetology at the University Hospital of Bern, Switzerland, performed formative workplace-based assessments under direct observation of a senior physician and an allied health care professional. Feedback of both observers was given after every assessment to the resident. Focus group discussions were conducted to analyze the perception of participants, using a constructivist grounded theory approach.

Summary of Results: While different social identities are the source of interprofessional hierarchies, they do not hinder the receptivity to feedback. Perceived trustworthiness of the feedback is given more importance than professional affiliations, whereas intraprofessional hierarchies between physicians led to the perception of a more summative character of the feedback and rather hindered receptivity. Interprofessional feedbacks strengthened collaboration but organizational support is required to promote such activities.

Discussion and Conclusions: Despite disposing of a firm professional identity, residents in a postgraduate training in diabetology retained a positive attitude towards interprofessional feedback in the context of workplace-based assessments. Perceived credibility of the feedback source was crucial for acceptability of feedback. Interprofessional workplace-based assessments require institutional support, but might be a promotor for improving interprofessional collaboration.

Take-home Messages: Interprofessional feedback from allied health care professionals can be a powerful resource for residents in the setting of a postgraduate subspecialty training, taking its role outside the sometimes conflicting area of intraprofessional hierarchies.

UK trainee clinical scientists' perceptions and experience of Interprofessional Education

AUTHOR(S):

- Jaimini Patel, University of Birmingham, UK (Presenter)
- Sharon Buckley, University of Birmingham, UK
- Sandie Gay, National School of Healthcare Science, UK
- Ian Davison, University of Birmingham, UK
- Alistair Hewison, University of Birmingham, UK

ABSTRACT

Background: Clinical Scientists have a vital role in the UK NHS workforce, working in multi-professional teams to deliver high quality patient care (Department of Health, 2010). Interprofessional Education (IPE) is recognised as an important pedagogy for developing the knowledge, skills and attitudes required for effective collaborative working. The UK Scientist Training Programme (STP) is a pre-registration training programme for clinical scientists which combines workplace-based learning with a Masters degree in Clinical Science. All STP trainees must engage in IPE, however little is known about their perceptions of IPE or the nature of their IPE experience.

Summary of Work: Nine hundred STP trainees were invited to complete an online questionnaire incorporating the Interprofessional Education Perception Scale (IEPS) (Luecht, 1990), to explore their perceptions and experience of IPE. Semi-structured interviews with seven final-year trainees were conducted to examine their experiences in greater depth.

Summary of Results: Two hundred and fifty five trainees (28.3%) completed the questionnaire and 45.8% had experienced IPE before starting the programme. The mean IEPS score for all respondents was 270.87 (± 33.74), with no significant differences in perceptions between cohorts or between respondents from the scientific specialties (Physiological, Physical, Life or Informatics). Subscale scores were: Competence and Autonomy (79.59 ± 0.67), Perceived Need for Cooperation (62.97 ± 0.58), Perception of Actual Cooperation (76.88 ± 0.72) and Understanding Others' Value (51.44 ± 0.60). The number of respondents reporting experience of IPE in STP work-based clinical placements and in academic components was similar (118 and 101 respectively), six or more episodes of IPE were more frequently reported for clinical than university settings (62.7% and 20.8% respectively). Qualitative responses supported these findings, with interviewees acknowledging the importance of collaborative working for their understanding of patients' pathway and other professionals' roles.

Discussion and Conclusions: Our findings suggest that STP trainees view IPE positively and reflect those obtained for other pre-registration health professionals. Opportunities for IPE are available within the STP, particularly on work-based placements. Implications for future development of the STP are discussed.

Take-home Messages: UK trainee clinical scientists view IPE positively and are able to access IPE through the Scientist Training Programme.

The interprofessional training ward Zurich - Conceptualisation and Roll out

AUTHOR(S):

- Gert Ulrich, "Interprofessional Training Ward Zurich" Network, Switzerland (Presenter)

ABSTRACT

Background: Interprofessional training wards (IPTW) have emerged as promising work-place based trainings for health professions to improve interprofessional (IP) learning and patient outcomes. On IPTW, students from various health professions collaborate and learn together to care for 'real' patients under supervision of experienced facilitators. To the best of our knowledge, however, most of the IPTW do not base on a scientific theoretical framework that allows to be transferred on various medical disciplines, wards and hospitals, respectively. Therefore, the aim of our project was to develop a general, evaluated concept for an IPTW that can be rolled out in various wards or hospitals.

Summary of Work: In 2018, after 1.5 years of feasibility study, the first Swiss IPTW was successfully transferred into practice and evaluated in a pilot phase with engagement of 6 institutions located at the Swiss canton of Zurich (IPTW Zurich network). The IPTW was tested on a neurological ward (University hospital Zurich) including students and facilitators from medicine, nursing, physiotherapy and occupational therapy.

Summary of Results: During the feasibility and pilot phase, the essential scientific based findings (e.g. learning objectives, pedagogical concept, evaluation strategy, courses for facilitators) and practical recommendations (time schedule on the IPTW, infrastructure requirements, work shadowing plan) were documented in an IPTW manual by the project team to allow further wards and hospitals to adapt this concept. The implementation and roll-out is supported by a project team provided by the IPTW Zurich. Currently, the roll out aims at further university hospitals in the canton of Zurich and associated hospitals of the local Medical Faculty (University of Zurich).

Discussion and Conclusions: To the best of our knowledge, the development of a scientific based and broadly evaluated IPTW concept that allows to be expanded on further wards and hospitals is novel in German speaking countries. In this conference contribution, the IPTW Zurich concept, the roll out strategy, as well as the underlying relevant documents will be presented and discussed.

Take-home Messages: For the roll out of IPTW concepts, a manual including theoretical and practical relevant documents as well as the provision of services (e.g. courses for facilitators) are required.

Construction and validation of geriatric cases for Interprofessional Education

AUTHOR(S):

- Carolyn Teuwen, Noordwest Ziekenhuisgroep, the Netherlands (Presenter)
- Rashmi Kusurkar, Amsterdam UMC, the Netherlands
- Hermien Schreurs, Noordwest Ziekenhuisgroep, the Netherlands
- Hester Daelmans, Amsterdam UMC, the Netherlands
- Saskia Peerdeman, Amsterdam UMC, the Netherlands

ABSTRACT

Background: Interprofessional Education (IPE) can be offered in classroom setting through the use of constructed cases, provided that the cases are realistic and adjusted for the competence level of the involved group. Despite this need of good quality cases, there is a lack of literature on how to construct them, or how to validate their content. How can cases suitable for IPE be constructed and validated, with the input from different professions in clinical practice?

Summary of Work: We constructed four geriatric cases in alignment with the growing geriatric population in Europe. The four cases we constructed were used for pairs of medical and nursing students to develop treatment plans together. To reach consensus, between the different experts in clinical practice, about the content of the patient description and treatment plans, we made use of different consensus methods like Delphi and Nominal Group. The expert information was generated in three different rounds to validate the cases. Experts from eight different professions were involved. There was email as well as face-to-face contact.

Summary of Results: After three expert rounds we reached consensus about the content. We incorporated these 3 rounds (step 1, 5 and 7) into 8 steps to validate the cases: 1. Inventory of common geriatric cases; 2. Construction of four cases out of step 1; 3. Define difficulty of each case; 4. Draw up treatment plans; 5. Validation of patient descriptions and treatment plans by eight experts; 6. Inventory of suggested adjustments; 7. Consensus through discussion with two experts; 8. Pilot with students.

Discussion and Conclusions: We developed 8 steps to construct and validate content and treatment plans of cases suitable for IPE. Due to the different professions involved, a variety of opinions can arise and can make it difficult to reach consensus. Especially on the treatment plans experts showed diverse opinions. We showed how to reach consensus between these different experts and validate the cases, using various aspects of consensus methods.

Take-home Messages: It is possible to construct and validate geriatric cases for IPE in undergraduate education. We developed 8 steps to validate the content using different opinions of experts in clinical practice.

Well begun is half done: The importance of an inclusive programme at the start of (bio)medical education

AUTHOR(S):

- Gönül Dilaver, UMC Utrecht, the Netherlands (Presenter)
- John Meeuwssen, UMC Utrecht, the Netherlands
- Gisela van der Velden, UMC Utrecht, the Netherlands

ABSTRACT

Background: An inclusive programme at the start of the academic year can ensure that all students feel welcome and comfortable at university. This is important since an inclusive atmosphere is associated with enhanced study performance and better collaboration among students. However, many reports show that not all students actually feel included among their peers and different minority groups experience forms of exclusion during their education period.

Summary of Work: To ensure an inclusive atmosphere for the bachelor's programmes Biomedical Sciences and Medicine at Utrecht University, we trained second- and third-year students (mentors), who guided the first-year students during an orientation period, with a bias training. This bias training aimed to make mentors become aware of common prejudices people have towards other people, and to offer them tools to create an inclusive atmosphere during the introduction period. We evaluated the perception of mentors on the bias training and how they changed their acts to be inclusive to all students after the 10-weeks introduction period using questionnaires. In addition, diversity and perception of inclusion was anonymously evaluated among all first-year students. Social inclusion was measured using a validated questionnaire.

Summary of Results: Preliminary results show that most mentors found the bias training useful and instructive. A few mentors felt that the training was unnecessary or that the training induced stereotyping behaviour. The majority of first-year students indicated they felt included and that they were able to be their authentic self. Some students mentioned parties or pub crawls as not being inclusive. In addition, they mentioned that taking part in these activities should be accompanied by explicitly mentioning that the use of alcohol is optional.

Discussion and Conclusions: In conclusion, the bias training for mentors was regarded as useful and instructive. During the introduction, most students felt they were part of the group. However, several signals indicated room for improvement for an inclusive environment.

Take-home Messages: To avoid minority groups feeling excluded or feeling unable to be their authentic selves, future introduction programmes should aim to empower mentors to be inclusive. In addition, alternative activities should be planned alongside or instead of parties and pub crawls. These activities could ultimately lead to an all-inclusive introduction.

Social justice in medical education: inclusion is only the first step

AUTHOR(S):

- Marco Antonio de Carvalho Filho, UNICAMP - University of Campinas, Brazil (Presenter)
- Maria Machado, UNICAMP - University of Campinas, Brazil
- Diego Ribeiro, UNICAMP - University of Campinas, Brazil
- Esther Helmich, University of Groningen, the Netherlands

ABSTRACT

Background: The competition during the selection for medical schools often requires great financial investment and full-time dedication, which culminates in a bias towards admitting students from upper social classes. Affirmative policies and programs have been adopted to enhance social diversity and inclusion. In a medical school in Brazil, the program PROFIS was devised to include students from extremely poor neighborhoods; those students become the first generation to get a university degree. Few studies have investigated how students from those affirmative programs cope and adapt to the university life while navigating the implicit and explicit cultural norms and rituals.

Summary of Work: Medical students originated from PROFIS made a Rich Picture representing a challenging situation they experienced in medical school, considering their admission background. After the picture, students were interviewed to deepen the understanding of the challenges they face. The interviews were transcribed and an iterative thematic analysis informed by Communities of Practice (CoP) framework informed data analysis.

Summary of Results: Following CoP theory, developing an identity involves engagement, imagination and alignment, and PROFIS students struggle in all these dimensions. They have financial and social limitations to fully participate in the medical community activities, such as congress, extra-curricular courses, and students' associations. PROFIS students do not feel part of the group and experience feelings of low self-esteem and low self-confidence, they have difficulties imaging themselves as doctors. Because of their different social and racial background, PROFIS students make sense of their experiences through an often-different point of view and struggle to align with the group. PROFIS students experienced racial and social prejudice and were considered less capable and treated differently by some of the teachers. On other hand, PROFIS students mentioned that their social trajectory brought them closer to the patients because they were more able to show empathy.

Discussion and Conclusions: Including students with different economic and social background is a complex process that goes beyond admitting them as freshmen/freshwomen. We should devise strategies to foster their socialization through activities that lift up their self-esteem by explicitly showing their contributions to the group.

Take-home Messages: Affirmative polices should go beyond inclusion to address professional identity development.

High school grade discounting to widen access to medicine: should we do it? If so, how low should we go?

AUTHOR(S):

- Lewis Paton, University of York, UK (Presenter)
- Lazaro Mwandigha, Imperial College London, UK
- Paul Tiffin, University of York, UK
- Adetayo Kasim, University of Durham, UK
- Jan Boehnke, University of Dundee, UK

ABSTRACT

Background: Medical schools use secondary (high) school performance as a major determinant of whether to offer a place or not. This emphasis has partly contributed to the over-representation of socioeconomically privileged individuals in medicine. In the UK, approximately 80% of medical students applied from only 20% of the country's secondary schools. As such, there is a desire to widen access to the profession. There is some evidence that university academic achievement may be inversely related to the performance of a secondary school an entrant attended. Indeed, some medical schools already offer 'grade discounts' to applicants from less well-performing schools. However, evidence to guide such policies is lacking. This study aimed to provide guidance on the extent to which grades should be discounted for applicants from poorly performing secondary schools.

Summary of Work: The study used routinely collected national selection data and linked medical school outcomes for knowledge and skills-based tests during the first five years of medical school. High school grades were available for 2107 students enrolled at 18 UK medical schools. Multilevel linear models were created to explore the influence of students' secondary schools on undergraduate achievement in UK medical school. A multilevel approach was used to account for variation in outcomes between universities.

Summary of Results: Undergraduate achievement was inversely related to secondary school-level performance. This effect waned over time and was less marked for skills, compared with undergraduate knowledge-based outcomes. Thus, the predictive value of secondary school grades was generally dependent on the secondary school in which they were obtained. In particular, those from high schools performing below the second decile nationally achieved comparable undergraduate results to those from educational establishments above the eighth decile, even with two grades lower obtained at high school.

Discussion and Conclusions: Significant secondary school effects were observed on medical school performance. However, this effect does depend on the stage and aspect of undergraduate performance measured.

Take-home Messages: Grade discounting for those applicants from the most poorly performing secondary schools is justified. In the UK, this would translate into a decrease of approximately one to two A-level grades.

Widening Access to Medical Education: Comparing a Situational Judgement Test to other selection measures

AUTHOR(S):

- Kelly Dore, McMaster University, Canada (Presenter)
- Fern Juster, McMaster University, Canada
- Christopher Zou, Altus Assessments, Canada
- Robin Baum, New York Medical College, USA
- Harold Reiter, McMaster University, Canada
- Donald Risucci, New York Medical College, USA

ABSTRACT

Background: While grades and standardized cognitive test scores for medical student selection provide invaluable predictive validity for future academic performance, they also typically generate effect size differences across demographic categories that hinder widened access goals. However, these studies were conducted with traditionally closed-response (i.e., multiple-choice) SJTs. Would similar relative benefits for widening access be found for constructed-response situational judgment tests when operationalized for medical student selection?

Summary of Work: Beginning in 2015, New York Medical College School of Medicine (NYMC-SOM) required all their applicants to complete an online SJT (CASPer). Effect sizes (Cohen's D) were calculated on grade point average (GPA), old version and new 2015 version of Medical College Admissions Test (MCAT), an online constructed response SJT (CASPer), and local multiple mini-interview (MMI) using bivariate analyses on American Medical College Application System (AMCAS) categories: Socioeconomic status was measured across three variables a) SES self-declared disadvantaged status), b) recipients of financial assistance program (FAP), c) parental educational/occupational levels (EO1 or higher). Other AMCAS categories compared included: gender; race (African-American versus White); and ethnicity (Hispanic/Latino versus non-Hispanic/Latino).

Summary of Results: 9,096 applications were analyzed for all students completing secondary applications, including all 1,656 students who attended for MMI. Effect sizes [95% confidence intervals] for GPA, old MCAT, MCAT 2015, and SJT across categories demonstrated: for gender $d=-0.01 [-.06,.03]$, $d=0.36 [.30,.41]$, $d=0.37 [.31,.44]$, $d=-0.20 [-.24,-.16]$; for African-American $d=0.98 [.90,1.07]$, $d=1.25 [1.11,1.39]$, $d=1.43 [1.32,1.55]$, $d=0.60 [.51,.68]$; and for Hispanic/Latino $d=0.54 [.46,.62]$, $d=0.64 [.52,.75]$, $d=0.86 [.74,.97]$, $d=0.29 [.21,.37]$ respectively. Group differences were significantly smaller or reversed for SJT as compared to the cognitive metrics for nearly all categories.

Discussion and Conclusions: Previous studies have demonstrated that the integration of SJTs, traditionally in the closed-response format, in the medical school admissions process can help promote diversity of the student population. This study builds on this work to further illustrate that SJTs in the constructed-response format may be even more effective in widening access to medical education, as the effect size differences were generally much smaller than what was observed with cognitive assessments.

Take-home Messages: The adoption of a constructed-response SJT in the medical school admissions process can increase the diversity of the student population.

Medical school choice among applicants from different social backgrounds: A national qualitative interview study in the United Kingdom

AUTHOR(S):

- Eliot Rees, UCL Medical School, UK (Presenter)
- David Harrison, UCL Medical School, UK
- Karen Mattick, University of Exeter Medical School, UK
- Katherine Woolf, UCL Medical School, UK

ABSTRACT

Background: Widening access to medical students from non-traditional backgrounds has become a political and research priority, in order to utilise the full talent pool of applicants, create doctors representative of the communities they serve, and ensure social justice and fairness. It is known that medical schools vary in the number of applicants from non-traditional backgrounds they attract and accept, but the reasons for this remain poorly understood, with concern that applicants from non-traditional backgrounds are less equipped to make informed choices and maximise their chances of success. This study seeks to explore how and why applicants from different social background choose which medical schools to apply to.

Summary of Work: We conducted a national qualitative interview study, adopting a social constructivist perspective. We purposively sampled applicants and first year students from eight UK medical schools, chosen based on patterns of medical school co-applications.. Participants attended semi-structured individual or group interviews exploring motivations for studying medicine, how they gathered and valued information regarding different medical schools, and how they made their choices. We performed a thematic analysis, identifying codes inductively from the data. We sensitised our analysis using sociological theories of capital.

Summary of Results: Sixty-three individuals participated: 35 applicants and 31 students, 15 and 9 from non-traditional backgrounds (first in family to attend higher education & state-schooled) respectively. We identified three main themes: priorities, perceived resources and constraints, and strategies for choice. Participants' background influenced their priorities in choosing medical schools. Traditional applicants were more likely to prioritise prestige, whereas non-traditional applicants were more likely to describe being concerned with fitting in, being close to home, and finance. . Applicants described how their beliefs about their own educational, social, financial, and psychological capital expanded or constrained their choices. Based on their differing priorities and perceived resources and constraints, applicants adopted various strategies in making medical school choices.

Discussion and Conclusions: Priorities, and perceived resources and constraints shaped applicant choice of medical schools, and these varied depending on applicant social background. Participants from non-traditional backgrounds were more concerned with fitting in, being close to home, financial concerns, and often felt disadvantaged by their lack of educational and social capital.

Resilience and Burnout: comparison between postgraduate year 1 (PGY1) doctors and faculty members in a Paediatric Department within a tertiary hospital in Singapore

AUTHOR(S):

- Mae Yue Tan, Khoo Teck Puat-National University Children's Medical Institute, National University Health System, Singapore (Presenter)
- Jeremy Bingyuan Lin, Khoo Teck Puat-National University Children's Medical Institute, National University Health System, Singapore
- Marion Aw, Khoo Teck Puat-National University Children's Medical Institute, National University Health System, Singapore

ABSTRACT

Background: The aim of the study was to measure and compare resilience, burnout as well as identify individual protective factors associated with resilience, in junior (postgraduate year 1) and senior (faculty) doctors, within a Paediatric department in a Singapore tertiary hospital.

Summary of Work: Postgraduate year 1 (PGY1) doctors and faculty in our department were asked to complete an anonymised self-administered survey that included questions on demographics, and validated questionnaires - Connor Resilience Scale (measure of resilience), and Maslach's Burnout Inventory (MBI) (measure of burnout). Sixty-seven doctors (36 PGY1s, 31 faculty) participated.

Summary of Results: There was high burnout in PGY1s (36.1%) compared to faculty's (6.5%) $p < 0.05$, in all aspects of the MBI. PGY1s had lower mean resilience score (65) than faculty (77), $p < 0.001$. There was strong positive correlation between high Personal Accomplishment (low burnout) and high resilience for both groups ($r = 0.576, p < 0.001$ PGY1 and $r = 0.512, p = 0.003$ faculty). Older age, being married/ having a partner, having a religion were not associated higher resilience.

Discussion and Conclusions: Doctors have higher resilience compared to population norms but this does not protect junior doctors from the high burnout in PGY1s. More can be done to help junior doctors develop protective factors to prevent early burnout. These could include working towards building their sense of personal accomplishment. Resilience has an inverse relationship to burnout in both groups in our study and this confirms prior observations. Physicians in our department have high resilience compared to population norms, but burnout is still present.

Take-home Messages: Knowing which aspects of the MBI affects resilience can help departments target efforts to boost resilience, by enhancing sense of personal accomplishment and competency for all doctors such as recognising efforts and having a reward system in place.

Holding Hands: An Initiative to Improve Junior Doctor Wellbeing

AUTHOR(S):

- Magali Dubus, East Kent Hospitals University Foundation Trust, UK (Presenter)
- Olatokunbo Sanwo, East Kent Hospitals University Foundation Trust, UK
- Shaveta Mulla, East Kent Hospitals University Foundation Trust, UK

ABSTRACT

Background: Burnout is increasingly recognised as a problem among junior doctors; contributing to low morale, physical and mental health issues. Within the United Kingdom there are various regional and national initiatives to support doctors, however local support is variable, particularly in district general hospitals. Paediatric and neonatal doctors often work isolation, rarely getting the opportunity to share experiences and discuss difficulties with colleagues.

Summary of Work: We introduced a monthly peer-led meeting with a set agenda addressing both positive and negative aspects (clinical and non-clinical) of working life, inviting all paediatric and neonatal junior doctors. A consultant was designated to oversee the project, and attended one meeting every three months. In conjunction with this we introduced Encouraging Praise in Colleagues (EPiC), a positive feedback mechanism where members of the healthcare team were encouraged to provide feedback on examples of good clinical and personal practice. Specific time during the meeting was dedicated to planning departmental social events. We distributed a modified Copenhagen Psychosocial Questionnaire at the start of the project and after 6 months of Holding Hands meetings.

Summary of Results: There were 16 attendees to the meetings, 60% completing questionnaires. Likert scales were used to measure a number of outcomes; in comparison to the pre-meeting questionnaire less people felt there was an uneven distribution of work, more people felt supported by colleagues, motivated, involved in work and that they had positive feedback from seniors. 88.9% knew where they could find support for an emotionally challenging situation. We also gained qualitative data confirming that this initiative has been helpful to attendees.

Discussion and Conclusions: To be able to deliver the excellent levels of care we want to provide to patients, we have a responsibility to look after our own and our colleagues' wellbeing. Holding Hands and EPiC have provided a safe, supportive atmosphere for trainees to develop and improve resilience, equipping them with the emotional skills to be able to handle the pressures of clinical work.

Take-home Messages: Peer-led interventions can help improve motivation, feelings of support and general satisfaction in the workplace.

The conceptualization of educational supervision amongst supervisors and residents in a postgraduate psychiatry residency training program

AUTHOR(S):

- Lay Ling Tan, Changi General Hospital, Singapore (Presenter)
- Pim Teunissen, Maastricht University, the Netherlands
- Wee Shiong Lim, Tan Tock Seng Hospital, Singapore

ABSTRACT

Background: Supervision is central to the development of expertise in psychiatry, where counselling skills can be mastered only with effective supervision and mentoring. Adoption of competency-based psychiatry residency training and its emphasis on assessment of competencies may have blurred the roles of educational supervision. To understand how supervisory roles may have been affected, conceptualizations of educational supervision amongst supervisors and residents were explored in this study.

Summary of Work: A qualitative research strategy was adopted. Individual in-depth interviews using a semi-structured interview guide with a purposive sample of 6 supervisors and 6 newly graduated residents were conducted. Transcripts of the interview were analyzed and coded using the Atlas Ti software.

Summary of Results: A thematic analytic approach led to the identification of 5 major themes: (1) meaning and definition of supervision; (2) expectations and responsibilities of the educational supervisor; (3) personal and professional development of residents in supervision; (4) mentoring elements in educational supervision and (5) enablers and inhibitors of the residency supervisory framework.

Discussion and Conclusions: Supervisors and residents perceived educational supervision narrowly to be transactional with acquisition of knowledge and skills, but residents yearned for more relational interactions. Emphasis on assessment of competencies might have contributed to tension and lack of a mentoring role. This might affect residents' personal and professional identity development in their psychiatry training. This study showed a lack of clarity with regards to the roles and functions of supervisors in educational supervision. It also identified a lack of a mentoring orientation in supervision in the psychiatry residency training program.

Take-home Messages: An unclear understanding of the roles and functions of educational supervision with a lack of a mentoring orientation may affect the personal and professional identity formation of the residents in the psychiatry residency training program.

Competency-based medical education training and evaluation in the field of clinical microbiology laboratory

AUTHOR(S):

- Wen-Shyang Hsieh, Department of Medical Laboratory, Taipei Medical University-Shuang Ho Hospital, Taiwan (Presenter)
- Tzu-Ying Lee, Department of Medical Laboratory, Taipei Medical University-Shuang Ho Hospital, Taiwan
- Ruo-Tzu Li, Department of Medical Laboratory, Taipei Medical University-Shuang Ho Hospital, Taiwan
- Horng-Ming Hsieh, Department of Medical Laboratory, Taipei Medical University-Shuang Ho Hospital, Taiwan
- Yin-Tai Tsai, Department of Medical Laboratory, Taipei Medical University-Shuang Ho Hospital, Taiwan

ABSTRACT

Background: The traditional education could not respond to the complex environment of medical laboratory. It also could not make laboratory scientists who finished the post graduated year (PGY) training got the professional ability in expected, especially in the field of clinical microbiology laboratory. The inference of entrusted profession activities (EPAs) could apply in creating the training courses of medical laboratory and also achieve the goal of competency-based medical education (CBME).

Summary of Work: To implement the CBME by the planned methods fitting the functional power of EPAs, and be used as a way of evaluating in clinical microbiology teaching and training. Combining the six core abilities of ACGME and milestone schedules, the training plan would get the achievement of the competency in clinical service.

Summary of Results: Abandoning the traditional scoring or the ranking assessments, and then using the description of supervision and trust level, the training objectives, clinical testing business and patient safety links. In addition, the reliability and validity of the assessment can also be improved by the evaluator focusing on the clinical task and supervision level, which improves the disadvantages of past clinical evaluation and the confusion of the evaluator.

Discussion and Conclusions: At present, the PGY training for medical personnel education is a fixed time schedule. It is impossible to recognize or consider the speed difference of PGY acquisition ability. Through CBME and EPAs, consider whether to prepare for independent execution of the business, and change the regular training of PGY from a certain period of time to a certain level of ability. Let the medical laboratory scientists who started the independent inspection business has a steady technical level.

Take-home Messages: CBME in the clinical microbiological tasks and implementation, through EPAs to reduce the gap between classroom learning and workplace practice. It gradually increases the participation and responsibility of PGY trainees, and transforms them into competent medical laboratory scientists who perform core clinical tasks, which in turn drives the positive development of modern medical education.

A dramaturgical analysis of a paediatric team handover

AUTHOR(S):

- **Stephen Bradley, Lakes District Health Board, New Zealand (Presenter)**
- Aaron Ooi, University of Auckland, New Zealand
- Kerry Stafford, Lakes District Health Board, New Zealand
- Shuvayon Mukherjee, University of Auckland, New Zealand
- Marcus Henning, University of Auckland, New Zealand

ABSTRACT

Background: Paediatric team handovers comprise the transfer of patient information from one shift to another and involve medical professionals and students and nursing staff at different levels of experience. The research question was: 'How can a dramaturgical investigative approach be feasibly applied to describing and researching the handover process within a paediatric setting?'

Summary of Work: A qualitative case study was performed using a dramaturgical approach to capture one handover session in a New Zealand paediatric department. Data were collected using video and audio recordings and notes were created by two independent observers. The handover had 15 participants who discussed 36 real patients. Data analysis consisted of qualitative review and quantitative assessment (voice-occupied time and number of contributions). The classification system included actors and audience, audience reaction, scripting, staging and performance.

Summary of Results: The consultant in charge spoke for 23% of the handover, whilst the senior registrar spoke for 15% of the time. The remaining 13 attendees were classified as either major support actors, support actors or bit actors. Those who spoke for less than 5% of the time were deemed both bit actors and audience. The performance revealed a clinical hierarchy and the students were included in the discussion mainly when a learning point was emphasised. The script was often improvised when discussing patient care or education for junior personnel. The staging included the seating arrangements, whiteboard and data show.

Discussion and Conclusions: The findings confirmed the efficacy of the dramaturgical research approach. The video and audio recordings and the observer notes enabled researchers to review the handover system. Paediatricians not involved in the handover were able to independently view the handover video, read the transcript and make informed notes based on experience and expertise. These findings have implications for evaluating clinical education practices.

Take-home Messages: The dramaturgical approach could be applied to many clinical meetings, and used as either a research method or for audit purposes. The study identified a significant hierarchy within this team and suggested a strong educational purpose to the paediatric handover, which may have implications for how teams interact.

The potential impact of a pending labor law on young doctors in Japan: an analysis of national microdata from biennial government surveys (1996-2016)

AUTHOR(S):

- Kayo Fukami, National Institute of Technology, Toba College, Japan (Presenter)
- Yasuko Tomizawa, Tokyo Women's Medical University, Japan

ABSTRACT

Background: Women account for over 30% of all doctors in Japan, and an increasing number of women are choosing to become surgeons while overall surgeon numbers decrease. The government has tried to improve the current working environment, including maternity/parental leave. However, 90% of university hospitals and 80% of hospitals with emergency services still have at least one doctor working over 1920 hours/year. In addition, the government is considering the introduction of a new law that would allow trainees and doctors in major hospitals to work up to 2000 hours/year of overtime. This new law is likely to affect medical students' career choices and younger doctors' work-life balance. We investigated the potential impact of this law on the working environment based on national microdata.

Summary of Work: We performed a cross-sectional and time-series analysis. Closed microdata on doctors' age, sex, specialty, appointment, and location were obtained from the 'Survey of Physicians, Dentists and Pharmacists', which includes data from all doctors registered in Japan. Data on working hours were acquired from Ministry of Health, Labour and Welfare publications, and details of the new law were obtained from the official proceedings of the legislative working group.

Summary of Results: In 2016, 18.4% of all doctors worked for university hospitals. A total of 721 doctors were on maternity leave (40% in university hospitals and 60% in other hospitals/clinics). In general, younger doctors prefer to work for university hospitals to develop their skills. However, the new law will allow trainees and doctors in major hospitals (mostly university hospitals) to work 7-8 hours/day of overtime. The government has set minimum standards for avoiding death from overwork and letting doctors sleep 6 hours/day, but these already exceed the official limits for preventing work-related injuries and illnesses.

Discussion and Conclusions: The new law would worsen the working environment, especially for younger female doctors. Younger doctors may choose to avoid working for university hospitals or have to accept a less-than-ideal career path.

Take-home Messages: Policymakers must implement extensive changes to provide a good working environment in Japan to ensure the optimal development of young doctors.

The '5x5 Approach' for clinical reasoning has larger effect on male than female residents

AUTHOR(S):

- Hisashi Shimozono, Tokyo Medical and Dental University, Japan (Presenter)
- Makoto Takahashi, Tokyo Medical and Dental University, Japan
- Yujiro Tanaka, Tokyo Medical and Dental University, Japan

ABSTRACT

Background: According to the Dual Process theory, clinical reasoning consists of 2 processes: System 1 (intuitive) and System 2 (analytical). Some psychology researchers suggest that males tend to depend more on System 2 process and females more on System 1 process. Our new model of clinical reasoning, the '5x5 Approach', is a combination of 2 views: 5 organs (brain, heart, lung, intestine/liver, kidney), and 5 systems (metabolism, endocrine, blood/tumor, infection, immune). As this is a model of System 2 reasoning based on these 2 views, we hypothesize that the 5x5 Approach has larger effect on male than female residents on clinical reasoning.

Summary of Work: Participants were PGY1 residents (n=106; male=62, female=44). The participants were randomly assigned to either the 5x5 Approach group (n=46; male=26, female=20) or a control group (n=60; male=36, female=24), using the scores on the medical licensing examination. The 5x5 Approach group had a one-hour lecture of the 5x5 Approach, and the control group had a non-related lecture. After the lecture, the participants had a written test which asked for diagnoses for 3 clinical cases. We compared the number of correct diagnoses (0-3) between the male and female participants.

Summary of Results: There was neither significant sex difference nor between-group difference in the scores on the medical licensing examination. In the control group, the number of correct diagnoses (0-3) was not significantly different between the male and female participants (median 1 vs 1, p=0.245, by Mann-Whitney U test). In the 5x5 Approach group, the number of correct diagnoses was significantly higher in the male participants (median 2) than females (median 1) (p=0.002).

Discussion and Conclusions: The 5x5 Approach as a model of System 2 reasoning has significantly larger effect on male than female residents on diagnostic accuracy. There would be a chance that the 5x5 Approach helps struggling male residents in clinical reasoning.

Take-home Messages: The 5x5 Approach as a model of System 2 reasoning has large effect on male residents, who are considered to have an analytical tendency.

Can published information from research impact on unwanted differential performance by candidate sex? A six-year review of attempts to reduce male/female differential performance in a national family

AUTHOR(S):

- **MeiLing Denney, RCGP, UK (Presenter)**
- Richard Wakeford, Hughes Hall, university of Cambridge, UK
- Rich Withnall, RCGP, UK

ABSTRACT

Background: Mandatory MRCGP examinations comprise a 200-item MCQ applied knowledge test, a 13-station clinical OSCE using simulated patients, and workplace-based assessments. A daily-palette of OSCE cases is balanced from a curriculum blueprint. Examiners score candidates on three domains (data gathering, clinical management and interpersonal skills) leading to a case score of 0-9. Recently, interest in differential performance on UK postgraduate examinations focussed on degree source (domestic/foreign) and candidates' ethnicity. But differential performance by candidate sex is substantial: in 2017-18, first-attempt male candidates failed the OSCE 1.7 times more than women. UK assessments have duties under the Equalities Act (2010) to work to minimise differences in candidate performance between groups 'protected' by the Act, including sex. Assessments in 2012-2013 showed substantial overall performance differences by candidate sex: two (of 24) OSCE curriculum areas showed highest such differential performance – 'women's health' and 'sexual health'. The report, published in 2014, proposed greater emphasis on consultation skills training, attending to trainees' case mix, and longitudinal monitoring studies. Here we review the situation four years later.

Summary of Work: We contrasted candidates' differential case performance by their sex across two triennia " 2012-14 ('before') and 2015-17 ('after') " overall, and on the two areas of 'women's health' and 'sexual health'. We examined performance on the three domains by sex, overall.

Summary of Results: 15,007 candidates first sat the CSA between November 2012 and December 2017, seeing 195,091 cases (81,692 2012-14; 113,399 2015-17): 63.7% were women, 36.3% men. Differential performance by sex reduced substantially and significantly from the first to the second triennium, both overall (17%) and on the two identified curriculum areas (by 8-9%). Overall domain score sex differences all reduced by 14-18%, remaining highest on interpersonal skills.

Discussion and Conclusions: Providing specific information on trainee sub-groups' performance on examinations and concerning curriculum areas was associated with reduction in the differential. As often, cause and effect cannot be proven. Work on lessening interpersonal skills differences and signposting male trainees to gynaecology and sexual health should be reinforced.

Take-home Messages: Training initiatives to reduce differential performance between candidate sub-groups may provide a positive impact.

Implementing intersectionality in the general practice curriculum of the model study program at the Hannover Medical School

AUTHOR(S):

- **Kambiz Afshar, Hannover Medical School, Germany (Presenter)**
- Stephanie Stiel, Hannover Medical School, Germany
- Nils Schneider, Hannover Medical School, Germany
- Petra Verdonk, Hannover Medical School; Amsterdam UMC-VUmc, the Netherlands

ABSTRACT

Background: An intersectional perspective states that individuals' (biological) sex, (sociocultural) gender and other aspects of diversity including age, cultural background, race, and sexual orientation shape each other and create unique social positions that play a role in health/health care. Medical curricula should prepare students to become culturally competent physicians with the knowledge, skills, and attitudes required to deliver adequate health care to patients with diverse backgrounds. In this project, we implement intersectionality in the general practice curriculum of the model study program at the Hannover Medical School (MHH) and evaluate the implementation process.

Summary of Work: A gender and diversity expert from Amsterdam, funded by the Lower Saxony government Maria-Goeppert-Mayer-Program for a visiting scholar, visits the Institute for General Practice at the MHH from January to June 2019. Intersectionality will be implemented in the module general practice of the 3rd academic year. The implementation process will be evaluated by a pretest-posttest-design in two successive trimesters. An iterative participatory approach will comprise six steps: (1) Participatory observation of the module; (2) Screening existing educational material in project group meetings; (3) Presenting an interim evaluation report to a larger group of teachers to discuss revision of educational material; (4) Revising educational material during and after a teach-the-teacher workshop in collaboration with students; (5) Expert monitoring of the same module in the next trimester to analyze the change process; and (6) Discussing/drafting a final evaluation report to ensure sustainability. Additionally, students will take part in an anonymous survey in each trimester to assess if the general practice curriculum increases the understanding of how intersectionality influences health/health care.

Summary of Results: Process evaluation will outline challenges and opportunities for implementing intersectionality in a medical curriculum. Survey results will reveal if the implementation process affects students' understanding of intersectionality.

Discussion and Conclusions: Project evaluation will provide insight in process and outcomes of a participatory approach to mainstreaming intersectionality in medical education.

Take-home Messages: Implementing intersectionality in medical curricula is an important step to promote adequate health care to patients with diverse backgrounds. External funding allows for expert support in tailoring mainstreaming activities.

“I have no choice but to challenge myself”: Masculinities and professionalism behind Ikumen-movement among male physicians in Japan

AUTHOR(S):

- **Noriki Kamihiro, Medical Education Center, Kyoto University, Japan (Presenter)**
- Futoshi Taga, Department of Education and Culture, Faculty of Letters, Kansai University, Japan
- Junichiro Miyachi, Hokkaido Centre for Family Medicine / Medical Education Center, Kyoto University, Japan
- Tomoko Matsui, Nagoya University Graduate School of Medicine, Japan
- Hiroshi Nishigori, Medical Education Center, Kyoto University, Japan

ABSTRACT

Background: In Japan, a nationwide discussion over physicians work hours and heated arguments over gender equality provoked by Tokyo Medical University's admission process have challenged the received notion of the ‘work’ of male physicians. The greatest amount of public attention and the greatest challenge to received notions of masculinity have involved male physicians who are ikumen, or fathers actively involved in childrearing. A similar term in English is caring masculinity, which indicates a male's style of engaging in childrearing activity, which is traditionally viewed as ‘feminine’. Contemporary sociological studies perceive caring masculinity as a shift away from hegemonic forms of masculinity; however, some scholars consider caring masculinity as merely a broadened version of hegemonic masculinity. Thus, we pose the following questions: How are ikumen doctors viewed in Japan? How do doctors experience professional and family lives? What kind of ethos undergirds their experience?

Summary of Work: Eleven male Japanese physicians who participate in daily childrearing were included through purposive sampling. Data collected through one-to-one semi-structured interviews were interpreted with a narrative inquiry method.

Summary of Results: Most interviewees remained in partial or ‘escapable’ childrearing roles under their wives’ Primary Caregiver (PC) roles. They situated themselves within traditional gender divisions, maintaining notions of what physicians’ ‘should-be’. These interviewees therefore embody ikumen as a broadened form of hegemonic masculinity. A male physician undertaking a PC role focuses his work style on the quality of contribution within a limited time rather than his innate macho attitude of ‘challenging myself’ or ‘completing stages’. The adoption of a PC role creates a sense of insufficient or inferior masculinity in the workplace. We identify the ethos that engenders the dilemma facing male physicians and which they learn as medical professionalism and traditional hegemonic masculinity.

Discussion and Conclusions: We argue that ikumen superficially pursued gender equality and ironically maintained or even reinforced hegemonic masculinity by subordinating male physicians undertaking PC activities at the workplace.

Take-home Messages: When discussing diversity in physicians’ working lives, we argue that physicians’ ethos and sense of professionalism should be considered.

Transgender people teaching medical students about transgender health: a mixed methods evaluation

AUTHOR(S):

- Anne Swift, University of Cambridge, UK (Presenter)
- Martha Hawker, University of Cambridge, UK
- Debbie Critoph, University of Cambridge, UK

ABSTRACT

Background: Approximately 1% of the UK population identifies as transgender (Winter et al, 2016), making it highly likely that all doctors will care for transgender people at some point in their career. There is a lack of medical school teaching on gender diversity in the UK, and there is evidence that students lack confidence in practical aspects of caring for transgender patients (Parameshwaran et al, 2017). We developed a student-led educational intervention that involved trans people in design and delivery with the aims of improving student knowledge, attitudes (if necessary) and confidence in caring for transgender people.

Summary of Work: We developed a short educational intervention comprising large group teaching on factual aspects followed by a discussion of issues by a panel of transgender people recruited from the local community. Teaching effectiveness was measured by pre/post ratings. Qualitative interviews were undertaken with panel members to understand participants' experience.

Summary of Results: 100% of students who provided evaluation (N = 19, 27%) rated the teaching as either 'excellent' or 'very good'. There was a significant increase in overall mean knowledge score and a highly significant increase in overall scores for student confidence in caring for transgender patients ($p < 0.0001$). Two key themes emerged from panellist interviews: that involvement in teaching is a positive experience for transgender people, and that human relatability is key to effective teaching and learning.

Discussion and Conclusions: We have demonstrated that a short educational intervention is effective in increasing medical students' knowledge and confidence in caring for transgender patients, and that being involved in developing and delivering such teaching is positive for transgender people. In particular 'being in the room' as a fellow human being is key for a positive learning experience. As this was undertaken in a single school we now need to examine whether these results are generalizable.

Take-home Messages: Short, large group teaching sessions can improve student knowledge and confidence in caring for transgender people. Involvement of transgender people in teaching delivery is positive for both students and members of the trans community.

#8T Round Table – Threshold Concepts

Threshold Concept-Based Transition Pedagogy in Pathway Programs Supporting Students' Transition into Allied Health Degrees

AUTHOR(S):

- Shaimaa Atwa, Western Sydney University, Australia (Presenter)
- Elizabeth O'Connor, Western Sydney University, Australia
- Iman Hegazi, Western Sydney University, Australia

ABSTRACT

Student numbers continue to rise in higher education worldwide. As a result, increasing numbers of students entering first-year university are under-prepared for the significant challenges of post-school study, particularly students who have traditionally been under-represented in the higher education context. Universities have addressed this by developing sophisticated strategies to tackle retention and attrition rates. In an Australian context, however, it is not clear if attempts by universities to address attrition rates have succeeded as recent numbers indicate that rates continue to rise. This rise in attrition is a multi-dimensional global phenomenon. Students' transition to university is an indication for the successful completion of a degree. The College, at Western Sydney University, provides pathway programs for students who enter with low high school scores. These pathway students' transition into Allied Health university degrees. Transition pedagogy can support these students in the successful and sustainable transition to university. Transition pedagogy represents a curriculum-mediated approach intentionally designed to address the phase of 'transition'.

This project aims to develop a threshold concept (TC) framework and use it to re-design transition pedagogy. By focusing on challenging yet transformative concepts, the developed framework would help move students through the threshold portal opening up a new and previously inaccessible way of thinking which helps them to progress. Though there has been ongoing research in different disciplines relating to TC, this project intends to take a further step, to developing a TC Framework in the Allied Health Science discipline. We hypothesize that by reducing curriculum content within a Health Science unit, while still maintaining disciplinary-specific scholarship, and by involving students in the co-authorship, we may enhance students' performance and experience in transitioning into university. The project will adopt a co-constructive approach which empowers the students in their transition.

Getting Practical: What Can We Do with Threshold Concepts in Medical Education?

AUTHOR(S):

- Janice Hanson, Washington University in St. Louis School of Medicine, USA (Presenter)
- Virginia Randall, Uniformed Services University of the Health Sciences, USA
- Meghan Treitz, University of Colorado School of Medicine, USA
- Daniel Nicklas, University of Colorado School of Medicine, USA
- Hilary Neve, Plymouth University Peninsula Schools of Medicine and Dentistry, UK

ABSTRACT

A threshold concept is an idea that, once grasped, changes the way learners think about themselves. The concept cannot be forgotten and may be emotionally difficult. An example is, “Medicine is rarely black and white.” Through experience, learners see the fallibility of healthcare professionals, but may struggle to accept their own fallibility, still hoping they can know everything and never make a mistake. Identifying threshold concepts may help educators support learners through the challenges of becoming a healthcare professional and can guide the formation of curriculum and learning environments.

The presenter will discuss how to prepare learners for encountering threshold concepts; what strategies will help those learners who struggle at the threshold of a concept; how can we facilitate thoughtful reflection about threshold concepts among our learners; and what aspects of the hidden curriculum may help or hinder learners to “get over the threshold”.

Coaching Learners Towards Formulating Professional Identity Using Threshold Concepts in Professionalism

AUTHOR(S):

- Parag Jain, Baylor College of Medicine and Texas Children's Hospital, USA (Presenter)
- Audrea Burns, Baylor College of Medicine and Texas Children's Hospital, USA

ABSTRACT

Professional identity formation (PIF), which involves development of professional values, actions and aspirations, has been prescribed as a major focus of medical education by the Carnegie Foundation. However, these professional values are often taught through hidden curriculum, often without a structured guided reflection.

The presenter will discuss how Threshold Concepts (TC), which opens a new and previously inaccessible way of thinking about something, can be used as a tool to coach learners how to improve upon lapses around professionalism and enhance one's PIF.

A Speed Mentoring Workshop: A venue for health professions educators to network and seek advice from experts

PRESENTER(S):

- Subha Ramani, Harvard Medical School, Boston, USA
- Helena Filipe, University of Lisbon, Portugal
- Alice Fornari, Northwell Health, Hofstra University, New York, USA
- Richard Hays, James Cook University, Tasmania, Australia
- David Irby, University of California San Francisco, USA
- Rashmi Kusrkar, Amsterdam UMC, Vrije Universiteit Amsterdam, the Netherlands
- Judy McKimm, Swansea University School of Medicine, UK
- Gary Rogers, Griffith University, Queensland, Australia
- Teri Turner, Baylor College of Medicine, USA
- Margaret Chisolm, Johns Hopkins University, USA
- Elizabeth Kachur, Global Consulting, New York, USA
- Patricia O'Sullivan, University of California, San Francisco, USA
- Daniel Schumacher, University of Cincinnati, USA
- Harish Thampy, University of Manchester, UK
- Keith Wilson, Dalhousie University, Canada

Background: Health Professions Educators today have several directions along which they can develop expertise, take on leadership roles and advance in their careers. It can be overwhelming for novice educators to pinpoint where their passion lies, where their institutional values align with their own, how and where they can develop needed expertise and what opportunities exist for leadership and scholarship. AMEE is excited to present its first speed mentoring workshop at the 2019 meeting in Vienna. The workshop will allow novice and aspiring as well as mid-career health professions educators to network with several internationally renowned experts and leaders in the field in a dynamic and fun setting. Mentors will encourage mentees to identify strengths as well as gaps in their skillset important for career advancement and generate solutions to perceived hurdles to professional growth. Learning from peers will also help participants to formulate next steps. Such a format can allow AMEE conference participants to build longitudinal relationships should they choose to do so.

Who should attend:

- Experienced educators who aim to nurture the next generation of educators and help them in their professional growth.
- Trainees and faculty who seek guidance on various aspects of their professional development as educators.

Structure of workshop:

- Brief introductions of mentors
- Discuss session goals, agenda, key elements of speed mentoring
- Rotating stations- 20 min at each table
 - In groups participants will rotate through tables (like OSCE stations) where specific topics in educational career development will be discussed. Participants will be able to complete a total of three 20-minute 'consulting' sessions
 - 3 mentors per table
 - 15 min for questions from participants and suggestions from mentors
 - Mentors wrap up with quick tips for success in that topic area
- The workshop will conclude with Q and A and thoughts on AMEE mentoring initiatives
- Table topics
 - Planning a career in education/early career decision making- Thampy, Filipe, Ramani
 - Becoming educational leaders- Hays, McKimm, Irby
 - Getting into education and/or education research- Kusrkar, O'Sullivan, Schumacher

- Mid-career development- being promoted as an educator- Chisolm, Wilson, Turner
- Organizing faculty development and CPD for educators- Fornari, Rogers, Kachur

Intended outcomes:

- Mentors will provide insights on career challenges and factors that contributed to their success.
- Mentees will seek advice on perceived challenges to their growth as educators and strategies for successful professional development.
- Identify core attributes and obligations of mentors as well as responsibilities of mentees seeking to grow in their chosen area of educational expertise.
- Participate in a mentoring session different than the traditional single mentor-mentee dyad.
- Propose key elements in designing and implementing effective AMEE mentoring programs.

Level: All

#8V Conference Workshop

8V (2726)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1400-1530

Location of Workshop: Room 0.11-12, Level 0

How Can Students Improve Your Medical School Curriculum?

PRESENTER(S):

- Catarina Pais Rodrigues, International Federation of Medical Students Associations
- Katerina Dima, International Federation of Medical Students Associations
- Silvia Matilda Astefanei, International Federation of Medical Students Associations
- Tao Le, Scholar Rx, USA

ABSTRACT

Background: Some educators have long argued for students' active engagement in the learning and teaching processes, so they become responsible for their own education. Traditionally, curriculum planning represents the territory of academic staff and faculty, with students having a more passive role. By encouraging students to become active designers and evaluators of their own learning, they improve a medical school's course structure and content. This enhances students' and educators' experiences of learning by producing a dynamic process of teaching, pushing the student's role to go beyond being merely course evaluators. Our workshop features interactive presentations with case studies of medical school curriculum programs where students are actively involved in the course design process, identifying strategies through which medical students and faculty can work together to implement curricular changes. Hence, students are empowered to take an active role in improving their educational experience.

Who Should Attend? Anyone with an interest in meaningful student engagement.

Structure of Workshop:

Introduction (10 min): Introduce panel and participants' goals.

Principles (20 min): Discuss benefits and challenges of having active student participation in the curriculum creation process. Present participation models from different schools with the respective approaches.

Application (30 min; small groups): Participants discuss medical curriculum needs at their home institutions, developing a plan to address it.

Discussion (20 min): Presentation of curriculum challenges and proposed solutions. Discuss benefits and obstacles to implementation.

Wrap up (10 min): Revisiting workshop goals and providing a brief summary that can be applied at participants' home institutions.

Intended Outcomes: The workshop will examine models and strategies of medical student involvement in curriculum design, so schools can move towards a paradigm where students are encouraged to actively contribute to their own learning. Consequently, we expect participants to be able to

- 1) discuss and describe learning models,
- 2) identify how students initiatives may be structured and implemented
- 3) discuss challenges and obstacles related to student involvement.

Level: All

#8W Conference Workshop

8W (2971)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1400-1530

Location of Workshop: Room 0.49-0.50, Level 0

The A-Z of Curriculum Mapping : Pedagogy to Implementation

PRESENTER(S):

- Colin Lumsden, University of Manchester, UK
- Lucie Byrne-Davis, University of Manchester, UK
- Hilary Dexter, University of Manchester, UK
- Timothy Cappelli, University of Manchester, UK

ABSTRACT

Background: Curriculum Mapping provides an opportunity for programmes to outline their intended learning outcomes with internal or external outcomes. By doing so curriculum designers and curators are able to plan and visualise the curriculum in ways never previously possible. We will introduce the basics of curriculum mapping taking participants from pedagogy to identifying the structure of their curriculum and finally to mapping their programmes to outcome taxonomies (eg General Medical Council Outcomes). We will demonstrate how this process can lead to the visualisation of the curriculum on the Manchester Curriculum Mapping Tool and how it can be embedded in learning resources to provide a single post of truth. The curriculum mapping tool was developed by the University of Manchester and is now being implemented in 6 UK medical schools.

Who Should Attend? Curriculum Designers; Instructional designers; Programme Directors; Curriculum Managers; Assessment directors and managers

Structure of Workshop: This will be an interactive workshop where participants will be guided on the process of curriculum mapping and work through their own examples in order to appreciate the challenges and benefits of mapping.

- 1) Introduction to curriculum mapping
- 2) Identifying the components that make up curricula
- 3) Categorising the identified components
- 4) Identifying taxonomies (eg GMC, Assessments, MLA outcomes etc ..)
- 5) Mapping sample outcomes to the identified taxonomies
- 6) Visualisation of the mapping exercise on the live curriculum mapping system

Intended Outcomes:

- 1) Define the purpose of curriculum mapping and underlying pedagogy
- 2) Identify and define taxonomies
- 3) Identify and categorise course structure in preparation for curriculum mapping (components, activities, units of time)
- 4) Be able to map sample learning outcomes to identified taxonomies
- 5) Describe the systems available for mapping and how they can be used to enhance the student experience

Level: Beginner to intermediate. Attendees should be familiar with the principles of outcomes based curricula, learning outcomes and be familiar with their own programmes

#8X Conference Workshop

8X (808)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1400-1530

Location of Workshop: Room 0.96-97, Level 0

Development of Institutional Assessment Framework: Practical Approaches for Postgraduate Education

PRESENTER(S):

- Hui Meng Er, International Medical University, Malaysia
- Vishna Devi Nadarajah, International Medical University, Malaysia
- Noraidah Yusoff, International Medical University, Malaysia

ABSTRACT

Background: Assessment activities in postgraduate training often involve non-clinical and clinical faculty and/or health professionals from various disciplines, full time or part time modes and sharing of institutional learning resources. In some circumstances, assessment regulations may be generic in the university, not differentiating undergraduate and postgraduate programmes. These factors can contribute to poor implementation of assessment principles and varied assessment practices, leading to barriers in improving assessment quality and operational efficiency. As a result, the educational experience of students will be affected. The challenges can be addressed by having a common institutional assessment framework which specifies the institutional philosophy, governance, quality and standards of assessment. It ensures that the institutional assessment system is reliable and valid to produce competent graduates. Moreover, it facilitates the institution's resource planning including faculty development and assessment quality assurance activities.

Who Should Attend? This workshop will be useful for university regulators, examination administrators, quality assurance personnel, academic programme coordinators, faculty and accreditation bodies.

Structure of Workshop:

- Introduction and context (15 minutes)
- Features of institutional assessment framework for pg education (45 minutes)
 - Purpose
 - Requirement features
- Approaches for development of institutional assessment framework (30 minutes)
 - Stakeholders
 - Potential challenges
 - Practical approaches
- Concluding remarks (15 minutes)

Intended Outcomes: Participants will be able to:

1. identify the features required for an institutional assessment framework
2. propose practical approaches for developing an institutional assessment framework based on institutional context, stakeholders and challenges

Level: Intermediate (with previous knowledge on basic principles of assessment)

#8Y Conference Workshop

8Y (2210)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1400-1530

Location of Workshop: Room 2.17, Level 2

Young Medical Educators' Workshop: Taming Wicked Issues with Adaptive Action

PRESENTER(S):

- Sören Huwendiek, Institute for Medical Education, Department for Assessment and Evaluation
- Stewart Mennin, Human Systems Dynamics Institute, USA
- Monica van de Ridder, College of Human Medicine Michigan State University / Spectrum Health, USA
- Charlotte Ringsted, Centre for Health Sciences Education, Denmark

ABSTRACT

Background: Succeeding as a young medical educator is challenging and involves complex relationships. Junior staff are often assigned difficult administrative and educational tasks. These are “wicked issues” because they share three key characteristics because they: 1) are defined and understood differently from multiple perspectives; 2) are context dependent yet show similar patterns across different contexts and; 3) are impossible to solve with traditional problem-solving methods (Rittel & Webber, 1973). Examples include: providing education in time-poor clinical settings; junior teachers learning on the job; research expectations without support; implementing new technologies and strategies. The workshop will provide young medical educators with an “alternative” to traditional problem-solving methods. Adaptive Action, an iterative process will be used to help tame participants wicked issues.

Who Should Attend? Young medical educators interested in learning to identify and tame their wicked issues.

Structure of Workshop: A brief (10 min) introduction to wicked issues and adaptive action, followed by open space technology to self-organize into groups of shared interest (15 min). Participants will record their adaptive actions on flip charts. We conclude with collecting, sharing and reflecting on what was learned, and next steps upon returning home.

Intended Outcomes: Workshop participants will be able to identify their wicked issues and apply Adaptive Action.

Level: Medical Educators in their early career

#8Z Conference Workshop

8Z (467)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1400-1530

How to use Technology to Demonstrate Scholarship in Medical Education - an AMEE TEL Committee workshop

PRESENTER(S):

- Poh Sun Goh, Yong Loo Lin School of Medicine, National University of Singapore, Singapore
- John Sandars, Edge Hill University, UK
- Alexandra Webb, ANU College of Health and Medicine, Australia
- Michael Botelho, The University of Hong Kong, Hong Kong
- Peter de Jong, Leiden University Medical Center, The Netherlands
- Martin Pusic, NYU Langone Health, USA

ABSTRACT

Background: There are increasing opportunities to demonstrate the scholarship of discovery and the scholarship of teaching by the use of technology. For scholarship of discovery, social media and open access publications offer new opportunities to widely demonstrate research and engage with the wider community of medical educators. For scholarship of teaching, there are opportunities to easily observe and measure a variety of teaching and learning activities. This workshop will highlight examples of how technology can enhance the scholarship of discovery and the scholarship of teaching, but also provides an essential critical space to consider the strengths and limitations of these new opportunities.

Who Should Attend? Medical Teachers who are interested in knowing more about, and aspiring to be, a Scholarly Educator and Educational Scholar.

Structure of Workshop: This workshop will be highly interactive, supported by a preworkshop blog for preparatory reading and activities, and in workshop discussions and personal reflections.

Intended Outcomes: Know, Do and Feel. Participants will know the key ideas, enabling an informed discussion of this topic with colleagues; have an awareness of open access, widely available, free, easy to use, technology platforms to enable them to demonstrate scholarship; and develop a feel for why, what and how to use technology to demonstrate scholarship in medical education.

Level: Introductory

#8AA Conference Workshop

8AA (2087)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1400-1530

Location of Workshop: Room 2.61, Level 2

A Whole New Medical Educator for 2025 and Beyond

PRESENTER(S):

- Sheila Crow, University of Miami Miller School of Medicine, USA
- Brownie Anderson, National Board of Medical Examiners, USA

ABSTRACT

Background: According to a recent report, there are five hard trends that will inform and influence the direction of medical education in the next ten years: 1) on-demand learning; 2) flipped clinics; 3) networked discovery; 4) high-resolution health; and 5) rapid prototyping cycles. These trends, and others, will reshape what students learn and how they are taught. Simpson et al have suggested future medical educators will be expected to be competent in multiple domains, all of which will require the development of new skills and the redesign or expansion of existing skills. This session builds on the current dialogue by addressing the following questions: 1) How might we teach medical educators these new skills? 2) How might we compensate and reward educators for these new roles? 3) How might we create designs to maximize and streamline learning at minimal costs? 4) What additional questions do we need to ask?

Who Should Attend? Anyone interested in the evolving role of educators.

Structure of Workshop:

20 minutes - Introduction and literature discussion

60 minutes - Each table group will have 15 minutes to develop innovative ideas for how we might address the three main questions described in the introduction, and identify additional questions for moving the conversation forward. Groups will receive one question to address then transition to another after 15 minutes. By the end of the session each table will have addressed the following four questions:

- 1) How might we teach medical educators these new skills?
- 2) How might we compensate and reward educators for these new roles?
- 3) How might we create designs to maximize and streamline learning at minimal costs?
- 4) What additional questions do we need to ask?

Two experienced medical educators will circulate to prompt participants and encourage innovative thinking to address the questions.

10 minutes - Facilitators will select one idea from each question and ask the table that developed the selected idea to present their concept.

Intended Outcomes:

- 1) Describe the projected roles of medical educators in 2025 and beyond.
- 2) Propose solutions for preparing medical educators for these new roles.
- 3) Identify additional questions for moving the conversation forward.

Level: All levels are invited.

#8BB Conference Workshop

8BB (1569)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1400-1530

Location of Workshop: Room 2.83, Level 2

The Long and the Short of It - Using Very Short Answer items for Summative Assessment

PRESENTER(S):

- Rachel Westacott, University of Leicester, UK
- Celia Brown, University of Warwick, UK

ABSTRACT

Background: Very short answer questions have recently been piloted and shown to be a reliable method of summative written assessment. They offer increased authenticity compared to single-best-answer (SBA) questions, whilst retaining most of the practicability of SBAs in large scale assessments.

Who Should Attend? Anyone interested in gaining and understanding of very short answer (VSA) questions: what they are, the benefits of using VSAs, and what we have learned about the construction and marking of VSAs from a large national pilot.

Structure of Workshop: This workshop will share our experience of delivering a successful national pilot of this innovative written assessment method, using a bespoke electronic delivery platform. Just over 1400 final year medical students across 20 UK medical schools took part in this study and this has helped inform practice in the construction and marking of VSAs. There are significant pedagogical reasons for using VSAs as opposed to the traditional single best answer (SBA) format and our study demonstrates the practicability of using this assessment method for large-scale high stakes assessments. The workshop will introduce the concept of VSA questions, explain the pedagogical and practical reasons for using this format and highlight the differences in student performance between VSA and SBA questions. There will be group discussions centred around differences in question construction and standard setting of VSAs relative to SBAs. Examples from our national pilot highlighting questions that perform well in this format alongside potential pitfalls will be shared. Finally, there will be an opportunity to answer some very short answer questions (specific medical knowledge not required), create marking rubrics and consider the standard setting of these items relative to SBAs.

Intended Outcomes: Increased understanding of the utility and scope VSAs. Increased understanding of the difference in performance between VSAs when compared to SBAs. Appreciation of the similarities and differences in constructing VSAs as opposed to SBAs. Experience of reviewing VSAs and considering answer rubrics and standard setting.

Level: No prior knowledge of VSAs required but prior understanding of SBA construction and use in summative assessments would be beneficial.

#8CC Conference Workshop

8CC (971)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1400-1530

Location of Workshop: Room 2.95, Level 2

Next Generation OSCE Checklists: Crowdsourcing authoring as a tool for developing, modifying and localizing OSCE checklists

PRESENTER(S):

- Daniel Salcedo, Center for Education in Medical Simulation, Taiwan
- Che-Wei Thomas Lin, Wanfang Hospital ,Taipei Medical University, Taiwan
- Wen-Cheng Huang, Wanfang Hospital ,Taipei Medical University, Taiwan
- Barry Issenberg, University of Miami Gordon Center for Simulation and Innovation In Medical Education, USA
- Jen-Chieh Wu, Taipei Medical University Hospital, Taiwan
- Jiann Ruey Ong, Shuang Ho Hospital Taipei Medical University, Taiwan

ABSTRACT

Background: Crowdsourcing authoring refers to the online collaboration of large numbers of individuals towards achieving a specific goal and has emerged as a major tool for the compilation of data from a wide range of content experts. A notable example of this approach is Wikipedia, one of the largest online information repositories worldwide. The Intelligent Test-generator of Objective Structured Clinical Examination (iTOSCE), is a free web-based application designed to allow the creation and modification of collaborative OSCE checklists through a dedicated crowdsourcing platform. The purpose of this highly interactive workshop is to introduce participants to the concept of collaborative OSCE checklist development through a hands-on experience utilizing a free online crowdsourcing authoring tool.

Who Should Attend? Faculty involved in the creation, editing and localization of OSCE checklists, who are interested in improving the quality of their assessments through crowdsourcing authoring.

Structure of Workshop:

- 1) Introduction
- 2) Challenges of OSCE Checklist Development: Participants discuss the major challenges of developing effective OSCE checklists and share their findings using an audience response system.
- 3) Best practices in OSCE checklist development: Participants work in small groups to identify best practices of checklist development and the potential benefits of crowdsourcing authoring.
- 4) The iTOSCE: A hands-on tutorial Guided tutorial on how to use the iTOSCE tool (laptop or tablet with WiFi access required for each participant)
- 5) Fix it!: Experiential learning activity in which participants collaborate in online groups to improve an existing OSCE checklist through a crowdsourcing authoring platform.
- 6) Summary and Debriefing: Participants present the outcomes of their online collaboration groups and reflect on their experience.

Intended Outcomes:

- 1) Identify common errors in OSCE checklist creation
- 2) Understand best practices in OSCE checklist development
- 3) Implement practices that promote collaborative work
- 4) Use the iTOSCE crowdsourcing authoring tool to create, edit, comment and rate checklist items
- 5) Create a collaborative OSCE checklist utilizing crowdsourcing authoring

Time of Session: 1400-1530

Location of Presentation: Foyer B, Level 2

From doctor in charge to doctor as coach

AUTHOR(S):

- **Maaïke Matulewicz, Amsterdam University Medical Centers, The Netherlands (Presenter)**
- Naomi Ehrlich, Amsterdam University Medical Centers, location VUmc, The Netherlands
- Lianne Both, Amsterdam University Medical Centers, location VUmc, The Netherlands

ABSTRACT

Background: In the future of health care, more self-management of patients will be necessary. This requires an active patient attitude. Currently a number of patients already manage their own care and use the physician as a sparring partner instead of a doctor in charge. This not only requires new skills from the patient, but also new, specific skills from healthcare professionals: the skills to coach and thus stimulate the active role of the patient.

Summary of Work: Medical students from the Amsterdam UMC are being trained to develop these skills. In bachelor year two students participate in five small-group training sessions, focusing on lifestyle change consultations. Main topics of these sessions are two-way traffic in communication, patient resistance, and Motivational Interviewing (M.I.). Students engage in diverse exercises, e.g. trying out M.I. techniques on their teacher (with the teacher disclosing a personal behavioral issue). Students also role-play a consultation, taking on both the role of the doctor and the role of the patient. By taking the position of the patient, they gain personal experience of what increases and reduces patient resistance. They also develop a vision on the importance of patients' contributions to consultations.

Summary of Results: Systematic evaluations show a high level of student appreciation for the training sessions. Mean scores range from 3.7 (for 'quality of classes') to 4.5 (for 'the ability to apply two-way traffic in communication') on a 5-point Likert scale. Students report 'growth in M.I. techniques', and the classes to be 'inspiring for learning so many new skills and knowledge'.

Discussion and Conclusions: Even though the classes are taught in the bachelor stage and thus might not qualify as 'just-in-time-learning', we consider this the right moment for this training. It is vital for the development of the students' vision on interpersonal patient contact and provides a basis for future communication skills.

Take-home Messages: Allowing students to participate in communication classes on lifestyle changes is appreciated by students and offers a suitable opportunity for training bachelor medical students in communication skills, necessary for their role as a coaching doctor.

#8DD ePosters - Transitions / Interprofessional Practice

“Finding My People”: A Longitudinal Study of Physicians in a Master's in Medical Education Program

AUTHOR(S):

- Samuel Rosenblatt, Children's Hospital of Philadelphia, USA (Presenter)
- Donald Boyer, Children's Hospital of Philadelphia, USA
- Dorene Balmer, Children's Hospital of Philadelphia, USA

ABSTRACT

Background: In health professions education (HPE), professional isolation can negatively impact career satisfaction and longevity. Isolation may be counter-balanced by continuing professional development (CPD) programs that foster a sense of belonging to a community of practice (CoP) among program participants. Ideally, participants engage in other CoPs when the program ends. But how do students in more intensive, degree-granting programs have this same sense of belonging, and how do they navigate other CoPs when the program ends?

Summary of Work: To address this research question, we conducted in-depth interviews with 11 physicians (anesthesiology-2, community health-1, medicine-3, neurology-1, pediatrics-2, surgery-2) in a 2-year, executive-format, Master's in Medical Education Program at the University of Pennsylvania, USA. Interviews were conducted at the start, midway through, and 3 months post program (n=32 interviews). We created codes, sensitized by educator identity literature, and iteratively revised codes based on incoming data. We clustered coded data into conceptual categories that described the longitudinal nature of students CoP engagement.

Summary of Results: Students in the Master's program consistently reported a sense of belonging to CoP within the program: 'What got me excited initially was identifying that community that we had built in our cohort, folks who were interested in education and developing educational opportunities.' Students described challenges to maintaining this CoP upon graduation: 'It's like the program was a link, and once the program is done, maintaining that link is more difficult.' Nonetheless, they valued, and sought out, other CoPs at local and national levels. 'I have been able to find my people through other ways, through the residency and through this [hospital-based] community.'

Discussion and Conclusions: Like CPD programs, Master's programs foster a strong sense of belonging to a CoP while in the program, but students seek other CoPs when the program ends. Continuation of this longitudinal research will address how graduates of the Master's program maintain engagement and minimize professional isolation over time.

Take-home Messages: Degree-granting programs in HPE should consider how to support graduates in maintaining a sense of belonging to a CoP as part of a joint effort to minimize professional isolation in HPE.

#8DD ePosters - Transitions / Interprofessional Practice

Lessons learnt in the conduct of a pilot interprofessional education program and ward rounds in Singapore

AUTHOR(S):

- **Oh Moh Chay, KK Women's and Children's Hospital, Singapore (Presenter)**
- Derrick Lian, KK Womens and Childrens Hospital, Singapore
- Mislia Supar, KK Womens and Childrens Hospital, Singapore
- Raymond Goy, KK Womens and Childrens Hospital, Singapore

ABSTRACT

Background: The use of the inter-professional (IP) ward rounds as routine clinical practice is in its infancy in Singapore. The Readiness for Inter-professional Learning Scale (RIPLS) survey in our hospital showed that healthcare providers did not have clear understanding of each other's professional role in patient care. Resultant challenges included the conduct of multiple separate ward rounds, ineffective communications, leading to lapses in transition of patient care, and missed learning opportunities between the professions. This study explores the utility and challenges encountered in the running IP ward round in an acute healthcare setting.

Summary of Work: The study was conducted at the KK Women's and Children's Hospital, Singapore. Prior to the IP rounds, the participants attended the training program, consisting of the introduction to a structured framework; 'one-minute preceptor teaching techniques; and IP experiential discussions. IPE ward rounds were conducted one month later in the pediatric ward, with the professions taking on the assigned roles of 'lead, presenter and scribe and member . Group interviews were conducted at midway and end of the IP activity.

Summary of Results: The participants agreed that the IPE program and ward rounds enhanced their collaborations in the care of the patient and their family. The format of the IPE rounds allowed all stakeholders equal opportunities to share their expertise and concerns. Positive experiences included (1) understanding of professional roles and challenges, (2) strong engagement of the IPE members in decision making, (3) formulation of patient care plans in single coordinated settings, (4) improved patient safety, and (5) team-based learning and support. The resources of the clinical rounds remained similar and the length were not significantly increased. Current challenges included (1) overcoming the strong work-place hierarchal relationships, (2) providing a secure environment for speaking up, and (3) formulating a common learning framework between the professions

Discussion and Conclusions: The pilot IPE training program and ward rounds were effective in enhancing professional collaborations in the care of the patient in an Asian healthcare setting. Some of the challenges will require long term planning and strategies.

Take-home Messages: It is feasible to conduct IPE ward rounds in an acute hospital setting.

Accelerated Readiness of Trainees in Oncology to Clinical Practise: Combining e-learning and Facilitated Group-based Discussion Led by Peers

AUTHOR(S):

- **Maiken Ulhøi, Department of Oncology, Aarhus University Hospital, Denmark (Presenter)**
- Nicolaj Andreassen, Department of Oncology, Aarhus University Hospital and Danish Society of Clinical Oncology, Denmark
- Nina Bjerre Andersen, Department of Oncology, Aarhus University Hospital, Denmark

ABSTRACT

Background: When treating and taking care of cancer patients, it is necessary to have both theoretical and practical basic knowledge about how to handle chemotherapy. Traditionally, the initial learning for trainees in this area has been mostly self-directed and largely dependent on direct clinical supervision from a specialist. In order to focus learning and accelerate trainee readiness to work independently clinically, a new concept for basic learning in chemotherapy was developed and explored.

Summary of Work: As a mandatory part of the introduction trainees conducted a 6 hours e-learning programme ('Chemo School', Metropol, University College Copenhagen) followed by a one-hour group-based discussion led by a more experienced trainee. Discussions of the most important learning objectives was guided by interactive multiple-choice questions. Interviews with 16 trainees on the outcome from the combined learning concept were performed.

Summary of Results: The e-learning programme was acceptable, easy to access and understand. The majority of trainees found the combined learning concept highly useful and time-effective as preparation to be able to treat patients with chemotherapy. Especially the group-based discussion with peers and a more experienced trainee was appreciated as a safe learning environment.

Discussion and Conclusions: Evaluation of the combined learning concept showed a positive impact on trainee self-efficacy in respect to readiness to clinical practise. However, transfer of trainees perceived learning to performance in clinical work was not investigated neither were the possible positive impact on time used by specialist to basic introduction of trainees. The use of experienced trainees as teachers may contribute to the implementation of the concept as it also supports the trainees abilities of teaching and skills related to leadership.

Take-home Messages: E-learning combined with group-based discussion led by experienced trainees is from a trainee perspective an effective introduction to basic concepts of chemotherapy treatment. The concept might accelerate trainee readiness to handle chemotherapy in clinical practice and may be of use internationally and in other specialities.

How the implementation of team-based learning into introductory session regarding transition into Clinical year influences medical students' confidence in adapting to Clinical Year

AUTHOR(S):

- Sunee Neesanun, Department of Internal Medicine, Sawanpracharak Hospital, Thailand (Presenter)
- Thanita Uyathanarat, Department of Pediatrics, Sawanpracharak Hospital, Thailand

ABSTRACT

Background: The period from preclinical to clinical year is a major transition within medical education as students adapt to the new academic environment. Previously, introduction to clinical year sessions, a method implemented in our system to navigate students through this period, are ineffective due to the lack of student engagement. This study aims to evaluate the role of team base learning in introductory session for senior students easing them transitional to clinical year.

Summary of Work: The introductory session was organized for fourth-year medical students at Sawanpracharak hospital. The first part of the session announces students academic performance and introduces students to the upcoming curriculum. The second part was divided students into four discussion groups. Through team-based learning, each group discuss their concerns, expectations regarding the clinical year and their opinions on working as doctors. During the final part of the session, each group share their findings to the class. Pre- and post- session, attendees were invited to anonymously complete questionnaire concerning their adaptation, learning and development as doctors.

Summary of Results: 29 students participated in the program. After the session, there was a decrease in concerns regarding adaptation and staff or senior abuse; from 50%, 10.7% to 14.3% and 3.6% respectively. There was an increase in student's confidence to learn in clinic year, treat patients and work in OR and LR ward. After the discussion, students are inclined to utilize multi-approach learning and self-learning instead of relying on lectures. In addition, students put more emphasis on professional development and find the role model to develop to be a doctor. The majority of students prefer to continue team-based learning in the introduction to the clinical year in the future.

Discussion and Conclusions: Team base learning in introduction to clinic decreased students' concern regarding adaptation and increased their confidence in learning in clinical year. This method of learning broadens students' perspective regarding education and professional development.

Take-home Messages: In conclusion, the utilization of team base learning in introduction to clinic for senior student decreases students' concerns regarding adaptations and eases students to learning in the clinical year.

An exploratory study of an individualized coaching exercise for professional development and support of Infectious Diseases physicians

AUTHOR(S):

- Sharavan Sadasiv Mucheli, NHG - Tan Tock Seng Hospital, Singapore (Presenter)
- Hsu Li Yang, NHG - Tan Tock Seng Hospital, Singapore

ABSTRACT

Background: New consultant doctors face unique challenges at the workplace, especially as they transit over from being supervised to being more independent. The present study explores the conduct of an individualized coaching exercise and its outcomes in a group of infectious diseases physicians of a Singapore teaching hospital.

Summary of Work: In October 2018, five consultants (i.e., coachees) and a visiting senior consultant (coach) participated in a brief coaching exercise over a two-week period. The exercise consisted of an initial introductory and goal-setting session (individualized), 2 to 3 sessions with direct clinical observation and a final debriefing session. Participants views of the coaching process and their perceived outcomes were evaluated by thematic analysis of data collected through semi-structured interviews.

Summary of Results: All participants perceived the coaching exercise to be helpful. Coachees set goals in both academic (viz. clinical decision-making, dealing with clinical uncertainty) and non-academic domains (viz. communication skills, time management, work-life balance, emotional regulation). Being approachable, trust-worthy and non-judgemental were deemed to be essential qualities of a good coach. The coach was able to reassure and reaffirm as well as guide coachees to 'self-remediate' when necessary. Specific feedback on the conduct of the exercise (longer duration, different observation frequency, better preparation etc.) was obtained to guide future implementation.

Discussion and Conclusions: This pilot study suggests that individualized coaching may be a useful tool for professional development, especially in supporting new consultants. Although the short time-frame and limited sample size of this exercise was a clear limitation, the study identified some key areas of improvement to consider when designing a future coaching intervention. Participants found the coaching exercise useful in addressing challenges in both academic and non-academic domains. Whether the results have an enduring effect remains to be explored.

Take-home Messages: A structured and individualized coaching program may provide good support to consultants, to cope with the challenges in their job roles. This intervention needs to be context-specific and sensitive to the work culture.

Enhancing knowledge of nursing staff with bedside teaching and cross-team discussion in the nephrology ward

AUTHOR(S):

- Chia Jung Chan, Taipei Medical University Hospital, Taiwan (Presenter)
- Chiu Ping Chiung, Taipei Medical University Hospital, Taiwan
- Chih Chin Kao, Taipei Medical University Hospital, Taiwan

ABSTRACT

Background: The traditional training program for new staff members is only dominant in the nursing care of kidney disease, which lacks actual case discussion and clinical application. Thus, by utilizing bed-side teaching technique combining the cross-team discussion with the nutritionists to enhance our nursing staffs knowledge and skills.

Summary of Work: Nursing staff will report a case with a specific topic once a month. The discussion will first be made based on the scheduled topic, and it will be further carried on bed-side. The content of the bed-side teaching includes the pathophysiology of disease, physical examination. Participants must finish the pre/post-test and satisfaction questionnaire.

Summary of Results: A total of 11 bed-side teaching sessions were held, with an average of 79.9 points in the pre-test, and 99.6 points in post-test. An average improvement rate of 24.6% was noted. Average satisfaction score was 4.9 points (1-5 points).

Discussion and Conclusions: In our study, the average rate of the care acknowledgment after clinical bed-side teaching increased by 24.6%. Furthermore, the excellent satisfaction score was also noted with 4.9 points (1-5 points). In conclusion, this teaching method shows high satisfaction in nursing staffs during the application of their clinical knowledge in the care of patients. Through bedside teaching and cross-team case discussions, nursing staffs can improve the understanding of the patients' condition and continuously enhancing their professional knowledge and skills. Therefore, the nursing care quality could be further improved.

Take-home Messages: The combination program of bedside teaching and cross-team discussion could help that nursing staffs effectively enhance their clinical knowledge and skills. In the future, we could integrate more different interprofessional teaching. By expending the team, nursing staffs will exchange and learn from each other to improve their ability through inquiring professional knowledge and sharing with others.

What does it mean to be a medical intern? A phenomenographic study

AUTHOR(S):

- **Matilda Liljedahl, Sahlgrenska University Hospital, Sweden (Presenter)**
- Yvonne Carlsson, Sahlgrenska Academy, Sahlgrenska University Hospital, Sweden
- Anna Nilsson, Sahlgrenska University Hospital, Sweden
- Stefan Bergman, Sahlgrenska Academy, Sweden

ABSTRACT

Background: Entering a professional career in medicine is known to be associated with a number of transitions and research has shown how this phase often is characterized with feelings of stress and being 'thrown in at the deep'. Various forms of introduction programs have therefore been established with the ambition to ease the transition from medical student to practicing doctor. Even though experiences of the medical internship have been extensively explored, less is known about how medical interns understand and conceptualize the internship.

Summary of Work: This study aimed to explore what it means to be a medical intern. We designed a qualitative, phenomenographic study and performed semistructured individual interviews with 12 medical interns from both regional and university hospitals in Sweden. Interviews were audiotaped, transcribed verbatim and analyzed in line with the phenomenographic approach.

Summary of Results: Five qualitative differing categories were found which were sorted in the following hierarchical structure. Internship as in-service training emphasized how interns viewed learning as the primary task of their work. Internship as preparation meant that the internship was seen as preceding what would come later, namely, the real work as a doctor. Internship as growing illuminated the possibility to develop as a doctor through taking responsibility for patients. Internship as quality marker emphasized how the accomplishment of the internship indicated sufficient intern competence. Finally, internship as space implied how the internship ultimately provided an appreciated space for learning.

Discussion and Conclusions: This study showed that there are various ways of understanding the meaning of the internship. While internship as in-service training and preparation indeed was appreciated by our participants, the role of the internship as a possibility to grow was pivotal for participants' development as doctors. This study provided novel aspects of the internship as it was also conceptualized as a quality marker and as a space for learning.

Take-home Messages: The role of the medical internship is not only to provide junior doctors with the sufficient preparation for future work, but is a special time where substantial learning can take place because of the space provided.

The role of a one week Transition Course in preparing students for Foundation Year 1: Views of medical students and Foundation doctors

AUTHOR(S):

- **Rebekah Judge, Imperial College London, UK (Presenter)**
- Diluxshy Elangaratnam, Imperial College London, UK
- Joanne Harris, Imperial College London, UK
- Alexander Harding, Imperial College London, UK
- Emma Hatfield, Imperial College London, UK
- Rustam Karanjia, Weston Area Health NHS Trust, UK

ABSTRACT

Background: The transition from medical student to Foundation Year 1 (FY1) is challenging. Students feel inadequately prepared for both the clinical and the non-clinical aspects of working life (such as managing finances, career planning, and dealing with legal issues), causing stress and contributing to burnout. Imperial College School of Medicine (ICSM) offers a unique one-week transition course which aims to prepare students for both the clinical and non-clinical aspects of life as a doctor.

Summary of Work: This qualitative study aimed to evaluate perceptions of preparedness for the non-clinical aspects of life as a junior doctor, and the value our transition course. Views of final year medical students (n=6) and ex-ICSM FY1 doctors (n=4) were compared through interviews. Thematic analysis was performed by two independent researchers.

Summary of Results: Themes included Perception of preparedness for FY1, Experience of FY1 and Value of the Transition Course. Although students felt equipped with adequate knowledge for FY1, they felt inadequately prepared for the step up in responsibility and coping with stress. Current NHS pressures, a litigation culture, and the Junior Doctor contract contributed significantly to concerns about the transition. These concerns were echoed by FY1 doctors who experienced difficulty with responsibility, coping with pressure, managing their finances, and legal issues. The inability to fully prepare for the transition to working life was noted, with a sense that learning by experience was inevitable. However, both students and doctors felt that the course was beneficial in preparing for the transition. Suggestions for further improvement included covering these aspects earlier in medical school, tailoring information to individual need, and providing a better insight into what to expect.

Discussion and Conclusions: Students feel inadequately prepared for life as a doctor. Their concerns echo the real experience of FY1 doctors, and include concerns about finances, coping with pressure, career planning and litigation.

Take-home Messages: Addressing non-clinical aspects of life as a doctor during transition modules is beneficial, and may help ease the transition from student to doctor.

Postgraduate Education Fellows: Bridging the gap between trainees and trainers

AUTHOR(S):

- **Luciana Sowole, West Middlesex University Hospital, Chelsea and Westminster NHS Foundation Trust, UK (Presenter)**
- Emily Savage, West Middlesex University Hospital, Chelsea and Westminster NHS Foundation Trust, UK
- Shreena Shah, West Middlesex University Hospital, Chelsea and Westminster NHS Foundation Trust, UK
- Christina Cotzias, West Middlesex University Hospital, Chelsea and Westminster NHS Foundation Trust, UK

ABSTRACT

Background: The roles and responsibilities of Post Graduate Education Fellows (PGEdF) are multi-faceted. Annually in the UK the General Medical Council (GMC) asks all trainees to complete a National Training Survey (NTS). In preparation, the PGEdFs conduct a local internal survey prior to the NTS to focus on and enhance trainee's local education and training. The experience of devising and responding to these surveys in a climate of trainee 'survey fatigue' is described.

Summary of Work: The survey was specifically devised to focus on key areas of trainee experience -work load, patient safety, training, supportive environment and overall experience. The electronic 22 question condensed version of the NTS was sent to all local trainees for completion from December 2018 and ran for a 6 week period.

Summary of Results: 60 trainees responded. 12/60 (20%) reported experiencing undermining behaviour and 20/60 (33%) reported patient safety concerns. As with the annual GMC NTS, these identified reports triggered immediate investigation and action. The PGEdFs set up focus groups for trainees in specialities implicated. Structured anonymised feedback with recommendations for improvement by affected trainees was shared with departmental consultants with the support of the Director of Medical Education (DME). Actions for positive change were implemented in response.

Discussion and Conclusions: A focused pre- GMC survey created by PGEdFs highlighted trainee concerns. These were then dealt with sensitively, anonymously and proactively. By having PGEdFs lead the subsequent trainee forums, a flat hierarchy for open discussion was created, providing trainees a 'safe space' and the option to remain anonymous (if they chose). The non-consultant grade of the position is a significant benefit of the role, as we are able to facilitate peer to peer non-judgemental feedback, escalate concerns and ensure improvement ideas were heard in real-time. This highlights that a key role of PGEdFs can be to act as an effective interface between trainees and trainers to optimise learning and change opportunities.

Take-home Messages: PGEdFs can play a central role in bridging the gap between trainees and trainers, ensuring issues with training are identified and resolved. Proactive peer to peer engagement empowers trainees to lead change.

In situ Mock Codes or Sim Center Team-Based Training: Best bang for the buck? Lessons learned at our Center: Content

AUTHOR(S):

- Mena Khan, Central Michigan University College of Medicine, USA (Presenter)
- Robert Sasso, Central Michigan University College of Medicine, USA

ABSTRACT

Background: Our institution has been conducting hospital in-situ mock codes for several years with marginal documented improvement in team performance and code quality. A root-cause analysis for this lack of improvement revealed several plausible factors involved: 1. Lack of true code teams, but instead floor-to-floor rapid response teams of variable composition 2. Participant frustration with lack of familiarity with the mannequin 3. Suboptimal buy-in due to lack of orientation to simulation culture and pressure to return to clinical duties 4. Inadequate time and participation in the debriefing session

Summary of Work: We began a supplementary Simulation Center-based Team-Based Training for hospital personnel engaged in code-team events. This program includes an orientation lecture to simulation, debriefing techniques, and communication tools. Two simulated events (including patient codes) are then run. The first is debriefed using a rapid cycle technique and the second is traditionally debriefed at the case conclusion. Adequate time is allowed for a three-stage debriefing and case review.

Summary of Results: Code quality is gleaned from our simulators (Sim Man 3G) regarding performance parameters (hand placement, depth of compression, adequacy of ventilations, etc.). Preliminary data has shown significant improvement of these objective measures after the second simulated case. Percentage of time in which all AHA guidelines are met during the code was significantly improved over in-situ mock code training alone.

Discussion and Conclusions: Our mock code program has shown value in assessing hospital systems' strengths, deficiencies, staffing adequacy and response time. A detailed assessment of teamwork, communication and code performance can be gleaned, but improvement in these skills has not been well demonstrated. By survey, our external team-based program is greatly preferred by our learners. It has demonstrated, in the short-term, better code performance and adherence to AHA guidelines. Acceptance of feedback after sessions is likely better accepted by learners with an introduction to simulation culture and debriefing.

Take-home Messages: Mock codes have great value in assessing hospital systems, adequacies, and performance. However, an adjunct of simulation center team-based training may add significant improvement in actual code performance and team communication skills and efficiency.

Advanced physical examination training course improves medical students' confidence in physical examination

AUTHOR(S):

- Fen-Yu Tseng, National Taiwan University Hospital, Taiwan (Presenter)
- Yu-Ting Chang, National Taiwan University Hospital, Taiwan
- Chong-Jen Yu, National Taiwan University Hospital, Taiwan
- Shan-Chwen Chang, National Taiwan University Hospital, Taiwan

ABSTRACT

Background: Physical examination (PE) is a basic diagnostic tool in clinical settings. It is important to enhance medical students' skills and confidence in PE.

Summary of Work: Our medical students begin learning PE in the fourth medical year (M4). They undergo hands-on clinical training in the fifth medical year (M5). To improve the teaching of PE, we implemented an advanced PE training course (APETC) for M5 students. In APETC, PE skills for chest (CH), cardiovascular system (CV), and abdomen (GI) domains were demonstrated by senior specialists. Under tutors' supervision, students performed PE on selected patients with positive signs. To evaluate the effect of this training course, we designed a checklist to evaluate students' confidence level in PE before and after APETC. Average confidence scores of PE in CH, CV, and GI domains among different years and genders were compared using ANOVA tests.

Summary of Results: M5 students' confidence in PE for individual items on the CH, CV, and GI checklists increased significantly after the APETC, in both 2014 and 2015 (all $p < 0.0001$). The average post-course confidence scores of all items in CH, CV, and GI domains increased significantly over average pre-course confidence scores. The average post-course confidence score in PE was higher in the year 2015 than that in the year 2014. Male students tended to have higher confidence scores in PE than female students.

Discussion and Conclusions: APETC enhanced medical students' confidence in PE. Female students seem to have lower confidence in PE than male students.

Take-home Messages: Continuous improvement is important in teaching PE. Long-term effects of the APETC on improving medical students' skills and confidence of performing PE and the real impacts of gender on PE learning outcomes remain to be investigated.

Effectiveness of an evidence-based practice educational intervention with school nurses

AUTHOR(S):

- Pei-Lin Hsieh, Chang Gung University of Science and Technology, Taiwan (Presenter)
- Sue-Hsien Chen, Chang Gung Memorial Foundation Administration, Taiwan

ABSTRACT

Background: Evidence-based practice (EBP) in healthcare has focused mainly on the hospital setting. However, there is little research on the adoption and implementation of EBP among school nurses in Taiwan, many of whom have limited experience using and lack the necessary skills to confidently implement EBP.

Summary of Work: This study aimed to develop an evidence-based school nursing course with a Web-based blended format in which approximately 9 hours of the class were conducted online, 10 hours were conducted using a traditional in-class and face-to-face format, and outreach support was provided for 3 months. The support involved email, online interaction, and telephone contact. Knowledge, attitudes, and skills were assessed using a questionnaire administered at baseline, post-training program, and 3-month follow-up, and the program's effectiveness was analyzed using a repeated-measures ANOVA.

Summary of Results: Convenience sampling was used to recruit 345 primary school nurses in New Taipei City (38%) and Tao-Yuan City (62%). The participants' age ranged from 34 to 62 years, with a mean age of 40.75 years, and the mean length of time employed as a school nurse was 8.4 years; the majority had a bachelor's degree (73.3%), with 41.3% coming from medium-sized schools. The results revealed significant gains in knowledge at the post-training program stage ($p \geq .001$), which was maintained at follow-up. Although there was no statistically significant difference between pre-test and post-test attitudes, the scores at follow-up were significantly higher than at post-test ($p \geq .001$). The improvement in skills between post-test and follow-up was small and non-significant.

Discussion and Conclusions: A blended learning approach and outreach support led to a marked improvement in evidence-based practice knowledge and attitudes, but only minor changes in skills. Therefore, health educators should focus on skill development and help school nurses establish new routines around EBP.

Take-home Messages: A series of EBP training courses should be developed continually and coherently. The study findings can be used as a basis to develop a comprehensive strategy for building EBP competencies through proper training for school nurses.

The Situational Judgement Test - Can it really be taught? A near-peer teaching programme to help improve preparation for the SJT

AUTHOR(S):

- Bryony Peiris, Royal Berkshire Hospital, UK (Presenter)
- Tahira Mohamed, Addenbrookes Hospital, UK

ABSTRACT

Background: In 2013, the Foundation Programme (UKFPO) introduced the Situational Judgement Test (SJT), an exam for employment that tests the attributes needed to work as a doctor. The UKFPO states that students do not need coaching or to revise for the exam. However, final year medical students have been shown to feel unprepared for this exam and unsure how to revise.

Summary of Work: The aim of this study was to deliver a structured teaching program to final year medical students on the SJT, to assess if students felt more prepared for the exam and to evaluate the efficacy of teaching given by foundation year one doctors.

Summary of Results: A teaching programme was designed, developed and delivered by two recent medical graduates for final year medical students. This consisted of an introductory lecture and a series of workshops based on each of the SJT Target Attribute Domains. The course was open to students from all UK medical schools. Students were asked to complete a feedback form at the beginning and end of the introductory lecture and then at the end of the workshops.

Discussion and Conclusions: One-hundred and fifty-three questionnaires were analysed. Feedback was very positive with 99.3% of students stating that they found attending a workshop useful and the majority of students saying the course was well organised (94.2%), they felt more prepared for the exam (86.3%), and felt they knew better how to approach answering questions (88.9%).

Take-home Messages: Despite the UKFPO's recommendations, our results have shown that students have found this course useful in preparing for the exam, in particular to be taught by near-peers who have recently sat the exam themselves. Due to a lack of formal preparation materials being available to students, we hope this course can become an annual event as was expressed in feedback.

Educating and Empowering Ethiopian Medical Trainees on Quality Improvement and Patient Safety within the field of Infectious Diseases

AUTHOR(S):

- William Stokes, University of Calgary, Canada (Presenter)
- Candace Rypien, University of Calgary, Canada
- Bayan Missaghi, University of Calgary, Canada
- Aynishet Adane, University of Gondar, Ethiopia
- Dylan Pillai, University of Calgary, Canada
- Bonnie Meatherall, University of Calgary, Canada

ABSTRACT

Background: The University of Calgary and the University of Gondar Collaborative Short Course in Clinical Infectious Diseases is a four-day intensive training course that focuses on infectious diseases and patient safety and quality improvement (PSQI). It is taught at the University of Gondar in Gondar, Ethiopia and is geared towards medical trainees associated with the university. Our aim was to qualitatively and quantitatively determine how successful the course was among the participants.

Summary of Work: The clinical topics for the course were chosen based on a needs assessment by collaborators at the University of Gondar Internal Medicine Department. They included didactic lectures, clinical cases, microbiology lab work, and small group PSQI projects. Pre and post-course tests, individual interviews, focus groups, and feedback surveys were used to assess the needs of the course participants as well as the effectiveness of the course instruction.

Summary of Results: 18 trainees attended the course. 17 completed both the pre and post-tests; 5 interns, 7 general practitioners, and 5 internal medicine residents. Average pre-test and post-test scores were 47% and 73%, respectively, corresponding to a 26% difference ($p < 0.001$) which did not differ significantly between the trainees' education level. Participants median rating for all lectures was 'excellent' except for two. Based on interviews and focus groups, the most enjoyable course topics were the PSQI small group projects and the lectures that were case based.

Discussion and Conclusions: With WHO's recommendations for implementing patient safety in medical school curriculums worldwide, our course excels at expanding this patient safety curriculum to developing trainee-led PSQI projects, with an emphasis on infectious diseases.

Take-home Messages: The University of Calgary and the University of Gondar Collaborative Short Course in Clinical Infectious Diseases at Gondar, Ethiopia is a well-designed, interactive, and informative teaching course that enhances trainees' knowledge on tropical diseases and empowers them to consider incorporating PSQI measures into their local workplace. Further work is ongoing to strengthen the relationship between this medical partnership, such as by supporting longitudinal, trainee-led PSQI initiatives with the University of Gondar Department of Medicine.

Effectiveness of integrating EBM into PBL sessions in Pharmacist PGY Training Program

AUTHOR(S):

- Hui Chen Su, Chi Mei Medical Center, Taiwan (Presenter)
- Mei Chuan Lee, Chi Mei Medical Center, Department of Pharmacy, Taiwan
- Yi Ming Hua, Chi Mei Medical Center, Department of Pharmacy, Taiwan
- Ying Ling Liu, Chi Mei Medical Center, Department of Pharmacy, Taiwan
- Hsing Chun Hsieh, Chi Mei Medical Center, Department of Pharmacy, Taiwan
- Yu Fen Huang, Chi Mei Medical Center, Department of Pharmacy, Taiwan

ABSTRACT

Background: PBL is during the teaching process, with practical issues as the core, encouraging student discussion to develop active learning, critical thinking and problem solving skills. EBM is a systematic approach that integrates individual clinical knowledge and best evidence for clinical care decisions. Both EBM and PBL focus on the resolution of patient's clinical problems. This is the study through real or virtual clinical cases combined PBL and EBM to evaluate the effectiveness in Pharmacist under the Post Graduate Year training Program.

Summary of Work: A total of 25 pharmacists entered this study. We design the basic lessons for EBM, including PICO, search, and critical appraisal. Using the PBL lesson, Lung Cancer Drug Therapy, that design allows students to use the EBM skill to find the best evidence and provide the suggestions to patients. This study use Fresno Test to analyze the differences after this training program.

Summary of Results: Fresno Test is a standardized, objective tool for measuring the ability of Evidence-Based Medicine. It also evaluates knowledge and skills and has a good reliability and validity. There are 12 questions in the Fresno Test, with a total score of 216. This study excludes the diagnostic type appraisal, so the total score is modify to 156. 25 pharmacists. There was a significant difference after the integrating PBL and EBM training program. The pre-test score was 93.43 ± 24.32 , and post-test was 129.71 ± 22.34 ($p < 0.0001$).

Discussion and Conclusions: EBM is a core skills in clinical medical members. Through integrating EBM into PBL sessions, that use virtual cases, guide students practice and provide an appropriate clinical suggestions. This is a successful learning module and worth to promote.

Take-home Messages: Through the simulated case, provide students practice opportunity. Let the knowledge complete in three stages: know, get, and do.

Educational Programs and their Influence on Pharmacist Satisfaction and the Quality of Pharmaceutical Services: Serial Analysis in a University Hospital

AUTHOR(S):

- Er-Ying Wang, Taipei Medical University Hospital, Taiwan (Presenter)
- Han-Yin Lo, Taipei Medical University Hospital, Taiwan
- Bi-Li Chen, Taipei Medical University Hospital, Taiwan

ABSTRACT

Background: It appears that the current clinical internship for pharmacists is insufficient in preparing graduates for performing in-depth assessments or making recommendation for physicians. In this paper, we outline an interactive educational program aimed at enhancing the professionalism of pharmacists.

Summary of Work: A total 24 individuals were enrolled in the program which ran from Dec. 2017 to May 2018. They were distributed in terms of work experience as follows: < 2 yrs (33.3%), 2-4 yrs (20.8%) and > 4 yrs (45.8%). The program included weekly classes on topic-driven journal reading in conjunction with a case-based discussion. Questionnaires administered before and at the end of the program were used to evaluate the participants' level of professional knowledge, problem-shooting skills, and issues pertaining to professionalisms. Pharmaceutical outcomes were evaluated before and during the program as well as 6 months after completion by tabulating the number of prescriptions recommended (RN), pharmacist suggestion rate (PSR), the RN out of total prescriptions and physicians concur rate (PC). Results were calculated using a two-sided Students' t-tests, and a computed p value < 0.05 was considered significant.

Summary of Results: We observed gradual improvements in outcomes in average RN (228.8, 310.7, and 335.2). The PC increased from an initial value of 91.6% to 95.1% and 94.9%. We observed a significant increase in PSR over time from initial 1.1% to 1.4%, and 1.6%, ($p = 0.015$ and 0.004 , respectively). Participants with less experience (≤ 4 yrs) reported a high degree of satisfaction (77.3% to 85.4%, $p = 0.005$), particularly in problem-shooting skills ($p < 0.01$).

Discussion and Conclusions: The program was shown to enhance professionalism and pharmaceutical outcomes even after the program ended. Clinician participation is crucial to the success of such programs. Barriers for sustainable programs include a lack of teaching staff, low physician attendance, and a lack of institutional support.

Take-home Messages: On-job training programs can better improve physicians' prescriptions.

Formal Procedural Skills Training for Internal Medicine Junior Doctors with Task Trainers - A Singapore Experience

AUTHOR(S):

- Lee Deanna, Sengkang General Hospital, Singapore (Presenter)
- Dong ChaoYan, Sengkang General Hospital, Singapore
- Chua Melvin, Sengkang General Hospital, Singapore
- Aw Derrick, Sengkang General Hospital, Singapore

ABSTRACT

Background: Singapore Board of Internal Medicine requires doctor's actual demonstration of competence and safe performance of a set of specific procedures through direct observation before formal credentialing and certification process. Formal accreditation is crucial to provide a safe practicing environment on top of building upon procedural knowledge, hands-on skills, confidence in practice for doctors before attempting procedures on real-life patients. Present data show that trainee doctors who lack procedural experience significantly cause complications like increased length of stay and procedural complications.

Summary of Work: From May 2018 till Jan 2019, a total of 120 Junior doctors rotating through Sengkang General Hospital Internal Medicine posting underwent formal procedural skills training certification course. They were given pre-reading materials and assessment of knowledge and confidence prior to hands-on demonstration and supervised practice using the task trainers. They were then assessed on their performance post course using the check-list and again their confidence in procedural performance. They were then deemed competent to perform these procedures (central venous catheter, lumbar puncture, abdominal paracentesis, joint aspiration, thoracocentesis, and chest tube) under direct supervision on real patients. Then, they were required to log in their procedures performed as part of formal credentialing process to progress to perform such procedures without direct supervision. Six months later, a follow-up assessment and confidence interval was also done to measure the effectiveness of this course along with procedural complication.

Summary of Results: 80% of the junior doctors felt that their confidence improved significantly after the procedure course and six months later ($P < 0.05$). Their knowledge improved by 75.5% post-course ($P < 0.05$), but dropped to 65.5% six months later. Their skills improved by 65.9% post course and 69% six months later with the practice on real life patient.

Discussion and Conclusions: The preliminary results show positive overall impact of this course. For the follow-up studies, we would measure changes in practice and patient care quality.

Take-home Messages: Formal procedural skills training for junior doctors using task trainers improved their confidence, knowledge and skills in internal medicine bedside procedures.

From experience to action! A new Strategy for breastfeeding education

AUTHOR(S):

- Su-Chiu Wang, Taichung Veterans General Hospital, ROC (Presenter)
- Yu-Yan Liu, Taichung Veterans General Hospital, ROC

ABSTRACT

Background: Promoting breastfeeding is very important for infant and women health. During the early postpartum period, the mother faced physiological discomfort such as wound pain and fatigue, so they delayed breastfeeding and rooming-in. Clinically, new nurses are often troubled by the inability to provide assistance. We used a breastfeed Experience camp for new nurses to improve their confidence index.

Summary of Work: Breastfeed Experience camp is designed from three parts: cognitive, Affective and skill. It used kahoot to concept clarification and tried role-play and zivio system to improve consultation. We used a warm bag for staffs to feel the pain of the perineum and used sandbags to feel the pressure of caesarean section wound. Then we try role play and help normal delivery and caesarean section women about how to breastfeed their baby. After experience camp, we used clinical reasoning teaching for to help new mom breastfeed her newborn. We collected and analyzed the data from the confidence index and teaching target achievement.

Summary of Results: Total 23 new staffs joined the experience camp. After the experience camp, the confidence index increased by 1.23 points. From the three teaching target of effectiveness, after the experience camp shows Significant.

Discussion and Conclusions: Health care staff education is the important factors that may help moms breastfeed longer. Experiential Learning for breastfeeding is funny and effective than traditional classroom lecturing. After experience camp, our new staffs know how the mother's feeling and to help them comfortable. We are developing a system of breastfeeding situation for training staffs to support breastfeed.

Take-home Messages: we should learn more Strategy for breastfeeding education.

Are 3rd Year Medical Students more likely to attend Medical Bedside Teaching or Case Based Tutorials? A study from a University of Liverpool teaching hospital

AUTHOR(S):

- Gershan Davis, University of Central Lancashire, UK (Presenter)
- Ekaterini Efstathiou, University of Liverpool, UK
- Julie-Anne Regan, University of Liverpool, UK

ABSTRACT

Background: Student attendance is felt to be linked to academic achievement and in our hospital there has been concern regarding medical student absenteeism at both bedside teaching (BT) and case based learning (CBL). We therefore investigated the reasons for attendance and nonattendance at BT and CBL amongst 3rd year medical students doing a clinical placement in Medicine at a University of Liverpool teaching hospital.

Summary of Work: Semi structured Interviews were carried out amongst 5 students of the previous year to aid the development of an anonymous questionnaire survey with accompanying free text. The final questionnaire was designed from a literature review and inclusion of local factors obtained from the thematic analysis of the interviews. 36 students in the then current year 3 were invited to participate.

Summary of Results: There was a 47 % overall response rate and 76% of students felt that attendance at BT was essential to becoming a good doctor whilst 63% felt that attendance at CBL was essential to becoming a good doctor. Reasons for attendance at bedside teaching were essential to becoming a good doctor (76%), enjoyment of attending (71%) and extrinsic motivation (important to maintain high level of achievement (71%), able to improve my knowledge (76%), helps understanding (71%). Commonest reasons for attendance at CBL were related to the students' feelings regarding the course characteristics such as Consultant delivered (81%), instructive (81%) and ability to ask questions and help understanding (81%).

Discussion and Conclusions: Despite the perceived value of BT, students are less likely to attend compared to CBL. They attend based on intrinsic motivational factors compared to CBL which they attend based on external motivation and the perceived educational value. They were disappointed by the content and teaching in BT and therefore less likely to attend compared to CBL.

Take-home Messages: Bedside Teaching needs to be addressed in the current UK health care setting so as to improve attendance and benefit medical student learning.

Case Based Learning versus conventional lecture in Clinical Pharmacology education and its relation to learning styles

AUTHOR(S):

- **Fatih Ozdener, Department of Pharmacology, Bahcesehir University School of Medicine, Turkey (Presenter)**
- Abdullah Canberk Ozbaykuş, Bahcesehir University School of Medicine, Turkey
- Melike Yavuz, Department of Public Health, Bahcesehir University School of Medicine, Turkey
- Demet Koc, Department of Medical Education, Bahcesehir University School of Medicine, Turkey

ABSTRACT

Background: Case based learning (CBL) has been proven to stimulate analytical and diagnostic thinking skills and has been utilized as an effective method of education in medical curriculums. Pharmacology is a discipline that bridges basic and clinical sciences and deals with clinical cases and their treatments and hence is a quite suitable subject for CBL. Despite that potential, CBL has been under-utilized in Pharmacology teaching in medical curriculums. This study was conducted to pilot CBL as a method of teaching Clinical Pharmacology to medical students at Bahcesehir University School of Medicine in Turkey and to find out whether it is more suitable for a particular learning style

Summary of Work: CBL sessions were given as part of the 3rd year clinical pharmacology curriculum and sessions were facilitated by a Pharmacology professor. Sixty seven students participated in the study after giving informed consent. Participants were given a questionnaire of 15 questions to rate the CBL sessions and compare them to conventional lecture format. Subsequently, a validated questionnaire (VARK) was applied to students to determine their learning styles. The results of CBL session questionnaire was compared to learning style questionnaire to detect possible associations between the learning style and the opinions by a particular student.

Summary of Results: In a Likert scale of five points, frequency distribution has shown that the vast majority of the responses were positive between agree and strongly agree points for positive opinions on CBL. The students strongly agreed that this teaching method stimulated critical thinking, helped familiarize with clinical cases and that it could be utilized by other disciplines as well. Furthermore, there were no differences between responses by students with multimodal versus dominant uni-modal learning styles showing that all learner types equally benefited from the CBL sessions.

Discussion and Conclusions: Our study has shown that CBL in Clinical Pharmacology is highly regarded and positively taken up by medical students that had already acquired prior basic knowledge. Beneficial effects of CBL is not confined to a particular learning style and therefore is applicable to all students.

Take-home Messages: CBL is an effective alternative method for Clinical Pharmacology education regardless of learning styles.

A test-driven learning in acute cardiac care conference effectively improves electrocardiogram (ECG) reading skills of medical students and residents

AUTHOR(S):

- Chungyu Lin, Department of Internal Medicine, National Taiwan University College of Medicine, Taipei, Taiwan (Presenter)
- Ming-Shiang Wu, Department of Internal Medicine, National Taiwan University College of Medicine, Taipei, Taiwan
- Po-Yuan Chang, Department of Internal Medicine, National Taiwan University College of Medicine, Taipei, Taiwan

ABSTRACT

Background: Although the training course of electrocardiogram (ECG) interpretation was started early in medical school, the accuracy in interpretation of 12-lead ECG under emergent conditions has remained a challenge for junior doctors (students and residents). Timely and correct ECG diagnosis is the most important factor determining clinical outcome in patients with acute myocardial infarction. To improve junior doctors' ability in critical ECG readings, we have initiated a weekly cardiac care conference focused on ECG teaching since 2012 using a test-driven strategy.

Summary of Work: Junior doctors who rotated to cardiology department were required to attend the 1-hour acute cardiac care conference every week. In the beginning of the conference, they were given a questionnaire about their ECG training background along with a pre-test sheet of 3-5 ECGs obtained from critical patients. After 30 minutes, a post-test sheet containing another 3-5 ECGs was given. The correctness of these tests, the junior doctors' confidence in ECG reading and their feedback were evaluated by certified cardiologists.

Summary of Results: The junior doctors were divided into two groups according to whether they ever attended this conference before. Based on their answers in the questionnaire, Group 1 had attended the conference at least once while Group 2 had not. Compilation analysis showed that in the pre-test, Group 1 clearly demonstrated a higher percentage of correctness of ECG test questions than Group 2. In the post-test, there was no difference. Both Groups revealed a better rate of ECG correctness in the post-test compared to the pre-test. In addition, the confidence in reading difficult ECGs also improved after attending this conference for both groups.

Discussion and Conclusions: A test-driven learning strategy in a critical care conference not only increased young learners' participation but also improved their confidence in the management of acute cardiac patients. This strategy also improved the reading skills of difficult and complex ECGs with a short learning curve.

Take-home Messages: Improving ECG reading skills is a prerequisite for junior doctors to work confidently in the critical care units. A test-driven learning strategy in acute cardiac care conference improves young learners' participation, their ECG reading skills, and the confidence in the management of acute cardiac patients.

How to gain Radiology Knowledge? Comparison between the group lecture and integration learning of 4th year medical students in Lampang Hospital MEC

AUTHOR(S):

- Sarawadee Chatchavan, Lampang Hospital Medical Education Center, Thailand (Presenter)
- Jaruporn Ruanrung, Lampang Hospital MEC, Thailand

ABSTRACT

Background: Medical students need to acquire basic skills in image interpretation, anatomical knowledge, clinical of patient and background of underlying disease for interpretation X-ray images. There is difference of diagnostic Radiology curriculum for medical students in each Medical school. Some MEC have integration extending across the four-year curriculum. Some of MEC as well as in Lampang MEC of Thailand has a 4-weeks separate radiology course for fourth year medical student curriculum. Groups of medical student passing major wards have ward round teaching and evaluated by integration learning. The study who never pass teaching from major wards round were teach by group lecture before examination.

Summary of Work: To determine the differences of knowledge assessment in imaging interpretation of 4th year medical student in Lampang MEC between the group that having group lecture learning and integration learning.

Summary of Results: A retrospective study based on the records of the radiology assessment scoring system of fourth year medical student of Lampang MEC enrolled in 2014 to 2018 was used. Comparison of radiological knowledge after completed lecture blog or integration learning blog, between 4 groups of students in last five years since 2014-2018. The group divided to 1) and 2) nothing to ward round or passed outpatient department 6 months, group lecture. 3) and 4) passed inpatient department 6 months or verall rotations and the last rotation is radiology, integration learning. - Pre-test and post-test for evaluated basic radiology knowledge. - The 4 type of questionnaire was blinded and randomised, given from Radiology Department, Faculty of Medicine of CMU, Thailand. - Knowledge was gain and difference of diagnostic radiology knowledge before and after group lecture (about 5.8 to 14.6 score, p-value < 0.01) There was assessment of radiology knowledge between the groups that having group lecture learning(group 1-2) (mean =14.87 and S.D.= 3.5) and integration learning (groups 3-4) (mean =9.75 and S.D. 5.3), (p-value < 0.01).

Discussion and Conclusions: The group lecture still advantage to developing radiology knowledge more than integration learning. The more to known basic science from lecture learning, the more student gain knowledge.

Take-home Messages: The group lecture was hit to the point to learning of radiology more than integration learning.

Flipped classroom Versus Classic Lectures in Medical Education: What do Moroccan Students Prefer?

AUTHOR(S):

- Ghita Hjiej, Université Mohamed Premier, Morocco (Presenter)
- Naima Abda, Laboratory of Epidemiology, Clinical Research and Public Health. Université Mohammed Premier, Morocco
- Maryam Fourtassi, Université Mohammed Premier, Morocco

ABSTRACT

Background: Lectures are still very widespread, and known as the main teaching method in Moroccan Universities, including Medical Schools. However, they are widely criticized for their passive methods not allowing the student to be an actor in the learning process. The present study aimed to assess the introduction of a more active teaching method combining e-learning and flipped classroom in a course thought to undergraduate medical students, at the Faculty of Medicine of Oujda.

Summary of Work: 223 second-year medical students participated in the study. The teaching of the module Physiology of the Nervous System was performed according to the classic lecturing method for its first half and using the flipped classroom concept for the second half. In this latter, students were provided educational videos as a course material to study off-class. The comparison of the two teaching methods was based on 3 criteria of judgment; 1-the overall satisfaction of the students, 2-the number of questions asked by the students during each of the two halves of the course, and 3-students' grades in the final assessment of the course.

Summary of Results: The main results revealed a superiority of the flipped classroom method compared to the lecturing one within the 3 criteria of judgment. 56% of the participating students stated a preference for the flipped classroom, compared to 44% who preferred the lectures. Students asked 4 times more questions during the flipped sessions (102 questions) compared to the lecture sessions (24 questions). And the error rate during the final assessment was slightly higher in questions related to the classical part (37.1%) than the flipped part (37.6%).

Discussion and Conclusions: Flipped classroom seems to be a good method for medical education because it allows students to be actors of their own learning and to take more advantage of their teacher's time and knowledge through answering their questions. Furthermore it can make use of more attractive and widespread technological tools this new generation of students are fond of.

Take-home Messages: Flipped classroom combined to E-learning tools can be implemented in medical studies in Morocco, as they engage students more actively in their learning.

The Perspectives of Evidence-Based Health Care Teaching on Undergraduate Medical Education in Taiwan

AUTHOR(S):

- Yu-Fang Huang, National Cheng Kung University Hospital, College of Medicine, National Cheng Kung University, Taiwan (Presenter)
- Jing-Jane Tsai, Institute of Education, College of Social Sciences, National Cheng Kung University, Taiwan
- Ting-Yu Yang, National Cheng Kung University Hospital, College of Medicine, National Cheng Kung University, Taiwan
- Yi-Ching Yang, National Cheng Kung University Hospital, College of Medicine, National Cheng Kung University, Taiwan
- Chih-Wei Chang, National Cheng Kung University Hospital, College of Medicine, National Cheng Kung University, Taiwan
- Pei-Ying Wu, National Cheng Kung University Hospital, College of Medicine, National Cheng Kung University, Taiwan

ABSTRACT

Background: Medical education in Taiwan has undergone dramatic changes over the past two decades. The goal of producing graduates who are scholar-scientists focuses on developing the abilities to apply the scientific method and recognized approaches to medical research; critically appraising relevant medical or scientific studies; applying findings from literature; and understanding the ethical and governance issues. This study aims to investigate evidence-based medicine teaching for developing future evidence-based health care (EBHC) curricula.

Summary of Work: We conducted a validated mail survey to investigate the EBHC curricula and present practices of 13 medical schools and 68 teaching hospitals/medical centers across Taiwan in 2012. Moreover, teachers' cognitions, attitudes, and teaching experiences regarding EBHC education for undergraduate medical students were studied.

Summary of Results: The response rate was 51.6%; 231 respondents (94.7%) provided information about their cognition, attitude, and satisfaction regarding EBHC teaching; EBHC education was conducted by 81.3% of medical schools for undergraduate year (UGY) 1-5 students and 86.2% of teaching hospitals for UGY 6-7 students. We demonstrated the most common teaching formats, assessments, and challenges in EBHC education between early and advanced undergraduate stages. Significantly fewer teachers in hospitals compared to those in medical schools were satisfied with EBHC teaching and agreed with the necessity of EBHC. However, approximately 50% of the surveyed institutes did not have assessment tools for EBHC learning. The Berlin Questionnaire and Fresno test were the most common tools applied to evaluate students' epidemiological skills and competence in evidence-based practice (EBP), respectively.

Discussion and Conclusions: Future assessment tools should be developed with the assistance of the Classification Rubric for EBP Assessment Tools in Education framework to measure the effects of EBHC education. The incorporation of standardized EBHC assessment into OSCE may place on the importance of EBHC education in medical school curriculum.

Take-home Messages: - Modern medical education emphasizes learning outcomes consistent with students' competence to apply their knowledge and skills in evidence-based health care. - The elucidated 5-steps of evidence-based practice has been promoted broadly in undergraduate years with a lack of standardized assessment tools. - The implementation of EBHC education might be achieved by developing standardized measurements and by incorporating the assessment tools into national clinical examination.

Cross-cultural adaptation of the Four Habits Coding Scheme (4HCS) for teaching and assessing patient-centered communication skills in Brazil

AUTHOR(S):

- Helena Paro, Federal University of Uberlândia, Brazil (Presenter)
- Renata Catani, Federal University of Uberlândia, Brazil
- Emiliana Valadares, Federal University of Uberlândia, Brazil
- Renata Giaxa, Federal University of Uberlândia, Brazil

ABSTRACT

Background: Brazilian educational guidelines reinforce patient-centered care (PCC) communication skills (CS) as an important competence for medical students. The Four Habits Coding Scheme (4HCS) is an instrument used for teaching and assessing clinicians' communication skills in a person-centered care approach. We aimed to translate and culturally adapt the 4HCS into Brazilian Portuguese.

Summary of Work: The translation process was accomplished in seven stages: initial translation, reconciliation, back translation, review by the author, independent review, consensus version through Delphi technique, review by a language coordinator, and pre-test. During pre-test, three independent observers assessed four medical consultations performed by medical students and residents that had been recorded in a real health care scenario.

Summary of Results: Reviewers had difficulty in reaching consensus on expressions referring to understanding the whole person, such as 'Engage in small talk', 'Expansion of concerns', 'Elicit full agenda', 'Use patient's frame of reference', and 'Explore plan acceptability'. They also had difficulty in reaching consensus on the translation of the word 'clinician', which was first translated as 'physician'.

Discussion and Conclusions: The translation of the word 'clinician' was the most typical example of the difficulty in incorporating PCC principles into Brazilian medical practice. Even provided with the definition of 'clinician', both physicians and translators could not come to terms with it appropriately. Most likely, the historically dominant physician behavior and the idea that the physician is the one responsible for establishing communication in the physician-patient relationship may have influenced this result. The use of rigorous translation and adaptation techniques with the participation of a panel of qualified experts and language coordinators has resulted in a culturally, conceptually, semantically and operationally sound instrument. It may represent an important advance for strengthening the person-centered care model in Brazil.

Take-home Messages: The use of the 4HCS in Brazil for teaching and assessing communications skills may represent an important advance for strengthening the person-centered care model in our country.

Preparatory course for medical students undertaking humanitarian services during Enrichment Year: Global Health competencies and course evaluation

AUTHOR(S):

- Dana Vackova, The University of Hong Kong, Hong Kong (Presenter)
- Mohammed Bedru Hussen Hussen, The University of Hong Kong, Hong Kong
- Janice Mary Johnston, The University of Hong Kong, Hong Kong

ABSTRACT

Background: The University of Hong Kong (HKU) Li Ka Shing Faculty of Medicine new MBBS 130th curriculum offers to medical students in Year 3 Enrichment Year (EY) a unique opportunity to enhance their total learning experience through self-tailored local or overseas learning activities in following categories: (1) research, (2) intercalation or (3) humanitarian services. Students selecting humanitarian services are required to pass the preparatory course to ensure their readiness to embark on their journey for the benefit of communities.

Summary of Work: The course main Global Health (GH) competencies were aligned with Consortium of Universities for Global Health, Medical Council of Hong Kong, and HKU educational aims. Interdisciplinary collaboration strategies and innovative teaching were adopted to support students' learning. A mixed method study was used for the course evaluation. The qualitative analysis of focus groups with MBBS Year 3 students (N=15) was used to analyse the main criteria important for gaining GH competencies. Marking scores using grade descriptors and students' course evaluation questionnaire were analysed quantitatively using frequency analysis and 2-tailed t test to evaluate course effectiveness.

Summary of Results: The course arrangement, workload, relevance to humanitarian work and assessment methods represented the main criteria for gaining GH competencies. All MBBS Year 3 students selecting humanitarian work in the first semester (N=34) passed the course (≈ 60% of the total score). The lowest sub-scores were obtained in a project assessing population needs (average score 63%) and in a quiz (average score 68%) where 8.8% of students failed. The highest sub-scores (average 79%) were obtained in problem base case studies. Students' evaluation at the end of the course showed the highest satisfaction with tutors' guidance (mean 3.74, $p < 0.001$), workshops assisting students to acquire knowledge and skills needed for humanitarian work, and overall course quality (mean 3.71 and 3.55 respectively, $p < 0.001$).

Discussion and Conclusions: The course was effective in developing students' main GH competencies to pursue humanitarian work. However, robust knowledge is essential for maximising the benefits from humanitarian activities.

Take-home Messages: Careful planning of learning activities and assessment strategies is necessary to ensure students' improvement in knowledge, skills, social responsibilities, and applied learning before commencing humanitarian work.

Benefits of giving international students a voice in a safe arena to improve communication skills

AUTHOR(S):

- **Tim Newson, East Kent Hospitals NHS Foundation Trust & Kings College London Medical School, UK (Presenter)**
- Bruce James, Stoke Mandeville Buckingham Health Care NHS Trust & St George's International Medical School Grenada, UK
- Sally Edmonds, Stoke Mandeville Buckingham Health Care NHS Trust & St George's International Medical School Grenada, UK

ABSTRACT

Background: We provide clinical training for International students in the U.K. and have recognised that many students found the transition to NHS attachments challenging with Directors of Medical Education (DME) often expressing concerns about their communication skills.

Summary of Work: We devised a one day course for 9 students identified by DME as needing help with communication skills from 2013 -2018. Our aim was to give these student's a voice in a supportive, non-judgemental, safe arena with the emphasis on learning and creating new understandings. The students were asked to prepare a talk for 5 minutes without PowerPoint on a subject they felt passionately about and familiarise themselves with 3 patient scenarios in the week prior to attending. The course started with the student presentations to the group . Feedback was then related to consultation skills empowering the students performances to hopefully be transformative. They then completed scenarios each with actors, each student being the doctor and other two critiquing using a prompt tool with a facilitator. Further scenarios included paediatrics and breaking bad news .De-brief sessions were punctuated throughout. Quantitative and qualitative feedback was collected anonymously via survey at the end of each course.

Summary of Results: Between 2013 and 2018 53 students attended the course which was universally very well received and valued with scores of 4.5 to 6/6 (1=poor 6= excellent) in all domains (content, structure and learning). 80% of presentation topics were non medical eg cultural identity, mental health, politics, inspirational role models, social media, and family. This session in all courses helped engender a safe arena and bond the group. Qualitative feedback was positive : informative, non threatening environment, practicals extremely useful, helped identify my weaknesses, gave me ideas on improving consultations, critique role helpful, role playing liked interaction, presentation fun.

Discussion and Conclusions: This course provided a safe arena with opportunities for students voice to be heard early in the programme aiding bonding within the group and enhancing their engagement in learning and improving communication skills.

Take-home Messages: Teaching international students communication skills benefits from giving a student's voice a platform within a safe non judgemental arena

Student support system for foreign medical students

AUTHOR(S):

- Hana Svobodova, 3rd Medical Faculty, Charles University, Czech Republic (Presenter)
- David Marx, 3rd Medical Faculty, Carles University, Czech Republic

ABSTRACT

Background: Since 1992 Third Medical Faculty Charles University in Prague has been admitting approximately 1/3 of students (cca 100) into the English language MD program. For many students the pressure of initial years of medical studies together with transfer into a different country, culture and language present a source of significant stress which has led in the past to premature terminating of studies or repeated study interruption, psychological issues requiring therapy (anxiety, depression) and even to suicidal attempts.

Summary of Work: In 2010 a new student support system was launched consisting of the following: a) launching a 24/7 helpline for students in need b) tutor system - each study group is assigned one student tutor and one faculty tutor c) contracting 2 English speaking psychologists that are available for short or long-term psychotherapy.

Summary of Results: During the period 2010-2018 a total number of 312 phone calls have been received and the main topics of calls are: 1) health issues 2) psychological problems (exam anxiety, sleeping problems, mood changes) 3) problems with accommodation 4) administration problems (visa issues) 5) need for urgent interpretation.

Discussion and Conclusions: The poster presents analysis of the reasons for psychological referrals and comparison of study failure rates before/after introducing student support system.

Take-home Messages: International groups of students need to definitely feel a support for adaptation in a foreign country, especially psychosocial support is needed.

International clinical exchange programs for medical students: perspectives and influencing factors

AUTHOR(S):

- Thanaphon Harnpoonvittaya, Faculty of Medicine, Srinakharinwirot University, Thailand (Presenter)
- Arucha Treesirichod, Faculty of Medicine, Srinakharinwirot University, Thailand

ABSTRACT

Background: As multi-connectivity becomes a trend in modern education, international clinical exchange programs have also grown into a significant part of medical curricular. The students are encouraged to step beyond the norms of their studies and cultures, and to explore for themselves how medicine is taught and studied around the globe.

Summary of Work: Self-administered questionnaires were used to determine perspectives of clinical students of Srinakharinwirot University towards the programs and the influencing factors that affect the decision-making process. Results were further compared between those who have and have not participated in these programs to determine the factors that could be withholding even greater participation.

Summary of Results: Regarding the perceptions towards international clinical exchange programs (n=106), both groups of participants agree that the programs help broaden their views on medical education worldwide (87.8%), made them more active in self-directed learning (82.1%), encouraged them towards improving their communication skills (95.3%), cultural adaptability skills (94.3%) and boosted their responsibility (82.0%). Both groups did not think the programs created stress (68.9%) or were a waste of time (70.8%). Comparison showed a significant difference in that the programs were more helpful in deciding future career paths for those who have participated over those who have not (p=0.024). Both suggested that future programs include an academic preparatory course (67.0%) and more financial support for each individual (91.5%). In correlation with these suggestions, academic incompetency (p<0.001) and financial shortage (p<0.001) were found to be significant inhibitory factors for non-participants. Along with them were language barriers (p=0.002) and lack of advertisement (p<0.001).

Discussion and Conclusions: The trend of future education will most likely involve global academic exchanges. A sensible goal would be to ensure more students have access to this opportunity. The results indicate that medical students have optimistic views towards international clinical exchanges and strategies could be instigated to provide better opportunities and enhance their global exchange experiences.

Take-home Messages: International clinical exchange programs are viewed productive and helpful by medical students. Further steps such as additional academic preparation and budgetary support will most likely result in greater involvement from the students.

The Learning Experiences of International Post-Baccalaureate Medical Students in Taiwan: a qualitative study

AUTHOR(S):

- Pei-jung Tsai, E-Da Hospital/ I-Shou University, Taiwan (Presenter)
- Ru-yi Huang, E-Da Hospital, Taiwan
- Wan-ling Hsu, E-Da Hospital, Taiwan
- Fan-Ko Sun, I-Shou University, Taiwan
- San-nan Yang, I-Shou University, Taiwan
- Hsing-yen Hsieh, I-Shou University, Taiwan

ABSTRACT

Background: To improve the well-being of people throughout the pacific islands, Caribbean, Africa, middle and South America, Taiwan started a program to share medical education and healthcare resources to the friendly countries. This program embraced students from 15 nations that are dedicated to improve medicine and public health. The aim of this study is to explore the experience of international medical students training in Taiwan Medical College.

Summary of Work: This study is a qualitative research with trained interviewers. We planned to enroll 20 fourth-year students or until reach the data saturation. Results were analyzed using Colaizzi's seven research and analytic steps with NVivo11 software. There are five areas in the semi-structured in-depth interview outline: life, academic and clinical learning, interpersonal relationship and cross-cultural medical experiences.

Summary of Results: The initial sub-themes from fourth-year students on life experience: hard to adapt to the food and dorm life in the beginning, but are most satisfied with Taiwan's transportation and information technology. On academic and clinical learning experiences: their major concern is whether the program recognized by their local university and hospitals. The challenges were highly-packed learning schedule, language barrier which affected practicing hands-on skills, but found that teaching teams were helpful. On the interpersonal relationship: feeling friendly atmosphere in Taiwan, but still comfortable within their own ethnic group. On cross-cultural experience: adjust to local Taiwanese norms regarding behavior, eye contact, religion and holidays.

Discussion and Conclusions: Adjustment of life and culture is hard initially, but also benefit in forming different viewpoints. The language barrier made communication difficult, and impeded their practice of hands-on skills and procedures. Noteworthy, some students were worried about the unstable diplomatic relationship and if the program could be recognized locally. The results provide schools useful information to improve their curriculum through understanding the experience of international medical students who are studying abroad.

Take-home Messages: It is crucial to develop the cultural competence and methods to conquer language barrier when setting an international medical education program, so to achieve a better global healthcare.

Clinical, social and educational analyses of a University Extension project at a Riparian Community

AUTHOR(S):

- **Ricardo Costa, Barretos School of Health Sciences Dr. Paulo Prata - FACISB, Barretos, São Paulo, Brazil (Presenter)**
- Amanda Gonçalves Costa, Barretos School of Health Sciences Dr. Paulo Prata - FACISB, Brazil
- Roberta Thome Petroucic, Barretos School of Health Sciences Dr. Paulo Prata - FACISB, Brazil
- Lucas Henrique Viza Amorim, Barretos School of Health Sciences Dr. Paulo Prata - FACISB, São Paulo
- Alicia Monte Vicente Medina, Barretos School of Health Sciences Dr. Paulo Prata - FACISB, Brazil
- Flavio Mavignier Cárcano, Barretos School of Health Sciences Dr. Paulo Prata - FACISB, Brazil

ABSTRACT

Background: Social accountability mobilizes the individual to act in a disinterested and gratuitous way, sacrificing their good for the good of others. Developing this concept in medical students, through experiences that extrapolate the curricular environment and by teaching them about their role in the society, is fundamental for proper medical training. The 'Ribeirinho Project' was a University Extension project which consisted in giving assistance in preventive and basic health to a riparian community, in the Amazon surroundings, Brazil. The community has fishing as source of livelihood, high rate of illiteracy and lives far from the main health care centers. The aim of the study was to analyse the clinical, social and educational outcomes of the Ribeirinho Project.

Summary of Work: Cross-sectional study analysing the care of a riparian community. Demographic, social and health variables, were collected between 2016 and 2017. Also, the perception of the medical students committed to the project was obtained through a questionnaire.

Summary of Results: 204 subjects (age > 21 year) were attended and mostly were women (68.1% in 2016; 63.6% in 2017) and brown people (90.0% in 2016; 49.4% in 2017). Data from 2017 showed that 85.4% of the subjects didn't have treated water at their homes. The main reason to seek medical care was pain (23.3% in 2016; 22.7% in 2017). All the 14 students understood that being committed to the project contributed to their medical training and improved their understanding about the impact of psychosocial aspects on the health-disease process, while the majority believed that the project improved their empathy (85.7%) and technical skills (71.4%).

Discussion and Conclusions: Brazilian riparian communities present strong needs for basic health care and reaching out these populations should be part of the social accountability of medical schools, providing also a differentiated medical training focused on humanized medicine. The students recognized that the Ribeirinho Project contributed to their medical training.

Take-home Messages: The development of extension projects at communities living in precarious conditions enrich the medical education process while improving the well-being of people in need.

#8FF ePosters - Cross-Cultural Programmes / International Students

Achieving Cultural Competency through a Blended Teaching Program - Creating a culturally safe environment

AUTHOR(S):

- **Pei-Ling Wu, E-Da Hospital, Taiwan (Presenter)**
- Wei-Lin Chin, EDA Hospital & I-SHOU University, Taiwan
- Ru-Yi Huang, EDA Hospital & I-SHOU University, Taiwan
- I-Ting Liu, EDA Hospital & I-SHOU University, Taiwan
- Pei-Jung Tsai, EDA Hospital & I-SHOU University, Taiwan
- Chi-Wei Lin, EDA Hospital & I-SHOU University, Taiwan
- San-Nan Yang, EDA Hospital & I-SHOU University, Taiwan

ABSTRACT

Background: The international medical education program which recruited students from culturally and linguistically diverse backgrounds is challenging. Hence, the School of Medicine for International Students set up a specific educational program to improve better teaching of cultural competence on patient care. This study aims to understand the effects of this program on enhancing cultural competency.

Summary of Work: We designed (1) One oriented training of cross-cultural patient-centered care model, strengthened with small group discussion and video demonstration. (2) Five cross-cultural workshops in the faculty development program. (3) The teaching team, composed of attending physicians, postgraduate year-1 residents, and international medical students, rotates together. The CAST questionnaire was performed to evaluate the knowledge, attitudes, and skills for cultural competency every season for one year. The non-parametric tests of Wilcoxon rank sum test and Kruskal-Wallis test were performed with SAS 9.2 software.

Summary of Results: 35 international medical students(IMS), 77 local medical students(LMS), 27 postgraduate year-1 residents(PGY), and 18 attending physicians(P) responded. The cultural knowledge (p-value:0.01) and skill (p-value:0.001) were significantly different between attending and non-attending groups (resident and medical students). The ranking of CAST was: cultural knowledge: IMS>LMS=PGY=P (p-value:0.003); attitude: IMS>LMS=PGY>P(p-value:0.48); skill: IMS>PGY=P>LMS (p-value:0.02, <0.001).

Discussion and Conclusions: The unique program enhances cultural-competent knowledge and skills of international medical students when compared to local students and postgraduate year-1 residents. Nonetheless, the faculty training modules barely improve the cultural aware practice which indicates that cultural education could start earlier in the educational process. However, the culturally-appropriate attitude did not differ between teachers and students. One possible explanation is that a teaching team with peer support could foster an atmosphere of proper cultural awareness. To summarize, in our study, developing an effective training program needs to include lectures, group discussions and team assisted learning to improve cultural awareness, cultural sensitivity and skills.

Take-home Messages: Implementing the effective teaching methods for cultural competency of international medical education programs is crucial. Trainees especially the international medical students gain better knowledge and skill through the designed cultural program.

Does Technology Cause a Placebo Effect in Medical Education?

AUTHOR(S):

- Carl Gustaf S Axelsson, Department of Surgery, Massachusetts General Hospital, Harvard Medical School, USA (Presenter)
- William T Curry, Department of Neurosurgery, Massachusetts General Hospital, Harvard Medical School, USA
- Michael Healy, Department of Surgery, Massachusetts General Hospital, Harvard Medical School and NEJM Group, USA
- Emil Petrusa, Department of Surgery, Massachusetts General Hospital, Harvard Medical School, USA
- Deborah Rooney, Department of Learning Health Sciences, University of Michigan, USA
- Roy Phitayakorn, Department of Surgery, Massachusetts General Hospital, Harvard Medical School and NEJM Group, USA

ABSTRACT

Background: Medical education research and teaching has become increasingly focused on measuring objective outcomes attributable to specific educational technology interventions. However, little scholarly work discusses the potential for placebo effects on these outcomes. Two common measures of the effectiveness of educational interventions are increased self-efficacy and knowledge. We studied changes in both of these outcomes with a randomized controlled intervention of neurosurgery video-based education modules with medical students in their surgical clerkship.

Summary of Work: A two-week asynchronous, video-based curriculum for four key topics in neurosurgery (Intracranial Hemorrhage, Neuro-Imaging, Hydrocephalus and Glasgow Coma Scale) was created and implemented for groups of Harvard Medical School clerkship students (n=65). On day 1 of the study, each student was randomly assigned to one of two pairs of videos and given a pre-test for knowledge and self-efficacy on all four topics. On day 14, students completed a post-test for knowledge and self-efficacy on all four topics. Subsequent statistical analysis was performed.

Summary of Results: Comparing pre- to post-intervention for all students in the study and all topics, both self-efficacy (+1.37, p=0.001) and knowledge (+6%, p=0.001) significantly increased. Students who watched the modules (n=53) increased their knowledge (p=0.03) and self-efficacy (p=0.024) from pre- to post. Students who did not watch the modules (n=12) showed no change in knowledge (58.8% vs 58.3%, p=0.830), but a significant increase in their self-efficacy ratings (+1.42, p=0.009).

Discussion and Conclusions: All students enrolled in the study significantly improved their content-related self-efficacy, yet only students who watched the modules demonstrated a simultaneous and significant knowledge increase. This placebo effect may be due to potential access to the new education technology or maturation bias within the clerkship even though neurosurgery content is not specifically addressed anywhere else within the clerkship.

Take-home Messages: This study emphasizes the need for strict quality control of external biases when assessing new education technologies.

Vaginal Delivery Manikin Test Effect National License Score in Undergraduate Medical Learning

AUTHOR(S):

- Phornsawan Wasingthon, Buddhachinnaraj Hospital, Thailand (Presenter)
- Auttaya Ratanakaew, Buddhachinnaraj Hospital, Thailand

ABSTRACT

Background: Vaginal delivery is a fundamental skill test. The pretest-national licenses examination should be prepared before the medical students will have the core national licenses examination at the medical council examination centre.

Summary of Work: Forty-six of sixth-year medical students had the vaginal delivery manikin test at the obstetrics and gynaecology department after one week of labor room rotation. All 57 of sixth-year medical students had the vaginal delivery with the involved-umbilical cord on the neck of a newborn for pretest-national licenses examination (pretest-national licenses) at Buddhachinnaraj Hospital.

Summary of Results: All 57 of sixth-year medical students have been assigned to study in every ward while the male and female is 25 and 32 respectively. One-sixth-year medical student did not have both examinations. The 46 of medical students had rotated at a labor room ward. The 11 of medical students had no manikin test before rotation. Mean of the vaginal delivery manikin score was 88.67 with the scores of minimum and maximum were 52 and 100 respectively. The pretest-national licenses had arranged for the 56 of medical students. The pretest-national licenses score was significantly less than the vaginal delivery manikin examination ($p < 0.05$). Mean of the pretest-national licenses score was 47.28, the scores of minimum and maximum were 11 and 90.5 respectively. Mean of the pretest-national licenses score in the vaginal delivery manikin test group was 53.94 and the non-manikin test group was 21.35, while both two groups had significant difference score ($p < 0.05$). Passing level of the pretest-national licenses was more than 60, the 18 of the sixth-year medical students had passed the exam with the mean of 72.94 while the minimum and maximum score was between 60 and 97.5. The mean of non-passed of the pretest-national licenses was 35.43 on the 39 of the sixth-year medical students.

Discussion and Conclusions: By the effect of excitement, the medical students could not concentrate on the advanced skill test. A comprehensive studying and the problem-based scenarios with a mannequin will be useful for the medical students to learn by themselves for long memory and realization.

Take-home Messages: The medical students have to learn by themselves for long memory and realization.

Accreditation on Routine Practice to Improve Patient Safety - from Clinical Pathway to Medical education

AUTHOR(S):

- Chih-Chien Cheng, Taipei City Hospital, Taiwan (Presenter)

ABSTRACT

Background: Educational competencies for the medical assistants are very important and can be performed in a various ways by medical educators. The intended purpose of our goal is to provide evaluation methods and educational procedures for meeting competencies of medical assistants in order to improve patient safety. Vaginal gauze packing is an effective, rapid, and convenient hemostatic procedure carried out either after trans-vaginal surgery or vaginal delivery. Retained vaginal gauzes following procedures are increasingly recognized as a problem. If not removed, it might lead to fever, pain, infection, hemorrhage and psychological problems. Retained surgical gauze is a preventable problem but continues to occur periodically. Prevention remains the key to this problem.

Summary of Work: To develop the educational competencies for the medical staffs/assistants, we used lean concepts and documentations including training and education regularly. We designed a clinical pathway which provide the medical assistants/nurses a checklist and double-checked documents in order to avoid the possibility of retained vaginal gauze jeopardized to patients' safety.

Summary of Results: There are seven branch hospitals of Taipei City Hospital with total 3,103 beds and 17,809 day surgeries (office procedures) in 2018. Before this educational strategy/concepts performed, there has been three cases in 2016 and two cases in 2017 of retained vaginal gauzes reported. Tracing back year 2018, there has no retained vaginal gauze reports after our educational model performed. The pathway is provided as a curricular guide for medical assistants and nurses developing cognitive objectives, performance objectives, evaluations and teaching materials and methods.

Discussion and Conclusions: The intended purpose of our subject is to provide methods and educational procedures in a curriculum for purposes of accreditation, but this concept provides ideas and evaluation methods that can be used clinically. With pre-assessments and post-educational evaluations, this performance of the clinical pathway based on outcome assessments and improvement of patient safety were promising.

Take-home Messages: Educational competencies for the medical assistants are important and can be performed in a various ways by medical educators. Our subject provided evaluation methods and educational procedures to improve competencies of medical assistants in order to highlight patient safety.

Assessment of knowledge and work-placed based education of transfusion medicine in tertiary care, non-university hospital, a pilot study

AUTHOR(S):

- Yada Siriphannon, Buriram Medical Education Center, Thailand (Presenter)
- Detdana Wannapong, Buriram Medical Education Center, Thailand
- Narin Chindavech, Buriram Medical Education Center, Thailand
- Rungnapa Pengprakhon, Buriram Medical Education Center, Thailand
- Surisa Sririvong, Buriram Medical Education Center, Thailand
- Thanatpong Thienwuttivong, Buriram Medical Education Center, Thailand

ABSTRACT

Background: The current curricula in medical schools and hospital worldwide lack exposure to blood transfusion medicine, and require the reformulation of academic programs. In many countries, training in blood transfusion is not currently offered to medical students or during residency. Our previous clinical practice indicates that blood transfusions occur more frequently than recommended, contributing to increased risk of this procedure. Therefore, the rational use of blood and its components is essential for medical students, due to the frequent undesirable reactions.

Summary of Work: A cross-sectional 2 months study, a multidisciplinary team consisted of clinical pathologist, hematologist, blood bank scientist, blood bank nurse rotated to all IPD in hospital to educate and evaluate. Physicians' knowledge was assessed by the questionnaires comprising of 20 questions and 5 case-scenarios addressing basic knowledge, clinical aspects of blood use, threshold transfusion trigger, transfusion reactions, blood safety and hemovigilance, first aid in blood donors. Total score was 25 and duration session was 40 minutes with debriefing feedback after completed. Prospective regular schedule re-assessment was planned.

Summary of Results: Total of 112 physicians were participated (71.4% junior doctors and intern, 19.6% medical students, 9.0% residents), rotated in department of surgery 62.5%, medicine 28.6%, age range 22-45 years and female was 54.4%. The common transfusion errors were prescribing errors 76.5%, monitoring transfusion reactions 17.9%, emergency cross match errors 2.3% due to human errors and multifactorial causes. The hemoglobin transfusion threshold was 9.1 ± 1.7 g/dL in surgery higher than medicine department, 7.5 ± 1.2 , $p < 0.05$. Overall knowledge score was 17.5 ± 3.8 , especially low in clinical aspects of blood used and transfusion reactions. Knowledge score slightly decreased with increasing years of practice ($p < 0.05$). Eighty percent of physicians believed that they required special education to raise their transfusion medicine knowledge.

Discussion and Conclusions: Knowledge of physicians was lower than the expected level. Therefore, educational materials concerning transfusion medicine should be provided in initial step and required long term monitoring and comprehensive corrective feedback.

Take-home Messages: Continuous medical education program should be offered so that the level of transfusion medicine knowledge can be improved.

Chunk training versus holistic training for trauma boot camps

AUTHOR(S):

- Osaree Akaraborworn, Prince of Songkla university, Thailand (Presenter)
- Burapat Sangthong, Prince of Songkla university, Thailand

ABSTRACT

Background: Bootcamp in education has a role to increase the confidence of learners. The learning experiences can be chunk training which is easier for learners to learn or holistic training or holistic training which give students more clinical correlation. This study aimed to compare which approach could improve the confidence of students in trauma resuscitation better.

Summary of Work: Methods The boot camps were held for the last year medical students. The first group received the chunk training of essential skills in trauma resuscitation which consisted of the primary survey, the secondary survey, pelvic binding, splinting of fracture, FAST(Focused Assessment with Sonography in Trauma), and c-spine collar application. The second group received the holistic training which consisted of six trauma scenarios on simulated patients and each scenario integrated essential skills. The confidence of the students was assessed by questionnaire before and after the boot camp.

Summary of Results: There were 344 students, 167 students received the chuck training and 177 students received the holistic training. Forty-seven percent of the students had participated in trauma resuscitation before the boot camp. The confidence of the students before the boot camp did not show a difference between 2 groups (5.3 vs 5.4 (1 to 10 scale), $p = 0.50$). After the boot camp, the confidence of the students increased significantly (7.3 vs 7.9, $p < 0.001$). The difference of confidence between pre and post boot camp also significant between 2 groups (2 vs 2.5, $p < 0.001$).

Discussion and Conclusions: Conclusions The holistic training was a better approach to enhance the confidence of students in trauma resuscitation when compared with the chuck training.

Take-home Messages: Trauma resuscitation is a high acuity, a low-frequency situation which leads to low confidence in medical students. A boot camp is a method to enhance the confidence and using the holistic approach on the boot camps is better.

Do medical students understand the educational benefits in attending the operating theatre?

AUTHOR(S):

- **Shahid Bukhari, University College London Medical School, UK (Presenter)**
- Emma Obiri-Darko, University College London Medical School, UK
- Jenan Younis, University College London Medical School, UK
- Tarek Abdel-Aziz, University College London Medical School, UK

ABSTRACT

Background: It has been recognised that surgical education digresses from traditional undergraduate teaching methods and thus, medical students have difficulty harnessing its merits. Operating theatre experience provides a useful educational adjunct to undergraduate teaching, allowing multiple curricula objectives to be met. Our aim was to establish whether students from a UK medical school understand the potential learning objectives in attending the operating theatre.

Summary of Work: A PubMed literature search was undertaken and a validated questionnaire was identified and used in this study. This was distributed to University College London Medical School (UCLMS) students who had completed their surgical placements. Questions involved asking students understanding of their learning outcomes from attending the operating theatre and whether they thought their time in theatre was beneficial.

Summary of Results: 55 medical students participated. 54% of respondents reported that they did not find their time in the operating theatre beneficial ($p < 0.05$). 93% stated that they did not understand their learning outcomes from attending the operating theatre ($p < 0.05$).

Discussion and Conclusions: A statistically significant number of UCL medical students did not understand their learning outcomes in attending the operating theatre and as result may not be harnessing the full educational value. The operating theatre has been shown to be beneficial in a number of ways such as consolidating clinical learning as well as educating students regarding the multidisciplinary team, effective teamwork, patient safety and professionalism. These are all aspects that have been highlighted as priorities in the GMC outcomes for graduates. Establishing clear learning objectives is crucial to facilitating more valuable educational environments. This can be extrapolated to the operating theatre which may improve undergraduate surgical learning experiences.

Take-home Messages: Establishing clear learning objectives regarding operating theatre attendance may serve to enhance the undergraduate surgical education.

Learning FAST skill for small group using OSCE checklists

AUTHOR(S):

- Smith Soimadee, VachiraPhuket Hospital, Thailand (Presenter)

ABSTRACT

Background: In learning session of focus assessment with sonography in trauma (FAST) skill we have one teacher per 8 students. They were accomplished in pre skill lab session about basic knowledge of ultrasound and FAST. How to enhance learning and engage them in this limited resources and time come to be this model of teaching.

Summary of Work: The study included one teacher and 8 5th-year medical students, participating in class. OSCE checklists were used to guide their observation and feedback. The activity took place in 3 hours period. Phase 1. Mannequin 1. Teacher demonstrate FAST at his normal pace without any comment 2. Then repeats and describes all necessary sub-steps. 3. One student performed FAST on the mannequin within 5 minutes and the others do OSCE checklists for evaluation 4. Teacher and peers feedback. 5. Step 3 and 4 repeated in turn until the last student Phase 2. Real patient The student perform FAST examination on his own within 5 minutes and was evaluated and feedback by their peers and teacher.

Summary of Results: Phase 1. Nearly all of them (7/8) did not show precaution of angulation at the junction of line and probe. The difficult part is left upper quadrant and subxyphoid view. Five students cannot show a good picture for that view. Half of them did not handle the probe correctly and forget to orientation probe at subxyphoid view. Three students cannot demonstrate hepatorenal pouch and caudal tip of liver. Phase 2. Most of them (5/8) can pass with score 100%. Some student continue confusing about how to handling probe, orientation and get a good picture for sub xyphoid view. They feel that the mannequin is so stiff not like the real patient. But they can pass with score 94, 96 and 98 %.

Discussion and Conclusions: Teaching FAST in small group using OSCE checklist as a tool to gain attention and formation of concept can bring a satisfactory result in learning. The students can see their teacher and friends, do by themselves at least 2 times, give and received feedbacks from each other and teacher.

Take-home Messages: OSCE checklists can be used as a tool to enhance learning.

Effect of Using Counseling Checklist in Colonoscopy Counseling Course for Colorectal Cancer Screening Patients in Fourth Year Medical Students, Vachira Phuket Hospital

AUTHOR(S):

- Nutchaya Sukon, Vachira Phuket Hospital, Thailand (Presenter)
- Kawintharath Harirugsakul, Vachira Phuket Hospital, Thailand
- Bundit Wannasuphapol, Vachira Phuket Hospital, Thailand

ABSTRACT

Background: Colonoscopy is a gold standard for screening colorectal cancer, the third most commonly cancer, recommended by NCCN. However, bowel preparation is a crucial step for success. Thus, this colonoscopy counseling course and checklist are developed to train medical students to be future general practitioners who would be able to advice patients properly.

Summary of Work: This study was conducted as randomized controlled trial study and included all fourth-year medical students. The course provided pre-test, lecture, practical test, and post-test. Developed checklist was reviewed by surgery staffs. Students had to counsel simulated patient and was separated to two groups: experimental group (with checklist), control group.

Summary of Results: There are 11 and 13 students in experimental and control group accordingly. Their qualification are not significantly different (GPA, experience, pretest score). Posttest score is significantly different from pretest in both groups (experimental group: p-value = 6.99×10^{-8} , control group: p-value = 2.44×10^{-8}), but not significantly different between groups (p-value = 0.25). Confident score is raising after participated, but score in control group (Mean = 3.46) is higher than experimental group (Mean = 3.09) with p-value = 0.05. Practical score between groups is not different (p-value = 0.38). Additionally, advising about symptoms and preparation at procedure date is only one aspect that the experimental group perform better. However, students consider that checklist is helpful (81.82% in experimental, 92.30% in control group).

Discussion and Conclusions: Using checklist has insignificant benefit statistically though students consider there is benefit to use it. Furthermore, students in experimental group are able to advise about symptoms and preparation at procedure date better than control group. Therefore, it is implied that checklist is useful but require advanced development for users friendliness.

Take-home Messages: Colonoscopy course is helpful for medical students in patients preparation. Though checklist is required, being familiar with and carefully use is suggestive.

The impact of extracurricular surgical experience on veterinary students' performance of canine ovariohysterectomy and orchidectomy in a clinical skills curriculum

AUTHOR(S):

- Julie Williamson, Lincoln Memorial University College of Veterinary Medicine, USA (Presenter)
- Stacy Anderson, Lincoln Memorial University College of Veterinary Medicine, USA
- Julianne White, Park Equine Hospital, USA
- Christopher Kelly, Lincoln Memorial University College of Veterinary Medicine, USA
- Dawn Spangler, Lincoln Memorial University College of Veterinary Medicine, USA

ABSTRACT

Background: Veterinary students frequently pursue extracurricular surgical experiences before performing surgery in their curriculum. How these experiences impact students' confidence and subsequent surgical performance is not known.

Summary of Work: We sought to evaluate the impact of extracurricular surgical experiences on students' first canine surgery performed during their veterinary school curriculum. We enrolled 69 third year students to complete pre- and post-operative surveys reporting confidence to perform surgery as part of their clinical skills curriculum and self-assessing their surgical performance. Students previously completed five semesters of surgical skills training on models, but varied in their participation in extracurricular surgical experiences. A subset (n=27) were digitally recorded while performing ovariohysterectomy (16) or orchidectomy (11) under the supervision of a licensed veterinarian. Digital recordings of their surgical performances were scored by a blinded rater using task-specific rubrics and a global rating scale. Surgical time was recorded.

Summary of Results: The number of extracurricular surgeries that students had performed was correlated with their confidence to perform orchidectomy ($r=0.78$) but not ovariohysterectomy ($r=-0.17$). There was no correlation between extracurricular surgeries performed and subsequent rubric scores or surgical times for ovariohysterectomy ($r=-0.01$, $r=-0.14$) or orchidectomy ($r=0.09$, $r=-0.18$).

Discussion and Conclusions: Previous extracurricular surgical experiences did not impart an improvement in performance scores or surgical time during students' first ovariohysterectomy or orchidectomy of their veterinary curriculum, though it did increase their confidence to perform orchidectomy, the easier of the two surgeries. We did not find an improvement in performance scores, perhaps because of temporal decay of students' skill prior to performing their scored surgery. Alternatively, the extensive model training our students underwent previously may have prevented us from detecting a difference by eliminating true surgical novices from the study.

Take-home Messages: Practice is key in learning surgical skills; however, extracurricular surgical experience undertaken by students prior to performing live surgery in their veterinary curriculum demonstrated little measurable value in this study where student confidence, skill, and surgical duration were assessed several months later. Additional research is necessary to clarify how model training and live extracurricular surgical experiences interact to affect students' subsequent surgical performance.

How to work smarter not harder - a structured morning handover meeting saves time and improves learning outcomes

AUTHOR(S):

- Per Helligsø, South Jutland Hospital, Aabenraa, Denmark (Presenter)
- Jan Krzak, University of Copenhagen, Denmark
- Mads Rye Bjerregaard MD, South Jutland Hospital, Aabenraa, Denmark
- Ada Krzak, University of Cambridge, UK
- Emilie De Leon, University of Copenhagen, Denmark

ABSTRACT

Background: Optimization of work schedule is an easy strategy to improve efficiency and increase productivity. The morning surgical handover meeting at our hospital was identified as a potential target for such an improvement. Firstly, the handover was combined with the radiology multidisciplinary meeting. Secondly, the agenda for the meeting was changed from brief discussion of every admission in the previous 24 hours to a detailed discussion of the 2-4 most complex cases. The aim of this study was to assess the impact and attitudes towards the new framework.

Summary of Work: Questionnaires about time efficiency, educational value, relevance and opportunities for further discussion were distributed to all doctors participating in the meeting. All parameters were assessed with a scoring system ranging from 1 (low/irrelevant) to 5 (high/highly relevant).

	Before (n=26)	After (n=26)	P-værdi
Question 1: Time efficiency (mean/median)	2.01 / 2	4.12 / 4	<0.01
Question 2: Educational value(mean/median)	2.69 / 3	3.92/ 4	<0.01
Question 3: Relevance(mean/median)	2.58/ 2	3.65/ 4	<0.01
Question 4: Opportunities for further discussion (mean/median)	2.50/ 2	4.00/ 4	<0.01

Summary of Results: We received 26 (82%) completed questionnaires. Scores reported before and after introduction of the new framework were: 2.01 and 4.12 ($p<0.01$) for time efficiency; 2.69 and 3.92 ($p<0.01$) for educational value, 2.58 and 3.65 ($p<0.01$) for relevance; 2.50 and 4.00 ($p<0.01$) for opportunities for further discussion.

Discussion and Conclusions: We observed a statistically significant improvement in the assessed parameters after introduction of the new framework. By integrating the morning handover meeting with the radiology MDT and shifting the focus to discussion of the challenging cases, we improved educational value and efficiency of the meeting, while allowing the salvaged working time to be dedicated to other duties.

Take-home Messages: A structured morning handover meeting saves time and improves learning outcomes, while allowing the salvaged working time to be dedicated to other duties.

McSTU: Multi-disciplinary Course in Theatre Skills Training of Undergraduates

AUTHOR(S):

- **Fatima Nawrozzadeh, London North West University Hospital NHS Trust, UK (Presenter)**
- Nicola Schunke, London North West University Healthcare NHS Trust, UK
- Monica OMalley, London North West University Healthcare NHS Trust, UK
- Aynkaran Dharmarajah, London North West University Healthcare NHS Trust, UK

ABSTRACT

Background: The operating theatre environment is a complex multi-disciplinary community of practice where inter-disciplinary communication and teamwork are vital to patient safety. Theatre experience is essential in medical education, but students are often seen hovering awkwardly in the peripheries. Student perceptions of theatre experience highlight that they feel intimidated and under-prepared, often passively involved.

Summary of Work: The McSTU course consists of a mix of in-situ simulation and skills-based teaching designed to introduce the theatre environment taught by multi-disciplinary faculty. The main aims of the course were to improve understanding of the theatre team roles, patient safety and clinical skills in-situ. The objectives were to increase student engagement, enabling them to make the most of their surgical attachment. The course was open to third year medical students and other newly appointed healthcare staff in theatres.

Summary of Results: In total, from 2015-2017, 65 third year medical students, 3 recovery nurses, 1 perioperative nurse and 2 trainee Operating Department Practitioners completed the course. Students agreed that the course matched their learning needs (88.7%), made them comfortable in the theatre environment (94.4%), addressed non-technical skills (88.7%), facilitated better understanding of team roles (93.0%), safety and risks (91.5%).

Discussion and Conclusions: The course was generally welcomed and viewed positively. The majority on the course were medical students with a few newly appointed permanent staff. This is due to small turnover of staff, with variable availabilities and conflicts with the medical student timetable. We covered the medical student surgical curriculum and at the same time managed to impact aspects of the 'hidden curriculum', positively influencing medical student perceptions of the operating theatre, patient safety culture and the wider team.

Take-home Messages: Multidisciplinary in-situ learning in the theatre setting is an effective way to improve non-technical skills such as team work and communication skills in a high-risk setting. It also enables students to feel more comfortable in the theatre environment, and encourages them to take on a more active role. It can be challenging to set up and involve all members of the wider team, but this can be factored in when planning sessions.

Effectiveness of inter-professional education through a nursing attachment for medical students in Singapore

AUTHOR(S):

- Qin Yi Lee, Tan Tock Seng Hospital, Singapore (Presenter)
- Kar Yen Mok, Tan Tock Seng Hospital, Singapore
- Kaushal Amitbhai Sanghvi, Tan Tock Seng Hospital, Singapore
- Cheong Wei Terence Huey, Tan Tock Seng Hospital, Singapore
- Qinghui Sarah Lu, Tan Tock Seng Hospital, Singapore

ABSTRACT

Background: Effective inter-professional education (IPE) and collaboration has long been shown to enhance team work and increase job satisfaction amongst healthcare workers. Improvement in patient outcomes, reduction in medical errors and positive patient experiences are amongst some of its other benefits. The importance and advantages of inter-disciplinary collaboration has been widely acknowledged in Western countries and it is slowly gaining recognition in Asia. To our knowledge, IPE is not routinely taught in local medical schools in Singapore and there are few opportunities for inter-disciplinary collaboration during clinical rotations. We sought to evaluate the effectiveness of inter-professional education through a nursing attachment for medical students in Singapore.

Summary of Work: All third year medical students rotated to the General Surgery Department in a tertiary hospital in Singapore over a 4-month period were enrolled in this study. Each student was scheduled to assist a nurse for a full nursing shift in the general surgical ward. The remodelled Interdisciplinary Education Perception Scale (IEPS) was administered at the beginning and end of their surgical posting. Further Subscale analysis (Subscale 1: Competency & Autonomy; Subscale 2: Perceived need for cooperation; Subscale 3: Perception of actual cooperation) based on the remodelled IEPS were undertaken. Data were analyzed with the Student's paired t-test.

Summary of Results: 24 medical students completed both the pre and post questionnaires. On overall analysis, significant improvements were found in male students' overall attitudes to inter-professional collaboration. Gender stratified analysis showed that improvements were observed in subscale 3 (Perception of actual cooperation). Having a healthcare worker in the family, previous healthcare work experience or previous hospitalization did not influence the students' attitudes to IPE. On the contrary, students without any previous healthcare work experience nor hospitalizations showed improvements in subscale 3.

Discussion and Conclusions: This study suggest that an interdisciplinary workplace observation and practice based attachment for medical students is instrumental in nurturing positive inter-professional attitudes. It should be introduced early on in their training to complement core curriculum for maximal benefit.

Take-home Messages: Practice based interdisciplinary attachment should be encouraged amongst all healthcare students.

Does the surgeon's assistant role affect medical students' confidence levels in surgical airway management?

AUTHOR(S):

- Sorracha Sophanate, Ratchaburi Medical Education Center, Ratchaburi Hospital, Thailand (Presenter)

ABSTRACT

Background: Surgical airway management, such as, transtracheal needle ventilation, cricothyroidotomy, percutaneous or open tracheostomy should have taken place when endotracheal intubation cannot be achieved by direct laryngoscopy, especially in emergency condition. Otolaryngology department, Ratchaburi medical education center has established a surgical airway management session (SAMS) for fifth year medical students over the last 3 years. This session consists lecture, demonstration, mannequin training and attending as surgeon's assistants (SA) in elective tracheostomy surgical field. However, due to time limitation and the number of patients, every student could not have a chance to fulfill SA role. This study aims to compare knowledge and confidence levels after SAMS in 2 groups; SA and observers.

Summary of Work: A prospective study was performed in fifth-year medical students, during otolaryngology rotation in January-March of 2016-2018. The class was a 3-hour session consisting of basic knowledge of SAM, video presentation, mannequin training and attending as surgeon's assistants (SA) in elective tracheostomy cases. All of students introduced themselves to patients and relatives. Informed consent was a process for getting permission before conducting. Knowledge assessment was determined by a ten-question, pre-test and post-test. At the end of the class, the students completed their 5-point Likert scale confidence level evaluation questionnaire.

Summary of Results: Of the 93 medical students, 45 students were SA. The median scores, interquartile range (IQR) of post-test, between SA and observers, was not different (8, IQR 8.0-9.5 vs 8, IQR 8.0-8.5, $p=0.98$). Moreover, the student median confidence level, IQR after training, was similar (4, IQR 4.0-5.0 vs 4, IQR 4.0-5.0, $p=0.36$). Overall, medical students improved scores (5, IQR 4.0-6.0 vs 8, IQR 8.0-10.0, $p<0.001$) along with confidence levels (2, IQR (2.0-3.0) vs 4, IQR (4.0-5.0), $p<0.001$) after finish class.

Discussion and Conclusions: According to limit time and the number of patients, every student could not have a chance to fulfill SA role. However, after finish SAMS, knowledge and confidence levels between SA and observers were not different. The further interest issue is studying about knowledge and confidence levels between 2 groups (students who had chance to perform tracheostomy by themselves and observers), while medical ethic is the most important thing to concern.

Take-home Messages: The surgeon's assistant role does not affect medical students' knowledge and confidence levels in surgical airway management session.

The Practical Application of 3-dimensional Printing Tools in Surgical Training Courses in the Metropolitan Hospital in mid-Taiwan

AUTHOR(S):

- Cheng-hsi Liao, Taichung Armed Forces General Hospital/National Defense Medical Center, Taipei, Taiwan (Presenter)
- Chin-Hu Lai, Taichung Armed Forces General Hospital/National Defense Medical Center, Taipei, Taiwan
- Chia-Wen Kuo, Taichung Armed Forces General Hospital/National Defense Medical Center, Taipei, Taiwan
- Deng-Ho Yang, Taichung Armed Forces General Hospital/National Defense Medical Center, Taipei, Taiwan
- Jia-En Chen, Department of Biomedical Engineering, National Defense Medical Center and Tri-Service General Hospital, Taiwan
- Chih-Hung Wang, Taichung Armed Forces General Hospital/National Defense Medical Center, Taipei, Taiwan

ABSTRACT

Background: For the past 10 years, 3D-printing technology has become a new trend to clinical teachers. Nowadays, we catch up with the trend to develop the 3D-printing skills and cooperate with the medical 3D printing center to design practical tools applying in surgical courses, which can advance our clinical skills.

Summary of Work: We've the IPE team, using the 3D tools after designing what clinical need. We demonstrate simulation scenarios in surgical training courses (Ex. Urological endoscope procedure), and do more practices to teach the green-handed residents, and new-coming staff, not directly on real patients.

Summary of Results: Since 2017 Dec, we cooperated with the 3D medical center to create our own 3D-printing tools, and we hold conferences, workshops and master speeches to teach our members how to apply these techniques until now. Then our IPE members can design their own 3D tools in teaching students and residents. Routinely we hold meetings bi-monthly and perform clinical scenarios by using these tools applying in surgical training courses, such as the urologist's endoscope procedure.

Discussion and Conclusions: 3D-printing technology is complicated, but not hard to learn. Fortunately, hospital superintendent supports the plan and offers us financial help. Therefore, we make our IPE team how to design a practical tools, and then apply in surgical training courses. In hospital, the patient safety is always the first priority, so we don't practice immature skills. Routinely we'll trace the teaching and learning effects bimonthly. Rapid changes in health care systems for decades. We've developed our own 3D-printing skills and cooperate with 3D medical center, to let our IPE members design suitable and practical teaching tools, to shorten the surgical learning curve of green-handed trainees.

Take-home Messages: 1. Cooperate with 3D medical center to design about what surgical need to make sure the 3D tools are suitable and practical. 2. Teach the IPE members to use the 3D teaching tools, applying in surgical procedures, then routinely follow the learning effects bi-monthly. 3. Perform simulation scenarios case-by-case with IPE team members to teach new-coming staff by using those 3D tools. 4. Let hospital managers know how we use these tools, keep supporting the plans, and give us enough financial help.

“Kahoot!” and online group chat boards facilitated the interpretation skills of chest radiograph in medical students

AUTHOR(S):

- Rungnapa Pengprakhon, Buriram Medical Education Center, Thailand (Presenter)
- Narin Chindavech, Buriram Medical Education Center, Thailand
- Surasak Aumkaew, Buriram Medical Education Center, Thailand
- Yada Siriphannon, Buriram Medical Education Center, Thailand
- Thanatpong Thienwuttivong, Buriram Medical Education Center, Thailand
- Detdanai Wannapong, Buriram Medical Education Center, Thailand

ABSTRACT

Background: The medical students in clinical year are usually familiar with normal finding in plain chest radiograph. However, description of abnormal finding and interpretation are difficult and need more frequent practice to develop long term skill. Transform teaching and quiz of chest radiograph to Kahoot game and interactive feedback by using real patient chest X-ray via online group chat boards may enhance medical student engagement and improve this skill.

Summary of Work: In the teaching period of essential chest plain radiographs; sixty five of 4th and 5th year students during medicine rotation were applied one of two learning modules; class room, homework with formative feedback (FF) and using Kahoot interactive feedback (KIF). Formative feedback model, each student was assigned for describing twenty of chest X-ray with interpretation from their real patient via online chat board and the teacher corrected the wrong answers. The KIF model, the teacher converted the same interesting CXRs to quiz and stimulated students to participate to answer with the game and finally concluded and summarized the answers.

Summary of Results: The KIF model had significantly higher scores than FF model (16.5 ± 4.1 vs 14.2 ± 1.7 , $p=0.01$) comparable similarly resulted in both 4th and 5th year medical students (14.3 ± 5.8 vs 12.5 ± 4.6 , $p=0.52$ and 18.4 ± 2.0 vs 16.5 ± 3.7 , $p=0.01$, respectively). The medical students also reported positive feedback for exciting game, quick reply, teamwork discussion and remembering accurately in the KIF model.

Discussion and Conclusions: Overall the interactive feedback with playing Kahoot to describe chest radiograph finding from real patients enhanced student engagement for inquiry-learning owing to solve problems. Moreover, the KIF created an exciting, enthusiastic learning atmosphere between themselves and teacher leading to long term skill. Conclusion: The kahoot quiz and online chat boards application enhance self-challenges and learning experience and can create learning atmosphere of peer groups and each students into depth learning in clinical context for x-ray describe finding.

Take-home Messages: Interaction between students and teachers via “Kahoot!” and online group chat board can improve chest x-ray describe finding and interpretation skill.

Role of social media groups in Foundation Doctors

AUTHOR(S):

- Yen-Jei Chen, Manchester University NHS Foundation Trust (MFT), UK (Presenter)
- Ray Keelan, Manchester University NHS Foundation Trust, UK

ABSTRACT

Background: The number of people using social media are increasing. Social media use by doctors is fraught with ethical difficulties when due care is not taken and GMC guidance on social media use was issued in 2013. Furthermore, the use of social media groups at work can mean that it is increasingly difficult to switch off from work. However, social media is also a new platform for education and social networking. We aim to identify how foundation doctors use social media groups, whether such groups are beneficial and their perceived impact on work-life balance.

Summary of Work: Foundation year (FY) doctors were asked to complete a survey when attending regional teaching. All surveys were anonymous. 23 FY1 and 20 FY2 doctors were surveyed.

Summary of Results: All 43 doctors use social media group with work colleagues, 16 exclusively for work. 88% find being part of the group beneficial in managing work. The main uses for the groups are managing rota, social networking, followed by clinical advice. The main members of the groups are fellow FY doctors. 70% had been asked work-related question that requires action outside of working hours. 25.6% state these groups make switching off from work more difficult. 72% feel using social media group for work is generally positive.

Discussion and Conclusions: While there are many guidelines on how doctors should use social media, very little is known about junior doctors' opinion of the new and growing media. Majority of those surveyed use social media groups for managing rota, social networking and clinical advice with few using it for education, this may be due to no mandatory exam for FY doctors. It is interesting to note that despite most doctors having been asked work-related questions outside of work, most doctors view social media groups positively.

Take-home Messages: The majority of the FY doctors surveyed use social media groups for multiple purposes for work. The view of social media is predominately positive despite all the potential pitfalls relating to social media use in health care.

Optimizing the potential of social media in undergraduate curriculum: student perspective in Thailand

AUTHOR(S):

- Phunlerd Piyaraj, Phramongkutklao College of Medicine, Thailand (Presenter)
- Kawin Wongthamarin, Phramongkutklao College of Medicine, Thailand

ABSTRACT

Background: Social media is everywhere in the society and its usage is rapidly expanding, especially among medical students. Social media can integrate into the curriculum and provide educator with tools to share information, to discuss learning content, to assign working group, and to assess student feedback. However, little is known about how medical students use social media and the way it appropriate for their learning preferences.

Summary of Work: A cross sectional was performed during January 2018. A standardized questionnaire was developed to explore the demographics, academic performance and attitude toward the potential role of social media in medical education e.g. usage of social media in daily life and what type of social media is suitable to their learning. Data were analyzed using STATA version 14.

Summary of Results: Total of 182 students were participated. Average time spent on social media is 5.3 hours per day. The most common daily use of social media are Line (50%) and Facebook (25%). 73% of the students choose Line as the most appropriate way for communication between students and educator. Facebook (33%) and YouTube (30%) are most used as social media for self-study. The students perspective explains the advantages of Facebook in the group studies as it is easy to send files and each post can be divided into clear conversation topics. While Line is easy to chat and respond quickly.

Discussion and Conclusions: The results show that students choose different kind of social media for different purposes and each social media has different advantages. To apply, Line is suitable for share information, to assign working group, and answer the student questions. While Facebook appropriate for files transfer and multiple topics conversations at the same time. Understanding medical students use of and attitudes toward social media reveals a need, and provides a basis, for improve educational programs.

Take-home Messages: Medical educational planners should take into account this modern tool in the curriculum development, to get access to their students; given the facilities of sharing information and stay connected. Moreover, students can express doubts and tutors can provide support through discussion or sharing information.

Social Media Addiction in Medical Students at Khonkaen University, Thailand

AUTHOR(S):

- Intira Anantpinijwatna, Mahasarakham Hospital, Thailand (Presenter)
- Bunyanut Phanurak, Mahasarakham Hospital, Thailand
- Boonyaporn Hengwichai, Mahasarakham Hospital, Thailand
- Kotchakorn Chomchoei, Mahasarakham Hospital, Thailand
- Chayanit Poonsawaspong, Mahasarakham Hospital, Thailand

ABSTRACT

Background: Nowadays, social media plays an important role in our daily life and its usage tends to be dramatically rising. The inappropriate amount of the usage may lead to social media addiction. The aim of this study was to survey and determine social media addiction and its relation to academic achievement among medical students.

Summary of Work: This study was a cross-sectional analytic study in the 1st to 6th year medical students at Khon Kaen University. An online questionnaire was sent. The questionnaire includes demographic characteristics, social media usage behaviors, and the Social Media Addiction Test (SMAT).

Summary of Results: The number of responded students is 209; in which there are 47 addicted, 100 obsessed, and 62 non-addicted. The addicts have at least 5 social media accounts. The top three favorite applications are Facebook, Instagram, and YouTube. The addicts spent 3-5 hours per day on their smartphones. The purposes of using are following friend activities, watching movies and listening to music.

Discussion and Conclusions: More than half of the studied group has been categorized as social media addict and social media obsession.

Take-home Messages: The faculty should closely monitor the social media addicted and obsessed medical students. The faculty should prepare attractive alternative activities to turn them away from their unfavorable behavior.

Feasibility and efficacy of using mobile communication application to enhance clinical skill training

AUTHOR(S):

- Li-Ying Huang, Fu Jen Catholic University Hospital, Taiwan (Presenter)
- Po-Jui Yu, Fu Jen Catholic University Hospital, Taiwan
- Kun-Long Hung, Fu Jen Catholic University Hospital, Taiwan
- Chun-Wei Chang, Fu Jen Catholic University Hospital, Taiwan
- Bi-Hua Cheng, Fu Jen Catholic University Hospital, Taiwan
- Juliana Tze-Wah Kao, Fu Jen Catholic University Hospital, Taiwan

ABSTRACT

Background: The emergence of mobile communication applications have allowed people to send text messages, photos or videos conveniently. With proper design, it may be used to enhance clinical skill training. To explore the feasibility and efficacy of applying mobile communication application in clinical skill training, we have conducted a pilot study.

Summary of Work: In 2018 October, a postural drainage and chest percussion skill training course was held at the Fu Jen Catholic University Hospital OSCE center, where a nursing Anne simulator and smartphone holders were available. The Line mobile application was used for post-course communication. Professional clinical skills and smartphone video recording skills were illustrated by teachers and then practiced by students. After the class, students were asked to send back their self practice videos through Line application. And the teachers used checklist and direct observation of procedural skills (DOPS) method to evaluate their skills in the video and provide feedback. Furthermore, students were able to seek support for an extended period through the application.

Summary of Results: Our study found that using mobile communication applications and video recording to assist clinical skill training was effective and feasible. After training, students learned proper angle of framing and were able to receive post-course coaching through the communication application. Their postural drainage and chest percussion skills showed significant improvements (clinical skill average scores: pre-test 37.5 / post-test 100) after the application-assisted training course. More than 90% of the students were highly satisfied with this program.

Discussion and Conclusions: Self practice video recording and interactive post-course discussion through mobile communication applications provide an effective way for the students to extend their learning after class. This method may be applied to more procedural skill training in the future.

Take-home Messages: Using mobile communication applications, video recording and interactive feedback to enhance clinical skill training is effective and feasible.

Development of an app-based learning tool for medical students to access local clinical skills resources

AUTHOR(S):

- Niki Newman, University of Otago, Christchurch, New Zealand (Presenter)
- George Sim, CDHB, New Zealand

ABSTRACT

Background: Instant access to local clinical skills resources via mobile technology makes the most of learning opportunities using readily available devices. Although students can easily access medical information from global sources, access to authorised information on how to safely perform procedures in the local clinical environment is not readily available.

Summary of Work: A final year medical student with self-taught knowledge on how to code for iOS mobile devices chose to develop a smartphone based application (app) as a project whilst on a four week 'selective' placement. The aim was to develop a reliable, accessible resource for medical students while on clinical placements, based on the clinical skills resources currently available as part of the curriculum via the eLearning platform MedMoodle. It includes checklists on how to perform procedures safely and effectively with information relevant to daily practice in the local teaching hospital and community. The project was implemented as part of the Clinical Skills Module as a point-of-care learning tool. Following the success of the app on iOS devices, an android version was then developed. Students in years 3-6 of their medical training downloaded the app for free.

Summary of Results: In its first year the app has been downloaded 193 times. Initially there were some challenges with lack of awareness of the app being available, difficulty downloading and lack of an android version. Ongoing marketing to students was required throughout the year with corresponding spikes in downloads. Students completed a questionnaire at the end of the 2018 academic year with positive responses including 'very condensed and easy to follow', 'handy refresher', 'quick revision before I do any procedure' and 'easy to access and a reliable source of information'. There were requests to include more procedures, photos and videos.

Discussion and Conclusions: A phone application developed by students for students provides immediately accessible, locally relevant, point-of-care information. It has been widely used and well received by students and their constructive feedback will inform further app development and availability.

Take-home Messages: A point-of-care clinical skills app featuring local practices and procedures can be used as an effective adjunct to medical students' learning in the local clinical environment.

Using smartphones during inpatient visits, is it unprofessional? The patients' and their relatives perceptions

AUTHOR(S):

- Chirabat Techato, MEC Songkhla Hospital, Thailand (Presenter)
- Kalyanee Asanasak, MEC Songkhla Hospital, Thailand

ABSTRACT

Background: Nowadays, smartphones have become an inseparable part of our daily lives. It has no exception for physicians to be one of the professionals that get advantages from smartphones. In the situation that physicians using smartphones during their inpatient visits would create different perceptions from patients and their relatives. The purpose of this study is to explore several aspects of patients and their relatives' opinions on the use of smartphones by doctors and medical students during their inpatient visits.

Summary of Work: The cross-sectional descriptive study was performed by selecting the participants which are the patients and their relatives in Songkhla Hospital's wards. The participants are literate in Thai. They were asked to complete questionnaires before and after receiving the medical treatments. 136 participants from various departments had completed the questionnaire. The characteristics of all participants will be shown. The statistic used in the study is McNemar's test and paired T-Test.

Summary of Results: The study revealed that most patients and their relatives perceived that doctors and medical students used smartphones for opening documents, searching the internet, e-books for medical treatments during inpatient visits. Using smartphones during inpatient visits do not impact the doctors and medical students' reliability on medical treatments. Nevertheless, doctors' average satisfactory score decreases significantly toward smartphone use during inpatient visits in the aspect of providing disease and symptoms explanation (P-value 0.02), forecast and clear direction of treatments (P-value 0.02). In addition, the patients and their relatives perceived that using smartphone could result in untimely treatments and less attention to the patients.

Discussion and Conclusions: The perception of the patients and their relations toward smartphone usage during ward during is good attitudes. But the acceptance from the medical students is more than the attending doctors. It might due to perceived that using smartphone could result in untimely treatments and less attention to the patients.

Take-home Messages: Using smartphones is becoming a routine behavior in our daily life but during ward-round may result in unprofessional behavior and results in low quality, low standard in medical service.

How smartphone overuse is affecting our clinical year medical students

AUTHOR(S):

- **Napattamon Manorat, Roi-Et Hospital Medical Centre, Thailand (Presenter)**
- Chanthit Phunlap, Roi-Et Hospital Medical Centre, Thailand

ABSTRACT

Background: Nowadays, smartphones play an important role in the lives of people. This is especially true for medical students as they use this technology for learning, communicating and organizing. Although this technology has its benefits, the extensive usage of smartphones leads to various health dysfunctions, including suffering from musculoskeletal pain, fatigue, and emotional imbalance. One such form of the latter is nomophobia, the fear of being out of mobile phone contact. This study was designed to assess the smartphone usage patterns of clinical years medical students and the effect this usage has upon their physical and mental health.

Summary of Work: Using a cross-sectional design, self-report questionnaires were distributed to all medical students in years 4-6 at Roi Et Hospital Medical Center. The surveys consisted of 20 items from the Nomophobia Questionnaire (NMP-Q) that clustered in four factors. In addition, we inquired about the characteristic of devices used and the related symptoms, such as eye strain, musculoskeletal discomfort, fatigue and headache after prolong use, and experiencing phantom vibrations. Afterwards, the results were evaluated by using descriptive statistics.

Summary of Results: Response rate was 80.72% (67/83). Seventy percent of respondents spend more than 4 hours per day on their smartphones. 76.20% slept next to their smartphones. The most common purposes for using their smartphone were for social media (95.52%), communication (86.57%), and education (80.60%). Most of the students (98.51%) were classified as having some form of nomophobia (mild - 22.38%, moderate - 62.69%, severe - 13.44%). 72% of users reported experiencing occasional phantom vibrations. After prolonged, respondents often had eye strain (56.71%), headaches and fatigue (50.74%) and musculoskeletal discomforts (56.71%).

Discussion and Conclusions: Smartphones have become an integral part of our medical students' lives; they spend a great deal of time on their smartphones day and night. However, addiction to smartphones carries both physical and psychological problems. The results may help device users consider trying to balance their screen time with other aspects of life to live more happily with smartphones.

Take-home Messages: To reduce the harmful effects of overuse of smartphones, one should always remember that a smartphone is a device, not a master, and it should never be used too frequently.

Preparing for Distance Learning: Designing an Online Orientation for Nurses

AUTHOR(S):

- **Machiko Saeki Yagi, Jichi Medical University, Japan (Presenter)**
- Reiko Murakami, Jichi Medical University, Japan
- Mitsue Suzuki, Jichi Medical University, Japan
- Shigeki Tsuzuku, Kumamoto University, Japan
- Hiroshi Nakano, Kumamoto University, Japan
- Katsuaki Suzuki, Kumamoto University, Japan

ABSTRACT

Background: Continuous learning is critical for improvement of the quality of patients' care. However, the shortage of nurses is a substantial problem, so nurses cannot leave their workplace to improve their knowledge and skills. Nurses have the chance to use distance learning systems to learn whenever and wherever they desire. However, some papers have reported that nurses had difficulties with basic skills, such as attaching documents and engaging in online discussion for collaborative learning, for distance learning.

Summary of Work: Two types of online orientation were developed for this study prior to a main course opening to train critical thinking, physical assessment, and patient safety, etc to continuous learning. Version A, with 60 nurse participants, was short and included a test, search engines usage, attachments training, and online threads for peer discussion. Version B, with 123 nurse participants, additionally included mutual evaluations and chat rooms for questions. The participants' login frequency to the online orientation and the main course completion rate were analyzed to determine the effects of the online orientation.

Summary of Results: The demographic data between A and B were not significantly different; however, the completion rate of the main course was increased from A to B (77% to 93%). The login frequency to the online orientation in noncompleters in both versions was lower than that of the completers ($p=.00$). Additionally, significant differences were found in the work experience and qualified Advanced Practice Nurses between completers and noncompleters ($p=.02$, $p=.02$). The login frequency of online threads increased from A to B ($p=.00$). Additionally, difficulties in the main course with online discussion and mutual evaluations decreased in participants of version B.

Discussion and Conclusions: This study demonstrates that appropriate online orientations, including online threads, improve collaborative learning online and help with online learning success. Additionally, the results suggest that online course faculties need to monitor the login frequency in the orientation and check learners' work experience and qualifications to prevent drop out.

Take-home Messages: Appropriate online orientation helped nurses to complete the main course. In particular, online threads helped them learn collaboratively.

Developing Peer-to-Peer Public Health Online Courses

AUTHOR(S):

- **Katja Čič, International Federation of Medical Students Associations (Presenter)**
- Omnia El Omrani, International Federation of Medical Students Associations
- Anna Herzeg, International Federation of Medical Students Associations

ABSTRACT

Background: The Public Health Leadership Training (PHLT) is a standardized workshop for all healthcare students worldwide, imagined as a longitudinal concept of training IFMSA members. Since 2016, 25 PHLT workshops were conducted in more than 18 countries worldwide. There's an urgent need for qualified trainers to ensure a high-quality execution of the workshop. In addition, we introduced the Activity Management Online Course (AMOC) to guarantee the quality of our activities in the long term and measure their impact.

Summary of Work: Two IFMSA Online courses were developed; PHLT-T and Activity Management Online Course (AMOC). The PHLT-T equips trainers with in-depth knowledge and advanced skills to facilitate PHLT's 3 major pillars - Leadership, Activity Management and Public Health. On the other hand, the AMOC particularly trains members in basic and advanced Activity Planning as well as essential methods of evaluation and impact tracking. Both online courses end with an exam to thoroughly assess the knowledge and understanding of participants of the materials learned.

Summary of Results: 3 PHLT-T and 1 AMOC courses have been successfully conducted. Through standardized assessments, we were able to improve the methods and materials used. We also sought to sustain the continuity and quality of the courses in the upcoming terms. SCOPH currently has 22 certified PHLT Trainers. As for the AMOC Round 1, SCOPH now has 12 AMOC Trainees and 14 trainees registered for Round 2.

Discussion and Conclusions: Through the PHLT-T, we can now provide comprehensive training that creates competent trainers able to give our students all the basics to comfortably and confidently act within the field of Public Health. We are also capable of establishing sustainable activities and tracking long-term impact through the transfer of knowledge and skills in the form of a well-implemented handover. This was predominantly accomplished by the AMOC.

Take-home Messages: The common goal of both courses is to ultimately empower future public health leaders to understand the intricate workings of activity management, create powerful activities and track their impact, as well as lead their communities towards better health.

The Effectiveness of Technology-Enhanced Learning on Electrocardiography Teaching to Undergraduate Medical Students

AUTHOR(S):

- **Chin Lin, National Defense Medical Center, Taiwan (Presenter)**
- Hsueh-Hsin Pan, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Hsin-Hui Chen, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Wei-Shiang Lin, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Cheng-Yi Chen, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Chin-Sheng Lin, Tri-Service General Hospital, National Defense Medical Center, Taiwan

ABSTRACT

Background: Although electrocardiography (ECG) plays a critical role in biomedicine, it remains a great challenge for undergraduate medical students in real world practice. Technology-enhanced learning (TEL) provides deliberate learning for medical students to promote patient safety and medical quality. This study evaluates effectiveness of TEL on the recognition of the presentation of ECG in patients with acute myocardial infarction (AMI) and explores the association between students exercise behaviors and the ECG recognition capacities.

Summary of Work: We developed a web-based system involving 97 selected ECGs. There are 119 fourth-year medical students recruited in the AMI ECG recognition class. The teaching process as follows: (1) a 20-minute video teaching, (2) a web-based randomly replaced ECGs exercise, (3) an online reflection and review mechanism, (4) online pre-test, (5) in-class pre-test, (6) a 30-minute classroom talk, (7) final test.

Summary of Results: The students were divided into 4 categories by user behavior, which were shown as follows: (1) without exercise (n = 13), (2) less exercise (n = 17), (3) exercise with well preparation (n = 56), (4) extensive exercise without well preparation (n = 33). There were significant differences of the in-class pretest score among these 4 groups (57.69±36.32, 65.29±35.38, 79.82±11.04, and 73.64±19.66, respectively; p = 0.004). After formal classroom teaching, their final test score improved to 72.31±34.44, 71.18±36.21, 88.21±11.62, and 85.76±11.19 (p = 0.004), respectively. Further analysis revealed the critical role of exercising experiences on the in-class test scores. Students who had the exercise experience more than 10 times got significantly higher scores than those who didn't. (87.25±11.55 vs. 70.71±35.69, p < 0.001).

Discussion and Conclusions: This web-based exercise help students recognize the ECG presentations in real patients with AMI. We considered that traditional classroom teaching helps students to learn abnormal features from physiological mechanism, and the real case exercise helps students to be familiar with interpretation process. Based on this successful experience, further larger and wider database will be applied in following courses to confirm the beneficial effects.

Take-home Messages: Our study demonstrated the promising effects of the online-based exercise on the recognition of AMI ECG presentations, which could make up for the inadequacies of traditional classroom teaching.

An analytical model to assess the feasibility of integrating augmented reality applications into medical education curricula: a pilot study

AUTHOR(S):

- **Derrick Cheng, The Warren Alpert Medical School of Brown University, USA (Presenter)**
- Kevin Tang, The Warren Alpert Medical School of Brown University, USA
- Paul Greenberg, Providence VA Medical Center, The Warren Alpert Medical School of Brown University, USA

ABSTRACT

Background: Augmented reality (AR) has the potential to transform learning in medical education, and hundreds of augmented reality applications (ARAs) have already been developed for medical training within the last several decades. While prior literature has described the role of technology-enhanced simulation in medicine, there are no conceptual frameworks or standardized methods for evaluating ARA potential in medical education. In this study, we propose and pilot test an analytical model to assess the feasibility of ARA implementation into current educational curricula.

Summary of Work: We developed an analytical model based on a systematic literature review and Cook et al.'s (2011) meta-analysis of simulation-based education for health professionals. Our model utilized four assessment criteria: quality, scored by study type, presence of bias, and data consistency; content, the relevance and applicability of ARA content as evaluated by experts in the field; outcome, scored by statistically significant improvements in learner performance; and feasibility, evaluated by faculty/trainee interest and costs of implementation. We used this model to evaluate three well-described ARAs: ProMIS (Haptica, Dublin, Ireland), AR MagicBook (Istanbul, Turkey; various), and mARble (Hanover, Germany).

Summary of Results: The ProMIS laparoscopic simulator achieved moderate quality, high content, limited outcome, and low feasibility scores. The AR Anatomy MagicBook demonstrated high quality, high content, good outcome, and good feasibility scores. The mARble Classroom ARA achieved low quality, average content, poor outcome, and high feasibility scores.

Discussion and Conclusions: This analytical model can be used to assess the feasibility of ARA integration into medical educational curricula. Of the three ARAs evaluated, the AR Anatomy MagicBook achieved the highest overall score, suggesting this application is the most qualified for implementation. Further work assessing ARAs in educational settings is needed to determine this model's accuracy in predicting ARA success.

Take-home Messages: Augmented Reality is a rapidly growing field within medical education. However, there are no standardized methods for ARA assessment. Here, we propose an analytical model for the assessment of ARAs prior to their use.

Development of an Educational Video Assessment Scale

AUTHOR(S):

- Lina Shehadeh, University of Miami, Miller School of Medicine, USA (Presenter)
- Sean Schooley, University of Colorado School of Medicine, Anschutz Medical Campus, USA
- Sean Tackett, Johns Hopkins Bayview Medical Center, USA

ABSTRACT

Background: Learning resources in medical education are numerous, and videos are often used. No standardized measures exist for estimating the education quality of videos, and popularity is a poor surrogate. Therefore, we developed a scale for medical educators and content creators to evaluate medical education video quality.

Summary of Work: Based on literature surrounding source reliability, multimedia and curriculum development principles, and studies of educational videos and learning, we created a scale with 25 domains. The scale was then piloted by two raters using 15 “cardiovascular physiology” videos from YouTube. Descriptive analyses and tests for internal consistency and inter-rater reliability were performed.

Summary of Results: Each video was rated in an average of 20 minutes. The average “technical quality” section scored 7.9/10, while “educational design” and “reliability” sections together scored 3.4/12. Only 13% of videos clearly identified informational sources, 7% clearly identified the last content update, and 0% acknowledged areas of uncertainty surrounding the topic. Also, no videos provided opportunities for self-assessment. Cronbach’s Alpha of (0.939, CI (0.690, 1.000)) for the scale total indicated the internal consistency was high. ICC(2,1) of (0.7084, CI (0.6247, 0.7700)) for the scale total indicated the intra-rater reliability was good.

Discussion and Conclusions: Results from this pilot seem to indicate that producers of videos emphasize technical quality of videos over educational design, reliability, or assessment. This is concerning because studies have shown that video consumers cannot distinguish videos with useful content from other videos, and suggest that content and sources of educational videos deserve greater scrutiny. Likewise, assessment drives learning, but opportunities for assessment are lacking. Finally, pilot results from our instrument development are promising and warrant further efforts to generate validity evidence for its use.

Take-home Messages: The quality of medical education videos can be assessed in a reasonable and effective manner. Using a scale such as ours is a tool that can be used by instructors and content creators to utilize and produce better quality products that are more effective for students.

Innovative Strategies for Clinical Microscopy Instruction: Virtual versus Light Microscopy

AUTHOR(S):

- M. Jane McDaniel, Yale School of Medicine Physician Assistant Online Program, USA (Presenter)
- Greg Russell, Wake Forest School of Medicine Department of Biostatistical Sciences, USA
- Sonia Crandall, Wake Forest School of Medicine Department of Physician Assistant Studies, USA

ABSTRACT

Background: This study compared the effectiveness of clinical microscopy instruction for physician assistant (PA) students using virtual microscopy versus hands-on light microscopy.

Summary of Work: A prospective, randomized crossover design study was conducted with a convenience sample of 67 first year PA students randomized to two groups. One group used light-microscopes to find microscopic structures, while the second group used instructor-directed video streaming of microscopic elements. At mid-point of the study, the two groups switched instructional strategies. Learning outcomes were assessed via post-test following each section of the study, with comparison of final practical exam results to previous cohorts. Attitudes about the two educational strategies were assessed by a post-course Likert-scale questionnaire.

Summary of Results: Analysis of the first post-test demonstrated students in the virtual microscopy group had significantly better learning outcomes than the light microscopy group ($p=0.004$; Cohen's $d = 0.74$). Analysis of the post-test after crossover did not show differences between the two groups ($p=0.48$). Between the two post-tests, students first assigned to the light microscopy group scored a 6.6 mean point increase (± 10.4 SD; $p=0.0011$) while students first assigned to the virtual microscopy group scored a 1.3 mean point increase (± 7.1 SD; $p=0.29$). The light microscopy group improved more than the virtual microscopy group ($p=0.019$). Analysis of practical exam data revealed higher scores for the study group compared to the previous five cohorts of first year students ($p<0.0001$; Cohen's $d = 0.66$). Assessment of student attitudes at the end of the study showed that 92% of students preferred virtual microscopy instruction to traditional light microscopy instruction.

Discussion and Conclusions: Virtual microscopy is an effective educational strategy for teaching clinical microscopy and was preferred by a single cohort of PA students over conventional instruction. The single cohort design is a notable limitation to generalizability. Implementation of virtual microscopy instruction may reduce formal instruction in the use of light microscopy, thereby challenging the use of light microscopes in clinical practice.

Take-home Messages: Virtual microscopy is an effective educational strategy, learning outcomes appear to be significantly higher using this method of clinical microscopy, and students prefer this method of learning.

Evaluating the Effects of Distance Learning on the Physician Assistant National Certifying Examination Pass Rate

AUTHOR(S):

- Jennifer Forbes, Idaho State University, USA (Presenter)
- Anntara Smith, Idaho State University, USA
- Marvin Sparrell, Idaho State University, USA
- Jared Papa, Idaho State University, USA

ABSTRACT

Background: Incorporating information technology in the classroom and utilizing distance learning in the education of physician assistants (PA) can allow for increased student enrollment with minor additions to faculty and staff. Distance learning can also be used to address the health care workforce shortage in underserved areas in the USA when satellite campuses are opened in underserved areas. This allows for the connection of learners, instructors and resources that are not occupying the same physical space. There is increasing interest from PA programs to offer distance learning at satellite campuses in addition to having a main on-campus program. The number of PA programs operating satellite campuses has doubled over the last decade. While there are many benefits to offering distance learning, there has not been any published research evaluating the effect this variable may have on the pass rate of the Physician Assistant National Certifying Examination (PANCE). The PANCE is the national board exam that PA program graduates must complete and pass before they can enter clinical practice in the USA.

Summary of Work: Information from the Physician Assistant Education Association (PAEA) program directory and the PAEA Research Program Report #33 were utilized to obtain the name and number of PA programs that offer distance learning in their curriculum. The National Commission on Certification of Physician Assistants (NCCPA) PANCE Exam Performance Summary Report was reviewed for each PA program offering distance learning. The five-year first-time taker mean pass rate for all PA programs offering distance learning was calculated and compared to the five-year national first-time taker average for all PA programs in the USA over the same five year period.

Summary of Results: The mean of the five-year first-time taker pass rate for PA programs offering distance learning was 97%. The five-year national first-time taker average was 96%.

Discussion and Conclusions: Students who attend a PA program that utilizes distance learning have the same or greater chance of passing the PANCE as students who attend a PA program that does not offer distance learning.

Take-home Messages: PA programs that utilize distance learning prepare students to pass the PANCE as effectively as PA programs that do not offer distance learning.

Emotional goals in e-learning: possible or impossible

AUTHOR(S):

- Nikoo Yamani, Isfahan University of Medical Sciences, Iran (Presenter)
- Sara Heydari, Isfahan University of Medical Sciences, Iran
- Peyman Adibi, Isfahan University of Medical Sciences, Iran
- Athar Omid, Isfahan University of Medical Sciences, Iran

ABSTRACT

Background: Today, medical education around the world is mostly focused on cognitive and psycho-motor goals. But a professional physician, should also be able to communicate well with patients and understand their feelings. Currently, e-learning is widely used to train medical students. It is very important to pay attention to the emotional goals of e-learning in which there is no teacher-student face-to-face contact. The purpose of this study was to develop strategies for teaching emotional goals in e-learning from the perspective of clinical professors, e-learning and medical education experts.

Summary of Work: This qualitative study was conducted in 2018. Clinical faculty of medicine, medical education and e-learning specialists from Universities of Medical Science in Iran participated in the study. The sampling was purposeful. Data was collected using 18 semi-structured in-depth individual interviews and were analyzed through conventional content analysis. Validity and accuracy of data were provided on the basis of Guba & Lincoln criteria.

Summary of Results: Three categories "Content" (design, media), "course management" (learning environment, interaction, blended learning), and "learner" (motivation, readiness, individual characteristics) were extracted.

Discussion and Conclusions: Participants believed that content should be designed creatively and engagingly. In the course management category, the blending was the most frequent code. Various studies have also reported the effectiveness of this method compared to completely electronic or completely face-to-face courses. Obviously, the interaction of students together or with the teacher can facilitate the achievement of emotional goals. Also, emphasizing the learner, real world examples can motivate them; creating feelings of satisfaction and trust, and giving appropriate feedback. Preparing e-learners for e-learning is important. Paying attention to individual characteristics and personalizing learning is another suitable solution.

Considering emotional goals in e-learning is important and its keys are using appropriate media for presenting content, blending learning, individualizing learning, and designing interactive learning environments.

Take-home Messages: We can teach emotional goals in e-learning by blending learning, individualizing learning, and designing interactive content.

Informing Entrustment Decisions: Designing Assessment Reports For Competence Committees Using Messick's Validity Framework

AUTHOR(S):

- Ryan Luther, University of Toronto, Canada (Presenter)
- Rodrigo Cavalcanti, University of Toronto, Canada
- Sylvia Heeneman, Maastricht University, Netherlands

ABSTRACT

Background: Assessment models for training doctors are transitioning toward competency-based medical education (CBME). In the Canadian context, entrustable professional activities (EPAs) were created to operationalize CanMEDS roles. EPAs are assessed through instruments which produce both quantitative and qualitative data. Entrustment decisions in CBME require group decision making by clinical competence committees (CCCs). However, the volume of raw assessment data may be too great for committees to review in its entirety for each entrustment decision. To facilitate interpretation, data must be collated, analyzed, and displayed in reports that facilitate decision-making. This study seeks to understand how assessment data can be reported to support CCCs in making valid entrustment decisions.

Summary of Work: Using a design-based research methodology, template assessment reports were developed using Messick's validity framework. Mock reports were created to represent well-performing, borderline, and poorly-performing residents. Through semi-structured individual interviews, reports were presented to 10 competence committee members from 2 training programs at the University of Toronto. Interviews sought to understand how CCC members interact with reports and identify which elements are used to support valid entrustment decisions. Data were analyzed using a framework analysis, using Messick's validity framework as a guide.

Summary of Results: Template assessment reports designed using Messick's validity framework provide CCC members with evidence to support entrustment decisions. While analysis is ongoing, data from 2 interviews indicates that CCC members rely on contextual information to support entrustment decisions. They also ensure narrative comments are congruent with numerical scores. Detailed analyses from the complete dataset will be presented to provide insights into how CCC members interpret validity evidence and help inform design of more user-friendly and valid reports.

Discussion and Conclusions: Results from this study will be used to inform development of assessment reports and expand its use in other clinical training programs. Interview data will also contribute to understanding of how CCCs use validity evidence to support entrustment decisions.

Take-home Messages: The expanding volume of assessment data in CBME requires programs to aggregate data to support decision-making. It is important that aggregated reports provide adequate validity evidence, to optimize the quality of decisions.

Using Entrustable Professional Activities (EPA) in Emergency Medicine

AUTHOR(S):

- Michele Gawlinski, The University of Western Australia, Australia (Presenter)
- Ian Dey, South Metropolitan Health Service Fiona Stanley Hospital, Australia
- Greg Sweetman, South Metropolitan Health Service Fiona Stanley Hospital, Australia
- Erin Furness, South Metropolitan Health Service Fiona Stanley Fremantle Hospitals Group, Australia
- Denese Playford, The University of Western Australia, Australia

ABSTRACT

Background: Entrustable Professional Activities (EPA) describe units of clinical activity. Their value as descriptors of clinical care has gained widespread commitment across a range of medical specialties. EPA have been explicitly linked to competency frameworks. However there is considerably less information on outcomes associated with EPA as a form of work-based assessment. This study outlines preliminary findings for EPA assessment of trainees in Emergency Medicine. It tracks entrustment decisions from the first to fourth post-graduate year (PGY1-4), associating EPA scores from registrars and consultants across the EPA domains originally described in 2014 as those required for day one of residency.

Summary of Work: The EPA form was developed in consultation with Emergency Medicine clinical staff. Twelve core EPAs were selected and five entrustment levels identified as appropriate to the EM context, as guided by the work reported in the Association of American Medical Colleges documentation. 32 matched pairs of registrar and consultant data for the same trainee were obtained over one calendar year. Individual and total EPA scores were obtained for a total of 64 assessments.

Summary of Results: There was a significant increase in total EPA score from PGY1 to PGY4 ($F=11.228$, $p<0.000$). Each EPA domain developed at different rates over time, with relatively few being scored as 'able to perform without supervision' in PGY1. Assessments by registrars and consultant entrustment decisions were positively correlated ($r = 0.406$, $p = 0.023$); there was no significant difference between their scores ($t=0.237$, $p = 0.814$); and descriptive comments provided useful behavioural comment tags for entrustment decisions.

Discussion and Conclusions: EPA scores increased with postgraduate year, with very few EPAs given total entrustment in PGY1 and some still in development by PGY3. These data provide insight into appropriate expectations at the commencement of clinical practice for Australian interns, and provide valuable training information.

Take-home Messages: Trainees demonstrate individual EPAs at different rates over time and relatively few EPAs were given total entrustment at day one of residency. Entrustment scores were consistent between registrar and consultant assessors, who also provided concordant behavioural tags for their decisions.

Evidence-based Competency in OSCE: An Analysis of the Relation between Entrustable Professional Activities Scale and OSCE Assessments

AUTHOR(S):

- Chih-Ming Hsu, Chiayi Chang Gung Memorial Hospital, Chang Gung Medical Education Research Centre (CG-MERC), Taiwan (Presenter)
- Chih-Cheng Hsieh, Chiayi Chang Gung Memorial Hospital, Taiwan
- Cheng-Ting Hsiao, Chiayi Chang Gung Memorial Hospital, Taiwan

ABSTRACT

Background: Medical knowledge evolves rapidly. Providing optimal medical care, healthcare professionals should integrate the latest scientific evidence and patient values with professional knowledge. Solving clinical problems with evidence-based medicine (EBM) is a key theme in medicine. Therefore, training and evaluating medical students' ability to apply evidence-based medicine is an important objective.

Summary of Work: Five experts developed the EBM OSCE, comprising five stations, of which two were unscored. Scored stations were: (1) medical history performance/PICO, (2) literature search/evaluation ability, (3) explanation of condition by literature. Fifteen PGYs participated (n=45 stations). Pearson's Correlation examined associations between OSCE checklist, global rating, and Entrustable Professional Activities (EPAs).

Summary of Results: The correlations among the three assessments were moderately/highly correlated: medical history performance and PICO establishment ($r=.722^{**}/.540^{*}/.561^{*}$), literature search and evaluation ability ($r=.915^{**}/.941^{**}/.899^{**}$) explanation of condition by literature ($r=.883^{**}/.879^{**}/.909^{**}$). Three types of questions reached significance, which means the EPAs Scale of the EBM shows the same results as the OSCE.

Discussion and Conclusions: The OSCE checklist assessed two concepts: EBM and consultation skills. This might have confused evaluators administering the EPAs scale, confounding the EPAs scale-OSCE assessment relationship. Overall, the EPAs scale is comparable to an OSCE, given the intense preparation for OSCE, EPAs scale is a more accessible and convenient evaluation method.

Take-home Messages: EPAs Scale is a fast and easy way for clinical teachers to assess trainees' competency in evidence-based medicine when there is insufficient time for an OSCE. The scope of application for an EPAs scale in teaching can be further explored in the future.

Formative assessment with the entrustability scale in a postgraduate resident objective structured clinical exam

AUTHOR(S):

- Kuei Ting Tung, Far Eastern Memorial Hospital, Taiwan (Presenter)
- Wei Horng Jean, Far Eastern Memorial Hospital, Taiwan
- Huey Ling Chen, National Taiwan University Hospital, Taiwan
- Chih-Wei Yang, National Taiwan University Hospital, Taiwan
- Pei-Chun Lin, Far Eastern Memorial Hospital, Taiwan
- Yun Chen, Far Eastern Memorial Hospital, Taiwan

ABSTRACT

Background: The objective structure clinical exam (OSCE) has been widely applied for assessment of postgraduate training. Whilst checklist scores and global ratings are useful for summative assessment, their value for formative assessment and feedback in competency-based education are more limited. Increasingly, “entrustability scales” have been utilized to reflect a judgment of competence and progress that is clinical meaningful to both raters and trainees. We hypothesize that incorporating an entrustability scale would be more objective than the global rating and improve feedback.

Summary of Work: Forty-two first year postgraduate general medicine residents participated in an end-of-year OSCE. Two separate OSCEs were held, each consisting of five long stations (12 minutes) from different specialties assessing clinical skills. For each exam, two separate faculty raters assessed the residents with checklist scores. They were further assessed with either a global rating (Likert scale 1-5) or a modified entrustability scale (Score 1-5, level of supervision). The inter-rater reliability of these scores was analyzed with intra-class correlation (ICC). Raters were surveyed on their satisfaction with the global rating or entrustability scale.

Summary of Results: Entrustability scale scores were lowest in pediatric and obstetrics/ gynecology exams, with average scores from 2 (proactive supervision with assistance when needed) to 3 (supervisor immediately available). Although variable, inter-rater reliability of the entrustability scale (ICC 0-0.995) was comparable to checklist scores (ICC -0.031-0.943) and global ratings (ICC -0.04-0.93). Good reliability (ICC >0.6) was found on half of the exams. When raters were surveyed comparing the entrustability scale to global rating, the entrustability scale was found to be more objective, easier to rate, better reflecting the checklist score, more useful to differentiate resident proficiency and more useful for feedback.

Discussion and Conclusions: The entrustability scale is useful measure of physician competence, is an objective measure and can be incorporated into the OSCE to assess postgraduate residents and provide feedback. Inter-rater reliability varied greatly, likely reflecting the need for further faculty training.

Take-home Messages: Entrustability scales reflect whether a postgraduate resident can perform important clinical skills independently. Incorporating this measurement into the OSCE if valuable for assessment and feedback.

The integration of on-line workplace assessment with entrustability scale to evaluate the milestones in ENT residents

AUTHOR(S):

- Chia-Der Lin, China Medical University & Hospital, Taiwan (Presenter)
- Po-Chang Wu, China Medical University & Hospital, Taiwan
- Xiao-Juan Lin, China Medical University & Hospital, Taiwan
- Fremen Chih-Chen Chou, China Medical University & Hospital, Taiwan

ABSTRACT

Background: It is still a challenge to accurately evaluate the progression of clinical competency. Frequent trainee's observation may result in highly variable evaluations which are skewed by factors other than the student's actual performance. Entrustability scales, composed of distinct narrative descriptions, are more meaningful to clinical assessors. Many ad hoc entrustment decisions are crucial to the final summative judgement for the trainees. How to accumulate enough ad hoc entrustments may be important in the clinical assessment of residents' competency.

Summary of Work: According to the traditional milestone program of ENT residents in Taiwan ENT Society, the assessment items of entrustable professional activities (EPA) were established using modified Delphi's method by experienced senior assessors. An on-line workplace assessment with entrustability scale to evaluate the milestones in ENT residents was developed. The trainees could send out their EPAs to their assessors in their daily work through this system, while the assessors might evaluate the trainees and give their realtime feedbacks. Finally, the residency review committee summed up the residents' performance yearly.

Summary of Results: 12 EPAs (including 67 observable professional activities, OPAs) were established using modified Delphi's method by 11 experienced senior assessors. 10 Residents (from 1st year to 5th year resident) participated in this EPA survey of clinical competency from July, 2017 to December, 2018. All the residents could comply with the survey well. The scales of clinical performance were higher as the resident training proceeded. All the residents and assessor perceived the assessment as a convenient and feasible way without interrupting their clinical work.

Discussion and Conclusions: Our on-line workplace assessments with entrustability scales are situation dependent. It could provide many ad hoc entrustment decisions by different assessors in daily clinical settings, including wards, operative theaters or emergency. In addition, it could effectively promote mutual feedbacks between clinical teachers and trainees, especially in a busy clinical scenario. Significant advancement of overall clinical performance was observed in different training stages.

Take-home Messages: A delicate integration of on-line workplace assessments with entrustability scales could provide another useful and inspiring tool in authentic clinical settings.

Establishing consensus for entrustable professional activities (EPAs) assessment via interprofessional collaboration: a pilot faculty development program

AUTHOR(S):

- Jung Chieh Du, Department of Medical Education and Research, Taipei City Hospital, Taiwan (Presenter)
- Jason Jiun Shiou Lee, Department of Research and Medical Education, Taipei City Hospital, Taiwan
- Ting Fang Chiu, Department of Research and Medical Education, Taipei City Hospital, Taiwan
- Lin Yang Chi, Department of Research and Medical Education, Taipei City Hospital, Taiwan
- Yi Ning Liu, Department of Research and Medical Education, Taipei City Hospital, Taiwan
- Da Chen Chu, Department of Research and Medical Education, Taipei City Hospital, Taiwan

ABSTRACT

Background: Entrustable professional activities (EPAs) are the units of professional tasks which can be entrusted to a trainee once adequate competence has been reached. However, the assessment of EPAs usually still faces the lack of consensus between various medical specialties. Therefore, we've designed a faculty development program for reaching consensus of EPAs assessment via inter-professional collaboration.

Summary of Work: The Department of Research and Medical Education in Taipei City Hospital had held a faculty training workshop of EPAs assessment for PGY trainees since Dec, 2018. The workshop had two sessions, including practice and designing of EPAs assessment, respectively. All participants were divided into several groups for discussion and collaboration. At practice session, several videos of clinical scenarios such as PGY trainees doing patient interview or duty handover were displayed and every group could discuss and judge the level of supervision scales (total 5 levels) for EPAs according to PGY trainees' performance. At second session, each group was requested to choose one clinical task as EPA for PGY trainees and work together to design suitable evaluation items as its assessment.

Summary of Results: A total of 44 participants had joined this workshop, including medical doctors, nurse practitioners, pharmacists, and other paramedical staffs. As to practice of EPAs assessment, the percentage of five levels of supervision scales were 12.1% (level 1), 28.8% (level 2), 30.3% (level 3), 19.6% (level 4) and 9.1% (level 5), respectively. The result revealed that level 3 (practice with supervision on demand) was the easiest to reach group consensus, but level 5 (perform without supervision) was the hardest. As to designing of EPAs assessment, most groups had chosen specific interprofessional practice as topic, such as inter-disciplinary consultation or competence to conduct IPP conference.

Discussion and Conclusions: The purpose of this workshop focused on establishing consensus for EPAs assessment via interprofessional collaboration. Such teamwork made most participants know what items of EPAs that other specialists concerned, too. The feedback from most participants also appreciated this workshop arrangement.

Take-home Messages: This program not only helped for forming consensus of EPAs assessment, but also provided a nice model for interprofessional collaboration.

Using EPAs to assess readiness for post-graduate training

AUTHOR(S):

- Wayne Woloschuk, University of Calgary, Canada (Presenter)
- Sylvain Coderre, University of Calgary, Canada
- Kevin McLaughlin, University of Calgary, Canada

ABSTRACT

Background: The purpose of undergraduate medical education is to prepare students for residency. In an attempt to assess our graduates' readiness for post-graduate training we requested feedback from resident program directors about the entrusted professional activities (EPA) of our medical school graduates.

Summary of Work: An assessment tool asking whether a resident is capable of performing 6 EPAs with entrustment at an indirect level of supervisions (Yes/No), whether the resident required remediation (Yes/No), plus an overall rating [1 (Much weaker than most) to 5 (Much stronger than most)] was developed. The form was sent to program directors to assess our MD graduates approximately 6 months into post-graduate training. Performance data on two recent classes (2017 and 2018) were collected. Students provided consent for our program to collect the data.

Summary of Results: Program directors returned performance data for 126/155 (81%) graduates of the class of 2017 and 95/145 (66%) graduates of the class of 2018. Entrustment (Yes) was reported for 221/221 residents on EP1 (History & physical exam), 219/221 on EPA2 (Differential diagnosis), 221/221 on EPA3 (Investigations), 220/221 on EPA4 (Communicate results), 219/221 on EPA5 (Management plan) and 220/221 on EPA6 (Recognize urgent/emergent care). 1/221 (0.5%) resident required remediation. Overall, 125/220 (57%) residents were rated stronger than most residents in the program, 84/220 (38%) were rated as similar to most residents and 11/220 (5%) were rated as weaker than most residents in the program. One resident was rated U/A (Unable to assess).

Discussion and Conclusions: Assessing the readiness for residency of MD graduates using EPAs is feasible. Program directors, using 6 EPAs, reported the entrustment of nearly all of the assessed graduates who were approximately 6 months into post-graduate training. Because some EPAs are more advanced than others waiting until later in training to assess all 12 EPAs is necessary.

Take-home Messages: Requesting program director feedback on entrustment activities can be used as a gauge for undergraduate medical education programs to determine whether their graduates are adequately prepared for post-graduate training.

A systematic review on entrustable professional activities in clerkships during undergraduate medical education - preliminary results

AUTHOR(S):

- Severin Pinilla, University of Bern, Department of Psychiatry, Switzerland (Presenter)
- Eric Lenouvel, University of Bern, Department of Old Age Psychiatry, Switzerland
- Andrea Cantisani, University of Bern, Department of Psychiatry, Switzerland
- Werner Strik, University of Bern, Department of Psychiatry, Switzerland
- Christoph Nissen, University of Bern, Department of Psychiatry, Switzerland
- Sören Huwendiek, Institute for Medical Education (IML), Switzerland

ABSTRACT

Background: We conducted a systematic review in order to identify the available evidence in the field of designing clerkship curricula based on entrustable professional activities (EPAs) in undergraduate medical education (UME) (ten Cate et al. 2015). Further aims of the review were to clarify key strategies to implement EPA-based clerkship curricula and to examine the emerging evidence in the early phase of introducing EPAs in UME. The results are considered relevant for planning future research and clinical teaching activities in this medical education field.

Summary of Work: We searched PubMed, Embase, Cochrane Library, ERIC, PsycINFO, Scopus, Web of Science and all Ovid journals for articles reporting qualitative and quantitative research as well as conceptual and curriculum development reports on entrustable professional activities in clerkships during undergraduate medical education until 15th January 2019. We based our review method on the Preferred Reporting Items for Systematic reviews and Meta-Analyses (PRISMA) (Moher et al. 2009).

Summary of Results: 2,026 records were screened after database searching. A total of 27 articles were included in the systematic review. Three countries (Canada, USA, Switzerland) have developed discrete sets of EPAs for UME. The included articles investigated assessment strategies of EPAs, EPA-based curriculum development, and educational outcomes of EPA-based curricula. 30.7% of studies were specialty specific research reports.

Discussion and Conclusions: In addition to EPA-based curricula covering all years of medical school, several clinical specialties are starting to integrate EPAs in their clerkship curricula. Currently there are only preliminary data for few EPAs with regards to educational outcomes. However, there is a growing body of evidence indicating that EPAs can be effectively used for undergraduate medical education and serve as a basis for internationally comparable competency-based curricula.

Take-home Messages: There is limited but increasing evidence, that EPAs have a positive impact on educational outcomes in undergraduate medical education. Further research is needed to understand how educational resources should be allocated in order to develop efficient and effective EPA-based curricula spanning the learning trajectory from classroom to bedside in different specialties in undergraduate medical education.

Planning the introduction of Entrusted Professional Activities (EPAS) in undergraduate medical education

AUTHOR(S):

- Nêmora Barcellos, Unisiversidade do Vale do Rio dos Sinos - Unisinos, Brasil (Presenter)
- Elson Romeu Farias, Unisinos, Brasil
- Cláudia Salles Stadlober, Unisinos, Brasil
- Maria Letícia Ikeda, Unisinos, Brasil

ABSTRACT

Background: EPAS were developed to articulate competencies needed by a medical professional into clinical practice, making them feasible [Ten Cate O. Med Educ. 2005; 39 (12): 1176-1177]. These are tasks or procedures, that can be entrusted to a graduate or resident after supervised training, for unattended execution. An EPA requires multi-skill proficiency and is a facilitator in evaluation, when compared to assessment based on isolated competencies [Ten Cate O, et al. AMEE Guide No. 99. Med Teach. 2015; 37 (11): 983-1002].

Summary of Work: In the new Unisinos Medical Course, EPAS will be introduced in the second semester and progressively in the following ones. Different evaluation methods, as well as the Unisinos alumni e-Portfolio, will support EPAS-related assessment and feedback.

Summary of Results: An example of competency matrix/EPAS is presented. It was developed for the activity of Individual-Community Interaction, in which the students go to the field, with teachers, and accompany families in the territory of a Family Health Strategy, during three semesters. 1. Develop attitudes for the care of health problems/CanMEDS 2.2/Collaborator/Nutrition counseling 2. Healthy lifestyles promotion, reconciling individual and community needs and promoting social transformations/CanMEDS 2.2/Collaborator/Guidance on household risks 3. Demonstrate ability to communicate and interact, working cooperatively in groups, respecting differences and acting as articulator/CanMEDS 5.1 and 5.2/Professional/Anthropometry and vital signs 4. Understand the importance of surveillance systems, and training for routinely feeding them and register on medical records into daily practice/CanMEDS 5.1 and 5.2/Communicator/Document clinical encounters with accuracy and accessible language

Discussion and Conclusions: Although numerous universities use EPAS with medical residents, their use in undergraduate education is still innovative. EPAS approach is related to the progressive development of skills within learning and the development of confidence, increasing effectiveness of the educational process, patient safety and quality of care. [H. Carrie Chen, et al. Academic Medicine, Vol. 90, No. 4 / April 2015]

Take-home Messages: Innovation is needed to ensure medical students' interest and the effective incorporation of competencies in medical practice.

Evaluation of the use of mobile technology in competency-based assessment in undergraduate medical education

AUTHOR(S):

- **Norah Duggan, Memorial University of Newfoundland Faculty of Medicine, Canada (Presenter)**
- Heidi Coombs-Thorne, Memorial University, Canada
- Vernon Curran, Memorial University, Canada
- Diana Deacon, Memorial University, Canada
- Stephen Pennell, Memorial University, Canada
- Katherine Stringer, Memorial University, Canada

ABSTRACT

Background: In 2015, Memorial University became the first medical school in Canada to introduce EPAs into an undergraduate clerkship curriculum and to structure a formative assessment process around EPAs. This process was based on the concept of programmatic assessment consisting of cycles of training and longitudinal assessment. An electronic EPA clinic card was introduced that enabled preceptors to submit formative observational assessments of learner performance using mobile technology (e.g., mobile phones). This study evaluates validity, feasibility and educational effect of electronic clinic cards in the formative assessment of EPAs.

Summary of Work: Our study uses a mixed-methods triangulation approach encompassing: reliability and inter-rater analyses of EPA scores for N=80 students in the Core Experiences clerkship course; predictive validity analysis of EPA scores with summative discipline examination scores; student and faculty surveys; and faculty focus group to explore satisfaction with a mobile technology EPA-based assessment system.

Summary of Results: Survey results from students (response rate 21.3%) and preceptors (response rate 25.8%) indicate the electronic card was easy to access and use and was dependable. Both groups felt the electronic card process was less successful in facilitating effective coaching feedback between learners and preceptors. Preceptors responded that more faculty development was needed. Contrary to the intent of the process, to encourage immediate feedback, participants did not respond in a timely fashion.

Discussion and Conclusions: Free text comments allow the collection of rich assessment data and are especially useful in formative assessment. Training is essential for both learners and preceptors in a variety of formats to reach all users. Involving users in development and implementation ensures the assessment system is user friendly. User acceptability is influenced by a number of factors, including the process for data entry and submission. Cultural change is a major determinant of success in implementation of new assessment systems, and stakeholder engagement is essential for successful uptake of mobile technologies for work-based assessment.

Take-home Messages: Mobile technology offers a feasible means for facilitating work based assessment of EPA achievement and encouraging direct observation and assessment of learner performance.

Professional development among medical students in Longitudinal Integrated Clerkship in Taiwan: A Qualitative Study

AUTHOR(S):

- Shih-Chung Huang, Kaohsiung Armed Forces General Hospital, Taiwan (Presenter)
- Chao-Heng Kao, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Yan-Di Chang, National Defense Medical Center, Taiwan
- Yaw-Wen Chang, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Chou-Yuan Ko, Kaohsiung Armed Forces General Hospital, Taiwan

ABSTRACT

Background: Professional development is needed throughout the whole medical school curriculum. The clerkship is a pivot stage for medical students to achieve professional skills in their early years of clinical training. The longitudinal integrated clerkship (LIC) is a model of clinical education and commonly implemented in western countries. This study is aimed to explore the outcome of professional development among LIC students in Taiwan.

Summary of Work: LIC graduates of academic year 2015/16 and LIC students of 2017/18 were invited. An in-depth interview script was developed by the authors, designed to guide participants in their reflections on three aspects: the length and nature of the relationship with their LIC patients, the ethical/professionalism issues on patient encounters, and the development of professional skills. A general inductive method was used in the analysis to identify themes from interview data.

Summary of Results: Seven graduates and five medical students were enrolled in this study. Six major themes were found: 1) holistic approach to patients, especially on psychosocial aspects; 2) honest about and realizing one's limits; 3) more willing to see and listen to patients; 4) more confident to first-line care of patients; 5) able to prioritize clinical tasks; 6) better communication skills. The participants reported that the developed skills which they valued most during LIC were: problem-solving, communication with the attending/patient, and establishing a therapeutic alliance with the patient.

Discussion and Conclusions: The LIC program strengthened the students' ability to approach patients holistically with bio-psycho-social aspects. In general, students learned to take responsibility for their patients and be more pro-active. They were better at cultivating a good relationship with and gaining their patients' trust even years after the program. The also showed honesty and professionalism after LIC training. The limitation of this study was a small sample size and no comparison group.

Take-home Messages: The design of LIC could improve students' motivation to understand, communicate with, and take care of patients.

Facilitators and Barriers to Medical Student Learning in the Outpatient Setting

AUTHOR(S):

- Philippa Horner, The Hillingdon Hospitals NHS Foundation Trust, UK (Presenter)
- Dilshani Hunukumbure, The Hillingdon Hospitals NHS Foundation Trust, UK
- Jonathan Fox, The Hillingdon Hospitals NHS Foundation Trust, UK
- Saroj Das, The Hillingdon Hospitals NHS Foundation Trust, UK

ABSTRACT

Background: Much of the education of medical students takes place in clinical environments. The outpatient clinic is one setting where students can struggle to use their time effectively for learning. Studies show barriers to learning in clinical settings include factors such as lack of a learning plan (Taylor and Hamdy, 2013); specific to outpatient settings, Regan-Smith et al (2002) found lack of predictability and lack of continuity as problematic for learning. This study aims to achieve insight into the views of learners and clinicians with regard to facilitators and barriers in clinic-based learning.

Summary of Work: This is a qualitative research study with a social constructivist outlook. Data collection is ongoing (January-March 2019) using semi-structured interviews and questionnaires to gain insight from the perspective of ten medical students and ten clinicians. Triangulation of this information will improve the accuracy of the results. Semi-structured interviews will be recorded and transcribed verbatim. Once all data is available, thematic analysis will be performed.

Summary of Results: Interview data thus far explain that the opportunity for students to get “hands on” and immerse themselves in the clinical reasoning and management plans further enhances the benefits of this environment. As well as clinical knowledge, students can learn a lot about clinical communication skills through the role-modelling of their “teachers”. Key barriers can be considered as: a) teacher-related e.g. lack of attempts to engage students in discussion, b) student-related e.g. lack of interaction with patients and c) environment-related e.g. lack of time available to discuss patient cases and lack of space available for students to assess patients independently.

Discussion and Conclusions: Delivering high-quality educational interventions in the busy setting of the outpatient clinic can be challenging but clinicians have many opportunities to influence a student’s learning by guiding them in practical activities and setting examples of good clinical practice. Students must engage with this process, however, in order to develop as medical professionals.

Take-home Messages: Students attending outpatient clinics should be mindful that engaging in patient interactions will enhance learning and clinicians should strive to facilitate this by setting learning goals and asking thought-provoking questions.

Optimising medical students' learning during clinical placements

AUTHOR(S):

- Vardah Alam, GKT School of Medical Education, King's College London, UK (Presenter)
- Bahadur Anjum, Newham University Hospital, UK

ABSTRACT

Background: Much has been written about learning styles, how expertise develops in medicine and the influences on student mind-sets and behaviours. Little has been documented by students about which learning methodologies they find most beneficial and why. This study puts students' perspectives about their learning during a paediatric clinical placement at its core and offers an insight into how students' learning experiences can be optimised and delivered in an effective and clinically relevant manner.

Summary of Work: Medical student paediatric placements were redesigned in Newham Hospital in response to Action Research based recommendations. Bedside teaching became focused on history elicitation and signs analysis followed by a brief discussion on management, rather than the presentation of clinical cases in a classroom. A weekly single best answer question style session was initiated as well as a weekly session requiring students to recognise symptoms and signs through images. Feedback was collected from 149 students over five years using a Likert scale questionnaire and free texts. Freehand comments were also encouraged; these then underwent conventional content analysis to code and identify themes in the data.

Summary of Results: 149 students completed their evaluation forms, with no unusable forms, and 297 freehand comments were received. Teaching methods consistently rated highly for educational value were those that are practical; focused on clinical signs and symptoms; which offered opportunities for discussion and student involvement with timely feedback. In this respect 51% (n= 1073) of all changes were rated as very useful and only 3% (n=62) were rated as not useful. In terms of the learning environments: students preferred inpatient settings to community settings.

Discussion and Conclusions: Often students experience difficulty not in the traditional content learning of medicine but in learning to recognise and interpret the data before them. Students found this placement was made effective as they were exposed to a wide variety of presentations for common conditions and encouraged to develop their own patterns of those symptoms and signs that occurred consistently or most commonly.

Take-home Messages: (1) Seeking student feedback consistently is crucial in optimising their learning experience. (2) Creating placements that offer strong theoretical knowledge grounded in practical patient examples establishes good clinical practice.

Improvement of Self-confidence of Medical Students after online Procedural Video Demonstration (SimME5)

AUTHOR(S):

- **Rossukon Khotcharrat, Naresuan University, Thailand (Presenter)**
- Napat Rattanawongsa, Maharaj Nakhonratchasima Hospital, Thailand
- Thitirat Pattanathaiyanon, Songkhla Hospital, Thailand
- Sutthini Tirat, College of Medicine and Public Health Ubonratchathani University, Thailand
- Thanachai Panaput, Khon Kaen Hospital, Thailand
- Withita Jangiam, Vachira Phuket Hospital, Thailand

ABSTRACT

Background: The level-1 procedural skills (does without supervision) of Medical Competency Assessment Criteria for National License is crucial. Some procedures are required for review and practice. Thus, easily accessible electronic instructional media may enhance procedural proficiency and self-confidence.

Summary of Work: Objectives To Compare the medical student's self-confidence of procedural skills before and after watching online video demonstration produced by the EMCE5 group. Satisfaction, recommendation, and additional view were also evaluated. Methods Twenty-six level-1 online procedural video demonstrations; 11 for 4th-yr, 11 for 5th-yr and 4 for 6th-yr, were produced and uploaded to Youtube (link <http://goo.gl/kv4tiY>). Pre and post attending questionnaires for evaluating the self-confidence and satisfaction were created using 5-score Likert scale. We have surveyed between June 1 and July 12, 2018. The paired t-test was used to compare the pre and post average scores of the self-confidence, p-value<0.05 was the level of significance.

Summary of Results: A total of 238, 126 4th-yr, 49 5th-yr and 63 6th-yr, medical students from 28 medical education centers answered the questionnaires. The overall mean+SD scores of post attending confidence, 3.98+0.13, was higher than pre attending confidence, 2.77+0.31, p<0.01. The mean score of satisfaction was 4.33+0.15. All procedures showed significant increasing of mean self-confident scores after watching video demonstration. There were some procedures that had mean self-confident scores < 2.5 regarding, aerosol therapy, gastric gavage & lavage, intravenous fluid and normal labor.

Discussion and Conclusions: SimME5 is useful for improving confidence in procedural performance of clinical year medical students and should be considered as supporting instructional media.

Take-home Messages: At the present time, electronic procedural instruction media is useful and accessible all the time to serve the student's needs.

A corpus-based linguistic approach to the pedagogy of the writing of the story of patient's illness

AUTHOR(S):

- Pi-Hua Tsai, Mackay Medical College, Taiwan (Presenter)

ABSTRACT

Background: The history of the present illness (HPI) is a written narrative that tells the story of the patient's illness, including how it started and how it progressed (Buttrey, 2013). Medical students have trouble deciding what content to include and writing it grammatically.

Summary of Work: Taking a corpus linguistic approach, this study investigated the differences in the linguistic features and content of HPI writings of interns or residents in a local hospital in Taiwan and those of the HPI by an American physician, who taught them medical writing. Three corpora were created: a corpus of 11 actual case histories of the present illness by the interns or residents (2355 words) and the rewrites-up of the same cases by the American physician (2424 words); the American physician's comments on the content of the interns or residents' writes-up (4326 words); the American physician's comment on the English they used (2783 words). Wordsmith Tools was employed to compare and analyze the corpora.

Summary of Results: The results showed that no perfect tenses were used to indicate the duration of a patient's illness in the interns or residents' HPI writings. Nor were adjectives (e.g. intermittent) and articles (e.g. the or a) added to indicate such symptoms as fever and dizziness. Moreover, the number of the verbs "noted" and "denied" used by the interns or residents was twice as much as that used by the American physician. In the case of the noun "patient," they used half as much as that by the American physician. As to the content, the American physician suggested more information and description about symptoms be added, (e.g. when exactly the pain started, where it was and how long it lasted), the past and the family history of the patients, the risk factors for a disease, and patient's social life (e.g. drinking).

Discussion and Conclusions: The alternative linguistic forms used by Taiwanese interns or residents might be influenced by their native language. Some guidance for the instruction and learning of HPI writing is also proposed.

Take-home Messages: The results of this corpus linguistic analysis can contribute to the designing of teaching authentic materials for HPI writing and medical students' self-study.

We learned more in a smaller hospital: The medical students' experiences and feedback on morning reports in two hospitals

AUTHOR(S):

- Yu-Hsin Chen, Tri-Service General Hospital, National Defense Medical Center, Taiwan (Presenter)
- Shih-Chung Huang, Kaohsiung Armed Force General Hospital, Taiwan
- Yaw-Wen Chang, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Yan-Di Chang, National Defense Medical Center, Taiwan

ABSTRACT

Background: Morning report is an important educational activity for the medical staffs. The human and logic resources are more abundant in a medical center than in a regional hospital, which might have an impact on teaching capacity. The study aimed to compare the medical students' experience and feedback on the morning report held in two hospitals.

Summary of Work: The internal medicine training in M5 core clerkship composites of 9 segments of two-week rotations in a medical center, and one two-week rotation in a regional hospital. Medical students at the end of internal medicine rotation were invited. The data were collected using semi-structured interviews and analyzed using the general inductive method.

Summary of Results: The frequency, duration, and the number of participants were almost equivalent in two hospitals. But in the medical center, the morning report was held in one sub-specialty division and the focus of the discussion was specific to that field. Almost all of the medical students reported they learned more from the morning reports in the regional hospital. It might refer to three reasons: 1. Common language: Abbreviations would confuse the beginners. Searching them made students lost in the discussion. 2. Complete thinking process: Processes of clinical reasoning which was important for the beginners were usually skipped in the single sub-specialty morning report. 3. Multiple sub-specialties: Students could see how doctors collaborate and communicate. Moreover, they could receive feedback from various sub-specialist at the same time.

Discussion and Conclusions: The advantage of morning reports in a medical center was that the students can see rare cases and complications. Instead, students preferred to engage more in a regional hospital. A good morning report should allow learners and teachers to interact and discuss patient care, improve clinical reasoning skills, learn teamwork, and receive feedback from various sub-specialist at the same time.

Take-home Messages: Medical students learned more in morning reports that engaged learners by using common language, displaying the thinking process, and demonstrating collaboration.

Level of Confidence in Non-technical skills of Clinical Year Medical Students and the Contributory Parts of the Medical Curriculum

AUTHOR(S):

- Pophum Lawtongkum, Srinakharinwirot University, Thailand (Presenter)
- Orasa Sukmark, Srinakharinwirot University, Thailand
- Wipada Laosooksathit, Srinakharinwirot University, Thailand
- Amarin Narkwicheckan, Srinakharinwirot University, Thailand

ABSTRACT

Background: While non-technical skills are crucial for developing safe practices within the medical sphere, Srinakharinwirot University does not yet have an explicit training of such skills. This questionnaire assesses the level of confidence in non-technical skills of clinical year students and establishes which parts of the curriculum aided in their development of which may be improved upon.

Summary of Work: A questionnaire was sent out to clinical year students, comprising of questions determining the level of confidence in each skill using a Likert scale. This was followed by tick-the-box questions determining the part of the medical curriculum which contributed to the development of the corresponding skill. The mean and standard deviation of the Likert scale scores were calculated and ranked, while percentages pertaining to the parts of the curriculum to each skill were established.

Summary of Results: The skill students scored as most confident in was 'offering assistance' (7.98±1.64), of which clinical clerkship on the wards was the most contributory in its development (29.5%), with community medicine (26%) and extracurricular activities (14%) following suit. Similarly, clinical clerkship contributed most to the second and third scoring skills of 'planning and preparation' (7.92±1.61) and 'role responsibility' (6.41±1.92). This was followed by community medicine (12.89%, 14.97%) and problem-based learning (14.68%, 12.57%). In lower scoring skills such as 'generating alternative options to problems' (5.94±1.85), and 'maintenance of standards' (6.41±1.91), clinical clerkship was also the most contributory (36.0%, 36.14%) in the development of the skills.

Discussion and Conclusions: The clinical year Srinakharinwirot University student's confidence in non-technical skills can be developed mainly through clinical clerkship. Knowing this, it is not difficult for improvements to be made in the already existing clerkship syllabus framework, and through encouraging role models (interns, residents, attending staff) in the wards to better aid in the development of non-technical skills.

Take-home Messages: Non-technical skills in medical students can be developed mainly through clinical clerkship, of which it is not difficult to plan the existing syllabus to aid better in the development of the skills.

“Not all of us can do great things. We can do only small things with great love”

AUTHOR(S):

- Chalermpong Sukontapol, Vachira Phuket Hospital, Thailand (Presenter)

ABSTRACT

Background: Caregiving only calls us to learn into love. We didnt know possible. Caregivers have an important role for many long time. Vulnerable patients with such as children, psychiatric and mental health problems or deliberating conditions may need a special holistic care. Patients and doctors may be an important combination group. Caregivers may have a function to join together bonding for strengthening of physical, mental, social and spiritual healing power. How did we expect the important role of our caregivers?

Summary of Work: Clients, caretakers and mental health care team were interviewed and check rating scale to their opinions about how importance of the caretakers in various aspects (30 participants). (Each item 100 is perfect) This study was done in Talang rural hospital in Phuket. Importance about physical, medication care Importance about mind, mental health and encouraging Importance about social, activity and relationship Importance about better continuing treatment by doctors, nurses and team Importance about learning climate for medical students

Summary of Results:

Total points = 500 (100*5)

CC1 = 380, CC2 = 400, CC3 = 380, CC4 = 450, CC5 = 500, CC6 = 480, CC7 = 500, CC8 = 450, CC9= 480, CC10 = 500, CC11 = 500, CC12 = 500, CC13= 500, CC14 = 320, CC15 = 500, CC16 = 500, CC17= 500, CC18 = 480, CC19 = 335

Average (mean) = 455.53

Discussion and Conclusions: Total points of rating scale about caregiver were response in agreeable. Average score can be confirmed interesting point. Caregiver may be a person to teach our medical student and also have an important role for holistic care. We hope caregiver to develop a new pattern of holistic care and help for practical points in our study. Lesson learnt will develop this idea to our clinical curriculum.

Take-home Messages: Caregiver may be a group of person that we neglect to learn from them. Someone to help us for holistic care of the patient. New era of caregiver may just start.

Outcomes of the short session structured Chest X-ray evaluation training for 4th-year medical students, Suratthani Medical Education Center, Thailand

AUTHOR(S):

- Thotsaporn Morasert, Suratthani Hospital, Thailand (Presenter)
- Arunee Tipwong, Suratthani Hospital, Thailand
- Direk Ekbawornwong, Suratthani Hospital, Thailand

ABSTRACT

Background: The evaluation of Chest X-ray (CXR) is often challenging for medical students and requires extensive experience. The structured interpretations of CXR are a process that requires a systematic approach; they would be the helpful guide for novice students to interpret the CXR. This study aims to compare the confidence and accuracy of CXR diagnoses between two different types of structured evaluation training on the 4th year medical students.

Summary of Work: A total of 25 fourth-year medical students were randomly allocated to one of two structured CXR evaluation training either ABCDEH mnemonic (ABC) or inside-out (ISO) groups. Thirteen students in the ABC group were taught with mnemonic: Airway, Breathing, Circulation, Diaphragm, Extra, Hidden, and 12 students in the ISO group were guided to evaluate CXR as inner-outer direction for 30 minutes. After finishing the training, 20 CXR quizzes (2 minutes per quiz) without clinical history were tested simultaneously. Twelve quizzes (60%) were abnormal images (3 pneumonia, 2 atelectasis, 2 lung mass, 1 congestive heart failure, 1 emphysema, 1 hilar mass, 1 pneumothorax, and 1 pleural effusion).

Summary of Results: There were no differences between mean \pm SD score (7.5 ± 2.5 vs 6.6 ± 2.4 , $P = 0.344$), the pre-test confidence level (5.2 ± 1.2 vs 4.1 ± 1.4 , $P = 0.051$) of ABC and ISO group, respectively. The mean confidence levels of post-test were significantly increased in both ABC (2.0 , 95%CI 1.13-2.85, $P < 0.001$) and ISO (2.57 , 95%CI 1.47-3.67, $P < 0.001$). The accuracy of interpretations were similar between ABC and ISO group, sensitivity (89.1% vs. 88.9% [proportion of correctly identified abnormal images out of the total number of abnormal images]) and specificity (45.2% vs. 45.8% [proportion of correctly identified normal images out of the total number of normal images]).

Discussion and Conclusions: Fourth-year medical students lack confidence and skill in CXR interpretation. However, their confidence improved after both short-session structured CXR evaluation training. The students have high sensitivity to detect the abnormal CXR but low specificity to identify the normal CXR.

Take-home Messages: Structured Chest X-ray evaluation is a helpful teaching strategy for the 4th-year medical students.

The Learning Reflection of Medical Students on the Sky Doctor Class

AUTHOR(S):

- Kanjane Wachirangsiman, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand (Presenter)
- Sivanath Peerachair, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand

ABSTRACT

Background: Due to the spatial distributions of rural population in Thailand, access to health care services is fraught with difficulties. Therefore, the National Institute of Emergency Medicine has set up “Thai Sky Doctor Project” to help transporting patients through emergency aeromedical service using helicopters with Tak as one of the provinces driving this project. The Medical Education Center at Somdejphrajaotaksin Maharaj Hospital recognizes the importance of the project and launched the “Sky Doctor Class” in November 2018 to enhance emergency aeromedical service skills at real settings by using the role-play method as a teaching tool. This research study aimed to study the learning reflection of the medical students participating the “Sky Doctor Class”.

Summary of Work: This study was qualitative research with 17 medical students during clinical training who participated in the “Sky Doctor Class” as key informants. The data was collected from the written reflection of the participating medical students while data analysis was performed using descriptive statistics.

Summary of Results: Based on the reflective writings of the medical students, the reflection can be divided into 5 aspects as follows: (1) 17 students gained knowledge on emergency aeromedical service (100%), (2) 12 students derived a positive and enjoyable experience (70.5%), (3) 8 students realized the geographical and societal contexts of Thailand (47.05%), (4) 6 students felt their communication skills improved (35.29%), and (5) 4 students experienced anxiety while practicing emergency aeromedical service on the helicopter (23.52%).

Discussion and Conclusions: There was evidence from this study that the “Sky Doctor Class” can be used as a supplemental activity to empower medical students and broaden their vision of working as physicians in the future.

Take-home Messages: The reflective writing technique can identify the learning outcomes, recommendations, or concerns of medical students on supplemental activities. Data from reflective writings can be used to improve the next session of any given supplemental activity and increase the learning satisfaction level of medical students.

Sky Doctor Project for Medical Students with Role-Play Learning Management

AUTHOR(S):

- Sivanath Peeracheir, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand (Presenter)
- Kanjaneer Wachirarangsiman, Somdejphrajaotaksin Maharaj Hospital Medical Education Center, Thailand

ABSTRACT

Background: The National Institute of Emergency Medicine established Thai Sky Doctor Project since 2009 with the aim to transport patients from remote areas by air. In the meantime, Tak is one of the provinces in Thailand in which Thai Sky Doctor Project has been implemented due to its mountainous geography with the population residing in such remote areas. Somdejphrajaotaksinmaharaj Hospital Medical Education Center realizes the importance of project and initiated the Sky Doctor Project to train medical students for aeromedical patient care. This research has aimed at assessing the participating medical students on the knowledge gained and satisfaction derived from project.

Summary of Work: The participants included 4 physicians, 17 medical students and 10 multidisciplinary health professionals. The activities were divided into 2 parts; the first was lecture on the aeromedical patient care principles and the second was a role-play of aeromedical patient care conducted at Tak Aviation Unit with 3 groups of SP. During the simulated scenario, the medical students role-played in transporting patients to helicopter. When project's activities were completed, participating medical students were asked to complete a questionnaire to assess their knowledge gained and the satisfaction derived from using a five-point Likert scale.

Summary of Results: All participating medical students, prior to this study, had not been involved in the Thai Sky Doctor Project. Overall, the Sky Doctor Project was assessed at the highest level of 4.71. The knowledge gained from participating in the project was at the highest level (mean=4.67) while the satisfaction level was also at the highest (mean=4.75).

Discussion and Conclusions: The development of aeromedical patient care skills under the Sky Doctor Project using role-playing in real settings was found to be one of the most effective teaching and training methods for medical students. Not only did this activity promote knowledge and satisfaction among the medical students but it also created a collaborative working experience between medical students and multidisciplinary health professionals.

Take-home Messages: With regards to certain topics in emergency medicine, medical instructors can apply role-plays in real settings in training medical students. Meanwhile, this role-play method is also consistent with instruction in the 21st century and can be used to transfer knowledge to medical students.

The positive effect of student-oriented hospital ward rounds employing role-play and peer review on the clinical performance and professionalism of clerkship students

AUTHOR(S):

- Hajime Kasai, Health Professional Development Center, Chiba University Hospital, Japan (Presenter)
- Shochi Ito, Health Professional Development Center, Chiba University Hospital, Japan
- Hiroshi Tajima, Department of Respiriology, Graduate School of Medicine, Chiba University, Japan
- Mayumi Asahina, Health Professional Development Center, Chiba University Hospital, Japan
- Ikuko Sakai, Interprofessional Education Research Center, Graduate School of Nursing, Chiba University, Japan
- Koichiro Tatsumi, Department of Respiriology, Graduate School of Medicine, Chiba University, Japan

ABSTRACT

Background: While role-play and peer review are used to train and evaluate communication skills in clinical education, it is rare for them to be used in combination during clinical clerkship (CC). We evaluated the effect of role-play and peer review in student-oriented hospital ward rounds dealing with actual patients during CC.

Summary of Work: Clerkship students conducted medical interviews with and performed physical examinations on their patients; these were reviewed by five peer students. Peer students observed the performance of the clerkship students while role-playing as senior physicians or patients' families; the performance was then evaluated based on the mini-clinical evaluation exercise (Mini-CEX) and the professionalism mini-evaluation exercise (P-MEX) by two attending physicians, comparing results from before and after the rounds. After CC, the students responded to questionnaires about the rounds.

Summary of Results: Ninety students completed the rounds, and the duration of each round was 39.3±7.7 minutes. The counselling abilities and professionalism of the students on Mini-CEX, as well as their doctor-patient relationship skills and reflective skills on P-MEX, showed significant improvement after the rounds (5.5±1.2 vs. 6.8±1.2, p<0.001; 5.7±1.1 vs. 7.1±0.9, p=0.001; 3.0±0.3 vs. 3.4±0.3, p=0.001 and 3.2±0.3 vs. 3.6±0.3, p=0.001). There was also improvement in the performance of medical interviews and physical examinations. The student satisfaction level of the rounds was acceptable, and students recognized that the rounds provided multilateral viewpoints of patient care, which improved self-directed learning.

Discussion and Conclusions: Combining role-play and peer review in hospital rounds in CC improved the clerkship students' clinical performance and professionalism. The rounds also promoted the students' awareness of the importance of multilateral viewpoints in patient care. This method could encourage both comprehensive patient care, considering the patients bio-psycho-social aspects, and an increase in learning motivation. Additionally, this method can be easily and quickly implemented, because preparations involved with simulating patients and creating scenarios are not required. Moreover, the rounds were favorable to students and were of a suitable duration for them.

Take-home Messages: Role-play and peer review during student-oriented hospital ward rounds is a resource-effective tool in CC and can improve the clinical performance and professionalism of clerkship students.

Perceptions of Negative Teaching Approaches by Clinical Tutors in Kuwait

AUTHOR(S):

- Manal Bouhaimed, Faculty of Medicine, Kuwait University, Kuwait (Presenter)
- Jasmine Eliwa, Kuwait University Faculty of Medicine, Kuwait
- Deena Jamal, Ministry of Health, Kuwait
- Abdelrahman Alashqar, Ministry of Health, Kuwait
- Bann Qadoura, Faculty of Medicine, Kuwait

ABSTRACT

Background: Clinical ethics is a mandated core principle in Kuwait University Faculty of Medicine (KUFoM), the only medical school in Kuwait. Students are taught and expected to adhere to a code of ethics, including proper communication skills, with their patients, peers, and clinical tutors. However, various KUFoM clinical tutors implement negative teaching approaches towards students, a teaching style that is outdated in many curriculums worldwide. The study aims to identify KuFOM students' perceptions towards a negative clinical teaching approach based on their personal experiences.

Summary of Work: A questionnaire was distributed to a stratified random sample of 152 clinical year students in KUFoM. The questionnaire assessed each student's socio-demographic, personal experience with clinical teaching approaches, and perception towards such experience and approaches.

Summary of Results: A majority of students (71%) personally experienced negative teaching from a clinical tutor, including being asked questions intimidatingly (72%), spoken to rudely or with hostility (61%), belittled or humiliated (61%), and yelled at (54%). In addition, 82% of students witnessed other students experience negative teaching, including being yelled at (83%), spoken to rudely or with hostility (81%), asked questions intimidatingly (78%), belittled or humiliated (73%), and cursed or sworn at (32%). 40% of students reported that clinical tutors in both medical and surgical departments implemented negative teaching of equal frequency (40%), while 37% of students considered medical clinical tutors more adherent to negative teaching. All in all, 94% of students prefer the dissolution of negative teaching approaches with 87% of students perceiving the lack of usefulness in negative teaching, including asking intimidating questions (77%).

Discussion and Conclusions: Most medical students in KUFoM have experienced and witnessed negative teaching approaches implemented by clinical tutors. Moreover, most students do not benefit or support negative clinical teaching. Developing and improving the clinical teaching environment, including training clinical tutors with positive teaching approaches, is warranted.

Take-home Messages: Negative clinical teaching is commonly implemented in KUFoM with a lack of benefit reported by students. Training clinical tutors with more positive teaching approaches is warranted.

Repeated examination and retention of plastic surgical skills in medical students after one-day session skills training

AUTHOR(S):

- Nadda Kaewkumsan, Uttaradit Hospital, Thailand (Presenter)

ABSTRACT

Background: Incorporating plastic surgical skills, more complex activities, into basic surgical training in the medical student is challenging, especially, without self-controlled practice. Repeated examination reflecting motivational influences on learning may enhance and prolong the retention of the skills. This study aimed to test the hypothesis whether repeated examination can prolong the retention of skills.

Summary of Work: This was a controlled trial. We purposively assigned the fourth-year medical student to either repeated examination of the skills (intervention) group or conventional, one time, examination (control) group. The one-day session of the plastic surgical skill training covered skin lesion excision and Z-plasty. The session comprised self-directed training on bench models with immediate feedback from the researcher. Test for objective-structured clinical examination (OSCE) performance on week 4 and 8 for the experimental group and on week 8 for the control group after the end of the course. Task-specific checklist (TSC) and global rating scale (GRS) were performed by two independent plastic surgeons via recorded video of the students' OSCE performance measured at 8 weeks after the end of the course. Logbook to collect the number of individual practice prior to the exams.

Summary of Results: From 25 students; 12 in the intervention group and 13 in the control group, we found that TSC scores were not significantly different between the intervention and control groups (44.2+3.0 vs. 45.6+3.6, $p=0.06$). GRS scores of intervention group (36.4+4.4) was lower than control group (38.8+4.8, $p=0.01$). The number of individual practice of the intervention group (5.0+0.9) was lower than control groups (6.5+2.7, $p=0.07$). OSCE performance of intervention group were significantly decreased at week 8 ($p<0.05$).

Discussion and Conclusions: Repeated examination of manual skills could not prolong the retention of surgical skills comparing to one examination. However, the number of individual practice prior to the exams also might influence the skills.

Take-home Messages: Self-controlled practice was the primary motivation for prolonging the retention of manual skills. In this study, the motivation of learning was not influenced by repeated examination. Repeated examination may be less stressful than one examination that consequently decrease attention on self-controlled practice.

No evidence for differences in outcome between digital and paper-based course evaluations

AUTHOR(S):

- **Andrea Fast, UMC Utrecht, The Netherlands (Presenter)**
- Anne Oosterbaan, UMC Utrecht, The Netherlands
- Allard Van Ark, UMC Utrecht, The Netherlands
- Melanie Kalee, UMC Utrecht, The Netherlands
- Marjo Wijnen Meijer, Technische Universitaet Munchen, Germany
- Eugène Custers, UMC Utrecht, The Netherlands

ABSTRACT

Background: Over the past decade, digital questionnaires have become the standard in course evaluation in the medical curriculum. Yet, digital questionnaires are associated with a persistently lower response rates, which may threaten the reliability of the outcomes. Reliability may be threatened by two factors: the shift from paper to digital evaluation per se, or by the timing of the evaluation request (in-class versus afterwards, by e-mail). The aim of this study is to assess whether the method of evaluation would systematically affect evaluation results.

Summary of Work: Courses at UMC Utrecht Medical School are evaluated by questionnaires in which students indicate (dis)satisfaction with several aspects of the course on Likert-scales. Evaluation of the first- and second-year communication skills and professional attitude training moved from paper questionnaires to digital questionnaires between the academic year 2015-16 and 2016-17, while the moment of completion stayed the same (during the last session of the course). Over the years, the training itself has remained stable, with only few changes in programme, teachers, and content. We compared the evaluation results of each training between 2014-15 and 2017-18.

Summary of Results: Mann-Whitney U-tests were performed between the responses on corresponding statements in the questionnaires of the four academic years. Response rates turned out to be comparable and no general trends could be observed between the “paper” years and the “digital” years. The significant differences that we did find were related to different editions of the training and were irreproducible over the years.

Discussion and Conclusions: Results indicate that the transition from paper questionnaires to digital questionnaires has no systematic effect on students’ appreciation of a course. In a future study, we will investigate possible differences in quality of students’ comments. In addition, we suggest a study to assess the effect of timing of digital evaluation on evaluation results and response rates.

Take-home Messages: A change from paper to digital evaluations, has no impact on the results.

Professional Behavior and Medical Competencies from Graduates' Perspective: A Curriculum Evaluation

AUTHOR(S):

- Mia Kusmiati, Medical School Bandung Islamic University, Malaysia (Presenter)
- Noor Aini Abdul Hamid, International Medical School Management Science University, Malaysia
- Suhaila Sanip, University Sains Islam Malaysia, Malaysia
- Ova Emilia, Faculty of Medicine Gadjah Mada University, Indonesia
- Ieva B. Akbar, Medical School Bandung Islamic University, Malaysia

ABSTRACT

Background: Since the outcome-based education is growing up on medical education, performance of alumni will be core of expected achievement. Alumni is one of stakeholder in medical education has key role to contribute the evaluating curriculum. This study describes professional behavior and medical competency that were needed for practice as a curriculum evaluation

Summary of Work: The semi structure interviews have been conducted to 3 medical graduates of batch 2006, 2007, and 2008. The qualitative result found that there are some themes for developing professional behavior and competencies in the workplace. Themes for curriculum evaluation include suitability of competency with medical practice, communication ability, skills needed, professionalism enhancement, character of Moslem doctor, and assessing performance from others. From 6 themes was created 55 items of questionnaire about outcome of education. The 98 alumni were asked to fill out the questionnaire for exploratory factor analysis (the EFA) by using principle axis factoring of Varimax rotation with Kaiser Normalization.

Summary of Results: The 98 participants of medical graduates have completed the questionnaire. Fifty-four medical graduates and 44 clerkship students in final year yielded 38 items of questionnaire was valid and reliable. Items were obtained from conducting exploratory factor analysis. From these factor analysis, detailed perspective suggested that the most appropriate fit was 7 factors which explained 53.7% of the variance between them after 21 iterations with Cronbach's Alpha of 0.916. They comprise of 1). suitability of competency with medical practice, 2). communications skills, 3). skill needed on medical practice, 4). impact of educational process on professionalism enhancement, 5). characters of Moslem doctor, 6). performance assessment from others, and 7). intra-personal attribute expected.

Discussion and Conclusions: The tool has achieved a construct validity score. Some aspect professional behavior and medical competency from graduates' perspective identified have given novel contribution to evaluate curriculum in terms of educational outcome

Take-home Messages: Many challenging problems in the medical practice can be approached through professional behavior teaching. These can be nurtured during medical education program and its assessing was conducted continuous even after they had graduated.

Application of a Cognitive Diagnostic Assessment to Evaluate GI Physiology in a Reformed Foundational Science Curriculum

AUTHOR(S):

- **Jeremy Laukka, University of Toledo College of Medicine and Life Sciences, USA (Presenter)**
- Bindu Menon, University of Toledo College of Medicine and Life Sciences, USA
- Coral Matus, University of Toledo College of Medicine and Life Sciences, USA
- Kelly Kovacs, University of Toledo College of Medicine and Life Sciences, USA
- Youn Seon Lim, Donald and Barbara Zucker School of Medicine at Hofstra/Northwell, USA

ABSTRACT

Background: The need for scientific studies that assess innovative learning strategies is increasingly evident. We introduced an integrative learning strategy in the physiology course of our revamped medical school curriculum. The instructor assigned short e-learning modules (LMs) to the students in preparation of in-class sessions. The objective of this study was to evaluate the efficacy of this new pedagogy.

Summary of Work: We used a cognitive diagnostic assessment to analyze the performance of students in the exam. The course instructor identified six binary skills, one or more of which were marked to be necessary for answering each exam question. A non-parametric Q-matrix estimator was used to validate the question-by-skill Q matrix. The results helped us to determine the percentage of students who were successful in attaining these skills and to identify their mastery of the contents.

Summary of Results: We found that 82% of exam takers attained the skills necessary to answer questions drawn from the LMs only, compared to 53% from in-class sessions, and 63% by integrating content from both LMs and in-class. Only 28% of exam takers acquired complete mastery of the content. It was noteworthy that all students who attained mastery of skills from in-class sessions succeeded in attaining competency from LM content as well.

Discussion and Conclusions: Our study showed that more students acquired mastery of content from LMs compared to in-class sessions. However, only those students who mastered the contents of both in-class sessions and LMs were able to attain 100% mastery in the entire content. This study scientifically demonstrates the strength of e-technology as a learning enhancer when used as a facilitating feature integrated into the traditional lecture style classes. It also gives us an opportunity to identify the weaker aspects of our course. Further studies are ongoing to analyze if there is a correlation between the attendance of students in the in-class sessions and content mastery.

Take-home Messages: Studies which quantitatively analyze the curriculum based on student's performances and mastery provides great opportunity for instructors to identify the strengths and weakness of their courses. Vertical integration of such studies will provide an opportunity to continually assess the pedagogy and make necessary amendments as needed.

Implementation of Onsite-multisource Feedback of Medical Graduates in the Community Hospitals

AUTHOR(S):

- Amnuayporn Apiraksakorn, Khon Kaen Medical Education Centre, Thailand (Presenter)

ABSTRACT

Background: Following-up on medical graduates reflects the validity of the curriculum in a real-life setting. The onsite-multisource feedback provides valuable information. This study was to investigate our medical graduates' confidence in basic procedural skills, their learning needs, and performance. The assessment was done from interprofessional perspectives using multisource feedback.

Summary of Work: An interprofessional team of medical staff, nurses, educators, and medical students attended onsite-visits with 25 medical graduates at their community hospitals in the North-East part of Thailand. Self-administered questionnaires regarding their self-confidence on performing 46 basic procedural skills and learning needs were distributed. This was followed by individual interviews with graduates of the 2015 class. The survey was performed in 2017. We conducted an interview with hospital directors, physicians, nurses, pharmacists, and patients.

Summary of Results: Fifteen of the questionnaires were responded to by our graduates (60%), 40 of the medical staff (100%), 47 of the interprofessionals (100%), and 30 patients (100%) The graduates reported the most confident procedures were endotracheal intubation (93%), sutures (92%), and aspiration of the skin, subcutaneous tissue, and bursa (91%). The least confident procedures were umbilical vein catheterisation (48%), cervical biopsy (56%), and amniotomy (60%). The graduates felt they needed more training before graduation in: obstetric and gynaecological procedures; emergency care; and forensic medicine. They also felt they needed exposure to what their life would be like in a community hospital. The professionals suggested an expanded emphasis on medical ethics, communication skills, and team working in the medical curriculum. All patients felt satisfied with the graduates' medical services and provided good feedback on the graduates.

Discussion and Conclusions: During medical school, students should have more training in medical procedures for patient safety and quality assurance concerns. This training should continue through their internship. The medical school curriculum needs to be reformed to better prepare future rural doctors.

Take-home Messages: Interprofessional onsite visits and multisource feedback were good tools to evaluate needs and performances of new doctors in a community hospital.

Identifying and Tackling the Challenges of Collecting Feedback from Medical Students

AUTHOR(S):

- **Maria Constantinescu, Imperial College London, UK (Presenter)**
- Michel Abou-Abdallah, Imperial College London, UK
- Daniel Huddart, Imperial College London, UK
- Lasith Ranasinghe, Imperial College London, UK

ABSTRACT

Background: Imperial College London's Medical Education Society runs lecture series for all the academic years, covering key content for revision. These series have relied on student feedback to continuously improve our course's content. Nonetheless, collecting meaningful feedback remains a challenge. Student participation is inconsistent, and quality of feedback can vary greatly. This paper aims to analyse the rates of student participation in feedback during our Final Year Lecture Series, and the reasons for these fluctuations.

Summary of Work: Thirteen lectures were scheduled to cover the key concepts needed for final year exams over the academic year 2018-19. Each lecture included a link to the feedback form, as well as being shared via Social Media and email. Lecture slides were released once a satisfactory number of responses were reached as an incentive to drive feedback. The forms had five questions using Likert-type rating scale from 1 to 5; and three open ended questions. The rating scale assessed student overall satisfaction as well as appropriateness of level, pace and clarity of content. These were retrospectively analysed.

Summary of Results: 294 responses were gathered, with an average attendance of 50. There was a 68.3% decrease in responses after the first three lectures of the series. The highest number of responses were in the first three lectures of the series: Surgical abdomen (n=51), Orthopaedics (n=48) and Endocrinology (n=44). Our lowest rates of responses were in the second half of the series: Dermatology (n=6), Breast (n=10) and Ophthalmology (n=10). The overall satisfaction of students remained high throughout the lecture series, with level of content scoring on average 4.56 (± 0.10), pacing 4.27 (± 0.13) and clarity of content 4.52 (± 0.11).

Discussion and Conclusions: The Final Year Lecture Series was received with an overwhelming positive response. However, feedback has been difficult to maintain. This phenomenon may be due to a reduction in number of attending students with increasing proximity to exams and a lack of incentive for final year students to complete feedback.

Take-home Messages: There is a need to develop new strategies to improve feedback participation from final year medical students, including improving accessibility to feedback and providing better incentives.

Exploring the undergraduate factors that influence how prepared newly qualified doctors feel when they begin work

AUTHOR(S):

- Alexander Hollis, UK Foundation Programme, UK (Presenter)
- Mathew Gittus, UK Foundation Programme, UK
- Oluseyi Adesalu, UK Foundation Programme, UK
- Clare Van Hamel, UK Foundation Programme, UK

ABSTRACT

Background: The UK Foundation programme undertakes an annual survey aimed at newly qualified foundation year one doctors (F1). We aim to investigate and explore areas of the undergraduate curriculum that help newly qualified doctors feel prepared when they start work.

Summary of Work: The induction survey was open to all F1 doctors starting work in the UK and completed by 962. They responded to a Likert scale question; 'To what extent you agree with the following statement: I was adequately prepared for my first foundation post'.

Summary of Results: Timing of finals had a significant impact on how prepared new FY1s felt with those who took exams in the summer just prior to starting FY1 twice as likely to report feeling unprepared (26%, n=103) than those who took their exams in the preceding Spring (12%, n=291), Winter (12%, n=291), Autumn (8%, n=323) or Summer (3%, n=89). Availability of simulation training showed those who strongly disagreed that they had access nine times more likely to say they felt unprepared (45.45%, n=33) those who strongly agreed they had regular simulation (5.38%, n=223). Those that strongly disagreed that they had the opportunity to do paid or voluntary work reported feeling significantly more unprepared (15.89%, n=448) who strongly agreed (3.86%, n=153) with the statement. Finally, those who spent less than 50% of their final year in an apprentice role felt three times less prepared (15.2%, n=694) than those who spent over 50% of their time as an apprentice (4.2%, n=263).

Discussion and Conclusions: Work based experience seems to positively increase feelings of preparedness. With respect to the timing of finals one potential explanation would be that sitting your finals in the summer before starting FY1 may mean that you actually spend less time in simulation, apprenticeship role or gaining work experience as you are preparing for the exams.

Take-home Messages: Exposure to the work place in particular simulation training is shown to have an important role in preparing undergraduates for the work place. The timing of final exams is an interesting point to come from this study and further work is needed to elucidate why having finals closer to starting FY1 can reduce feelings of preparedness.

Designing a Peer-Driven, Multi-Pronged, Curriculum-Based Preparatory Module for Medical School Examinations - Lessons from the 60 hour Agenda

AUTHOR(S):

- Oluwasegun Afolaranmi, College of Medicine, University of Ibadan, Nigeria (Presenter)
- Jesutofunmi Omiye, College of Medicine, University of Ibadan, Nigeria

ABSTRACT

Background: Progress in medical school is largely determined by success in professional examinations taken at different levels. In most Nigerian medical schools, these exams have an infamous reputation of high failure rates and significant emotional distress amongst students. Small group learning is an important method of preparation for these examinations, however this approach remains riddled with challenges. We designed the 60-hour Agenda, a peer-driven discussion module for a class in a Nigerian medical school.

Summary of Work: Essential information on knowledge and competency requirements for the examination were extracted from the curriculum and used to draft a schedule of activities that included personal study and group discussion meetings. The class was divided into six groups which were further divided into twelve subgroups of 9-10 students based on participation in similar rotations. Individuals who had particular preferences were allowed to join groups of their choice. Each subgroup selected a leader who coordinated group activities and shared responsibilities to enhance collaborative learning. A personalized reading guide was designed to run parallel with the group meetings so that members could bring challenges from their personal study to these meetings. A coordinating team comprising of subgroup leaders, group coordinators and program directors monitored progress and met to discuss challenges and improve the program based on feedback gotten from individual members. A mid-program analysis was conducted and results were relayed to the class via digital tools.

Summary of Results: The program attracted overwhelming positive feedback from students and faculty. In a post-program survey, 97% of respondents were satisfied and recommended continuation of the program for subsequent examinations. Besides aiding success, participants also reported improved interpersonal relationships, increased confidence and reduced anxiety towards the examination. The Agenda was also adopted as a template for junior classes to develop similar models

Discussion and Conclusions: Properly-designed, peer-driven, small group discussions remain a formidable tool for helping students face the rigorous training and examinations of medical schools.

Take-home Messages: • Emphasis should be laid on careful design, feedback, monitoring and evaluation to improve the effectiveness of small group learning methods. • Medical schools should consider incorporating such modules into curriculum where non-existing, and reimagining the approach where already existent.

Curriculum Evaluation for Master of Public Health (MPH) Assessed by Alumni of Guilan University of Medical Sciences

AUTHOR(S):

- Farzad Mohseni, Medical Education Research Center, Education Development Center, Guilan University of Medical Sciences, Iran (Presenter)
- Abtin Heydarzadeh, Medical Education Research Center, Education Development Center, Guilan University of Medical Sciences, Iran
- Ideh Dadgaran, Medical Education Research Center, Education Development Center, Guilan University of Medical Sciences, Iran
- Nafisehsadat Dadgaran, Guilan University of Medical Sciences, Rasht, Iran

ABSTRACT

Background: Master of Public Health (MPH) is a higher education program that aims to empower the family physicians practicing within the Iranian healthcare system. Duties of most physicians and healthcare providers are merely restricted to service provision. Family physicians, who take the critical responsibility of orchestrating the services and assume accountability towards the health of individuals, families, and the covered community, are the only group of physicians that exercise the supervisory function of the headquarters on peripheral scales. Evaluation highly influences the quality of higher education, and its results are used by educational authorities in decision-making. Since a few studies have been conducted on this subject in Iran, the present study aimed to present an evaluation the curriculum of MPH program by alumni of Guilan University of Medical Sciences.

Summary of Work: The present study was a cross-sectional evaluation. The required information was collected using a questionnaire consisting of items on demographics and evaluation of the educational process. The second part, adapted from the questionnaire developed by Nojumi et al., consisted of 33 items on the curriculum organization, the program duration, the program execution, the program presentation, the program applicability, evaluation of the learners, and the curriculum required materials. The items were scored based on a 5-point Likert scale. Comments and views of participants were judged based on the mean scores and categorized as favorable, relatively favorable, and unfavorable. The study population consisted of all 158 GUMS alumni working as a family physician in 177 health centers in Guilan Province; they were selected as the sample based on the census sampling method.

Summary of Results: The results indicated that the participants evaluated different dimensions of the MPH program as follows: program duration: favorable (67.2%), and relatively favorable (31%); program presentation: relatively favorable (86.9%), and favorable (4.9%); program applicability: favorable (61.5%), and relatively favorable (32%); program execution: relatively favorable (88.5%), and favorable (4.5%); curriculum organization: relatively favorable (86.1%) and favorable (4.1%); and curriculum required materials: relatively favorable (45.9%), and favorable (6.6%).

Discussion and Conclusions: The result of the present study suggested that the MPH program has been educationally effective and relatively favorable.

Evaluation and learning: a professional combination for students and university

AUTHOR(S):

- Esther Tanck, Radboudumc, the Netherlands (Presenter)
- Nicole Sampers, Radboudumc, the Netherlands
- Yasmin Leenderts, Radboudumc, the Netherlands
- Michelle Jacobs, Radboudumc, the Netherlands
- Alwin Scharstuhl, Radboudumc, the Netherlands
- Petra van Gurp, Radboudumc, the Netherlands

ABSTRACT

Background: After extensive revision of the curricula Medicine and Biomedical Sciences, evaluation of the quality of education is essential. The students' role to provide feedback is important. In this study we discuss a newly developed evaluation procedure that was embedded as a learning activity for 1200 students in the line Professionalism, where respectfully giving your opinion and feedback are learning objectives.

Summary of Work: During group meetings (nine students plus teacher), scheduled in the line Professionalism, students digitally filled in five closed questions and one open question about a coherent part of the curriculum program. After a group discussion, narrative feedback to the open question, including suggestions for improvements, was formulated. Reports with summarized data of all groups were given to the program coordinators who subsequently provided the students with feedback, including actions that would be implemented. After several evaluation cycles, we evaluated and optimized this new evaluation procedure.

Summary of Results: In 2017-2018, we completed 12 evaluation cycles with a closed feedback loop covering the whole curriculum. The participation of the groups was on average 53% (range 36%-74%). The program coordinators valued the data and feedback from the students and were highly motivated to give them written feedback and implement actions, such as adapting the course schedule and content. Students indicated that it was instructive to formulate narrative feedback and that giving feedback to the program coordinators is important. To optimize the evaluation procedure, the purpose of the learning activity for both students and program coordinators was explicitly communicated and the questionnaires and feedback from the coordinators are now a recurrent part of the agenda of group meetings in the line Professionalism. In addition, one easy-to-find location on our digital-learning-environment was created for the whole evaluation cycle.

Discussion and Conclusions: The new evaluation procedure led to advantages for both program coordinators and students: 1) students practiced with formulating narrative feedback; 2) students recognized the importance of feedback; 3) the program coordinators received valuable feedback from students and implemented actions accordingly.

Take-home Messages: Evaluation integrated in the learning program is a successful method to learn in reciprocity.

Internet-based Measurement of Visual Assessment Skill of Trainee Radiologists: Developing a Sensitive Tool

AUTHOR(S):

- **Nadiah Fernandes, Chelsea and Westminster Hospital, UK (Presenter)**
- Amaka Offiah, Sheffield Childrens Hospital, UK
- Martin Thirkettle, Sheffield Hallam University, UK
- Mandela Thyoka, Sheffield Teaching Hospitals, UK
- Padmini Gopalan, Sheffield Teaching Hospitals, UK
- Tom Stafford, University of Sheffield, UK

ABSTRACT

Background: Expert radiologists exhibit high levels of visual diagnostic accuracy from review of radiological images. To train new radiologists, learning interventions must focus on the development of these skills. By developing a web-based measure of image assessment we aimed to capture differences in the performance of expert, trainee and non-radiologists.

Summary of Work: Twelve consultant paediatric radiologists, twelve radiology registrars, and thirty-nine medical students were recruited. Participants completed an online task requiring them to assess 30 images randomly drawn from a library of 150 paediatric skeletal radiographs. Participants identified whether an image contained an abnormality, and then clicked within the image to mark its location. Performance measures of identification accuracy, localisation precision, and task time were collected.

Summary of Results: Significant results were taken as those with $p < 0.001$. D prime for each group was calculated to combine specificity and sensitivity and used as a measure of identification accuracy. This measure showed that all comparisons were significant apart from the sensitivity comparison between consultants and registrars. With regards to localising the abnormality, students were significantly less accurate than consultants and registrars, while consultants and registrars were not significantly different from each other. Lastly, testing showed the consultants were significantly slower than both registrars and students.

Discussion and Conclusions: Consultant radiologists were found to be the most accurate both at identifying images containing abnormalities and at localising abnormalities on the images. One unusual result was the finding that consultant radiologists performed this task significantly slower than novice participants. This contradicts previous research findings but may simply be due to the open nature of our task which left the participants free to perform the task at different levels of meticulousness.

Take-home Messages: Our data demonstrate that an online measurement of radiological skill is sufficiently sensitive to detect group level changes in performance consistent with the development of expertise. This developed tool will allow future studies assessing the impact of different training strategies on cognitive performance and diagnostic accuracy. The next step in this project is to use the library of validated radiographs in longitudinal studies of cohorts and to add eye tracking experiments to examine changes in participants' search strategies with increasing experience.

What affects students' appraisal of clinical teaching?

AUTHOR(S):

- Li-Ting Wang, School of Medicine, Mackay Medical College, Taiwan (Presenter)
- Yang-Sheng Lin, Department of Medical Education, MacKay Medical Hospital, Taiwan
- Kung-Pei Tang, Department of Education and Humanities in Medicine, School of Medicine, Taipei Medical University
- Po-Fang Tsai, Graduate Institute of Humanities in Medicine, Taipei Medical University, Taiwan

ABSTRACT

Background: Assessments of students studying satisfaction are common for medical education. However, medical teachers question about the reliability of the survey results. One concern is that the interviewees could give negative feedbacks by processing their own negative self-perception in terms of projection. This study aims at investigating whether student's social and academic self-perception have effects on their appraisal of clinical teaching. The measurement instrument is Dundee Ready Education Environment Measure (DREEM) questionnaire, comprising five dimensions: student's perception of teaching (SPT), student's perception of learning (SPL), student's perception of atmosphere (SPA), social self-perception (SSP), and self academic perception (SAP).

Summary of Work: 75 seventh grade medical students in Mackay Memorial Hospital participated in this study. They fulfilled DREEM questionnaire according to their clinical training experiences in fall 2018. Hierarchical multiple regression (HMR) analysis includes two sequential regression models performed to examine the relationships of SPL, SPA, SSP, and SAP to SPT. Model I included SSP and SAP as research variables, then SPL and SPA as control variables were included in Model II. Model comparison was conducted to determine the effects of SPL, SPA, SSP, and SAP.

Summary of Results: Although Model I ($p < .001$, $R^2 = .45$) and Model II ($p < .001$, $R^2 = .61$) had significant explanatory powers, the change of F-sig ($p < .001$) showed Model II is better. In Model II, SPL and SPA had significant effects, but SSP didn't have a significant effect as it had performed in Model I. The model comparison showed SSP's effect on SPT may be mediated by SPL and SPA (proportion mediated = 89.8%) but the most important predictor of SPT was SSP.

Discussion and Conclusions: Unlike the academic self-perception, the social self-perception of students has significant effect on their appraisal of clinical teaching, but failed to keep its significant level when the perception of learning and atmosphere were included in the regression model. Students' perception of interpersonal interaction and clinical teaching may be mediated by their perception of learning and atmosphere.

Take-home Messages: Interpersonal relationship is correlated to students' impression of the teaching program under the influence of their perception of learning and atmosphere.

Exploring the learning environment: invisible forces influence the students' learning strategies

AUTHOR(S):

- Eleonora Leopardi, University of Newcastle, Australia (Presenter)
- Robbert Duvivier, School of Health Professions Education, Maastricht University, The Netherlands
- Caragh Brosnan, University of Newcastle, Australia
- Martin Veysey, Hull-York Medical School, University of York, UK

ABSTRACT

Background: Introducing the hidden curriculum theory in medical education, Hafferty described a learning environment composed of overlapping curricula: the formal curriculum, the informal curriculum, and the hidden curriculum. The theory describes how professionalism and humanism are often antagonised by the hidden curriculum. However, few studies have looked at the content of the informal and the hidden curriculum on the students' learning strategies. Additionally, the interactions between the curricula in the learning environment remain unexplored.

Summary of Work: A multi-sited comparative ethnographic study was conducted in the context of a joint medical program delivered at two medical schools. Over a 14-month field immersion, four research methods (observation, interview, focus group, document analysis) were used to study the learning environment and the learning strategies of students in the campus-based years.

Summary of Results: The multi-sited ethnography yielded a vast amount of data, which was analysed qualitatively. The delivery of the same program at two different institutions allows the influence of the informal and hidden curriculum to be considered separately from the formal curriculum, which is the same in both places. These other-than-formal curricula exert significant influence over the students' learning strategies.

Discussion and Conclusions: In spite of the emphasis placed on self-directed learning in the formal curriculum, the informal and hidden curriculum play a conspicuous role in how students choose to learn, resulting in homogeneous learning strategies: students, who are placed in the same environment, will adopt the same learning strategies rather than develop their own, as a result of the invisible influences they are subject to. In addition to this, the curricula influence each other, creating a unique learning environment at each location. The informal curriculum verbalises and transmits the messages of the hidden curriculum, while the hidden curriculum creates the conditions for informal exchanges to happen, for instance through the timetabling or the building structure.

Take-home Messages: The learning environment is permeated by influences that interact with each other and with the students. To support the students' development of effective learning strategies, medical educators must discover the extent and content of the informal and hidden curricula influences in their learning environment.

Assessment of the educational environment in Medical Schools in Morocco: The Students' perspective

AUTHOR(S):

- **Maryam Fourtassi, Université Mohamed Premier, Morocco (Presenter)**
- Maher Imad Skakia, Université Mohamed Premier, Morocco
- Ayoub Kharkhach, Université Mohamed Premier, Morocco
- Ghita Hjej, Université Mohamed Premier, Morocco
- Naima Abda, Laboratory of Epidemiology Clinical Research and Public Health, Université Mohamed Premier, Morocco

ABSTRACT

Background: The educational environment represents one of the key elements of learning and reflects the quality of the educational process. Its regular assessment is part of the recommendations of the international academic authorities for any training institution willing to improve its services and the performance of its students. The current study aimed to assess the educational environment in Moroccan Medical Schools, from the students perspective and to identify factors associated to a poorer assessment of this environment.

Summary of Work: We conducted a large survey to assess students perception of their educational environment using the DREEM scale. Students from the seven public medical schools in Morocco were asked to complete an online questionnaire collecting demographics, academic and psychological data in addition to the DREEM scale items.

Summary of Results: 2515 responses were collected from students in different levels of studies. The average total DREEM score was 90.5 +/- 23.6 with significantly higher values in the most recent medical schools (Agadir and Tangier) and much lower scores in the older medical schools (Rabat and Casablanca). This total score, as well as the the different sub-scores were significantly higher among male students (p: 0.001), foreign students (p: 0.01), students in the second term of medical studies (p: 0.0001), students with the least academic difficulty (p: 0.0001) and among students who suffered less psychological stress (p: 0.0001).

Discussion and Conclusions: Our results had objectified, major problems of the educational system in the different explored areas, ranking Moroccan medical schools at the bottom of the scale compared to other African countries, such as Nigeria, and South Africa. Thus, it seems necessary and urgent to address the issues raised by the above results to ensure our young students optimal medical training, and to our fellow citizens the doctors of tomorrow who can offer us the best care.

Take-home Messages: (1) Moroccan medical students perceive their educational environment as below average, when using the DREEM Scale. (2) The situation is broadly similar in all Public Medical Schools with a slightly better score in the most recent Schools. (3) This poor perception of the educational environment is significantly associated to students' gender, origin, study level, academic performance and psychological distress.

Teacher is a Key Success Factor for Pre-Medical Learning in Newly Established Medical School, Princess of Naradhiwas University

AUTHOR(S):

- Aornrutai Promsong, Faculty of Medicine, Princess of Naradhiwas University, Thailand (Presenter)
- Taksin Ukkahad, Faculty of Medicine, Princess of Naradhiwas University, Thailand
- Yaowalark Sukthana, Faculty of Medicine, PNU and Faculty of Tropical Medicine, Mahidol University, Thailand
- Wutthipong Suwannit, Faculty of Medicine, Princess of Naradhiwas University, Thailand
- Chumpol Piamsomboon, Faculty of Medicine, Princess of Naradhiwas University, Thailand

ABSTRACT

Background: Perception of pre-medical students on educational environments was studied in order to use as an input for improvement of the educational achievement.

Summary of Work: The Thai version of DREEM questionnaires was assessed by a total of 81 first-to-third-year medical students, Princess of Naradhiwas University (PNU). The average total DREEM score and a mean score of each 5 subscales were analyzed and ranked, thus, areas for improvement could be identified. T-test and one-way ANOVA were used to compare total score and subscales of DREEM between two and more than two variables.

Summary of Results: The total DREEM score indicated the educational environments in PNU's medical school was more positive than negative ($\bar{x}=123.60\pm 17.44$). Considering DREEM subscales score, there was none reached ≥ 3.5 which demonstrated a real positive item. Majority of subscales (43 out of 50) score in the present study were ranged from 2.0-3.5 suggested those items could be enhanced for improvement. The PNU's medical school must be more closely looked in 7 problematic areas that showed average score lower than 2. Of which, 5 were in student's perception of learning and others were in student's perception of atmosphere and social self-perception. Those items included the teaching over-emphasized factual learning ($\bar{x}=1.40\pm 0.75$), the course was well timetabled ($\bar{x}=1.62\pm 1.15$), I was too tired to enjoy the course ($\bar{x}=1.80\pm 1.09$), the teaching time was put to good use ($\bar{x}=1.83\pm 1.03$), teaching was too teacher-centered ($\bar{x}=1.89\pm 0.88$), teaching was student-centered ($\bar{x}=1.91\pm 0.84$) and teaching was well-focused ($\bar{x}=1.95\pm 0.88$). The second-year medical students showed less positive to overall educational environments than the 1st- and the 3rd-year regarding academic self-perception ($F(2,78)=3.339$, p-value =0.041), atmosphere ($F(2,78)=16.636$, p-value <0.001) and social self-perception ($F(2,78)=3.595$, p-value =0.032).

Discussion and Conclusions: Teacher is a vital factor to improve learning achievement of the PNU's pre-medical students. Focus on student's needs and make more student-friendly in class could enhance the teaching and learning system.

Take-home Messages: The PNU's medical school must be more closely looked in 7 problematic areas that showed average score lower than 2. Of which, 5 were in student's perception of learning and others were in student's perception of atmosphere and social self-perception.

Comparing students' perception on clinical learning environments between Taiwan and Indonesia

AUTHOR(S):

- Yang-Sheng Lin, Department of Medical Education, MacKay Medical Hospital, Taiwan (Presenter)
- Li-Ting Wang, School of Medicine, Mackay Medical College, Taiwan
- Po-Fang Tsai, Graduate Institute of Humanities in Medicine, Taipei Medical University, Taiwan
- Kung-Pei Tang, Department of Education and Humanities in Medicine, School of Medicine, Taipei Medical University, Taiwan
- Rahmi Cut Rizka, Department of Education and Humanities in Medicine, School of Medicine, Taipei Medical University, Taiwan

ABSTRACT

Background: The quality of educational environment is a key element that determines the learning effectiveness. Dundee Ready Education Environment Measure (DREEM)-a 50-item questionnaire composed of five dimensions including SPT(Student Perception of Teaching), SSP(Social Self Perception), SPL(Student Perception of Learning), SPA(Student Perception of Atmosphere), and SAP(Self Academic Perception)-is widely used for assessment of medical students perception of learning environment. This study aims at comparing students' perception on learning environments between Taiwan and Indonesia.

Summary of Work: DREEM was conducted to 75 Taiwanese seventh grade medical student in Mackay Memorial Hospital and 92 Indonesian fourth grade medical student in medical department of Syiah Kuala University in 2018. We used descriptive statistics and independent sample t-test for comparative analysis.

Summary of Results: There was a significant difference in the mean score between Indonesia and Taiwan group in all five dimensions: SPT(M=2.826, SD=0.436/ M=3.570, SD=0.387; t=-11.514, p<0.001), SPL(M=2.637, SD=0.364/ M=3.857, SD=0.411; t=-20.300, p<0.001), SPA(M=2.615, SD=0.395/ M=3.642, SD=0.399; t=-16.620, p<0.001), SAP(M=2.869, SD=0.364/ M=3.616, SD=0.564; t=-10.325, p<0.001) and SSP(M=2.602, SD=0.363/ M=3.982, SD=0.601; t=-18.279, p<0.001). While Taiwan group has higher average score than Indonesia group in five dimensions of DREEM, there are different ranking-orders in the two groups respectively. In Indonesia group, "SAP"(2.87) rated highest and "SSP"(2.6) rated lowest, but in Taiwan group the average score was highest in "SSP"(3.9), and lowest in "SPT"(3.5).

Discussion and Conclusions: With the between-group comparison, there was a significant difference in the mean score between two countries in all five dimensions of DREEM, suggesting the students' perception on learning environment in Taiwan group is overall higher than that in Indonesia group. Based on this difference, when we dug into the within-group comparison, the ranking-orders showed a deeper difference. In Indonesia group, students are satisfied with their academic performance, while interpersonal communication in class needs improvement; in Taiwan group, students claimed there is good interpersonal communication, and there is room for improvement in teaching.

Take-home Messages: In terms of both between-group and within-group comparisons, students' perception on learning environment varies from different countries, not only differing in the overall DREEM but also appearing respective ranking-order among five dimensions of DREEM.

Study motivation and learning among first- to third-year students at Finnish universities: How do medical and dental students differ from other students?

AUTHOR(S):

- Lena Sjöberg, University of Helsinki, Faculty of Medicine, Finland (Presenter)
- Monica Londen, University of Helsinki, Swedish School of Social Science, Finland
- Jan-Erik Mansikka, University of Helsinki, Faculty of Educational Sciences, Finland

ABSTRACT

Background: The objective of this study is to examine study motivation, learning preferences and academic integration of Finnish students during their first three years at university.

Summary of Work: Web-based surveys were administered to all Swedish-speaking students from ten different study programs who started their university studies in 2014, among them the students of the Faculty of Medicine at the University of Helsinki. The four surveys during the first three study years focus on study motivation, academic integration and factors influencing learning. All surveys include both multiple choice and open-ended questions.

Summary of Results: All students at the Faculty of Medicine considered themselves motivated or strongly motivated for their studies; the difference compared to other students was statistically significant in all surveys. The medical and dental students differed from other students in their learning preferences: group discussions, independent reading, case examples, practical training of skills, study visits and written examinations were more popular than among students in other faculties, but on the other hand, lectures or learning diaries were not highly appreciated. The medical students highly valued the social environment of their studies and also considered their student organization very important for their academic integration, to a significantly higher degree than other students. During the third study year, all the above mentioned were still characteristic for the medical and dental students and furthermore, their expectations from study year one had been met to a significantly higher degree than those of other students. On the other hand, the medical students were not more confident than other students in self-reflection or critical thinking and had not developed their understanding of cultural diversity more than others.

Discussion and Conclusions: The high degree of study motivation of the medical and dental students persisted at least through the first three study years, as did their learning preferences and their appreciation of the study environment.

Take-home Messages: Our students have a high degree of motivation and they value their study environment. We could do more to increase their ability of self-reflection and critical thinking.

Medical Students' Motivation and Its Associated Factors

AUTHOR(S):

- **Kannika Tasasungkhin, Medical Education center at Sawanpracharuk Hospital, Nakhonsawan, Thailand (Presenter)**
- Tinakon Wongpakaran, Department of Psychiatry, Chiang Mai University, Thailand
- Nahathai Wongpakaran, Department of Psychiatry, Chiang Mai University, Thailand
- Wanida Lowphrukmanee, Department of Anaesthesia, Thailand
- Darika Thanbuasawan, Sawanpracharuk, Medical Education Center, Thailand
- Kanoklak Sirirungwatthanakul, Department of Psychiatry, Thailand

ABSTRACT

Background: Motivation is among factors that could influence people's decisions to become a doctor. According to self-determination theory, intrinsic motivation reflects the human propensity to learn and assimilate, while extrinsic motivation results from external control or true self-regulation. Lack of motivation could affect the path to become a doctor. This study explored motivation in studying medicine and its associated factors in Thai medical students.

Summary of Work: An observational study was conducted among 168 first to sixth-year medical students at a Medical Education Center in Central Thailand from December 2018 to January 2019, using academic motivation scale, strength base inventory, multidimensional scale for perceived social support and depression inventory.

Summary of Results: The mean age of the sample was 21.33 ± 1.69 , and 51.8 % were females. The majority was the third-year students (20.23%). The first-year students were the most highly motivated (127 ± 27.83), while the fifth-year students were the least (114.66 ± 32.63). There was a small disparity between the share of the most highly amotivated in the fourth and the fifth-year students (13.64 ± 6.42 and 13.62 ± 5.63 , respectively). Lack of motivation included physical exhaustion, inadequate sleep, insecurity, initial dispassion and concerns of legal issues. Perceived family support was the most influential factor for motivation ($r=0.37$, $P<0.001$), followed by perceived friend support ($r= 0.30$, $P<0.001$), and positive attribute of determination ($r=0.26$, $P=0.001$). The three factors were also related to extrinsic motivation ($r=0.32$ ($P<0.001$), 0.28 ($P<0.001$), and 0.20 ($P<0.009$), respectively). Depression, years of education, and age were associated with amotivation, r 's = 0.52 , 0.256 , and 0.248 , and P 's = 0.001 , all). The higher year and older age, the higher amotivation.

Discussion and Conclusions: Factors associated students' motivation in studying medicine included perceived support from family and friends, and positive attribute of determination. Amotivation was related to depression and year of study.

Take-home Messages: Many factors could affect students' motivation in studying medicine. Perceived support from families and friends should be considered in enhancing the students' motivation. Further investigation in a larger sample size regarding the association between the students' motivation and academic performance should be explored.

- Carolina Solis, Universidad Andres Bello Viña Del Mar Chile, Chile

ABSTRACT

Background: Motivation and learning strategies are two important areas to achieve a significant learning experience. The objective was to compare the motivational profile and learning strategies scores for medical students during a 2 year follow up.

Summary of Work: A cohort study with 33 students (60.6% females), from the two first year's of medical school was performed. Informed consent obtained. The Motivated Strategies for Learning Questionnaire (MSLQ), which measures intrinsic (IM) and extrinsic (EM)) motivation and learning strategies (LS), was applied for baseline data, and follow up at the beginning of the next year. Cronbach Alpha, Pearson Correlation, t Student, were used for statistical analysis.

Summary of Results: Regarding motivation, only females showed meaningful decreases $p < 0.05$. Learning strategies showed a significant decrease in both sexes especially the variable resource management, $p < 0.05$. There is a positive correlation between motivation and learning strategies both years, however valuation in motivation, had a meaningful influence on learning strategies. There is a meaningful and positive correlation of valuation, with expectations, cognitive and metacognitive strategies and resource management.

Discussion and Conclusions: Learning depends on motivation, and tends to decline for both genders. The significance found in women, may be due to the greater proportion of them in the sample. Learning strategies decrease globally as courses advance, which can be explained by learning process increasing complexity. Students seem to mismanage the resources given, as this is related to the tendency to close in on oneself and not ask for help.

Take-home Messages: It is suggested to encourage strategies that increase the motivation of students, through direct contact with patients early in the curricula and improve academic support to help the students learn to manage their learning resources.

“Strength of motivation” impact on medical students’ learning approaches: Results of a multisite cross-sectional study

AUTHOR(S):

- Milena Abbiati, UDREM - Faculty of Medicine, Geneva, Switzerland (Presenter)
- Anne Baroffio, UDREM - Faculty of Medicine, Geneva, Switzerland
- Thierry Pelaccia, CFRPS, France

ABSTRACT

Background: Promoting a deep approach to learning is a huge challenge in medical education. Over the last decade, research has highlighted the importance of motivation in training, with higher levels of student motivation predicting among other mobilization of effective learning approaches. Because students’ motivation is a major indicator of learning behaviors, there is a strong need of consistent and easy-to-use instruments to assess it. Among the instruments commonly used in medical education, most are designed to assess the type of motivation. In addition, the “Strength of Motivation for Medical School- Revised (SMMS-R)” scale assesses the overall “Strength of Motivation”, but little is known about whether and how it predicts learning approaches in medical students.

Summary of Work: The present study examines whether “Strength of Motivation” predicts learning approaches in medical students. To this end, we (1) verified the three-factor structure -Willingness to Sacrifice, Readiness to Start and Persistence subscales- of the SMMS-R and (2) determined the SMMS-R’s predictive validity for deep and surface learning approaches. Our sample comprised 372 students at three French-speaking medical schools, who completed the SMMS-R and the Revised two-factor Study Process Questionnaire (R2-SPQ). We used: (a) principal component analyses (PCA) to aggregate the 15 SMMS-R items and (b) linear regression analyses to determine whether SMMS-R (total and 3 subscales) predicted learning approaches.

Summary of Results: Results confirmed the three-factor structure of the SMMS-R questionnaire (KMO .88, $p < .001$, 44% of variance explained). Both Total Strength of Motivation and Readiness to Start positively predicted students’ use of deep approaches ($\beta = .28$, $\beta = .27$, respectively; $p < .001$) and negatively surface approaches ($\beta = -.22$, $\beta = -.30$, respectively; $p < .001$). Willingness to Sacrifice positively predicted deep approaches and Persistence negatively predicted surface approaches ($\beta = .44$, $\beta = -.30$, respectively; $p < .001$).

Discussion and Conclusions: Our results both support SMMS-R’s suitability as a tool for measuring medical students’ strength of motivation, and suggest that strengthening motivation, an inherently dynamic parameter, could be a way of fostering a deep learning approach and thereby improving academic performance.

Take-home Messages: Our findings confirm the impact of motivation on learning approaches and pave the way for developing new educational interventions aimed at strengthening motivation.

What Changes with Failure? A Narrative Analysis

AUTHOR(S):

- Geerthana Sundaram, Barts and the London, UK (Presenter)
- Esther Murray, Barts and the London, UK

ABSTRACT

Background: Failure is defined as “the fact of someone not succeeding”, “the fact of something not working” and “the fact of not doing something that you are expected to do”. All these definitions use the word ‘fact’ as if failure is proof, a positivist viewpoint. Kleinman (1988) said in his book “social reality is so organised that we do not routinely inquire in the meanings”. There is a lack of research looking into failure. Within the research that is available, the studies are emphasised on problem-solving solutions to the event of failure. There is limited research looking at the emotional and psychological aspects of failure in medical education. The purpose of my study is to explore failure through the eyes of students.

Summary of Work: This is a qualitative study to explore failure experienced by students through storytelling. Narrative analysis allows us to see how the student makes sense of the experience of failure through their psychologically constructed stories. Six medical students who had previously failed participated in an unstructured interview centred around one event of failure. Prior to this interview, the students produced a timeline mapping out experiences of failure in their life; an opportunity to edit and polish their story. This was desired as for whether the story is ‘true’ is irrelevant.

Summary of Results: The data collected will be analysed using Labov’s model created in 1972 to guide my analysis. This framework allows for analysing the participant’s meaning of failure by focusing on the structure and organisation of their story. Therefore, exploring how failure has affected the student and the changes that take place in their personal and professional lives.

Discussion and Conclusions: From this study, I hope to start the conversation on what it means to fail. Failure is something that many people experience but few discuss openly especially whilst going through it themselves. To change the medical culture, discussions need to be had. Normalising and removing the stigma within the medical school could be the initial stepping stone. How have you changed due to your failures?

Take-home Messages: I want to encourage students to look within and discover what failure means to themselves before seeking remediation.

Focused Clinical Undergraduate Support (FOCUS) programme: Facilitating medical students through exam failure

AUTHOR(S):

- Charlotte Brathwaite Shirley, Lewisham and Greenwich NHS Trust, UK (Presenter)
- Ashling Hill, East Kent Hospitals University NHS Foundation Trust, UK
- Natalie Howard, Guys and St Thomas NHS foundation Trust, UK
- Nabila Siddiqui, Croydon University Hospital NHS Trust, UK
- Nitin Shrotri, Kings College University Hospital NHS Foundation Trust, UK

ABSTRACT

Background: Failing a medical school examination can be a devastating period in a student's education. Studies show that students who have failed an exam during medical school are more likely to struggle in clinical practice as doctors. We found that students retaking exams often lacked support and confidence.

Summary of Work: Focused Clinical Undergraduate Support (FOCUS) was developed by junior doctors and consultant undergraduate leads. Medical students who had failed and were repeating their 4th year were invited to enrol on FOCUS. Each student was allocated a mentor, a junior doctor at the trust local to the student. There was an introductory meeting discussing the mentees personal concerns from which a individual revision plan would be developed. After which, mentees and mentors met as required. Mentees attended a revision day for exam technique and revision skills. Students completed pre and post programme confidence ranking scores on; self study skills, clinical skills, medical knowledge, exam technique, exam preparation and awareness.

Summary of Results: 10 out of 13 students engaged with FOCUS. 100% of students within the programme passed their exam. When asked about confidence in self study there was an increase of 25.9% with post programme scores showing an average of 3.4/5 compared to 2.7/5; based on a scale of 1-5 with 1 being not confident and 5 extremely confident. Confidence in their medical knowledge rose by 41.6% with score averages rising to 3.4/5 from 2.4/5. Confidence in exam technique rose by 36% with average rankings increasing to 3.4/5 from 2.5/5.

Discussion and Conclusions: The FOCUS programme successfully demonstrated the benefits of personalised support for struggling students. In particular how focusing on improving student's exam and study technique, results in greater confidence. Students felt less ostracised being among others in a similar situation. After its first year, FOCUS has expanded to other year groups and sites across London.

Take-home Messages: (1) Failing students should be seen as an opportunity to re-examine revision technique and provide skills that can be applied beyond medical school. (2) A dedicated peer support programme improves students' confidence.

The help-seeking intention among medical and health sciences students

AUTHOR(S):

- Yu Sui Chen, International Medical University, Malaysia (Presenter)
- Nicole Chen, International Medical University, Malaysia
- Eliza Wong, Ramsay Sime Darby Healthcare College, Malaysia

ABSTRACT

Background: Help-seeking intention reflects as actual behaviour that is most likely used by people to seek help. Studies revealed that less than 50% of students showed seeking-help intention and more so for students facing psychological problem. The aim of this study is to determine the help-seeking intention among the Asian medical and health sciences students.

Summary of Work: The subjects were all the medical, dental, pharmacy and health sciences students (estimated total of 2500) in a private medical university in Malaysia and they were recruited via universal sampling. General Help-Seeking Questionnaires (GHSQ) was used and consist of the demographic information and the measurement of help-seeking intention. GHSQ contained seven scenarios regarding stress, anxiety, depression, suicidal ideation, substance misuse, psychosis and heart disease. A descriptive statistical analysis was used to determine the prevalence of help-seeking intention in different programmes or academic status.

Summary of Results: There were 998 responses from Medicine (296), Dental (91), Pharmacy (303), Health Sciences (272) and others (36). Above 90% of students reported the seeking-help intention in six scenarios except stress (86%). However, they mostly seek help from intimate partners, parents and friends. The percentage that seek help from mental health professional for mental health problems is lower (52%) except for suicidal ideation (67%) and psychosis (66%). In contrast, 83% would seek help from doctor for physical health problems. The help-seeking intention from mental health professionals among medical, dental, pharmacy and health sciences students were 52%, 54%, 47% and 55% respectively. Those who had resit (88), repeat (33), deferment (9) or successful progression (868) and likely seek help were 55%, 51%, 67% and 49% respectively.

Discussion and Conclusions: Past studies reported similar outcomes that most college students preferred sharing their psychological problems with close friends rather than professionals. As such, the universities especially students services departments may consider developing programmes or activities that enable them to reach out to more students such as peer counseling programme.

Take-home Messages: The mental health professionals may rethink their approach to meet the needs of the rising number college students with mental health problems who are reluctant to seek professional help.

Increasing the Determination Coefficient of an Academic Risk Predictive Model for First Year Medical Students, Universidad Andrés Bello, Viña del Mar, Chile

AUTHOR(S):

- Peter McColl, Universidad Andres Bello, Viña del Mar, Chile (Presenter)
- Mariana Searle, Universidad Andres Bello, Chile
- Carolina Perez, Universidad Andres Bello, Chile
- Jessica Goset, Universidad Andres Bello, Chile
- Jonathan Acosta, Universidad Andres Bello, Chile
- Veronica Silva, Universidad Andres Bello, Chile

ABSTRACT

Background: Academic risk detection allows to opportunely support students and prevent delays in curricular advancement and/or desertion. A predictive Model for Academic Risk was tested in 2017. In 2018, several variables were included in a new intent to increase the model's determination coefficient. Objective: to increase the predictive value of the academic risk model incorporating new variables and second semester grades of the first year of medical school.

Summary of Work: A cross-sectional study was conducted (n54). Informed consent obtained. First semester 2018: students completed 2017's surveys, and Learning Strategies (ACRA); Burnout Syndrome (Maslach); Emotional intelligence (EQI-short); Attention (FFMQ) tests, and Sociodemographic questionnaire. For the analysis, 2017's variables were considered and also total and subscale score means from 2018's surveys. All variables were analyzed in relation to final first and second semester grades means. Correlation and linear regression, $p < 0.05$ were used.

Summary of Results: Students pass all first semester classes, so the model achieved best predictability when considering second semester final grade means. Meaningful variables were: critical thinking, effort regulation, help seeking, origin, family pressure, household tasks, previous mental health status, $p < 0.05$. In this multiple linear regression, the determination coefficient was 0,837, with a $p < 0,0000000735$. 2018's included variables are meaningful, and the model explains near 84% of second semester final grades means.

Discussion and Conclusions: The variables included in 2018, improved the model's academic risk predictability determination coefficient. 2017's model demonstrated a predictive value of 68%, whereas 2018's variables linked to the regression model were able to explain the variability of academic performance close to an 84%. Socio emotional variables play a key role in the predictability of the model, showing thus the importance of considering students psycho- affective dimensions.

Take-home Messages: To validate the academic risk predictive model, students from all three UNAB's medical schools will participate in 2019's survey process. It is a task to be observants and make timely professional referrals of students that have low academic performance and/or any other detected difficulty.

What's stopping the current? Early failure increases risk for problems in later years of medical education

AUTHOR(S):

- Adele Kastensson, Karolinska Institutet, Sweden (Presenter)
- Robert Lilford, Karolinska Institutet, Sweden
- Riita Möller, Karolinska Institutet, Sweden
- Eli Westerlund, Karolinska Institutet, Sweden
- Marie Dahlin, Karolinska Institutet, Sweden
- Ellinor Kenne, Karolinska Institutet, Sweden

ABSTRACT

Background: Each year a number of medical students face difficulties in following the curriculum on time. This affects the individual student and is an increasing problem for the university. Failure to complete coursework on time may result from not attending compulsory modules or from failing exams. In some instances, students may resit exams or complete lost modules while continuing to follow the curriculum. The aim of this study was to analyze the effects of early failure on student performance in later courses.

Summary of Work: University records were scrutinized regarding the time to course completion for students starting the undergraduate medical program between 2013 and 2017. We collected descriptive data on the first six courses during the first two curricular years by tracking individual student results in each freshman cohort.

Summary of Results: Preliminary data show that contrary to faculty perceptions of increasing numbers of failing students, we found no decrease in overall course completion between year 2013 and 2017. At the start of the second year, i.e. after three courses, 64±6% of students (n=7 cohorts, 1139 students) from the freshman cohorts were still on track. Furthermore, cohort performance indicated that students failing the first course had an enhanced risk (15% compared to 3% in students who passed the first course) failure in the second course. Finally, we found that the probability of completing a course decreases proportionally to the amount of time that has passed after the course has ended.

Discussion and Conclusions: Our analyses identified that failure during the first semester is a risk factor for future poor academic performance as well as an increased risk of not registering on future courses. Although these data do not take into account valid interruptions in the program, e.g. parental leave, they provide a solid ground for future investigations of underlying factors affecting student performance.

Take-home Messages: Early success is a good predictor for future performance. Therefore, it is key that the educational program develops strategies to promptly identify and support failing students.

Reaching the Troubled Learner: Faculty Development to Expand the Skill Set of Small Group Advisors

AUTHOR(S):

- Martha Ward, Emory University School of Medicine, USA (Presenter)
- Mary Jo Lechowicz, Emory University School of Medicine, USA

ABSTRACT

Background: Psychological distress is increasingly common in medical students. Despite this, few students seek treatment.

Summary of Work: Upon matriculation, students at Emory School of Medicine are assigned to a faculty Small Group Advisor (SGA). Small Groups meet regularly for interactive didactic instruction and process sessions. We created a faculty development curriculum for our SGAs aimed at enhancing their ability to provide support and identify adverse mood states. First, psychologists instructed the SGAs on group dynamics and facilitating a reflective practice. Next, SGAs participated in a faculty-only process group to discuss challenges and successes in leading their Small Groups. Finally, a psychiatrist created facilitator guides to assist SGAs in leading process sessions.

Summary of Results: 81.0% of SGAs (n=21) rated the faculty development sessions overall as “very useful” or “extremely useful.” The SGAs’ rating of the facilitator guides varied by individual subject and ranged from 54.5% to 88.9% rated as “very good” to “excellent.” 71% of students rated their SGA as “excellent” or “very good” (n=69) at leading process sessions. In response to the question “What techniques did your SGA use to facilitate the process group?,” students commented on the SGAs’ modeling disclosure, allowing space for self-discovery, and normalizing the challenges of medical training.

Discussion and Conclusions: Stigma and lack of readily available psychological/psychiatric resources likely contribute to medical students’ lack of help-seeking behavior. SGAs serve a unique role for students at our institution, and with training, can support students without imposing stigma in treatment seeking. Although they are not acting as therapists, SGAs can act as group facilitators, thereby increasing access.

Take-home Messages: Medical students suffer a disproportionate share of adverse psychological states. SGAs from diverse backgrounds have the ability to provide support and lead group discussions concerning the challenges of medical training. Faculty development is an essential part of preparing SGAs for this role.

A systematic Review of Remediation Strategies for Learners Struggling with Communication Skills

AUTHOR(S):

- Deema Al-Sheikhly, Weill Cornell Medicine-Qatar, Qatar (Presenter)
- Thurayya Arayssi, Weill Cornell Medicine-Qatar, Qatar
- Linda Östlundh, United Arab Emirates University, United Arab Emirates

ABSTRACT

Background: Interpersonal and communication skills are an integral element of quality patient care and are recognized as a core area of competency for medical students, residents, and practicing physicians. Trainees deficient in communication skills are not identified early enough and effective remediation strategies are not easily defined. We undertook a systematic review to determine which assessment methods are appropriate to identify learners struggling in communication skills and the strategies used to remediate.

Summary of Work: The literature was searched from January 1998 through to June 2018 using academic databases and grey literature. Trainees were defined as individuals in undergraduate and graduate health profession disciplines as well as those in healthcare practice. Characteristics of studies, assessment and intervention strategies and outcomes were synthesized qualitatively and summarized in tables.

Summary of Results: From an initial 1,178 records, 18 studies met the inclusion criteria. Majority of learners in the studies were medical students. Around half of the studies focused solely on learners struggling with communication skills. The majority of studies used a format of a clinical OSCE to identify struggling learners. None of the studies had a single intervention strategy with the majority including an experiential component with feedback.

Discussion and Conclusions: A few studies collectively described the diagnosis, remediation, intervention and the assessment of the outcomes of remediation of communication skills. For a remediation strategy to be successful it is important to ensure early identification and diagnosis, development of an individualized plan and reassessment with feedback. This study supports the need for more rigorous outcomes-based research, using control or comparison groups, for the diagnosis and remediation of healthcare practitioners struggling with interpersonal and communication skills across the continuum.

Take-home Messages: Early identification and diagnosis using multiple methods, followed by the creation of individualized plan and reassessment with feedback are key to successful remediation.

Factor affecting CPIRD and ODOD medical students' efficiency in passing the national license examination

AUTHOR(S):

- Piyabut Taotip, Roi Et Hospital Medical Education Center, Thailand (Presenter)
- Tawatchai Amornmoragot, Roi Et Hospital Medical Education Center, Thailand
- Sucheera Amornmahaphun, Roi Et Hospital Medical Education Center, Thailand

ABSTRACT

Background: The medical school has launched an One District One Doctor(ODOD)in parallel with the Collaborative Project to Increase Production of Rural Doctor(CPIRD)project.Though the ODODstudents were accepted to the medical school with a lower entrance score,they both enrolled in the same classes and took the same national license(NL)examination.This study aims to find the factors affecting NL passing between these two projects.

Summary of Work: The retrospective data collecting from the 132 students (classes 2010-2015) in order to use in this study included: gender, age, their clinical year, hometown, GPA score during their 3rd, 5th and 6th years,the project they are under and their first NL exam results in all 3 steps.

Summary of Results: There are 66% of CPIRD students and 34% of ODOD students. The first step NL exam passing rate is 68.9% for CPIRD students while ODOD students is at 86.7% with a statistically significant (p-value=0.026).The factors are as follow:

1)The ODOD project present with passing valued of OR=2.93 (95%CI:1.11-7.73;p-value=0.030) when comparing with CPIRD.

2)The GPA during students' 3rd year in school (≥ 3.00) representing with OR=16.21 (95%CI:6.21- 42.31; p-value<0.001) when compared with <3.00.

The second step NL exam passing rate is 92.0% for CPIRD students while ODOD students is at 84.4% with no statistically significant (p-value=0.184). The factors is the 5th year GPA ≥ 3.00 presenting the passing rate at OR=7.15 (95%CI:1.88-27.10; p-value=0.001) when compared with those<3.00.

The third step NL exam passing rate is 92.0% for CPIRD students while ODOD students is at 88.9% with no statistically significant (p-value=0.561) and there are no influential factors.

Discussion and Conclusions: For the first step of NL exam,the extra tutoring classes were provided to the ODOD students.Such classes should also be provided to CPIRD students.The second step of NL exam is a clinical knowledge test which relate to their clinical experiences and lectures,it was equally provided for students in both projects so the students who have high GPA is most likely to pass the test.The third step NL exam is based on the clinical experience which students from both projects have equal chance to practice so the passing rate showed no difference.The project or entrance score seem to show no influence.

Take-home Messages: There should be the follow-up and support system for those with low GPA, in order to help them to improve further in their academic year. There also should be enhance their clinical practice to archive a higher NL exam passing rate.

Trajectories of undergraduate medical students' performances and their relationship with learning approaches

AUTHOR(S):

- **Anne Baroffio, University of Geneva Faculty of Medicine, Switzerland (Presenter)**
- Giovanni Piumatti, University of Geneva Faculty of Medicine, Switzerland
- Milena Abbiati, University of Geneva Faculty of Medicine, Switzerland
- Margaret W Gerbase, University of Geneva Faculty of Medicine, Switzerland

ABSTRACT

Background: Highlighting predictors of medical students' academic performances since early study years is crucial to develop supporting interventions toward lower achieving students at risk of dropout. Previous studies evidenced how learning approaches have a strong discrimination power on students' performance. In this study we investigated the relationship between deep and surface learning approaches and academic performance in practical and theoretical examinations, from a longitudinal perspective.

Summary of Work: Sample consisted of 137 undergraduate medical students from the Geneva medical school (Mage=20.85 years, 53% females) recruited during their first pre-selection academic year (Year 1) who successfully passed to Years 2 and 3. Longitudinal group-based trajectory modeling traced trajectory groups of medical students based on two types of assessments, a knowledge-based multiple choice question test and a practice-based exam, recorded during three semesters throughout academic years 2 and 3. Moreover, at Year 1 students completed the revised two-factor Study Process Questionnaire.

Summary of Results: Three longitudinally stable trajectory groups of academic performance were found: low (n=38, 28%), average (n=64, 47%) and high achievers (n=35, 25%). Low achievers consistently reported the lowest results on both types of assessments across semesters. Average achievers had worse performances than high achievers (who reported the best scores on all semesters) especially on the knowledge-based test. Multinomial logistic regression evidenced that (1) students who had been repeating Year 1 after failing, were more likely to belong to the low vs. average (OR=-1.56, p=0.005) or high (OR=-2.15, p=0.001) achievers groups ; and (2) students using deeper learning approaches at Year 1 were more likely to belong to the average vs. low achievers group (OR=0.11, p=0.026).

Discussion and Conclusions: Undergraduate students can follow different trajectories of performances. These trajectories are associated with the learning approaches they used earlier during their studies. Students' use of deep learning approaches during their first study year is positively associated with the average vs. lower performance trajectory during the next 2 study years (but not higher vs. average).

Take-home Messages: Learning approaches are predictors of academic performance trajectory since early study years in medicine. Students repeating their first academic year are particularly at risk of exhibiting lower performance results during the following undergraduate years.

A Strategy for the Learning Enhancement of Medical Students in Achieving and Maintaining Success

AUTHOR(S):

- Lennon Bhagwandin, American University of the Caribbean, USA (Presenter)

ABSTRACT

Background: The medical school curriculum at USA schools is a rigorous one, aimed at a high percentage of students succeeding at the USA Medical Licensing Examination (USMLE). These challenges are soon realized by 'at-risk' medical students, many of whom fail multiple courses at the first sitting. Possible reasons for this are inappropriate study methods, time management, cultural approaches and difficulty comprehending medical concepts, amongst others. Thus there exists a dire need to address these deficiencies in this group, so as to equip them with the necessary approaches to achieve the desired success through implementation of study methods that work.

Summary of Work: In this present study at a large Caribbean medical school, an academic support program entitled Learning Enhancement Course (LEC), has been developed for these 'at-risk' students, in which they are exposed to a variety of study skills and strategies, which they then apply to their studies in order to succeed. A questionnaire was administered to these students to determine the effectiveness of the program.

Summary of Results: An analysis of the responses show that despite students finding the time needed for meetings as consuming, the program was highly beneficial to them and they are able to implement and apply the techniques taught to them, to succeed in their present courses as well as in future semesters.

Discussion and Conclusions: Students reported that using these new study skills coherently helped them gain a better understanding of their strengths and weaknesses and to think in a critical manner, thus enabling them to analyze exam questions efficiently and arrive at an informed decision.

Take-home Messages: In light of the perceived success of the LEC program, the question can also be raised as to whether the program could be expanded and developed to identify potential failures, so that remedial action can be implemented for this group during their first attempt at their respective courses.

Using the Objective Structured Clinical Examination to evaluate the newly graduated nurse in chest tube drainage care

AUTHOR(S):

- Chi-Yun Chang, Taichung Veterans General Hospital, Taiwan (Presenter)
- Li-Ling Hung, Taichung Veterans General Hospital, Taiwan
- Shaw-Shin Wu, Taichung Veterans General Hospital, Taiwan
- Su-Chiu Wang, Taichung Veitrans General Hospital, Taiwan

ABSTRACT

Background: According to the Taiwan Patient Safety Reporting System in 2017, a total of 133 chest tube safety incidents occurred. The content indicates that the technical failure or evaluation error is caused by the dropout of the pipeline (65%) and the disconnection of the pipeline (19%). We implement OSCE process to analyze NPGY who have been employed for less than 3 months for Cognitive, Affective, and Psychomotor.

Summary of Work: We designed a clinical situations case for those NPGY who are recruited from January to October, 2018 to test whether they are able to care chest tube patients. Before the test, NPGY read the standard documents and watch the training videos. The 12-item standardized checklist is used to evaluate the cognitive and care skills by 5-stage Likert scale. The examiner guides the NPGY to complete the operation and scores items. At the end of the test, the total evaluation is based on the global ratings scale A to C. Descriptive statistics was adopted to describe the average performance and the scores of the checklist items.

Summary of Results: Total 224 NPGY were tested. 12% of NPGY was graded in A in terms of Affective domain; 84% in grade B, and 4% in grade C. The top three items which below the standard refer to the Psychomotor Domain include: the drainage tube lying on the bed and no drooping loop (8%); wash hands before operation (7%); confirm the chest drainage bottle is tightly connected with the drainage tube and the lid of the bottle is tightly closed (6%).

Discussion and Conclusions: We can remind clinical teachers in the teaching process to use clinical actual cases to help students improve their perception and achieve the three major teaching objectives and thereby reducing the risk of patient health and pipeline safety incidents.

Take-home Messages: Learning by doing is an important part of Nursing education.

The effects of a 5 core teaching/evaluating skill workshop on teaching anxiety and effectiveness of Junior Residents

AUTHOR(S):

- Chih-Hsiung Hsu, Teaching Office, Tri-Service General Hospital, Taiwan (Presenter)
- Hao-Ming Chang, General Surgery Division, Tri-Service General Hospital, Taiwan
- Yaw-Wen Chang, Department of Family, Tri-Service General Hospital, Taiwan
- Pi Yu Wu, Teaching Office, Tri-Service General Hospital, Taiwan
- Cheng-Yi Cheng, School of Medicine, National Defense Medical Center, Taiwan

ABSTRACT

Background: Residents play an important role in the clinical teaching field. To be as a teacher, residents may have the same problem, teaching anxiety. Teaching anxiety could affect the ambiance in the clinical teaching field, leading to a reduction in students' learning and performing intention. There has been increasing recognition of the need to implement "Resident-as-Teacher (RaT)" program in hospital, which could improve teaching attitudes, skills, and behavior. The effect of RaT programs on teaching anxiety of resident, however, has not yet been investigated.

Summary of Work: The goal of this 7-hour workshop was training junior residents to teach the 5 teaching and evaluation skills, including the One-Minute Preceptor, bedside teaching, the teaching of evidence-based medicine (EBM), Mini-Clinical Evaluation Exercises (Mini-CEX), and Core EPAs for Entering Residency. To assess the Kirkpatrick level 1 to 3, Google Forms was used to assess the outcome before and after the workshop. To examine the "result level of Kirkpatrick model, we compared the result of student satisfaction to the participates before and after this workshop. We analyzed the participants' teaching anxiety, degree of understanding and self-efficacy about the 5 teaching and evaluation skills and participants' clerkship student satisfaction.

Summary of Results: After the workshop, the degree of understanding about the 5 teaching and evaluation skills was significantly higher than before the workshop. The residency self-efficacy of 5 teaching and evaluation skills increased significantly after the workshop. The score of control negative emotion, one of teaching anxiety scales, after the workshop was better than before workshop. The Internship-student satisfaction was slightly increased after the workshop for one month.

Discussion and Conclusions: The workshop containing the 5 teaching and evaluation skills could decrease the participant's teaching anxiety and improve clinical and teaching skills. Their student feedbacked higher satisfaction score.

Take-home Messages: RaT program helps junior residents decrease teaching anxiety and have better teaching performance.

A holistic evaluation system for post-graduate year students: experience sharing from a Taiwan teaching hospital

AUTHOR(S):

- Kang-Ju Chou, Taiwan (Presenter)
- Jin-Shuen Chen, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Yu-Huei Li, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Shao-An Fang, Tri-Service General Hospital, National Defense Medical Center, Taiwan

ABSTRACT

Background: One method to improve the quality of PGY training is to establish an ideal evaluation tool for communication among teachers, students and administrators. Here, a method from a teaching hospital in Taiwan for sharing our experience is demonstrated.

Summary of Work: First, an operating system in Excel was created. Parameters of student, teacher, tutor and a holistic assessment tools all were included in the system. Second, a flow chart for data collection, analysis and feedback was established. Data analysis was separated into two major parts for students and teachers. For students, we aimed to identify weak points and weakness. For teachers, we aimed to find any bias in the same assessment tool that needed to be pointed out and informed teacher. For administrators, we aimed to find any insufficiency in the flow chart.

Summary of Results: Data were collected from one year's cohort of 53 students. Data from the holistic evaluation system was analyzed, and separated into students and teachers. For students, data was presented according to each section and each student. Each month, the lowest scoring student of each section and bottom 10% of students were discussed. We found the variation of score between the top one and bottom students had no significant difference, so numeric assessment may not be a good indicator for improving ability of students. For teachers, score trends of each course and variation of score in different sections were analyzed. We found that different teachers and sections had significant variation in scoring for some courses. We suggested correction index for the score of each teacher may be necessary and all teachers needs to be attended an information session on scoring requirement before becoming a PGY teacher.

Discussion and Conclusions: A simple evaluation system in Excel and a flow chart for improving ability of PGY trainees were established and implemented in a teaching hospital in Taiwan.

Take-home Messages: The whole system is easy to operate, the tool identified weakness and challenge to be addressed in our program.

Measuring Metacognitive Skills: Pilot Results From A Study Involving Internal Medicine Residents

AUTHOR(S):

- Michael Healy, Department of Surgery, Massachusetts General Hospital, Harvard Medical School and NEJM Group, USA (Presenter)
- Emil Petrusa, Department of Surgery, Massachusetts General Hospital, Harvard Medical School, USA
- Craig Noronha, Department of Medicine, Boston Medical Center, Boston University School of Medicine, USA
- Carl Gustaf Axelsson, Department of Surgery, Massachusetts General Hospital, Harvard Medical School, USA
- Matthew O'Rourke, NEJM Group, USA
- Roy Phitayakorn, Department of Surgery, Massachusetts General Hospital, Harvard Medical School and NEJM Group, USA

ABSTRACT

Background: In today's healthcare environment, discoveries are continuously occurring. As such, a physician's learning must be continuous and occur throughout their career. Therefore, physicians need to use their metacognitive skills to both understand their strengths and weaknesses and to build learning strategies around them.

Summary of Work: To address this concept, we explored if metacognitive skills can be objectively measured and how these measurements can change over time to help learners develop effective learning approaches and strategies. Our pilot study consisted of 69 internal medicine residents who were provided access for a year to the NEJM Knowledge+ Internal Medicine Board Review (NEJM Knowledge+) product, an adaptive e-learning product that features a comprehensive question bank. As the residents answered questions from the question bank, they were simultaneously asked how confident they were in their answer.

Summary of Results: Metacognitive skills were measured by comparing resident confidence versus performance when answering questions and grouped into four objective categories (correct & aware; correct & unaware; incorrect & aware; and incorrect & unaware). At the initial 30-day period, 41 residents (59.4%) received individualized electronic feedback on their metacognitive skills. The metacognitive skills for these residents were longitudinally tracked, which allowed for comparisons between usage after an initial 30-day period in the fall of 2018 and usage as of January 2019. The percentages of average metacognitive skills measurements in the four objective categories for these 41 residents were as follows: correct & aware (58.6% and 56.9%, respectively), correct & unaware (11.3% and 11.0%, respectively), incorrect & aware (12.4% and 12.9%, respectively), and finally, incorrect & unaware (17.6% and 19.2%, respectively). There were no significant differences in each of these groups when comparing the two time periods.

Discussion and Conclusions: These pilot results indicate that metacognitive skills can objectively be measured. While there were no significant differences, future research will explore possible differences over an extended period, as well as other methods to offer individualized feedback to facilitate the improvement of metacognition and construction of new learning strategies.

Take-home Messages: Metacognition can be measured, but feedback may be best delivered utilizing individualized electronic feedback in tandem with other methods.

Designing and evaluating a departmental teaching programme

AUTHOR(S):

- Chiara Petrosellini, Whittington Health NHS Trust, UK (Presenter)
- Daniel Stott, University College London Hospital, UK

ABSTRACT

Background: Postgraduate departmental teaching can address knowledge gaps, support exam preparation and provide opportunities for trainees to share areas of expertise. Teaching peers is a GMC requirement of good medical practice and a curriculum requirement for The Royal College of Obstetricians and Gynaecologists. Despite the importance of departmental teaching, there is significant variation in its quality and structure.

Summary of Work: We surveyed junior doctors in the Women's Health department at The Whittington Hospital, London, via an anonymous online questionnaire seeking their views on the content, structure, timetable and location of departmental teaching. Overall the respondents (n=16) were dissatisfied with the quality of the existing teaching programme, and the self-reported attendance was poor: 80% of trainees attended either none or just one teaching session per week, often due to clashes with clinical commitments or poor communication around the teaching programme. Recurring themes emerged: there was little awareness of teaching activity, on-call teams were rarely able to attend, and there was a strong request for consultant-led teaching. Using these findings, we designed an updated departmental teaching programme. We adapted the timing and location of teaching to allow as many trainees as possible to attend. We created and distributed a teaching rota overview for every two-month block, as well as weekly email reminders of upcoming sessions. We contacted consultant colleagues from our department and allied specialities asking them to contribute to weekly teaching.

Summary of Results: Six months after implementing these changes we distributed another anonymous online questionnaire to junior doctors within the department. This showed attendance at departmental teaching had doubled and satisfaction with teaching content had significantly improved. All trainees were able to attend at least one session per week, and the majority attended two to three. The sessions were described as varied, engaging and worthwhile.

Discussion and Conclusions: Our data demonstrates that simple interventions can dramatically improve trainee attendance at, and satisfaction with, postgraduate departmental teaching.

Take-home Messages: Introducing peer-led and consultant-led teaching within a busy department is challenging. Small practical adaptations and regular reminders of upcoming sessions, however, can create a sustainable, comprehensive programme with excellent trainee satisfaction.

The more the merrier? Does time spent on appraisal meetings in postgraduate medical education make a difference?

AUTHOR(S):

- Anita Sørensen, Randers Regional Hospital, Denmark (Presenter)
- Marianne Kleis Møller, Aarhus University Hospital, Denmark
- Pernille Andreassen, Centre for Health Sciences Education, Health, Aarhus University, Denmark
- Bente Malling, Centre for Health Sciences Education, Health, Aarhus University, Denmark

ABSTRACT

Background: According to a national formal advisory program in Denmark, an educational advisor in the form of a senior colleague is assigned to every doctor in each rotation of postgraduate medical education. The advisor must conduct at least three appraisal meetings with the trainee. Inspired by the Success Case Method this study investigates differences between the doctors who in a survey evaluated the NFAP most positively (successes) respectively most negatively (non-successes).

Summary of Work: In 2017 a survey was conducted among all 129 doctors, who were employed in their first 6-month rotation of postgraduate medical education in one of five regions in Denmark. A cluster-analysis gave rise to a group of 8 successes, 7 non-successes and 62 in an average group. Differences in descriptive data were calculated by use of Chi2-tests.

Summary of Results: The response rate was 67%. Non-successes and successes had the same number of appraisal meetings, but the total amount of time spent on the meetings was significantly lower in the group of non-successes. For 60% of the successes their meetings in total lasted more than two hours, whereas the meetings for 100% of the non-successes lasted less than one hour in total.

Discussion and Conclusions: Other studies have proved that mentees, who meet their mentor more often, rate their mentoring higher. This study showed that it was not the number of appraisal meetings but the total amount of time spent on the meetings that diverged between trainees who evaluated their appraisal meetings the most beneficial and those who evaluated them the least beneficial. Nevertheless this is not the same as the more the merrier as other factors, such as the advisors' motivation and engagement, is known to be of importance to. Further studies are necessary to reveal if less time spent on meetings might be caused by lesser motivation and engagement from the advisor and/or even the trainee himself.

Take-home Messages: The total amount of time spent on appraisal meetings makes a difference as to whether trainees in postgraduate medical education perceive appraisal meetings as beneficial or not.

Video-assisted reflection of bedside teaching skills provides effective and objective feedback to young residents

AUTHOR(S):

- Wen-Hui Fang, School of Medicine, Tri-Service General Hospital, National Defense Medical Center, Taiwan (Presenter)
- Chih-Hsiung Hsu, Teaching Office, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Cheng-Yi Cheng, School of Medicine, Tri-Service General Hospital, National Defense Medical Center, Taiwan
- Chin-Sheng Lin, School of Medicine, Tri-Service General Hospital, National Defense Medical Center, Taiwan

ABSTRACT

Background: Resident as teacher (RaT) is current trend which not only provides training closer to learner but promotes healthcare quality. To be a teacher is challenging for young residents, who are under great pressure of clinical workload and unfamiliar to be teachers. Video-assisted recording could provide immediate and precise reflection, which potentiates the effects of the feedback from senior instructors. This study applied video-assisted reflection to young residents regarding the bedside teaching skills and evaluated the outcome of the program.

Summary of Work: We established a scoring system which comprised of 10 essential components of bedside teaching skills. Young residents were requested to participate the workshop of bedside teaching. During the workshop, essential components of bedside teaching skills were instructed by senior doctors. Then young residents did role playing to perform bedside teaching activities. All the activities were recorded by a video and evaluated by senior instructors. After the activities, senior instructors provided immediate feedback according to the scoring system, which was validated by video recording. Young residents who did not answer more than 8 out of 10 correctly were requested to repeat the activities. Questionnaires regarding the satisfaction, learning attitude, and learning motivation were obtained after the activities.

Summary of Results: There were 27 residents participating in the workshop. Eight out of all did not reach the criteria during the first activities. After the second activities, all the 8 residents passed the examination. The satisfaction rate of the curriculum was 91.17%. In the qualitative feedback, young residents suggested that the instructor feedback assisted by video recording rapidly pointed out their shortcomings, which are specific and easy to be improved.

Discussion and Conclusions: Undoubtedly, young residents need to be well educated to be teachers. However, with teaching anxiety among young residents, several methods have been developed in RaT program with variable outcome. Through video-assisted demonstration along with tutorial of experienced instructors, young residents could easily identify the essential components of the teaching skills, which helps them to be equipped as teachers.

Take-home Messages: Applying video-assisted reflection could be a promising strategy to give straightforward feedbacks and enhance bedside teaching skills to young residents who have teaching anxiety and heavy clinical workload.

Core competency evaluation complements general academic performance in prediction of clinical performance in internship

AUTHOR(S):

- Yih-Jer Wu, Mackay Medical College / Mackay Memorial Hospital, Taiwan (Presenter)
- Chun-Chih Peng, Mackay Medical College / Mackay Memorial Hospital, Taiwan
- Ling-Lang Huang, Department of Medicine / Mackay Medical College, Taiwan
- Chau-Shoun Lee, Mackay Medical College / Mackay Memorial Hospital, Taiwan
- Yat-Pang Chau, Department of Medicine / Mackay Medical College, Taiwan
- Hung-I Yeh, Mackay Memorial Hospital / Mackay Medical College, Taiwan

ABSTRACT

Background: All medical schools in Taiwan have their own pre-set core competencies (CCs) but few substantially evaluate these CCs before student graduation; instead, most of medical schools still give student credits by their general academic performance (GAP). We sought to investigate whether the addition of CC achievements to traditional GAP would be more predictive to their clinical performance (CP) in internship.

Summary of Work: Each of 7 pre-set CCs was stratified into 3 levels: “standard”, “good”, and “outstanding”, according to the achievement evidences provided. Students who achieved any “outstanding” or at least 4 “good” levels in 7 CCs were awarded in the graduation ceremony. The level of GAP (the final average score of all taught courses taken from years 1 to 4) was expressed as GAP rank in the class. CP in internship was evaluated as a composite rank in the class, according to their clinical competencies (70%), clinical knowledge (10%), OSCE (10%), clinical meeting performance (10%), and learning portfolio (bonus score).

Summary of Results: Totally 124 students graduated from 2016 to 2018 were enrolled. Students with CC awards had significantly better CP ranks (12.2±9.1 vs. 25.4±11.1, $P=3.9 \times 10^{-10}$) and GAP ranks (16.0±11.7 vs. 24.4±11.6, $P=4.1 \times 10^{-4}$) than those without. Both GAP rank and CC award were independent predictors for CP rank in internship (beta=0.61, $P<0.001$ and beta=-0.48, $P<0.001$, respectively). The addition of CC award to traditional GAP rank in the model reduced residual sum of squares from 11287 to 9469 with an increase of adjusted R squares from 0.37 to 0.47 ($P<0.001$), indicating a significantly better prediction for CP rank.

Discussion and Conclusions: We evaluated the 7 core competencies including service to the disadvantaged, care for humanities and environments, lifelong learning, critical appraisal, just to name a few, according to the achievement evidences provided by students themselves. CC achievement, though evaluated more qualitatively than quantitatively, was found to be a valuable supplement to GAP in prediction of future CP. A more comprehensive evaluation of CCs may be more predictive to future clinical competencies and professionalism.

Take-home Messages: CC evaluation is able to complement traditional GAP in prediction of future real-world clinical competencies.

Quantitating the effect of increased supervision using electronic records in an emergency department

AUTHOR(S):

- Sune Laugesen, Emergency Department, Odense University Hospital, Denmark (Presenter)
- Michael Hansen-Nord, Emergency Department, Odense University Hospital, Denmark
- Annmarie Lassen, Emergency Department, Odense University Hospital, Denmark
- Niels Thomas Hertel, Centre for Doctors Education, Denmark

ABSTRACT

Background: Despite certain, known drawbacks direct observation and feedback is considered an essential part of postgraduate medical training, perhaps even best-known practice. However, by some hospitals it is considered costly. This study aims to investigate if increased supervision of first year interns by senior consultants in the ED result in an increase in number of patients seen per shift and a decrease in time spent reaching a diagnosis and treatment plan, thus rendering the use of the consultant as a supervisor rather than clinician cost effective over a 6-month period.

Summary of Work: By use of the Cetrea system the date and time of first contact and time of conclusion and plan is available for all patients seen by junior doctors in the ED since 2007. Since July 2017 the number of consultants has been increased by 50% Monday, Wednesday and Friday with the sole purpose of increased supervision. Since October 2018 it has been further increased 50% on Tuesday and Thursday also. This study quantifies, per 10 hours shift, the number of patients seen as well as the speed with which a final diagnosis and plan is reached by the first-year residents in the ED. It compares the data from the three different periods with different amounts of available time for consultant supervision and guidance. It also quantifies the progress of each, individual resident during their 6-month employment. The numbers are corrected according to the total numbers of patients passing through the ED on that particular shift.

Summary of Results: The data has been collected but not yet extracted from the Cetrea system and analyzed. The study is expected to be finished, at the latest, by the end of May 2019.

Improving Quality of Educational Supervisor Reports and Supervised Learning Events

AUTHOR(S):

- Mumtaz Patel, Health Education England, UK (Presenter)
- Warren Lynch, Joint Royal Colleges of Physicians Training Board, UK
- Paul Baker, Health Education England, UK

ABSTRACT

Background: Our previous research has shown that Educational Supervisor Reports (ESR) and Team Assessment of Behavior are strongly predictive of doctors in difficulty.¹ However, quality of ESRs and Supervised Learning Events (SLEs) are variable and this study evaluates whether this can be improved using a structured framework with targeted feedback to trainers.

Summary of Work: A one-page framework developed to assess quality of ESR (n=15) by the Renal Medicine Annual Review of Competency Progression (ARCP) panel at Health Education England North West (HEE NW) in 2014. Formative feedback sent to each educational supervisor (ES) and comments individually discussed. Successive ESRs (n=15) then assessed by the Renal ARCP panel in 2015-2017 to evaluate if there was any improvement in quality. A similar framework used to assess quality of SLEs (sample of 3-4 per ES) by the Renal ARCP panel (n=21) in 2016-2017 and trainee feedback also collated. The ES and trainee feedback was assessed qualitatively using a thematic analysis.

Summary of Results: Successive ESRs showed: • Significant improvement in quality (Excellent grading 13.3-83.3%, $P < 0.0001$). • Detailed free-text comments referenced to multiple sources of evidence. • More constructive feedback with specific learning objectives incorporated into the personal development plan. • Good evidence of learning from clinical incidents. Successive SLEs showed: • Significant improvement in quality (increase in Excellent grading 28.6-50%). • More detailed free-text comments on clinical skills. • More specific free text comments on generic skills including communication skills and professionalism. The ES/Trainee feedback: • Overwhelmingly positive; valued the process.

Discussion and Conclusions: A simple structured framework to assess ESR and SLE quality during ARCPS can provide useful formative feedback to ES and this significantly improves quality of successive reports. The ESR quality work has now been rolled out regionally at HEE NW and nationally through the Joint Royal Colleges of Physicians Training Board.

Take-home Messages: Quality of ESRs and SLEs can be improved significantly by using a structured framework during ARCPS which provides useful targeted formative feedback to ES.

What are the social factors with greater incidence in the training process of resident physicians which contribute to the improvement of their professional performance?

AUTHOR(S):

- Haydee Parra- Acosta, Universidad Autónoma de Chihuahua, Mexico (Presenter)
- Julio César Gómez-Fernández, AMFEM, Mexico
- Luis Carlos Hinojos-Gallardo, Universidad Autónoma de Chihuahua, Mexico
- José López-Loya, CIFE, Mexico
- Bertha O Larrinua-Pacheco, Universidad Autónoma de Chihuahua, Mexico
- René Nuñez-Bautista, Universidad Autónoma de Chihuahua, Mexico

ABSTRACT

Background: The objective of this research is to identify the social factors with more incidences in the training process of resident physicians that contribute to improvement of their professional performance.

Summary of Work: An observational cross-sectional study was designed. The sample was composed by 212 resident physicians from 15 specialties offered by Faculties and Schools of Medicine, associated to AMFEM. Residents answered a questionnaire that included eight nominal variables and 109 variables adapted from different instruments. Variables were measured with a Likert scale of 0 to 6. Content instrument validation was carried out using the expert judgment technique (Parra, Garay and Aguilar, 2018). Its internal consistency was validated with a pilot group of 30 residents, obtaining $\hat{\alpha} = 0.94$. The analysis of the information was made by descriptive and inferential statistics with a $p < 0.01 - 0.05$.

Summary of Results: It was observed that, from 212 resident physicians: 83 were men and 129 women. This study highlighted that during their training process, residents considered: respecting the ideas of others (5.25), learning to relate to patients and professors (5.23) and feeling their integrity protected while interacting with their peers (4.90). In the correlational analysis it was observed that, the stronger interpersonal relationships, the less authoritarian the professors are ($r = -0.210$), less ridiculed by them ($r = -0.235$), and feel, less tired ($r = -0.181$), less frustrated ($r = -0.291$) and less dissatisfied by their work ($r = -0.254$). Likewise, the results of two linear regression models showed that, by respecting the ideas of others, predicts with a 78% an adequate preparation of resident physicians. In the same way, respecting the ideas of others and feeling their integrity protected while interacting with their peers, improves by 60% the humanistic performance towards their patients.

Discussion and Conclusions: Respect in the interpersonal relationships is a protective social factor in the training process for resident physicians, because it reduces the burnout and the possibility of being mistreated by their professors (clinical tutors), as reported in several studies (De Torres, 2016, Hamui-Sutton, et al., 2016).

Take-home Messages: It is important to promote a respectful educational environment during the training process for resident physicians to improve a humanistic professional performance with patients.

The Outcomes of a Post-Graduate Year Nursing Training Program at a Medical Center in Taiwan

AUTHOR(S):

- Hsiu-Yueh Wu, The Office of Nursing Staff Training, Department of Nursing, Kaohsiung Medical University Hospital, Taiwan (Presenter)
- Yu-Mei Hsin, Department of Nursing, Kaohsiung Medical University Hospital, Taiwan
- Yu-Ying Wang, Department of Nursing, Kaohsiung Medical University Hospital, Taiwan
- I-Kai Liao, Department of Nursing, Kaohsiung Medical University Hospital, Taiwan
- Shu-Chuan Hsieh, Department of Nursing, Kaohsiung Medical University Hospital, Taiwan
- Bih-O Lee, Kaohsiung Medical University & Kaohsiung Medical University Hospital, Taiwan

ABSTRACT

Background: Under Taiwan's health policy, a two-year post graduate year (PGY) training program has been promoting for medical personnel including nurses. The program outcomes are important for hospital and nurse manager, and need to be examined. The aim of this study was to evaluate the outcome of PGY training for trainees from novices to proficient nurses by setting up objectives by phases.

Summary of Work: This PGY training was conducted from 2016 to 2018 in southern Taiwan. Participants were new nurses who had a four-year bachelor degree. A total of 82 trainees participated in the program with four-phase plan. The first phase was a 9-day hospital orientation training. The second phase was a 3-month clinical skills training. The third phase was a 9-month core competency training. The fourth phase was a 12-month advanced nurse training. Outcome of each phase was evaluated by clinical preceptor using a three domain scale including "Attitude" (6 items), "Skills" (8 items), and "Knowledge" (5 items) ranged from 1 to 9 with higher score indicating more proficient. A seven-item self-report scale was completed by the trainee at each stage.

Summary of Results: The outcomes from this program were: First, nursing skills including "nursing care plan ability", "care quality control", "treasury management", and "professional role" were significantly improved in the second phase. Second, core competency related to "maintaining patient safety" was greatly improved by using evaluation tool such as Min-Cex in the third phase. Third, trainees developed better interpersonal communication and inter-professional collaboration through evidence-based practice, reflection skills and interdisciplinary case study in the fourth phase. Last, a radar chart combined with the four-phase outcomes and self-report scores was created by each trainee.

Discussion and Conclusions: This program aimed to evaluate the outcomes of the two-year PGY training program. The trainees, clinical preceptors, and hospital learning center worked together to achieve the objectives of the program. By using multiple teaching strategies and multiple assessments, this program did have positive effects for trainees, and it can be used to train competent nurses in the future.

Take-home Messages: The two-year post graduate year training program did have positive effects for new nurses, and could be promoted in different hospitals or countries.

Cross-Site Working (CSW) in North West London (NWL) - What Do Doctors Think?

AUTHOR(S):

- David Whittaker, Chelsea and Westminster Hospital NHS Foundation Trust, UK (Presenter)
- Christina Cotzias, Chelsea and Westminster Hospital NHS Foundation Trust, UK

ABSTRACT

Background: Multiple site units are more common as Hospital Trusts expand and integrate with neighbouring hospitals. Doctors in post-graduate training (DiPGT) are often required to work across multiple sites to optimise training opportunities and provide service. Within NWL, only one acute trust is a single site unit. The survey aim was to capture trainee opinions on CSW to help optimise CSW models.

Summary of Work: A survey of 11 questions asking about CSW was sent online to all DiPGT, across all grades and specialties in NWL.

Summary of Results: 60.5% (101/167) of those surveyed had worked across multiple sites in their current job, with the majority for day to day duties only. 16.8% (28/167) undertook CSW because of exceptional clinical demand, yet 40.1% (67/167) had done so for their own educational benefit. 76% (127/167) would like to work cross-site to benefit their training, with 64.1% (107/167) believing that CSW would help with curriculum completion. Respondents indicated that cross-site policies, clinical pathways, ID badges, inductions and IT systems, and provision of transport, would make CSW easier. 75.4% (126/167) of DiPGT cited lack of familiarity as a reason for not doing locums at other hospital sites, and this was raised as a significant concern for CSW.

Discussion and Conclusions: The majority of trainees surveyed have worked cross site, and felt it could benefit their training by improving achievement of curriculum competencies. Concerns raised by trainees included hours of work (including travel time), lack of continuity of patient care and lost educational and clinical opportunities. DiPGT in NWL recognise the educational benefits of CSW and we have captured a range of experiences, concerns and recommendations in relation to CSW. This survey will help improve future CSW models for trainees and hospitals to balance training needs with service provision.

Take-home Messages: DiPGT recognise the benefits of CSW and, with planning, service needs can be met and training opportunities maximised.

#8MM Posters - Postgraduate: Evaluation of the trainee and the programme

Evaluating the introduction of a ten-minute teaching session format in a Critical Care Unit

AUTHOR(S):

- **Timo Tolppa, The Royal Marsden NHS Foundation Trust, UK (Presenter)**
- Jonathan Dunne, The Royal Marsden NHS Foundation Trust, UK
- Sarah Brown, The Royal Marsden NHS Foundation Trust, UK
- Kate Tatham, The Royal Marsden NHS Foundation Trust, UK

ABSTRACT

Background: Organising teaching in a critical care unit (CCU) is challenging due to varying patient acuity and unpredictability of the workload. Additionally, the breadth of critical care knowledge makes it difficult to cover all topics relevant to doctors of differing grades and prior experiences. In our 16-bedded CCU of a tertiary cancer hospital, junior trainees received weekly one-hour seminars. Due to clinical demands, the regularity and attendance at teaching varied.

Summary of Work: We implemented thrice weekly ten-minute teaching sessions as part of the morning multi-disciplinary handover. The aim was to evaluate the impact of this change on the number of sessions, breadth of topics and educational value to trainees. The programme was evaluated with a semi-structured questionnaire at baseline and 16 weeks post-implementation with a new group of doctors. The survey included questions on session length, quality, topics and usefulness.

Summary of Results: A total of 17/18 trainees (94.4%) completed the questionnaire with nine responses at baseline and eight post-intervention. Attendance at more than six teaching sessions each month improved post-intervention (0% vs. 50%, $p=0.04$). Sessions delivered by the multidisciplinary team (MDT) increased from 0.3 ± 0.5 to 2.0 ± 1.8 ($p=0.02$). The baseline group felt there were too few sessions on CCU-specific topics (55.6%), data analysis (88.9%) and management of emergencies (100%). This perception improved for all three topics post-intervention ($p<0.05$). The perceived usefulness of teaching reduced post-intervention (100% vs. 50%, $p=0.03$).

Discussion and Conclusions: The number of sessions and topics covered improved significantly with the introduction of ten-minute teaching. The new timing allowed more trainees and MDT members to attend and deliver teaching sessions. The programme was, however, associated with a reduction in perceived usefulness. Therefore, ten-minute teaching may be appropriate for supplementing longer sessions to ensure exposure to more topics but may not be sufficient to cover the depth of knowledge for all learners.

Take-home Messages: Bite-size teaching is useful for covering a wider-range of CCU topics. Incorporating teaching into multidisciplinary handovers improves MDT involvement in teaching and regularity of sessions. Ten-minute teaching does not replace the need for seminars on more advanced CCU-related material.

Evaluate the impact of training for shared decision making in kidney transplantation

AUTHOR(S):

- **Mei-Yi Wu, Shuang Ho Hospital, Taipei Medical University, Taiwan (Presenter)**
- Tzu-Hsuan Lu, Medical Quality Department, Shuang Ho Hospital, Taipei Medical University, Taiwan
- Lung Chan, Department of Neurology, Shuang Ho Hospital, Taipei Medical University, Taiwan
- Ka-Wai Tam, Division of General Surgery, Department of Surgery, Shuang Ho Hospital, Taipei Medical University, Taiwan
- Yih-Giun Cherng, Department of Anesthesiology, Shuang Ho Hospital, Taipei Medical University, Taiwan
- Mai-Szu Wu, Shuang Ho Hospital, Taipei Medical University, Taiwan

ABSTRACT

Background: The aim of shared decision making (SDM) is that healthcare professionals provide the detail information of disease and treatment options which are based on the individual experience and the best external evidence before patients make their decision. For example, healthcare professionals provide detailed pros and cons for all possible treatments, so patients could make decision properly and easily. Patients and healthcare professionals discuss the issue and solution continuously. Finally, patients select the properly treatment according to the patient decision aids (PDAs), coaching, and personal considerations.. The application of SDM will improve the quality of health care.

Summary of Work: The present study was to promote the concept of SDM to improve the skills of clinical practice and communication for the post-graduate year students. The courses were including the lecture, comprehensive literature review, and practice; therefore, students can fully understand the concept of SDM, conduct the PDAs, and apply to clinical practice. Finally, we evaluated the effects of training courses for SDM.

Summary of Results: We used the topic of kidney living transplantation (KT) to complete the course. While the lecture of SDM and comprehensive literature review were finished, we completed the PDAs for living KT. We applied the PDAs to clinical practice, and we trained students to make PDAs, such as detailed pros and cons for all possible treatments, for patients. We observed that students who received these training courses learned better than those did not. In addition, we observed that students were actively involved in the training period of clinical practice for SDM, and they continuously dealt with the difficulties well.

Discussion and Conclusions: We observed that the performance of clinical practice among students who involved in the training project for SDM were better than those did not. It met the expectation that practice makes perfect; therefore, we suggested that post-graduate year students should take these courses for SDM to enhance their skill and enrich their clinical experience.

Take-home Messages: Based on the consideration of performance, clinical practice, clinical experience, training courses for SDM is benefit to the post-graduate year students.

Transforming Learning Outcomes for Innovative Curricula

AUTHOR(S):

- Anna Maria Jones, Imperial College London, UK (Presenter)
- Latha Ramakrishnan, Imperial College London, UK
- Jeffrey Vernon, Imperial College London, UK
- Sophie Rutschmann, Imperial College London, UK

ABSTRACT

Background: In light of a newly launched Learning and Teaching Strategy, Imperial College London has been undergoing curriculum review of the majority of its programmes for implementation in October 2019. Postgraduate FoM programmes have been focussing on three main areas, 'AMA': Active Learning, Measurable Learning Outcomes (LOs), and Authentic Assessment.

Summary of Work: The Faculty of Medicine (ICL) is the first within the College to initiate curriculum review of all its postgraduate programmes, 16 of which are healthcare related. As part of this, we, the postgraduate education team, have been encouraging the development of measurable and high-level LOs that focus on cognitive skills rather than content, that clearly align to assessment, to empower students in their learning.

Summary of Results: Prior to the curriculum review process, many programmes relied upon language such as 'understand' and 'appreciate' within their LOs, both difficult to measure and low-level for postgraduate study (according to the framework provided by Bloom's Taxonomy). Revised programme LOs are now both clearly measurable and reflect high-level cognitive skills, incorporating tasks such as 'evaluate', 'critique' and 'design'. These LOs further challenge our postgraduate students in their critical thinking, problem solving, innovation, independent learning and personal/ professional identity, in order that they might best fulfil ICL's Graduate Attributes. Additionally, careful design of measurable and high-level LOs capture what students will do and achieve within a programme, in line with active learning.

Discussion and Conclusions: Despite some programmes considering development of LOs to be simply semantics, it has been an educational experience for teaching staff, shifting their thinking to become more student-centred, i.e. 'what skills are my students going to leave with?' rather than 'what facts am I going to deliver on this course?', preparing graduates that are equipped to deal with future global challenges. We will be evaluating the implementation of this curriculum review in the coming years.

Take-home Messages: • It is imperative to have strong, clear learning outcomes that truly reflect the programme in order to appropriately set student expectations, particularly where L&T is moving away from 'traditional' teaching towards more innovative approaches. • Staff will need ongoing support, and sharing of good practice, to implement their revised curricula.

#9A Symposia

Date of Presentation: Tuesday, 27 August 2019

Time of Presentation: 1600-1730

Location of Presentation: Hall A, Level 2

Embracing CPD diversity. Bridging gaps!

Presenters:

Organised by the AMEE CPD Committee:

- Lawrence Sherman, The Academy for Global Interprofessional Learning and Education (AGILE), USA
- Dave Davis, Center for Outcomes and Research in Education (CORE), Mohammed Bin Rashid University of Medicine and Health Sciences (MBR-University), Canada
- Helena Filipe, Faculty of Medicine, University of Lisbon, Portugal
- Three CPD representatives reflecting global diversity

Summary of theme and why it is important:

- Welcome, Agenda
- Keynote Speech
- A series of up to three case based short presentations (3 invited global CPD representatives (America, Europe, Africa, Asia, Australia/New Zealand) online/recorded/onsite). Structure: (a) Region CPD Case picture; b) Challenges ahead, c) Plan to overcome them, d) How will your region's CPD look in 10 years)
- Audience Participation: share a different experience and personal views
- Summary and wrap up

Who should participate in the symposium? All AMEE members and non-members onsite or online with or likely to have a leadership role and responsibilities in Continuing Professional development (CPD) and all those finding interest in CPD.

What will they gain from participating?

- Better insight on CPD span and complexity
- Broader perspective on diverse ways of running CPD
- Reflect on the future of CPD - CPD in the future
- Approach the AMEE CPD SIG and Committee

#9B Symposia

Date of Presentation: Tuesday, 27 August 2019

Time of Presentation: 1600-1730

Location of Presentation: Hall C, Level 2

Teaching and Engaging the Millennials: What has changed?

Presenters:

Matthew Choon Eng Gwee, National University of Singapore, Singapore

Shuh Shing Lee, National University of Singapore, Singapore

Erle Chuen Hian Lim, National University of Singapore, Singapore

Gary D. Rogers, Griffith University, Queensland, Australia

Anthonio Adefuye, University of Free State, South Africa

Summary of theme and why it is important: The millennials, also referred to as Generation Y, and Generation Z (post-millennials) are now in your classroom, cafeteria, wards and clinics. They are now interacting with you and your colleagues as well as helping you and your colleagues in your work setting. Born after 1982, their characteristics have been found to be different from Baby Boomer and early Generation X. Notable differences that define this generation are: lack of professional boundaries influenced by socialisation, a need to have immediate feedback, a sense of entitlement, unrealistic expectations and an anticipation of a “how to guide” to succeed in and out of the classroom. They are also digital natives and use technology for most of their learning as well as interactions. It is well known that the present day instructors who are mostly Baby Boomers and Generation X need to change their strategies to engage the new learners. For this, the use of a wide array of instructional delivery methods is critical. The symposium will focus on the characteristics of millennials, how they learn and how to engage them effectively in the learning process be it in a clinical or classroom environment and how to train our faculty to equip with the skills required to teach these students.

Who should participate in the symposium? Everyone from different health professions education especially educators and leaders.

What will they gain from participating? After attending this symposium, the participants will gain an understanding on the following:

- Characteristics of the millennials in learning
- Methods to effectively engage the millennials in learning environment
- Faculty development approaches to equip the faculty with the necessary skills to support the learning process of the millennials

#9C Symposia

Date of Presentation: Tuesday, 27 August 2019

Time of Presentation: 1600-1730

Location of Presentation: Hall N, Level 1

Local responses to the complexities of European Medical Education: Dealing with globalization, migration and increased mobility

Presenters:

Richard Marz, Medical University Vienna, Austria

Janusz Janczukowicz, Medical University of Lodz, Poland

Marius Raica, Medical University of Timisoara, Romania

Anca Dana Buzoianu, Medical University of Cluj-Napoca, Romania

Ferenc Bari, University of Szeged, Hungary

Cosmin Sinescu, Medical University of Timisoara, Romania

Thikiri Yee, Medical University of Lodz, Poland

Michael Ramirez, medical student from the USA studying in Szeged, Hungary

Summary of theme and why it is important: Many medical students receive their education at universities located outside their country of origin, most of them because of capacity limitations at home. Drawn by better opportunities – perceived or real - they and many other graduates leave the country in which they received their training to practice medicine in yet other countries. The European Union has made mobility inside its borders rather easy but has issued little guidance to standardise the outcomes of medical education. Thus, individual universities are left to struggle on their own to triangulate national needs and expectations, international demands, and regulatory requirements. A very complex intersection of local, European and oversea licensing requirements characterizes numerous medical courses for non-European students. The symposium will explore how medical universities in Romania, Hungary, and Poland are responding to the challenges posed by globalization, migration and increased mobility.

Who should participate in the symposium? Those willing to consider the global political implications of educational issues.

What will they gain from participating? The issues raised are urgent and include educational as well as political aspects. Participants will gain needed information to join the in-depth discussion at an international level which must follow.

Pineapple Tarts: A multi-sensory neuroscience exploration of an Asian gustatory experience

AUTHOR(S):

- Derek Soon, National University Health System, Singapore (Presenter)
- Chelsea Chia, National University Hospital, Singapore
- Leonard Yeo, National University Health System, Singapore
- Dow Rhoun Koh, Yong Loo Lin School of Medicine, Singapore

ABSTRACT

Background: Neuroscience in the traditional undergraduate medical curriculum is taught in terms of anatomy, physico-chemical relations (neurotransmitters) and pathology (neurological illnesses from stroke to MS). With few exceptions, the neuroscience underpinnings of lived, everyday experience, are rarely, if at all explored in a meaningful, experiential way.

Moreover, in some medical schools, food is (mystifyingly) prohibited in the learning environment (due to a novel concept: “hygiene”). Learners consequentially experience sessional hunger pangs, and it is not unknown for some learners to become hangry with neurology.

Activity: This fringe, we would like to deliver our latest addition to the neuroscience curriculum, entitled “Pineapple Tarts”

Each learner will be given a delicious Singaporean confectionary (said pineapple tart).

The Portuguese and South American origins of this uniquely southeast-Asian dessert will be investigated, before embarking on a multi-sensory exploration of the experience of eating. The use of each of the 5 senses is explored in the process of looking at, smelling, tasting, chewing (mouthfeel) and swallowing the tart. Relevant neuro-anatomical pathways are highlighted, as are their connections with other sensory pathways and with deep brain structures involved in emotions and memory formation.

We summarise, as the brain does, by integrating the 5 senses in a unified experience, culminating in an orgy of dopamine fuelled nucleus accumbens activation.

Objective: Through this and similar lectures in the “special senses” series, we link lived experiences with underlying neurological processes, affording the learner a deeper appreciation of what is lost when these processes are disrupted. Also, munchies are avoided and nobody is hangry (provided there are enough tarts for everybody).

We would like to thank the Austrian Customs and Immigrations department for allowing our tarts through.

Aussiewood Downunder! Using musical comedy to educate doctors

AUTHOR(S):

- Katrina Anderson, Australian National University Medical School, Australia (Presenter)

ABSTRACT

Can comedy and musical theatre take learners and medical educators somewhere new in the context of healing and patient care. GP the Musical was first performed by a group of GP medical educators from across Australia at a medical education conference in Melbourne. Written by Dr Genevieve Yates and Dr Gerard Ingham, and directed by Dr Katrina Anderson the musical critiques the art of the doctor patient consultation and brings a compassionate gaze to the various perspectives of doctors and patients within a family medical practice. The musical was originally written for a doctor audience but mainstream audiences embraced it with sold out shows at commercial venues. What can a musical comedy teach students and trainees about patients? What can a musical comedy teach patients about doctors? What do our patients talk about in the waiting room? Could it be that patients are healing each other through dancing and singing? Come along to this fringe presentation to be entertained by moments and songs from this amazing musical and get some fresh ideas to engage students and trainees in the complexity of life as a family doctor. Hollywood and Bollywood eat your heart out! - we have "Aussiewood Downunder!"

I will NOT see you in court: What we can learn from the legal history of medical negligence

AUTHOR(S):

- Katie Macdonald, University of Bristol, UK (Presenter)

ABSTRACT

Treating any patient requires those in charge to make hundreds of decisions every day: What does this person need? How do I diagnose? What's the best treatment? However, the recent media attention on the seemingly phenomenal rise of compensation claims against doctors means perhaps we should focus on another question: Could I get sued for this? It may feel that every other week, another medical negligence case is splashed across headlines. The frenzy surrounding medicolegal news mounts pressure on doctors and medical students. The worry of being brought before a judge from a simple mistake could have anyone asking themselves: it could happen to anyone, so it could probably happen to me, right? No! This presentation aims to assuage your fears by providing a basic knowledge of the legal cases that have defined medical negligence and show that getting sued is an unlikely and easily avoidable event. This presentation will take the audience through the rich, complicated, and occasionally bizarre history of medical law; delving into the cases that have shaped the standards that we now uphold doctors to around the world. From an Australian doctor forced to financially support a child born as a result of his negligence, to a group of sadomasochists in Britain redefining the term "assault": medical law must be heard to be believed. This entertaining presentation aims to inform and amuse. I'll outline three key - slightly ridiculous - cases that have shaped the way we practice medicine. I aim to show people that most medical negligence cases derive from situations that are honestly avoidable, but with the right awareness of the laws and responsible medical practice, you need not worry about being sued ever again!

Can dance teach doctors?

AUTHOR(S):

- Deva Priya Appan, National Healthcare Group, Singapore (Presenter)
- Sharavan Sadasiv Mucheli, National Healthcare Group, Tan Tock Seng Hospital, Singapore

ABSTRACT

In recent years, there have been increasing reports of burnout amongst young doctors. Several studies have used the Maslach Burnout Inventory (MBI), a valid and reliable tool to measure occupational burnout. MBI measures dimensions, such as emotional exhaustion, depersonalization, cynicism, and loss of personal accomplishment. Amongst these, high rates of emotional exhaustion (in up to 32% of Australian doctors) were found in the beyond blue national mental health survey. A study by Kumar et al found that psychiatrists may be at high risk for burnout due to various factors. I strongly believe that creating more opportunities for self-awareness, and empathy early in one's medical career could help to alleviate the risk of burnout. How should that be done? Some medical educators have suggested that humanities are essential for physicians to empathize with patients, themselves and with the cultures they practice in. As a psychiatry trainee with experience in Bharatanatyam (a classical Indian dance form), I will present a case for including performing arts such as dance in the medical education curricula. This presentation will include a live dance excerpt followed by audience participation with the use of some dance techniques. There will be a short dialogue with the participants on their perceptions. I would then reflect on my personal journey with video excerpts from a recent dance project on mental illness and how it enriched my professional development.

Laughing to learn, our new experience in morbid anatomy

AUTHOR(S):

- Cristian Stefan, New York University College of Dentistry, USA (Presenter)
- Maira du Plessis, St George's University Grenada, Grenada
- Robert Hage, St George's University Grenada, Grenada

ABSTRACT

Having to learn gross human anatomy stiffens up many students. They find it overwhelming, smelly and just too much (to remember) in the time allocated. At SGU we have roughly 900 first term students and our imagination has worked towards making anatomy fun while still educational for both students and faculty. By starting the labs with a 10-minute interactive 'fringe' session, with faculty as players and students as active audience participants, we have received much positive feedback. The concept is to get across the 'must know' and/or difficult to grasp facts by anchoring them to a pleasant experience. The faculty members are viewed as active role players in knowledge transfer, with the wider implications of bridging a generation gap and increasing approachability and enjoyment.

In the lab, in batches of 150 students, we act out difficult concepts before they split up in groups of six students and rotate through six stations in just under two hours. Yes, we demonstrate how to catheterize a male patient which students will never forget, and the peritoneal folds in the female pelvis, to name a few examples.

Anatomy is an integrative subject necessary to becoming a good physician and our 'fringe' sessions incorporate anatomy with observation, narration and palpation. Sit back and imagine being a stressed first term student in an anatomy lab who studied all night and is still not confident with the high yield topics for next week's exam. We take the fear away and offer knowledge and fun..

Health professions education: The Musical!

AUTHOR(S):

- **Shelley Ross, University of Alberta, Canada (Presenter)**
- Brent Kvern, College of Family Physicians of Canada, Canada
- Lyn Sonnenberg, University of Alberta, Canada
- Shirley Schipper, University of Alberta, Canada

ABSTRACT

Health professions education has seen huge changes in recent years. Approaches to training are being scrutinized, and all aspects of training are being reconsidered in the light of emerging evidence for or against the value of current practices. The relenting onslaught of change can feel overwhelming: educators must now do competency-based medical education! They must change their assessment practices! Wait - they are not educators, they are coaches! Sometimes, you just wish it was yesterday, when all your troubles seemed so far away ... Yes, that's right, in this session we will address recent changes in health professions education through the universal medium of the MUSICAL. Join us on a very whirlwind tour of changes to assessment, curriculum, learner-centeredness, relationships, outcomes, and expectations conveyed through minor adjustments to the lyrics of some familiar tunes. While the medium is novel, the message is intended to be useful. Managing expectations is a key part of change management, and our intent is to present some of the perspectives of educators and learners as health professions education is transformed around them. These perspectives can help health professions innovators to consider where there may be obstacles and enablers in transforming education.

Learner Handover: How does it influence assessment?

AUTHOR(S):

- Tammy Shaw, University of Ottawa, Ottawa, Canada (Presenter)
- Claire Touchie, University of Ottawa and The Medical Council of Canada, Ottawa, Canada
- Debra Pugh, University of Ottawa and The Medical Council of Canada, Ottawa, Canada
- Timothy J. Wood, Department of Innovation in Medical Education, University of Ottawa, Ottawa, Canada
- Susan Humphrey-Murto, University of Ottawa, Ottawa, Canada

ABSTRACT

Introduction: Learner handover (LH) is the sharing of information about trainees between faculty supervisors. In a competency-based education model, LH should provide a scaffold to allow trainees to grow. However, the potential to bias future assessments has been raised as a concern, and one reason LH has not been widely implemented in North America. Psychology studies suggest that when prior performance information is provided to a rater, one of three possible results or “context effects” may occur: there may be bias toward the direction of the previous performance level (i.e., assimilation effect); bias away from the direction of the previous performance level (i.e., contrast effect), or no effect whatsoever(1). Assimilation effects are favored when the information was provided in an indirect manner, that is, from another source(2). This study aimed to determine whether LH, a form of indirect prior performance information, influenced assessment in the clinical context.

Methods: Faculty raters (n=42) were randomized to 1 of 3 groups. All raters viewed the same 6 simulated resident-patient encounter videos in the same order. In a counter-balanced design, each group received either positive (PLH), negative (NLH) or no LH/control (C) prior to each video then rated the performance using the Mini-CEX. The Mini-CEX includes seven 9-point rating scales to allow for assessment of several different competencies, and only those competencies relevant to the encounter were provided. Following these ratings, a questionnaire focused on raters’ perception and use of LH was completed.

For the purposes of the study, the LH was a brief written summary from the program director with NLH reflecting a resident with multiple areas needing improvement, and PLH reflecting a resident performing well above his or her peers. The videos used depicted average resident performances involving patients with a variety of medical issues. A Mini-CEX scale mean was created by calculating the average of the ratings on individual items for each rater by video. Mean and overall competence ratings were analysed using a factorial ANOVA. Content analysis was performed on questionnaire responses.

Results: The Mini-CEX mean ratings for each group across all videos were as follows: 5.29 NLH, 5.72 C and 5.97 PLH $p=.01$, $\eta^2=.126$. A post-hoc analysis (LSD) demonstrated a significant difference between the negative and the positive groups (Cohen’s $d = 0.81$, $p < .001$) with no difference between the control and positive groups (Cohen’s $d = 0.3$, $p = .37$) or the control and negative groups (Cohen’s $d = 0.56$, $p = .11$). Similar findings were found for the single overall competence ratings. In the post-study questionnaire, 23/28 (82%) of faculty had correctly guessed the purpose of the study and 19/28 (68%) felt the LH information was credible. Although several expressed concerns about its potential to create bias, 14/24 (58%) felt it did not influence their assessment.

Discussion & Conclusions: In keeping with the psychology literature, LH led to an assimilation effect; faculty provided with NLH generated lower scores than faculty provided with PLH after viewing the same performances. This may suggest that the provision of prior performance information about a trainee could influence a rater’s performance assessment. Moreover, this effect was noted despite raters’ awareness of the potential for bias. These results suggest careful consideration of the potential implications on LH use in clinical assessment.

Recipient of a 2017-2018 AMEE Research Grant Award.

Does the Opportunity to Reflect and Revisit during a Clinical Skills Exam Improve Students' Clinical Reasoning? Multicenter studies conducted at George Washington (GW), Jefferson, and University of Illinois, Chicago Schools of Medicine

AUTHOR(S):

- Benjamin Jim Blatt, The George Washington University School of Medicine and Health Sciences, Washington, DC, USA (Presenter)
- Rachel Yudkowsky, University of Illinois at Chicago- Department of Medical Education, Chicago, Illinois, USA
- Yoon Soo Park, University of Illinois at Chicago - Department of Medical Education, Chicago, Illinois, USA

- Karen Lewis, The George Washington University School of Medicine and Health Sciences, Washington, DC, USA
- Jaime Holden, University of Illinois, Chicago, Department of Medical Education, Chicago, Illinois, USA

ABSTRACT

Introduction: Though reflection is valued in clinical medicine, little empirical evidence exists to support its impact on performance.¹ Clinical skills exams (CSEs) are opportune for exploring reflection outcomes.² Typically, in CSEs students visit each standardized patient (SP) once. However, students' thinking may deepen if, after reflecting while writing their patient note (PN), they revisit their patients to further explore differentials. This study explored the effects of both live and virtual revisits on clinical reasoning. Aims: 1) examine the effect of a live revisit on students' diagnostic reasoning; 2) compare the clinical reasoning effect of a live revisit with the more feasible virtual revisit; 3) examine the effect of both on assessment psychometrics.

Methods: In spring 2017, 251 GW and Jefferson students and 179 UIC students conducted live and virtual revisits respectively during an end-of-third-year CSE. All students had 15 minutes for a focused history, physical and counseling and 10 minutes to write a USMLE-style PN. Live revisits added 5 minutes to revisit the patient and 5 minutes to complete a revisit questionnaire; virtual revisits added 5 minutes to complete the questionnaire. The questionnaire: "List up to 3 additional history questions or physical examination maneuvers that (live: you asked) or (virtual: you would like to ask) to clarify your differential diagnosis. Explain how this information would help you." Trained faculty used the UIC PN rubric to score patient notes, and a Revisit Rubric to rate the diagnostic relevance and rationale of revisit items. Results Live revisit: students listed additional H&P items in 59% (302/513) of revisit opportunities. Of the 547 items requested across cases, 107 (20%) were key to the diagnosis of the case, 357 (65%) were relevant but not key, and 83 (15%) were irrelevant. 306 rationales were provided: 216 (71%) were correct or partially correct. If the items listed had been included in the PN, 45 (15%) would have resulted in an increased score, 3 (1%) in decreased scores and 254 (84%) in no change. Virtual revisit: students listed additional H&P in 81% (373/463) of revisit opportunities. Of the 756 items requested across cases 148 (20%) were key, 454 (60%) were relevant but not key and 154 (20%) were irrelevant. 714 rationales were provided: 651 (91%) were correct or partially correct. If the items listed had been included in the PN, 98 (26%) would have resulted in an increased score, 17 (6%) in decreased scores and 258 (68%) in no change. There were no significant correlations between revisit scores, H&P checklist scores, or PN scores. Including revisit scores increased the variance associated with Person-Case interaction (case specificity) and decreased the reliability (Generalizability) of the CSE scores: G-Coefficient .32 to .13 and phi-Coefficient .21 to .10 in live and virtual revisits, respectively.

Discussion and Conclusions: In both live and virtual revisits, reflection while writing the PN resulted in most students identifying additional key/relevant H&P items, promoting diagnostic reasoning. Reduced reliability when including revisit scores may be from giving students more time to think of additional items, decreasing inter-student score differences resulting in more homogeneity. Virtual revisits require less time and may be more feasible than live revisits for busy clinical skills centers. Use depends upon training objectives: to optimize clinical outcomes is it more important to train students to reason in situ or to further calibrate their reasoning through reflect-revisit?

How teacher-learner relationships influence the learning potential of low-stake assessments - An international study within programmatic assessment

AUTHOR(S):

- Suzanne Schut, Maastricht University, Maastricht, The Netherlands (Presenter)
- Jan van Tartwijk, Utrecht University, The Netherlands
- Erik Driessen, Maastricht University, The Netherlands
- Cees van der Vleuten, Maastricht University, The Netherlands
- Sylvia Heeneman, Maastricht University, The Netherlands

ABSTRACT

Introduction: Low-stake assessments are theorised to stimulate and support self-regulated learning. The use of low-stake assessment as a learning opportunity requires an environment in which continuous improvement is encouraged. This may be hindered by learners' perceptions of assessment as high-stake. Teachers play a key role in influencing learners' assessment perceptions [1]. By investigating assessment perceptions through an interpersonal theory-based perspective of teacher-learner relationships, we aim to elucidate these mechanisms within the medical assessment culture.

Methods: An qualitative approach to data gathering and analyses inspired by constructivist grounded theory approach was used to analyse the data and reveal underlying mechanisms influencing learners' perceptions. First, twenty-six purposefully selected learners, ranging from undergraduates to postgraduates in five different settings of programmatic assessment, were interviewed about their assessment task perception [1]. Next, we conducted a secondary analysis using sensitising concepts from interpersonal theory [2] to elucidate the influence of the teacher-learner relationship on learners' assessment perceptions.

Results: The study showed a strong relation between learners' perceptions of the teacher-learner relationship and their assessment perception. Two important sources for the perception of teachers' agency emerged from the data: positional agency and expert agency. Together with teacher's communion level, both types of teachers' agency are important for understanding learners' assessment perceptions. High levels of teacher communion had a positive impact on the perception of assessment for learning, in particular in relations in which teachers' agency was less dominantly exercised. When teachers exercised these sources of agency dominantly, learners felt inferior to their teachers, which could hinder the learning opportunity.

Discussion & Conclusion: To utilise the learning potential of low-stake assessment, teachers are required to stimulate learner agency in safe and trusting assessment relationships, while carefully considering the influence of their own agency on learners' assessment perceptions. Interpersonal theory offers a useful lens for understanding assessment relationships in the context of medical education. The Interpersonal Circle model [2] provides opportunities for faculty development that help teachers develop positive and productive relationships with learners in which the potential of low-stake assessments for self-regulated learning is realised.

QI education outside of the clinical setting: A sequential explanatory mixed-methods study of QI training that uses the medical school as the context for improvement

AUTHOR(S):

- Lawrence Grierson, McMaster University, Hamilton, Canada (Presenter)
- Aditya Nidumolu, McMaster University, Hamilton, Canada
- Allison Brown, University of Calgary, Calgary, Canada

ABSTRACT

Introduction: Quality Improvement (QI) is a rigorous approach to reducing errors, mitigating adverse effects, and strengthening the systems that underpin excellent healthcare. Given its importance, QI is now recognized as an educational competency for all future physicians. However, training QI in the clinical is constrained by the availability of time, resources, and faculty. Thus, pre-clerkship is arguably the ideal time to begin QI training. However, for pre-clerkship students, QI education is uniquely difficult because of their lack of exposure and understanding of the clinical context (1). The Program for Improvement in Medical Education (PRIME) is a pre-clerkship extracurricular program that teaches medical students the fundamentals of clinical QI but challenges them to apply these principles in improvement projects that focus on their own education. That is, to consider and describe opportunities for improvement within the context of the medical school system.

Methods: A sequential, explanatory, mixed-methods approach was used to examine the impact of PRIME on the development of clinically-contextualized QI knowledge and comfort with QI concepts within 125 medical student participants. This approach combined insights from both quantitative and qualitative methods. To determine the impact of the Program on clinical QI knowledge, participants completed the well-established Quality Improvement Knowledge Application Tool (QIKAT) prior to and following involvement in the PRIME curriculum. To determine the impact of the Program on comfort with QI concepts, participants also completed the Quality Assessment and Improvement Curriculum toolkit (QAIC) prior to and following PRIME. Changes in knowledge and comfort were analyzed by way of independent, paired (PRE, POST) t-tests. To further explore aspects of QI knowledge and comfort, 11 participants engaged in semi-structured interviews regarding their QI experiences throughout PRIME. These were analyzed using qualitative analysis techniques adapted from constructivist methodological approaches.

Results: Analysis of QIKAT measures indicated that application of QI knowledge to clinical contexts improved significantly following the Program ($p < .001$), even though the learning activities were not contextualized in the clinical environment. Similarly, the QAIC analysis revealed participants as significantly more comfortable with QI principles following PRIME ($p < .001$). Analysis of the interview responses highlighted the way in which the medical school focus provided a meaningful context for learning QI for students at this stage of training. This fostered a sense of motivation among the participants to engage in QI projects when they matriculate into clinically-situated work. Features of the Program that were considered facilitators of QI learning and an overall positive experience included the team-based nature of the exercises, the available supporting resources (i.e., program handbook), and consistent and regular instructor feedback.

Discussion: QI education that is situated within the familiar context of medical education can be effective in developing knowledge and comfort within pre-clerkship learners that has relevance and resonance in the eventual criterion clinical context. These findings are consistent with the notion that training on fundamental concepts that underpin a skilled process can promote transfer of learning into new, more complex contexts (2).

Conclusion: The application of QI principles within the familiar context of the medical school allows pre-clerkship learners to develop an understanding of their relevance to clinical applications. In this way, QI training that occurs before clinical exposure represents a potential avenue to nurturing QI competency in a way that optimizes the effective allocation of clinical time and resources.

Clinical teaching on an expanding training platform: designing a fit-for-purpose faculty development framework for emerging clinical teachers in a resource-constrained environment

AUTHOR(S):

- Julia Blitz, Stellenbosch University, Cape Town, South Africa (Presenter)
- Marietjie de Villiers, Stellenbosch University, South Africa
- Susan van Schalkwyk, Stellenbosch University, South Africa

ABSTRACT

Introduction: Increasingly, medical schools are expanding their clinical training platforms beyond traditional academic teaching hospitals in response to imperatives such as increasing numbers of students, offering clinical training that covers the full spectrum of healthcare, and responding to notions of social accountability. With this expansion, is an obligation to maintain the quality of teaching in these new clinical contexts where clinicians play a crucial role in the training of medical students. Faculty development offers a means to strengthen and support this role. However, in resource-constrained environments, where there is a fairly rapid turnover of clinicians who are burdened with caring for large numbers of patients in quite difficult circumstances, it is incumbent upon those responsible for student learning to consider how best to design faculty development offerings for these emerging clinical teachers. Previously we described the journey undertaken by specialist clinicians at a new training site as they took on the role of clinical teacher [Blitz; 2014]. This gave rise to the question of how other clinicians in such situations, might be assisted on this journey, specifically in the context of expanding clinical training platforms.

Methods: As we approached this research from an interpretivist stance, qualitative methods were used. Based on Kern's six-step approach to curriculum development, the targeted needs of emerging clinical teachers were identified by using four different data sets to develop an understanding of current clinical teaching and strategies that were being used to strengthen it. Senior medical students, clinical teachers and staff responsible for faculty development were interviewed and clinical teaching episodes were recorded. Each data set was analysed individually, and then all four sets were synthesized and presented as a situational analysis to identify current strengths, weaknesses, opportunities and threats of clinical teaching. These findings and the notion of fitness-for-purpose informed the development of a faculty development framework for emerging clinical teachers.

Results: The outcome of the study takes into account the resource-constrained environment of both the university and the healthcare system. This work proposes a framework that is based on four constituent elements. The first is that faculty development be situated within the network of clinical practice, involving not only individuals, but also their clinical practice community and their academic disciplinary home. The second addresses clinical teaching as supervision; seen as the offering of affordances [Billett; 2002]. The third emphasises clinical learning as student engagement, with an essential interplay between the offering of affordances, and the development and exercising of student's agency for engagement. The last is using students' evaluations of clinical teaching effectiveness to inform and tailor-make the faculty development offerings suggested in the first element.

Discussion & Conclusion: As health professions education embraces learning in the workplace, so we need to attend to its counterpart, teaching in the workplace, and how best to optimise both the clinician's teaching and their students' learning. This work shifts the focus from more established forms of faculty development (as focusing on teaching knowledge and strategies) to encouraging an ongoing relationship between faculty developers and clinicians, aimed at iterative strengthening of clinical teaching effectiveness through responding to the student learning experience. We propose a fit-for-purpose faculty development framework that has the potential to assist clinicians at new sites as they embark on their journey to becoming confident clinical teachers; able to create an enabling learning environment.

Bias in the Mirror: Exploring Implicit Bias in Health Professions Education

AUTHOR(S):

- Javeed Sukhera, Western University, London, Canada (Presenter)
- Pim Teunissen, Maastricht University, Maastricht, Netherlands
- Lorelei Lingard, Western University, London, Canada
- Chris Watling, Western University, London, Canada

ABSTRACT

Introduction: Implicit biases include attitudes and behaviours exhibited by health professionals outside their conscious awareness and despite best intentions. Such biases can have a negative impact on equitable patient care. Despite growing interest, implicit bias recognition and management is an underdeveloped area of research in health professions education. Until we develop sound educational strategies to facilitate implicit bias recognition and management, the promise of equitable and just health care for all remains unfulfilled. This thesis sets out to explore the process of teaching and learning about implicit bias within both individuals and learning environments. A series of five interconnected studies sought to better understand how health professionals process and integrate feedback about their biases, and how individuals and learning environments influence each other once implicit biases are revealed.

Methods: All studies utilize qualitative research methods and are informed by constructivist epistemological stance, including core aspects of constructivist grounded theory methodology. Data were gathered through semi-structured interviews, and in study four, rich pictures were used to facilitate reflection. In several studies, the implicit association test (IAT) was utilized as an elicitation tool. The IAT is a computer-based exercise that calculates Individual response as a proxy for the strength of implicit associations between categories. The first study explored the social process of stigma within a clinical learning environment. The second, third and fourth explored how health professionals respond to feedback about their biases, and the fifth utilized longitudinal interviewing to explore how individuals and learning environments influence one another once awareness of implicit biases is triggered.

Results: When health professionals confront their biases, they experience powerful emotions. They want to better manage their biases, yet acknowledge that this process is inherently difficult. Participants suggested that recognizing and managing implicit bias through education requires a balance between striving for self-improvement while accepting one's flaws and vulnerabilities. Enacting this concept of "striving while accepting" may be facilitated through role modelling, relationships, sharing and dialogue.

Conclusion: Recognizing and managing implicit biases involves an iterative process of feedback seeking, role reflection, goal setting and role modelling behaviour change. Since constantly striving to manage one's implicit biases within a culture that rewards perfectionism has the potential to perpetuate psychological stress for learners, implicit bias curricula should address the balance between striving for the ideals while accepting the actual. This thesis proposes an integrated theory of implicit bias recognition and management that may be replicated or adapted across contexts and settings to mitigate the negative impact of bias and promote equity for a variety of underserved and marginalized patient groups.

Learning through Talk: The Role of Discourse in Medical Education

AUTHOR(S):

- **Walter Eppich, Northwestern University, Chicago, USA (Presenter)**
- Tim Dornan, Queen's University, Belfast, UK
- Jan-Joost Rethans, Maastricht University, Maastricht, Netherlands
- Pim Teunissen, Maastricht University, Maastricht, Netherlands

ABSTRACT

Introduction: Rather than treating talk as 'communicative competency', this thesis viewed talk as joint social activity and addressed the following research question: How does 'talk' contribute to learning in clinical education? We explored three instances of healthcare talk: (a) healthcare simulation debriefing, (b) workplace telephone talk, and (c) team reflection (TR). We aimed to identify lessons from these respective settings and articulate practical strategies to promote learning and patient care.

Methods: We used a variety of methodologies, including: (a) narrative reviews and synthesis to generate novel conceptual models; (b) case study of adult and pediatric resuscitation education; (c) design of a rater training curriculum to assess team performance in pediatric resuscitations, and (d) constructivist grounded theory and thematic analysis to analyze data from semi-structured interviews.

Results: Collectively, the published studies reported in this thesis explored talk in educational and workplace settings, using healthcare simulation debriefing, telephone talk, and team interactions as representative examples. 1. Our novel conceptual framework for healthcare debriefing offered a context-specific and adaptable structure to steer the talk of post-event debriefing conversations. From our case study, we articulated success factors for feedback and debriefing in resuscitation education. 2. We developed a rater training program to reliably train raters to assess team performance in simulated resuscitation scenarios, which can inform the content of team debriefings. 3. Using constructivist grounded theory, we analyzed 17 in-depth interviews with doctors-in-training about work-related telephone talk and identified 'productive conversational tensions' that influenced learning positively: (a) dealing with power differentials, (b) dealing with pushback, and (c) expressing uncertainty while embodying trustworthiness. 4. Using qualitative thematic analysis of the above 17 interviews, we identified formal and informal aspects of workplace telephone talk that influence learning. Informal conversational questions and interruptions served as 'disguised feedback' for doctors-in-training. Potential educational strategies to enhance telephone talk include: (a) embedding telephone talk in existing simulation activities and (b) sensitizing junior doctors to "disguised" feedback during telephone talk to augment future workplace learning. 5. Our novel conceptual framework for team reflection (TR) in healthcare extended traditional views of TR and encompassed three phases when TR occurs: pre-action TR (briefing before patient care), in-action TR (deliberations during active patient care), and post-action TR (debriefing after patient care). We theorized that TR contributes to highly situated forms of clinical workplace learning.

Discussion: When viewed through a socio-cultural lens, talk represents social activity that drives learning. Lessons from the structured talk of feedback and debriefing in healthcare simulation demonstrate the potential in deliberately steering workplace clinical talk by establishing learning relationships and attending to process and content elements. 'Productive conversational tensions' add a nuanced view of workplace talk in recognizing that some tensions motivate junior doctors to adapt their telephone talk in ways to minimize future tensions. Talk plays an integral role in conceptions of individual competence in clinical education, namely in developing competence, appearing competent, and assessing competence. Further, talk drives the development of shared understandings within teams and promotes collective competence.

Conclusion: Medical educators should steer the talk of practice in two ways: (a) through formal and informal means, such as structured feedback and debriefings that attend to relevant process and content, and strategies that foster relationships and supportive learning environments, and (b) through educational strategies that sensitize clinicians to the affordances of future workplace talk.

Learning to care for “difficult patients”: motivation, identity and reflection in medical students and residents

AUTHOR(S):

- Jody Steinauer, UCSF, San Francisco, USA (Presenter)
- Patricia O'Sullivan, UCSF, San Francisco, CA, USA
- Arianne Teherani, UCSF, San Francisco, CA, USA
- Olle ten Cate, UMC Utrecht, Utrecht, the Netherlands

ABSTRACT

Introduction: This thesis concerns interactions with patients toward whom physicians experience negative emotions. The literature commonly refers to these patients as “difficult”, and they experience lower quality of care. Because medical learners commonly experience patients as “difficult” using this definition, educators need to understand their experiences so they can support clinical learning, despite strong emotions. This thesis address three main research questions: 1. Who are “difficult patients” and why do medical students and residents find them difficult? 2. What do medical students and residents want from educators to support learning to care for “difficult patients”? 3. Can we train faculty to support verbal reflection about these patients?

Methods: Three studies addressed Question 1. Study 1 was a qualitative interview study of final-year medical students and Study 2 of final-year ob-gyn residents about interactions with patients toward whom they felt negative emotions. In both, constructivist grounded theory analyses addressed why they had negative emotions toward these patients. Study 3 analyzed medical students’ written reflections about challenging clinical encounters using content analysis with pre-determined codes identified in Study 1. Two studies addressed Question 2. Study 4 was a content analysis of data collected in Study 1 to reveal medical students’ strategies with challenging patients and what support they desired from supervisors. Study 2 assessed these in residents. Study 5 addressed Question 3 as an implementation study of a reflection workshop for residents through a train-the-trainer model. Finally, the thesis includes a narrative review of the “difficult patient” as described in the medical literature for the last eighty years.

Results: Question 1: Study 1 demonstrated that students’ negative emotions were exacerbated when patients countered their ideals about patient-centered care and their roles as medical students, when the patients’ behaviors were perceived to affect their performance, and when they lacked competence and autonomy in the patients’ care, thus indicating the importance of students’ identity and motivation in these interactions. Study 2 found that residents’ negative emotions toward patients occurred when patients interfered with residents’ roles and identities. Study 3 found that medical students described “difficult patient” interactions as worsened when they lacked competence, autonomy and a sense of connection to the team, consistent with self-determination theory, and when they couldn’t fulfill the identity of patient advocate due to their role. Question 2: Study 4 indicated that medical students (and Study 2 that residents) wanted faculty to devise teaching activities, such as reflection, to support the emotional challenges they experienced. Question 3: In Study 5, a faculty development session increased faculty confidence in facilitating conversations about “difficult patients”, and these faculty went on to facilitate verbal reflection seminars about emotionally challenging patients, which were well-received by residents. Finally, the “difficult patient” literature suggests that providers are increasingly taking ownership for these challenges and provides recommendations for educators.

Discussion and Conclusion: Interaction with a “difficult patient” is complex, with the learner’s ideals, identities and motivations playing important roles in the dynamic. Some interactions were uniquely challenging, for example, when learners were performance-oriented and worried that patients’ behaviors would make them look less competent. Students desire support and reflection around these interactions. Educators should consider these “difficult patient” interactions as key teaching moments and opportunities to not only train learners to provide patient-centered care when feeling strong emotions, but also to help shape their motivation and identity.

Patients in partnership with educators: use of design thinking to improve patient involvement in undergraduate medical education

AUTHOR(S):

- Lindsay Muscroft, Warwick Medical School, UK (Presenter)
- Jan Cooper, Warwick Medical School, UK
- Kate Owen, Warwick Medical School, UK

ABSTRACT

Background: Design thinking involves taking a designer's approach to problem solving, using empathy and experimentation to arrive at innovative solutions (ideou.com,2019). It can be especially useful for solving 'wicked problems', and consists of 5 stages: empathise, define, ideate, prototype and test. With the UK General Medical Council guidance actively encouraging the role of patients in development of curricula and assessments, we hypothesised that design thinking could be used to facilitate this.

Summary of Work: We report two experiences of using design-thinking methodology to generate ideas to promote patient involvement in undergraduate medical education. One involved groups of patients, students and educators exploring the theme of incorporating more of the patient perspective into the curriculum. The other asked patients and educators to explore how to involve patients in curriculum design, assessments and student selection.

Summary of Results: Multiple ideas generated by patients in the first workshop have been taken forward. A fellow has been appointed to write new case based learning scenarios with the assistance of patients with the conditions in question, and a student selected module in simulation is being developed to allow students and patients to work together to create role play scenarios based on real experiences. To promote student insight into the patient experience, a research study where students accompany patients whilst travelling to and from a hospital appointment, observing the appointment purely from the patient's point of view is currently underway. Ideas generated from the second workshop included establishing a physical presence for patient groups in the medical school promoting further collaboration in curriculum development. Other suggestions that are currently being explored are using real patients in exams including training them to provide feedback, and a lay panel at student selection centres with autonomy to decide their own questions.

Discussion and Conclusions: Design thinking is a useful tool to unlock creativity and promote collaborative practice between patients and educators. It provides a democratic forum in which patients and educators can work as a team to generate innovative strategies to increase patient involvement in medical education.

Take-home Messages: Collaborating with patients, and using design thinking to facilitate this, can help generate new ideas for medical curricula.

The patient, student and professional as equal educators and learners in the concept of Welearn in Human Embryology

AUTHOR(S):

- **Jos Draaisma, Radboudumc Amalia Children's hospital, the Netherlands (Presenter)**
- Iris van Rooij, Radboud Institute for Health Sciences, dept Health Evidence, Radboudumc, the Netherlands
- Joyce Geelen, Radboudumc Amalia Childrens hospital, the Netherlands
- Lia Fluit, Radboudumc Health Academy, the Netherlands
- Thomas Vijn, IQ Healthcare, Radboudumc, the Netherlands

ABSTRACT

Background: Welearn in Human Embryology is part of a 20-weeks minor program in the combined third year bachelor program medicine and biomedical science. The central learning objective is to be able to place a specific birth defect and its treatment in the context of the patient and/or the parents. In Welearn, students (n=29) meet (parents of) patients in the field of birth defects (n=10), a scientific researcher and a pediatrician. The goals are to improve person-centered care, to learn from each other, and to develop a research proposal initiated by the patients. Two to three students are coupled to a patient. There are three group sessions (Introduction, Communication and research, Experiences) and individual meetings with the patient at home and, when appropriate, in the out-patient clinic.

Summary of Work: The sessions were observed by a medical educator. The program was evaluated with evaluation forms for all participants after each session and three focus group interviews.

Summary of Results: The group session 'Introduction' was rated with an 8 on a 10-point Likert scale, 'Communication and research' with 7.3 by patients and students and 8.5 by professionals, and 'Experiences' with 6.8 by parents, 7.1 by students and 8.3 by professionals. In general, Welearn was rated 4.0 or more by all groups on a 5-point Likert scale. Positive points mentioned by all groups were: exchange of perspectives, equivalence, and person-centeredness. Points to improve were: management of expectations, more concrete framework, and support by literature.

Discussion and Conclusions: The targeted learning values of Welearn were person-centeredness, exchange of perspectives, equity, learning together by doing together, self-directed learning environment, transfer to practice and inter-professional learning. Most of these values were encountered, but students had difficulties in operating in the self-directed learning environment. They asked for more structure and instructions. Also the parents would be happy with a more concrete framework. Conclusion: Welearn as a program has proven to be valuable for patients, students and professionals.

Take-home Messages: By bringing patients, students and professionals together in a safe, role less and self-directed learning environment, a unique exchange of attitude, knowledge and experiences takes place.

The patient's voice in a pre-clinical curriculum

AUTHOR(S):

- **Laura Schwering, Radboud Universiteit, the Netherlands (Presenter)**
- Lotte Ensing, Radbouduniversiteit, the Netherlands
- Marianne Brouwers, Radboudumc, the Netherlands
- Rene Tabak, Radboudumc patient advisory board, the Netherlands
- Ron Hameleers, Radboudumc, the Netherlands
- Petra Van Gurp, Radboudumc, the Netherlands

ABSTRACT

Background: Early intensive contact between students and patients is increasingly recognized as beneficial for learning. However collaboration between students and real patients to improve medical professionalism is uncommon. Participation of patients, learning in collaboration and self-directed learning are the core of our newly designed curriculum (bio-) medical sciences. Within the ultimate framework of the study, patients will inspire students to learn and students will encourage patients to talk and participate in the education of future doctors and scientists. Learning takes place in a meaningful environment, practically orientated.

Summary of Work: In 2015 we co-created two educational activities with patient representatives for bachelor students: 1. Students meet Patient (SMP) : a program in which every student frequently meets different patients, each with a unique medical problem and context. 2. 'Bring your own patient' (BYOP): a 1-2 years longitudinal program for every student to study one patient in his context, being an expert of his medical journey. Both programs are supported with learning goals. Students also formulate personal learning goals e.g. on professional development. Students report about their experiences in written essays and during group meetings.

Summary of Results: Qualitative analysis of written essays shows that students are inspired by these contacts with patients and show professional development, improvement of interpersonal skills and increase in knowledge. There is diversity in lessons learned by students. Feedback of patients shows that they feel empowered to stress the impact of disease and the importance of shared decision making, contributing to patient-centered care.

Discussion and Conclusions: Exchange of unique experiences and thereby increasing learning output, is stimulated when individual patient contacts are embedded in the pre-clinical curriculum. Therefore we created discussions in small groups in the study-program 'professionalism' to maximize learning output. Patients also have a contact to share their experiences with if they would like to. Both longitudinal follow up (BYOP) and incidental individual patient-student contacts (SMP) are powerful to motivate the bachelor students in their study process, enhance patient-centeredness and professionalism and stimulate patient-empowerment in practice.

Take-home Messages: Active patient involvement in a pre-clinical curriculum is a successful method to learn in reciprocity.

Aboriginal patients as educators: 'clinical yarning' in healthcare settings

AUTHOR(S):

- Emma Webster, University of Sydney School of Rural Health, Australia (Presenter)
- Susan Anderson, University of Sydney, Australia
- Lynette Riley, University of Sydney, Australia
- Emma Walke, University of Sydney, Australia
- Kathryn Naden, University of Sydney School of Rural Health, Australia
- Susan Parker-Pavlovic, University of Sydney, Australia

ABSTRACT

Background: Aboriginal Australians are custodians for the longest continuing culture in the world, which has a strong oral tradition. The effects of colonisation continue after 200 years resulting in disparities in health status despite many Commonwealth programs to 'close the gap'. A community meeting was held in a major rural city to discuss the findings of a local diabetes study. Effective interactions with healthcare professionals were highlighted as a means to influence the understanding and management of diabetes. 'Yarning' is a traditional communication framework which can re-orientate communications to privilege an Aboriginal worldview. Aboriginal Elders attending the meeting requested that the local University of Sydney campus 'teach doctors how to 'yarn'.

Summary of Work: In response to this invitation, our University asked Aboriginal patients and community members to help us better define the communication problem from their perspective and to teach us about yarning. Consultation with Aboriginal people across three communities was guided by these questions 1) What are the major challenges in communicating with doctors and nurses? 2) What is yarning? What makes a good yarn with a doctor or nurse? 3) How do we go about teaching yarning to health students?

Summary of Results: An online course consisting of five modules was prepared for healthcare students from across the University. Starting with hearing patient stories, students learn about differences in cultural perspectives, see examples of yarning in healthcare and develop reflective practice skills to guide lifetime learning about yarning. The final module focusses on reciprocity. On completion, students have a foundation for improved communication with Aboriginal patients in both clinical attachments and in the workforce.

Discussion and Conclusions: Differences in conceptual cultural frames between western and Aboriginal approaches and the interdependence of language and culture amplify the communication gap which exists between non-Aboriginal health professionals and Aboriginal patients.

Take-home Messages: Healthcare professionals hold one type of respected knowledge. Our Aboriginal patients also hold valuable knowledge. When patients are invited to contribute as educators these knowledges are brought together. This approach could be extended to other First Nations people to improve communication and close the gap.

Patient safety on the agenda, a co-creation

AUTHOR(S):

- Petra Van Gurp, Radboudumc, the Netherlands (Presenter)
- Goof Claessen, Radboudumc Health Academy, the Netherlands
- Bo Nannekhan, Radboudumc patient volunteers, the Netherlands
- Bas Verhoeven, Radboudumc, the Netherlands

ABSTRACT

Background: Our topclass ‘innovation in care’, designed for residents, is a multidisciplinary skills training program to improve patient-care and patient-safety. Residents increase their knowledge, perform a quality improvement project (QIP) to practice skills and show leadership development (LSD). Every resident is connected with a patient (‘buddy’) to stimulate reflection on personal progress. In this report we focus on patient-involvement in our topclass.

Summary of Work: Patient platforms of the academic hospital are approached to recruit potential buddies. Buddies have authentic, relevant and valid expertise in illness and its consequences. Based on CV and a QIP-plan buddies link themselves to a resident. The resident informs the buddy about QIP and LSD in 3 personal contacts. To facilitate the learning process the buddy is trained how to stimulate reflection and give feedback on both topics. In between the buddy-resident-contacts, buddies meet to reflect on their experiences.

Summary of Results: Qualitative analysis of feedback and review-reports shows that the majority of couples learn in reciprocity, although they start insecure. Buddies learn about the daily practice of a resident, stress patient-centered care in LSD and notice the barriers in a QIP. Buddies and residents notice the enhancement of the patient perspective and participation in a QIP. In their review-reports at the end of the topclass, residents describe the influence of a new perspective on their professional performance. They are not used to ask feedback from patients on their personal professional development. Not only the patient perspective but also the professional background of the buddy can be useful in the learning process. Couples that perceived a ‘mis-match’ were coached to overcome the barrier.

Discussion and Conclusions: The patient seems to be the natural partner in a QIP in patient care, although in reality this is not common. A topclass to provide knowledge and skills to enhance patient participation can be helpful. Developing the topclass in collaboration with residents and patients facilitates more customization.

Take-home Messages: The patient as a buddy in a topclass for residents induces mutuality in learning and is therefore a strong and new instrument for professional development of these residents and patient-empowerment.

Patient voices in physician validation - a qualitative study

AUTHOR(S):

- **Carolyn Sehlbach, Maastricht University, the Netherlands (Presenter)**
- Marjan Govaerts, Maastricht University, the Netherlands
- Sharon Mitchell, World Heart Organisation, Switzerland
- Truus Teunissen, Amsterdam UMC Free University Medical Centre, the Netherlands
- Frank Smeenk, Catharina Hospital, the Netherlands
- Gernot Rohde, Johann Wolfgang Goethe University Hospital, Germany

ABSTRACT

Background: Despite increasing calls for patient and public involvement in healthcare quality improvement, the question of how patient evaluations can contribute to physicians' learning and performance assessment has received scant attention. This study aims at adding to the conceptualisation of patient involvement in quality of care and medical education through exploring patients' perspectives on their role in physicians' lifelong learning and re-validation processes.

Summary of Work: We used a qualitative approach and semi-structured interviews to explore patients' take on physician re-validation. We purposively sampled 25 patients from two Dutch hospitals, and through the Dutch Lung Foundation. Data was analysed according to the principles of template analysis. We started coding using a set of a priori themes developed from the literature on patient empowerment, performance feedback and assessment. We iteratively modified themes and refined templates throughout data analysis. The final template included themes around doctor-patient relationships, doctor-patient communication, feedback, patient empowerment, patient identity and power dynamics.

Summary of Results: Results show that patients differed with respect to the role they envisage for themselves in physicians' learning and re-validation. Three patient voices were discerned: the pro-active patient, the complacent patient, and the outsider. The voices differ in patients' willingness and perceived capability of providing feedback and evaluating physicians' performance. Patients' personal experiences and anticipated consequences of evaluating their physician appear to influence patients' readiness to play a role in feedback and validation processes. That is, the extent to which patients experienced a power balance within the doctor-patient relationship seemed to have a direct impact on their voicing behaviour.

Discussion and Conclusions: Reflecting on the challenges inherent in patient and public involvement, our results underline that no 'collective' patient voice exists, but that a multitude of experiences and patient perspectives must be considered in performance evaluation of physicians.

Take-home Messages: As not all patients are equally suitable or wish to play a role in physicians' learning and re-validation, it is crucial to maintain the right balance between empowering patients and respecting their uniqueness. To involve patients successfully in physicians' learning, it is imperative to ensure a safe environment for feedback and to foster patient awareness.

Student use of resources to prepare for USMLE Step 1 and COMLEX Level 1 Licensing Exams

AUTHOR(S):

- Sean Tackett, Johns Hopkins Bayview Medical Center, USA (Presenter)
- Ashwin Menon, Osmosis, USA
- Shiv Gaglani, Osmosis, USA

ABSTRACT

Background: USMLE Step 1 and COMLEX Level 1 are required for medical licensure in the U.S. To excel on these high-stakes exams, most medical students purchase commercial exam preparation resources. Our goal was to describe resource usage for preparation for Step 1 and COMLEX 1 and relationships with exam performance.

Summary of Work: After IRB approval, registered users of Osmosis - an adaptive learning platform often used for exam preparation - were surveyed by email 2 months after their exam date, for exam dates from May 1-July 25, 2018 in the Osmosis study schedule. Surveys captured students' usage intensity along a 5-point Likert scale for 18 commercial options. Students estimated the number of practice questions completed in each question bank, number of passes through each review book, total amount of money they spent on resources, MCAT total, class rank (as top, middle, or bottom third), and Step 1 and/or COMLEX 1 total scores. Linear regression models, adjusting for MCAT total and class rank, examined relationships between resource usage variables and licensing exam scores.

Summary of Results: 158/326 (48%) students across 57 medical schools responded. For Step 1, students used a mean of 8.3 (range 3-15) commercial resources, spending \$1020 (range \$50-6000), and, for COMLEX 1, used a mean of 7.5 (range 3-11) commercial resources, spending \$766 (range \$0-2500). MCAT total and class rank were strongly and independently associated with exam scores ($p < .001$) in all regression analyses. No significant relationships existed between licensing exam scores and resource number, use of a specific resource, number of practice questions attempted in one question bank or aggregated across question banks, or number of passes through review books. Greater spending was associated with worse Step 1 performance (1 point lower for every \$180, $p = .002$).

Discussion and Conclusions: Students use numerous commercial resources and incur significant out-of-pocket costs to prepare for licensing exams; yet, across this diverse sample, greater spending was associated with worse performance.

Take-home Messages: Prior class performance, not using an individual commercial resource, was strongly related to exam scores, suggesting that expending regular effort on building one's medical knowledge foundation within the curriculum could be a preferred licensing exam preparation strategy.

Promoting core medical science subject competency and feedback in an integrated assessment system - the case for longitudinal subject tracking

AUTHOR(S):

- Scarpa Schoeman, Wits University, South Africa (Presenter)

ABSTRACT

Background: The four year Graduate Entry Medical Programme (GEMP) at Wits University, South Africa uses an integrated, systems-based approach to teach and assess foundational medical and clinical science concepts during the first 2 years (GEMP 1-2) of training. Concerns were raised over time that students study strategically and could falsely pass these first 2 years with potentially significant knowledge gaps in critical subject areas (Pathology, Microbiology, Pharmacology, etc) leading to weaknesses in the clinical phase of their training (GEMP 3-4). Knowledge assessment in GEMP 1-2 years uses single best answer MCQs, with blueprinting, standard setting and reliability analysis, to ensure valid and reliable outcomes.

Summary of Work: A new system of critical subject group tracking was introduced in 2017, to monitor the progression and knowledge levels of GEMP 1-2 students in the 6 critical subject groups. This innovation was believed to drive engagement with all critical subject areas and reduce strategic studying. Every MCQ used in the year is coded to a subject track and at the end of the year students must pass the integrated component of the assessments as well as demonstrating they don't have a major weakness in any of the 6 tracks. Students also receive detailed individual feedback on their track results during the year to guide their learning and engagement.

Summary of Results: In 2016, prior to implementation, the rate of false positive (FP) outcomes in the GEMP 1-2 years were 9.8% and 6.1% respectively. Post implementation, the FP rates reduced to 5.2% and 2.5% respectively in 2017 and to 3.8% and 1.9% respectively in 2018. All FP outcomes in 2018 were prevented from progressing in the course.

Discussion and Conclusions: The longitudinal tracking of subject knowledge in an integrated curriculum is effective in driving engagement with those subject tracks and reducing false positive outcomes.

Take-home Messages: By tracking the performance of students in each track, as well as providing regular individual feedback on progression, strategic studying of students seems, leading to FP outcomes, to have reduced considerably. This promotes the development of a well-rounded knowledge base for students entering the clinical phase of training.

Valuing Mentoring in Programmatic Assessment: Experiences and Evaluation

AUTHOR(S):

- **Chris Skinner, Notre Dame University Fremantle, Australia (Presenter)**
- Dylan Griffiths, Notre Dame University Fremantle, Australia
- Frank Bate, Notre Dame University Fremantle, Australia
- Elina Tor, Notre Dame University Fremantle, Australia
- Robin Guttinger, Notre Dame University Fremantle, Australia
- Sue Fyfe, Curtin University, Australia

ABSTRACT

Background: In 2017, the University of Notre Dame School of Medicine (Fremantle) began moving towards a programmatic model of assessment. The School adopted an incremental approach to programmatic assessment which included, in the first instance, establishing a mentoring program and then re-engineering its suite of continuous assessments.

Summary of Work: The School's mentoring program collates feedback from multiple data points from various discipline domains and presents this feedback for students and their mentors to consider and action plan for the future (Boud & Molloy, 2013). Data were collected each year from students, mentors and support staff (academic and non-academic) using a combination of questionnaires for students and focus groups for staff. The student questionnaire included qualitative and quantitative components and, in 2017, posed 9 statements on mentoring.

Summary of Results: Overall mean scores for mentoring were positive in both 2017 and 2018. Students found it useful to communicate with a knowledgeable academic who was prepared to listen and guide them in their learning journey. Mentoring also complemented the incremental approach that the School adopted in its implementation of programmatic assessment. Mentors generally felt that their mentoring was worthwhile and added value to the student experience (e.g. 'It was a real privilege to sit with someone for half an hour, look through their marks and discuss their progress with them').

Discussion and Conclusions: The School commenced a journey towards programmatic assessment, but very quickly reached a point where significant strategic decisions were required in order to continue on this journey. Importantly, positive mentoring evaluation within the complexity of moving towards programmatic assessment, helped stabilise and validate the change process itself.

Take-home Messages: 1. Establishment of mentoring programme within a move towards programmatic assessment can validate a complex change management process 2. Mentoring supporting programmatic assessment can facilitate both students and staff educational understanding and conjoint development 3. Mentoring can help in the integration of specific disciplines in a medical programme.

Identifying the narrative used by educators in trainee evaluations to assist in articulating judgment of performance

AUTHOR(S):

- Nyoli Valentine, ModMed, Australia (Presenter)
- Lambert Schuwirth, Flinders University, Australia

ABSTRACT

Background: Modern assessment in medical education is increasingly reliant on human judgment, as it is clear that quantitative scales have limitations in fully assessing learners' competence and providing them with meaningful feedback to assist learning. For this, possession of an expert narrative and vocabulary is essential.

Summary of Work: This study explored how medical education experts voice their subjective judgements about learners and to what extent they are using clear, information-rich terminology (high level semantic qualifiers); and to gain a better understanding of the experts' language used in these subjective judgements.

Summary of Results: Six experienced medical educators from urban and rural environments were purposefully selected. Each educator reviewed a registrar clinical case analysis in a think out loud manner. The transcribed data was analysed, codes were identified and ordered into themes. Analysis continued until saturation was reached. Five themes with subthemes emerged. The main themes were: 1. Demonstration of Expertise 2. Personal Credibility 3. Professional Credibility 4. Using a Predefined structure and 5. Relevance.

Discussion and Conclusions: Analogous to what experienced clinicians do in clinical reasoning, experienced medical educators verbalise their judgements using information rich, high-level semantic qualifiers. In this study, we were able to unpack these. Although there may be individual variability in the exact words used, clear themes emerged. These findings can be used to develop a helpful shared narrative for educators in observation-based assessment. The provision of a rich, detailed narrative will also assist in providing clarity to registrar feedback with areas of weakness clearly articulated to improve learning and remediation.

Take-home Messages: Experienced medical educators use information rich, high level semantic qualifiers to verbalise their judgements of learners during assessment. This narrative is able to be used to support supervisors in translating their observations into feedback and decisions in real time.

Over 10 years of experience in collaborative assessment: The umbrella consortium for assessment networks (UCAN)

AUTHOR(S):

- Winfried Kurtz, Institut für Kommunikations- und Prüfungsforschung, Germany (Presenter)
- Konstantin Brass, Institut für Kommunikations und Prüfungsforschung, Germany

ABSTRACT

Background: To face upcoming challenges in medical assessment, institutions need to work together more intensively. A little more than 10 years ago, UCAN was initiated as a cooperation project. Today, 45 schools and boards from 7 countries work closely together, share knowledge and content, combine and optimize their resources and engage in collaborative assessment research.

Summary of Work: UCAN developed a web-based platform for authoring, sharing and reviewing exams. Since then, exams and OSCEs can be delivered on computers, scanner-readable sheets. Exams can be evaluated with test statistics and graded with customizable algorithms. Later on, a Simulated Patients Database was added to administer the SP programs. Since 2012, OSCEs and since 2014 exams including multimodal content can be delivered on mobile devices.

Summary of Results: More than 400.000 items were authored by 6,700 colleagues. Best practice examples for reliable exams, assessment content and workflows are collected and used at the partner institutions. New items and exam formats are continuously developed. So far, over 5 million students were assessed successfully in 25,000 exams.

Discussion and Conclusions: Over 10 years of cooperation in a collaborative network has proven to be an efficient way to face new challenges in medical assessment. Especially with the future requirements in the assessment of competencies and workplace based assessment, close tie-ups are highly recommendable.

Take-home Messages: Assessment institutions should work together in order to tackle common challenges. Over 10 years of successful cooperation at UCAN proves this approach to be both innovative and efficient.

#9J Short Communications - Faculty Development 2

Supervision training interventions in healthcare: a realist synthesis

AUTHOR(S):

- Sarah Lee, Monash University, Australia (Presenter)
- Claire Palermo, Monash University, Australia
- Charlotte Denniston, Melbourne University, Australia
- Eve Huang, Monash University, Australia
- Kirsty Pope, Monash University, Australia
- Charlotte Rees, Monash University, Australia

ABSTRACT

Background: Supervision training aims to develop supervisory capacity in the healthcare workforce. Despite extensive literature, understanding the mechanisms through which supervision training interventions produce their effects, for whom and under what circumstances is limited.

Summary of Work: We are conducting a realist synthesis of peer-reviewed literature (Medline, ERIC, PsychInfo, CINAHL, Social Services Abstracts, APAIS) following Pawsons five stages of realist review: 1) clarifying scope, 2) searching for evidence, 3) assessment of quality, 4) data extraction, and 5) data synthesis. This realist synthesis aims to answer the question: in what ways do supervision training interventions in the health and human services work, for whom and in what contexts and why.

Summary of Results: The search found 11,766 articles excluding duplicates. Application of inclusion/exclusion criteria for relevance, plus rigour checks removed 11,686 articles, leaving 36 articles in the final synthesis. Extracted data includes study characteristics, intervention type, contextual factors, mechanisms and outcomes. Patterns in context-mechanism-outcome configurations across the 36 articles will be identified. Preliminary findings suggest that supervision workshops and seminars (i.e. context) which include a mix of didactic teaching, group activities and role modelling can lead to improved supervisory behaviours (positive outcomes) for a range of health professionals through opportunities to discuss learning, sharing knowledge and reflective practice (i.e. mechanism).

Discussion and Conclusions: The interplay between context, mechanisms and outcomes for supervision training interventions will demonstrate the extent to which training interventions produce their effects, for whom and in what contexts. This research could help supervisors to better understand what types of supervision training might work best for their context. Faculty developers could also use these findings to guide future supervision training interventions and further scholarship and research in the field.

Take-home Messages: Supervision training is conducted to improve supervision outcomes. This realist synthesis will help to delineate for whom, how, and in what contexts, appreciating that a one-size-fits-all approach to supervision training is neither possible nor desirable.

Innovative, Comprehensive Faculty Development for Large Group Teaching in a Medical School affiliated with a Large Healthcare System

AUTHOR(S):

- Elisabeth Schlegel, Zucker School of Medicine At Hofstra/Northwell, USA (Presenter)
- Doreen M. Olvet, Hofstra Northwell School of Medicine at Hofstra/Northwell, USA
- Alice Fornari, Zucker School of Medicine at Hofstra/Northwell, USA

ABSTRACT

Background: Up to 30% of large group sessions at the Zucker School of Medicine are led by clinical faculty employed by our affiliated healthcare system (Northwell Health) spread out over far geographical distances. Large group leaders are expected to deliver the material using active learning techniques to ensure that students engage with the material, participate in class and collaborate with each other. There are significant challenges to providing faculty development to a geographically dispersed group. We describe a systematic approach to ensure teaching excellence among clinical faculty teaching in large group sessions.

Summary of Work: We implemented a 6-fold faculty development approach to build a cadre of healthcare system-based faculty equipped to use active learning techniques. Within Kern's curricular framework, the following steps are being implemented, (1) Foundational Skill Building, (2) Personal Coaching, (3) QA/QI Incorporating Feedback and Evaluation Data, (4) Continuous Introduction of Teaching Innovations, (5) a System-based Community of Practice, and (6) Educational Onboarding for newly-appointed faculty. Individualized personal consultations determine the needs, build a collaborative working relationship, and focus on improvements through a feedback cycle. Newsletters, templates and other resources are disseminated through the Learning Management System and distribution channels to maintain continuous communication.

Summary of Results: After partnering with individual faculty, student evaluations have been favorable commending enjoyable in-class activities and effective use of technology. Data will be presented from semi-structured interviews evaluating the program structure, as well as from student evaluations. Close collaboration with the course directors is needed to determine logistics of faculty development based on session performance and to acquire teaching skills.

Discussion and Conclusions: Targeted skill building, one-on-one targeted consultation and feedback, flexible availability of the faculty development specialist, enhanced communication strategies and innovative thinking are key to accommodating the different needs of faculty teaching in large group sessions.

Take-home Messages: Successful faculty development for educators working within a large healthcare system can be accomplished through flexibility and innovative communication strategies within a curricular framework. Our 6-fold faculty development program prepares health care professionals for effective teaching in large group sessions.

Education in health professions: building a community of practice in Midwest Brazil

AUTHOR(S):

- **Edlaine Faria de Moura Villela, Jataí Medical School, Federal University of Goiás, Brazil (Presenter)**
- Cristian Junior da Costa, Jataí Medical School, Federal University of Goiás, Brazil
- Wanderson Sant'ana de Almeida, Jataí Medical School, Federal University of Goiás, Brazil
- Mariana Severo Takatsu, Jataí Medical School, Federal University of Goiás, Brazil
- Giovana Rocha Queiroz, Jataí Medical School, Federal University of Goiás, Brazil
- Valdes Roberto Bollela, Ribeirão Preto Medical School, University of São Paulo, Brazil

ABSTRACT

Background: Education in health professions has an important aspect regarding the faculty development for undergraduate and postgraduate courses with teaching-learning active methodologies, thus guaranteeing the emergence of a community of practice.

Summary of Work: The Basic Module for Education in Health Professions (BM-EHP) was the first activity programmed by the Center of Innovation and Collaboration for Teaching (NICE), created in a public university in Brazilian Midwest in 2018. This center took as a model the Center of Faculty Development for Teaching (CDDE), in a public university in Southern Brazil. BM-EHP began in September 2018 and was designed with four face-to-face meetings of 4 hours each per month and four virtual meetings of 1 hour each per month, obtaining a total of 20 hours (05h/month). In our learning virtual environment, there are all bibliography and discussion forums to bring the faculty closer and enable collaborative learning.

Summary of Results: The face-to-face activities took place once a month, lasting four hours each. It was always used a room with mobile chairs so that it was possible to organize an educational environment that favored the activity in small and large groups, including presentation of the small group synthesis in plenary and brief theoretical presentations. The topics covered in three meetings were: 'Faculty development: from simple workshops to communities of practice'; 'Adult Learning Principles: How do we learn? Traditional Methodology or Active Methodology? Effective Methodology!'; 'Effective teaching-learning strategies'. For the fourth meeting (the last one), it was planned for each participant of the module to present proposals for educational intervention in their professional reality. We had 12 very interesting intervention proposals. The proposals aim to attend the courses of Medicine, Biomedicine, Nursing, Physiotherapy, Physical education and Veterinary Medicine and will be implemented in 2019.

Discussion and Conclusions: It was achieved a well-defined group of people with genuine interest in health education in order to maintain the discussion and qualification of the teaching practice at our university.

Take-home Messages: In the Faculty development process, it is necessary to ensure the creation of an active community of practice so that the process of teacher training will have continuity.

A Learning Community to Support Staff Scholarship and Progression

AUTHOR(S):

- Genevieve Stapleton, University of Glasgow Medical School, UK (Presenter)

ABSTRACT

Background: Professional development and progression as a scholar and teacher are key objectives in HE institutions, generating expertise which benefits teaching practice. Meeting staff development needs for progression and engagement with scholarship is variable and often provided through mentoring which has mixed success. Also, the transition from a research background to the scholarship of learning and teaching can be difficult and isolating.

Summary of Work: A Learning Community (LC), (Cox, 2004), was formed to support scholarship activities and progression of its members, and to explore whether it could provide an effective model of support. Membership was by 'invitation' and required the signing of a 'contract', agreeing to predefined objectives for the group to achieve. LC members met for 10 meetings over 12 months, and contributed equally to decisions regarding meeting content. A qualitative analysis of the effectiveness of the LC was carried out using pre-and post-LC focus groups, as well as members' reflective diaries.

Summary of Results: The LC was overwhelmingly welcomed by members with 97% meeting attendance. The LC filled a gap in support currently offered to lecturers engaged in scholarship. Members identified the barriers and difficulties to engage in scholarship and reflected on the parity of scholarship with research at an institutional level. The peer-support provided a collaborative environment which reduced feelings of isolation, anxiety and confusion for those in the early stages of their scholarship careers. The LC generated a strong sense of belonging which resulted in confidence to collaboratively and/or cooperatively engage with scholarship.

Discussion and Conclusions: The importance of learning spaces in HE extends to staff development with the LC providing a necessary space for shared experience and collaborative mentoring to engage in scholarship and progression. The LC experience aligns with transformative learning, where members moved to empowerment and control over their scholarship and progression.

Take-home Messages: Supporting engagement with scholarship and raising its profile can be achieved through a Learning Community, which was found to be an effective model to promote engagement with scholarship and parity with research.

MacAdemia: Meeting the Faculty Development Needs of Community Physician Teachers in Distributive Medical Education

AUTHOR(S):

- X. Catherine Tong, Waterloo Regional Campus, McMaster University, Canada (Presenter)
- Anjali Kundi, Niagara Regional Campus, McMaster University, Canada
- Anne Wong, Program for Faculty Development, Faculty of Health Sciences, McMaster University, Canada
- Amanda Bell, Niagara Regional Campus, McMaster University, Canada
- Cathy Morris, Waterloo Regional Campus, McMaster University, Canada

ABSTRACT

Background: Physician teachers in distributive/decentralized medical education (DME) sites who practice at varying distances from the main campus face increasing clinical and teaching demands. Although institutions offer ongoing faculty development programs, DME physician teachers do not participate optimally due to many barriers.

Summary of Work: The McMaster University Program for Faculty Development (PFD) Team administered a needs assessment survey to DME teachers. The results showed that although enthusiastic, they lack confidence in their skills and desire more feedback. To address these learning needs, in 2018, the PFD team launched MacAdemia, a new faculty development certificate program designed for physician teachers in two distributive campuses. Compared to the main campus programs, MacAdemia is unique. Workshops are developed for small groups of community teachers and made available online. The practice requirement is integrated into existing teaching responsibilities. Teachers are connected with resources specific to their needs through mentorship. The program may be completed over one to three years in a self-directed manner. All efforts are made to support the very busy physician teachers to reach their goals without incurring significant burden to their existing clinical and teaching practices.

Summary of Results: Eleven clinician teachers from various practice locations and specialties have enrolled in the program since spring 2018. One has completed the program. Although it is too early to evaluate the program from the participants' point of view, it has succeeded as a vehicle for faculty development delivery and a scaffold for building a teaching community-of-practice. As such, it potentially benefits all DME physician teachers including those who do not register in the program.

Discussion and Conclusions: Through MacAdemia, McMaster University PFD Team has started to succeed in engaging more DME physician teachers. As we support physicians in achieving their individual teaching goals and building a teaching community, we help deliver the university's academic mission in the DME setting.

Take-home Messages: Delivering faculty development effectively in the DME setting is challenging. The McMaster PFD team has seen initial success in the first cohort of the MacAdemia program.

Design of a program for complementary education of International Medical Graduates in Sweden - to include Swedish or not

AUTHOR(S):

- Magnus Hultin, Umeå university, Sweden (Presenter)
- Olof Semb, Umeå university, Sweden
- Krister Tano, Umeå university, Sweden
- Emil Molander, Umeå university, Sweden
- Gabriella Morén, Umeå university, Sweden
- Patrik Wennberg, Umeå university, Sweden

ABSTRACT

Background: International medical graduates (IMGs) can either select to take a proficiency test to become licensed to practice in Sweden or to take a 1-2-year complimentary medical education (CME) to qualify for internship. Both paths test the participant for proficiency according to the national Swedish standards for becoming a licensed physician and are given in Swedish. The national standards include medical knowledge, interprofessional skills, communication with patient, relatives and other personnel, and scientific scholarship. A prerequisite for the CME is a passing grade in a Swedish language level 3 course at an accredited adult education center. A recurring observation was that both those failing the proficiency test for IMGs and those taking previous CME was lacking in Swedish proficiency.

Summary of Work: A programmatic approach was taken to implement systematic training in Swedish applied in medicine at this two-year CME that is mainly based on distance training using videoconference systems. During the first year the language training corresponds to 50% of the curriculum. Research questions: Did the students at the new CME perceive the education in Swedish as valuable and did the students pass the examinations? Design: Cross-sectional study based on the course evaluations and the results of the examinations from the first semester.

Summary of Results: 28 students were admitted to the program and 22 remained with the course for the finals of the first semester. The majority had increased their proficiency in Swedish as measured in vocabulary and correct use of words, but the grammar had not improved. Half of the students failed the summative assessment and three of the students also failed the majority of the formative assessments. The participants scored the relevance and the value of the Swedish training as high.

Discussion and Conclusions: The students appreciate the training in Swedish while also having difficulties to pass the tests. A more comprehensive study is warranted to study how to best deliver language training to IMGs.

Take-home Messages: Medical education for IMGs needs to take language proficiency into account.

“My name is not Schneider”: a qualitative study on the social integration of immigrating, Middle-East physicians in Germany

AUTHOR(S):

- **Marwa Schumann, Alexandria Faculty of Medicine, Egypt (Presenter)**
- Asja Maaz, Dieter Scheffner Center for Medical Education and Educational research, Charité - Universitätsmedizin, Germany
- Harm Peters, Dieter Scheffner Center for Medical Education and Educational Research, Charité - Universitätsmedizin, Germany

ABSTRACT

Background: The healthcare systems of the 21st century have witnessed substantial numbers of migrating physicians and other healthcare professionals across the globe. Internationalization of the medical workforce has brought enrichment to the destination countries; however the diversity strains the national workforce. Successful integration of immigrating physicians is worth the effort as it is associated with improved quality of life and of the healthcare delivery.

Summary of Work: We conducted a qualitative study based on social constructivism epistemology. Our aim is to explore the social integration of immigrating physicians in the German society in general and the German healthcare system in particular. The coding framework was based on the social integration theory by Esser (2004), delineating the four dimensions cultural adaptation, positioning, interaction and identification. The study was conducted from June to September 2017 in Germany. Immigrating physicians from Syria, Jordan, Egypt, Palestine and Iran were invited to interviews and focus group discussions. We employed a purposeful maximum variation sampling strategy. Recruitment was mainly done by announcements on the corresponding social media groups.

Summary of Results: Nine interviews and one focus group discussion were conducted among a total number of 14 participants: 12 residents, and 2 specialists in different geographic locations in Germany. Participants became more culturally adapted with time; cultural competencies were acquired through self-learning rather than through orientation programs. Participants felt well positioned in their workplace; however they preferred interaction among circles of their ethnic origin. Identification with the German cultural values and life orientation was not achieved. The social integration was facilitated by language proficiency, personality traits, support from peers and supervisors. Barriers included lack of formal cross cultural training and heavy workload.

Discussion and Conclusions: Physicians from Middle-East immigrating into Germany undergo initial phases of loss and confusion of professional identity. Over time they become better socially integrated in some of the dimensions, but do not achieve full social integration.

Take-home Messages: Middle-East physicians experience an in-homogeneous, partly incomplete degree of social integration when immigrating to Germany. Orientation programs and formal cross-cultural training may help to facilitate their social integration in society and the workplace.

Going the extra mile: international patient handover in a European border region

AUTHOR(S):

- **Daniëlle Versteegen, School of Health Professions Education, FHML, Maastricht University, the Netherlands (Presenter)**
- Juliët Beuken, School of Health Professions Education, FHML, Maastricht University, the Netherlands
- Diana Dolmans, School of Health Professions Education, FHML, Maastricht University, the Netherlands
- Xavier Losfeld, CHR Citadelle, Belgium
- Lina Vogt, AIXTRA, Uniklinik RWTH Aachen, Germany
- Mara Bouwmans, School of Health Professions Education, FHML, Maastricht University, the Netherlands

ABSTRACT

Background: International patient handover is a complex and increasingly frequent event. Handover is associated with patient safety risks and many healthcare professionals perceive international handover to be even riskier. Insight in their perspectives is required to develop ways to support international collaborations in healthcare. We investigated perspective on international handover in the border-region Meuse-Rhine (EMR).

Summary of Work: We performed semi-structured interviews with healthcare professionals (physicians, nurses, paramedics and administrative staff) working in three international patient handover settings (two acute and one elective). The interview guide was based on the theory of planned behavior, addressing attitudes, behavioral norms and perceived behavioral control (Ajzen, 1991). Professionals were asked to describe (their experiences with) international patient handover and provide a recent example. All interviews were summarized and analyzed inductively (Braun & Clarke, 2006), looking for themes appearing in all three settings. Concepts of the theory of planned behavior were used as sensitizing concepts.

Summary of Results: Forty-three healthcare professionals participated. We identified four common challenges that arise from differences in perspective between healthcare professionals in the EMR: 1) communication (e.g. language), 2) processes of working (e.g. protocols), 3) healthcare system (e.g. financial organization), and 4) culture (e.g. interaction with colleagues). Three ways of overcoming these challenges were identified: 1) creating awareness, 2) changing attitudes, and 3) building collaboration.

Discussion and Conclusions: Although healthcare professionals involved in international patient handover share the same interest (patient care), they deal with many challenges. Suggested ways of overcoming these challenges focus on creating awareness about local differences in both human and system factors, which may lead to a better understanding and respect towards one another. This expectedly empowers professionals to improve international patient handover. Joint training, during which professionals can share experiences and discuss possibilities to improve international patient handover, is a frequently mentioned solution to reach this. For future research, we suggest investigating joint training approaches, leading towards situation-specific possibilities for improvement.

Take-home Messages: International patient handover comes with challenges concerning communication, processes of working, healthcare system and culture. Joint training seems to be a promising way to overcome these challenges.

Developing a rubric for measuring English history-taking skills of non-native English-speaking medical students

AUTHOR(S):

- Takayuki Oshimi, International University of Health and Welfare School of Medicine, Japan (Presenter)
- Tamerlan Babayev, International University of Health and Welfare School of Medicine, Japan
- Yusuke Hayasaka, International University of Health and Welfare School of Medicine, Japan
- Cosmin Florescu, International University of Health and Welfare School of Medicine, Japan

ABSTRACT

Background: There is little evidence on the effectiveness of assessment and intervention strategies to improve English proficiency for medical purposes of non-native English-speaking medical students. To evaluate history-taking skills, the United States Medical Licensing Examination Step 2 Clinical Skills (USMLE Step 2 CS) assesses performance in the following three areas: Spoken English Proficiency (SEP), Communication and Interpersonal Skills (CIS), and Integrated Clinical Encounter (ICE). As the USMLE Step 2 CS criteria are essentially an exit exam designed for American medical students, the assessment criteria are too advanced for measuring English communication skills of preclinical non-native English-speaking medical students. The purpose of this study is to develop a formative evaluation tool to guide English history-taking skills education for this group of medical students.

Summary of Work: First-year medical students (120 Japanese and 20 international) completed a preclinical program taught in English as well as 45 hours of history-taking skills training in English. A rubric was designed to evaluate their history-taking skills based on the three domains of the USMLE Step 2 CS criteria. In order to begin developing a validity argument for the new rubric, the three domain scores and pre- and post-program scores of Test of English as a Foreign Language Institutional Testing Program (TOEFL ITP®) were analyzed in a cross-sectional study.

Summary of Results: Pre-program TOEFL ITP® scores had significant positive correlations with all of the three domains (Pearson correlation coefficient: r values ranged between 0.448 and 0.745, $p < 0.01$). The strongest correlation was found between pre-program TOEFL ITP® Section 1 (listening comprehension) and spoken English proficiency in our history taking rubric ($r = 0.745$, $p < 0.01$).

Discussion and Conclusions: English listening comprehension is an important factor in predicting history-taking performance in English. We describe our experience of developing a novel rubric for history-taking skills of non-native English-speaking medical students which may help guide the development of future educational programs aimed at improving their history-taking skills in English.

Take-home Messages: Our novel rubric may help guide the development of future educational programs aimed at improving their history-taking skills in English.

Defining competency criteria for written clinical communication: The case of the Occupational English Test (OET) and its implications for medical education

AUTHOR(S):

- Tim McNamara, The University of Melbourne, Australia (Presenter)
- Ute Knoch, The University of Melbourne, Australia
- Cathie Elder, The University of Melbourne, Australia
- Eleanor Flynn, The University of Melbourne, Australia
- Elizabeth Manias, Deakin University, Australia
- Robyn Woodward-Kron, The University of Melbourne, Australia

ABSTRACT

Background: What level of written clinical communication skill should be required of immigrant health professionals entering practice in an English-medium clinical environment? An international test of clinical communication, the Occupational English Test, is now accepted for registration of health professionals in the UK and Ireland, and in Australia, Singapore and New Zealand. How can language professionals and health professionals work together to define the qualities of successful written clinical communication to inform the criteria used to judge performance on this test, which simulates workplace communication tasks?

Summary of Work: In a three-year project, a team of Australian language professionals and health professional educators investigated the following research questions: 'What do health professionals value when judging samples of clinical written communication? How can their insights inform test criteria and competency standards to be used in medical education?' Feedback from 16 clinical educators/supervisors in medicine on the adequacy of carefully selected authentic samples of discharge summaries and letters of referral was elicited in clinical and workshop settings, analysed, and the existing linguistic criteria evaluated in light of the findings.

Summary of Results: Themes emerging as being valued by the clinical educators/supervisors included appropriateness of writing to the style of the document, or to the audience; conciseness; sufficiency; accuracy of content; and clarity of language, content and organization. The existing linguistic criteria used to evaluate performance in the test are currently being modified in light of the findings, which also serve as potential guidance for education on clinical writing skills for both native and non-native speaking health professionals.

Discussion and Conclusions: Interdisciplinary collaboration between language professionals and health professionals results in more valid criteria by which to evaluate the clinical communication of international medical graduates working in English. Learning to see the qualities of communication from the point of view not just of language experts but of those actually engaged in the communication ensures more relevant and fairer evaluations and standards.

Take-home Messages: International health workforce mobility requires valid assessment of health professionals readiness to work within a second language (English). The Occupational English Test involves clinically relevant communication tasks, and interdisciplinary research has ensured performance is judged against clinically relevant criteria.

Health Education England's Global Learners Programme

AUTHOR(S):

- Elin Sandberg, Health Education England, UK (Presenter)
- Ged Byrne, Health Education England, UK

ABSTRACT

Background: UK healthcare can learn from global learners, who will bring their experience with them. Whilst in the UK they will gain new knowledge and skills and be ready to lead developments in healthcare in their home countries. The programme will focus effort on the integration of professionals back into their home clinical setting. The GLP actively creates better, more innovative and novel training environments that build and develop international best practice and promote life-long learning.

Summary of Work: The Global Learners Programme offers an educational programme for healthcare workers from other countries who would like to spend three years on an earn, learn and return scheme. The programme creates dynamic partnerships and build lasting relationships with global healthcare organisations and healthcare professionals alike.

Summary of Results: Since starting in 2017, the Global Learners Programme has expanded rapidly to facilitate hundreds of placement opportunities in the NHS. This comprehensive end to end process with a focus on enhancing skills and clinical practice provides international nurses with a unique opportunity and an exciting experience. The three-year programme begins with support to attain registration with the Nursing and Midwifery Council and then a comprehensive preceptorship programme. In years two and three, participants will acquire skills in mentorship, clinical skills development and can undertake post graduate education in leadership and nursing studies.

Discussion and Conclusions: There have been significant challenges in managing large scale international migration of nurses, both in managing the relationships with education providers, healthcare providers and governments, as well as the ethical sensitivities of international workforce movement. The quality assurance processes show a high level of satisfaction with the programme from overseas partners, NHS Trusts and Global Learners. Global Learner cohorts are being planned in a sustainable and ethical way alongside domestically trained staff.

Take-home Messages: Comprehensive clinical, educational and pastoral support programmes are critical for creating and maintaining positive learning opportunities. Large scale placement programmes require a much greater ethical emphasis than traditional international recruitment, with ongoing partnerships with education providers, healthcare providers and governments. Bi-directional workforce migration on earn, learn and return programmes offer significant opportunities for individuals and organisations involved.

Setting priorities for health education research: A Faculty-wide mixed methods study

AUTHOR(S):

- Charlotte Rees, Monash University, Australia (Presenter)
- Claire Palermo, Monash University, Australia
- Olivia King, Monash University, Australia
- Paul Crampton, Monash University, Australia

ABSTRACT

Background: To maximise research investment, it is important to identify high-priority research questions that meet the needs of multiple stakeholders. This study aimed to identify priorities for health professions education research to help develop a focused educational research strategy inclusive of all Monash University health science and health professions programs, plus facilitate collaboration through the development of new cross-faculty education research networks.

Summary of Work: We identified priorities, barriers, and enablers to health education research through a qualitative survey with 101 learners, patients, academics and clinicians across all health sciences and health professions. Next, we asked 780 similar stakeholders to rate and rank the identified priorities through a quantitative survey. We collected feedback on the priorities via six individual or group interviews with 16 stakeholders.

Summary of Results: Of 30 priorities identified, the top rated were: Understanding how best to ensure students develop the required clinical skills for practice; Understanding how to promote resiliency and well-being in students; and Ensuring the curriculum prepares for practice. Six themes were identified as potential networks for future health educational research at Monash: (1) Culture of learning together in the workplace; (2) Preparation for work; (3) Meeting future Australian healthcare needs; (4) Pedagogical effectiveness; (5) Workforce issues; (6) Curriculum integration. The greatest enabler to research was 'staff-motivation' (n=212, 12%) and barrier was 'lack of time' (n=259, 14%).

Discussion and Conclusions: Some of our key priorities are consistent with those identified in other recent priority setting exercises from the UK, Canada and New Zealand, illustrating that topics like workplace learning, preparedness for practice and curriculum integration are perceived to be important irrespective of countries, disciplines and time-periods. However, priority topics identified within 'Meeting future Australian healthcare needs' seemed unique to the current study.

Take-home Messages: These findings will be employed to develop an educational research strategy inclusive of Monash University's five health sciences and twelve health professional education programs. This will inform research investment, which consequently will address key health education research questions that can be translated into health educational practice and policy locally and beyond to improve health education and patient care.

Publications Outcomes of Abstracts Presented at the Association for Medical Education in Europe (AMEE) in 2013 and 2014

AUTHOR(S):

- Samy Azer, King Saud University College of Medicine, Saudi Arabia (Presenter)

ABSTRACT

Background: The quality of a research study is often assessed by a full-text publication. The purpose of this study was to assess the full-text journal publication rate of abstracts presented at the 2013 and 2014 AMEE conferences and determine possible predictors for successful publications.

Summary of Work: Abstracts presented at the 2013 and 2014 AMEE conferences were identified from the conference abstract books and grouped into short communications, research/PhD reports, and poster presentations. Using an online randomization program, abstracts were randomly selected from each group in the two years. Google Scholar, Google, PubMed, and the Web of Science databases were searched to locate publications related to these abstracts. Other information collected from publications were lag of time to get published, journal, Journal Impact Factor, number of institutes and countries involved.

Summary of Results: A total of 240 abstracts (100 short communication, 100 posters, and 40 research/PhDs reports) were selected from the two years. Of these 103 (43%) proceeded to full publications. Research presentations were most likely to proceed to full publications 36 (90%), followed by short communication 45 (45%) then posters 22 (22%) and were more likely to achieve publication in high impact journals. The lag of time to full publication varied from 1 month to 48 months. Countries that led the publication records were Canada, United Kingdom, Netherlands, and United States. We are currently working on examining more publication related parameters.

Discussion and Conclusions: This is the first study of its kind in medical education. Studies presented as research/PhD reports were more likely to be reported in a full-text publication. More than one paper was identified to the majority of abstracts under this category. While we do not know the exact cause for the low rate of publications observed for posters, further work is conducted to identify predictors of subsequent publication.

Take-home Messages: The study can guide researchers into factors that guide study design features and successful publication.

Setting Agenda for Medical Education Research in Pakistan

AUTHOR(S):

- Ahsan Sethi, Khyber Medical University, Pakistan (Presenter)
- Sarah Ali, Pakistan Medical and Dental Council, Pakistan

ABSTRACT

Background: Research in medical education aims at deepening the understanding of teaching and learning by studying phenomena, interactions and interventions. Few countries (Canada, New Zealand, Iran, Scotland) have previously conducted priority-setting exercises for medical education research. Pakistan is a developing country with limited number of trained medical educationist and research funds. Therefore, it is important to ensure that the training of healthcare educators contribute most effectively towards improvement in the healthcare. The current study aims to identify medical education research priorities in Pakistan for the next five years, along with their justifications.

Summary of Work: It is a two-stage exploratory mixed-method design. Participants included purposively selected faculty members, supervisors, undergraduate students, MHPE postgraduate students & policy makers from Pakistan. In stage-1: An exploratory open-ended qualitative questionnaire was emailed to 250 participants in which they were asked about medical education research priorities in Pakistan for the next five years, alongwith their justifications. Data from stage 1 were thematically analysed and a questionnaire was developed using those themes. In Stage-2: The participants were asked to rate the importance of these themes on a scale of 1 to 5, along with the justification for their choice. Quantitative data were analysed using SPSS v.21.

Summary of Results: One hundred and eighty participants from different stakeholder groups responded. We identified 20 research priorities including curriculum integration, equality and diversity, technology enhanced learning, assessment, faculty development, enhancing communication, feedback, role modelling, professionalism and ethics, and admission process etc. Justifications included policy and political agendas, and need for evidence-base.

Discussion and Conclusions: The priority areas and their drivers identified in the current study are in harmony with those identified in other countries. They provide a platform of evidence for researchers and funders, healthcare institutions, regulators and policymakers on which to base decisions about allocating time and funds for medical education research in Pakistan and beyond. Other countries need to conduct similar research to determine their own medical education research priorities.

Take-home Messages: There is a need for research in faculty development, improving assessment, enhancing communication and research skills among health professionals of Pakistan. Such studies help ensure resources can be utilized wisely to maximize productivity.

The PERFUME study: Peer-Ethnographic Research on Feedback in Undergraduate Medical Education

AUTHOR(S):

- Christopher See, Li Ka Shing Faculty of Medicine, The University of Hong Kong, Hong Kong (Presenter)
- Serena Ming Yan Tsui, The University of Hong Kong, Hong Kong

ABSTRACT

Background: The role of student feedback in medical education is critical for the continual evolution of student-centred medical curricula. There is an increasing burden on students to give feedback after each and every teaching event; however, the utility of such feedback can be questionable due to questionnaire burnout and evaluation fatigue. Our research questions on feedback are; What is the meaning of the process of feedback to students? What is the cultural significance of the phrases they use in their written feedback? What are their attitudes towards both formal and informal channels of feedback? We employed peer-ethnography; the training of a medical student in ethnographic research methods to generate insider or 'emic' knowledge on the topic through qualitative fieldwork.

Summary of Work: This study reports a series of works relating to the PERFUME study. Firstly, it describes the findings a systematic review of peer-ethnography in qualitative research which evaluated the studies using the Quallsyst qualitative evaluation tool. Secondly, it describes the peer-ethnographer training programme for medical students including its theoretical design, implementation and participant feedback. Finally, it will describe the findings the peer-ethnography fieldwork (January-June 2019), producing a rich-and-thick description of student attitudes and behaviours towards feedback.

Summary of Results: The systematic review revealed few peer-ethnographic studies employed in medical education, although it has been employed in other fields with varying degrees study robustness. Our peer-ethnographer training programme combined example case analysis, training in ethics, consent and qualitative analysis software and mock field-journal exercises to equip peer-ethnographers for fieldwork. The fieldwork phase, currently underway, shows promising and candid findings of the meaning of feedback to students. The full findings of the study will be reported.

Discussion and Conclusions: Peer-ethnography can be a powerful tool for understanding student populations. It can engage students as stakeholders in the process educational research and provide an avenue for self-advocacy. The findings of the underlying meaning of feedback for medical students has implications for curriculum design as well as educators' professional development.

Take-home Messages: Peer-ethnography is useful avenue for exploring educational research questions. Student feedback must be viewed in through the lens of student beliefs and attitudes towards the process for it to be meaningfully utilised.

An individualized approach to support academic publishing

AUTHOR(S):

- Darshana Shah, Marshall University Joan C. Edwards School of Medicine, USA (Presenter)
- Larry Dial, Marshall University, Joan C. Edwards School of Medicine, USA

ABSTRACT

Background: Publication rates are a vital measure of individual and institutional performance, yet many faculty and trainee experiences fail to fulfill this obligation. Although the number of abstract submissions is increasing at conferences, many in academia do not submit their work for publication as they lack expertise, support, and time for the scholarly publication process. Despite the importance of journal publications as a measure of scholarly activity, data on the successful faculty development of programs for publication remain limited.

Summary of Work: An innovative personalized faculty development program called 'Advancing Scholarly Productivity In Research & Education (ASPIRE)' was implemented to promote and enhance scholarly productivity among faculty and trainees. The program consisted of a supportive team of content experts, mentors, and technical experts including librarians and editorial support. The program participants were asked to identify their publication needs through an online needs assessment survey. Based on the participants response, the program provided personalized assistance, from writing, to editing, to publication. Participants received feedback and encouragement in preparing manuscripts for submission or resubmission, along with editorial support, professional writing tools, and strategies for academic publication.

Summary of Results: The impact of this intervention is assessed by tracking manuscript submissions, resubmissions, and final publications. Individuals who participated in this intervention successfully published 11 works in 12 months. The program has successfully increased the level of publication among novice authors such as medical students and residents.

Discussion and Conclusions: Publishing in academia is a key career step for advancement. The individualized program based on the needs assessment survey shed light on myriad barriers faced by authors including fear of rejection, uncertainty of direction, and feeling overwhelmed by the process. The supportive team of mentors, content experts, and technical experts helped the participants through these challenges. Successful publication requires not only writing skills, but a supportive and nurturing environment.

Take-home Messages: 'One size does not fit all' for general faculty development. An individualized faculty development process has the potential to have a substantial impact on faculty and institutional publication profiles.

The Implicit Association Test in Health Professions Education: A Critical Narrative Review

AUTHOR(S):

- Maham Rehman, Western University, Canada (Presenter)
- Javeed Sukhera, London Health Sciences Centre, Western University, Canada
- Michael Wodzinski, Schulich School of Medicine and Dentistry, Western University, Canada

ABSTRACT

Background: Implicit bias is a growing area of interest among health professions educators. Educational strategies used to recognize and manage biases include use of the Implicit Association Test (IAT), an online metric of response time. Although the topic of implicit bias in healthcare is gaining increased attention, emerging critique of the IAT suggests the need to subject its use to greater theoretical and empirical scrutiny.

Summary of Work: We employed a critical narrative synthesis to review existing research on the use of the IAT in health professions education. Four electronic databases were searched using key terms yielding 1151 titles. After title, abstract and full-text screening, 39 articles were chosen for inclusion.

Summary of Results: Two distinct, yet complementary, theoretical perspectives were found in the literature. The dominant perspective utilizes the IAT as a metric of implicit bias to evaluate the success of an educational activity. A contrasting perspective describes the IAT as a tool to promote awareness while triggering discussion and reflection. In the latter, the IAT itself is often part of a learning activity that involves debriefing and in some cases, the issue of defensive reactions regarding the test are also explored.

Discussion and Conclusions: Whether used as a tool to measure bias, raise awareness or trigger reflection, the use of the IAT provokes tension between epistemologically divergent theoretical perspectives. In the context of broader critique of the IAT, future research regarding implicit bias in health professions may be enhanced by critical reflexivity regarding assumptions, values and epistemological positioning related to the IAT.

Take-home Messages: Our critical analysis of IAT use reinforces that the IAT may be used in distinct but complementary ways. We emphasize that regardless of how the IAT is used in education, curriculum designers and educators must consider both the premise behind the test, and potential reactions from learners.

Beyond academic excellence: Does ability-based emotional intelligence and personality predict early clinical performance?

AUTHOR(S):

- Jo Bishop, Bond University, Australia (Presenter)
- Amy Bannatyne, Bond University, Australia
- Craig Gillies, Revelian, Australia
- Kirsty Forrest, Bond University, Australia

ABSTRACT

Background: Over the past decade, admissions committees at various medical schools have sought alternatives to traditional cognitive measures when selecting medical students. With communication skills, empathy, and interpersonal abilities increasingly valued and expected in health care, there has been a shifting focus to consider the emotional intelligence (EI) of applicants. Higher levels of EI have been associated with improved empathy in medical consultations, enhanced doctor-patient relationships and teamwork, improved clinical performance, and greater patient satisfaction. Furthermore, EI has been linked to academic success, social skills, job satisfaction, and improved interpersonal relations. In attempting to reduce emphasis of cognitive measures, Bond University recently incorporated ability-based EI and personality testing in the selection process for the 2018 cohort. The purpose of this study was to explore whether these non-cognitive abilities tested during selection could predict knowledge acquisition and clinical skills in the first year of study.

Summary of Work: Applicants who satisfied early screening requirements were invited to complete the MSCEIT and 16PF. Candidates offered a position in the medical program following the interview stage (N = 126) were tracked during their first year of study, with outcomes relating to early clinical (tutor-rated history-taking assessment) and academic performance obtained for analysis.

Summary of Results: Preliminary analyses revealed a significant positive relationship between EI levels and overall performance on the history taking assessment ($r = .30$). Higher EI was also significantly and positively correlated with ratings of communication skills ($r = .39$) and professional behaviour ($r = .22$). In terms of personality attributes, a significant inverse relationship was revealed between the 16PF factor 'abstractedness' and overall performance ($r = -.29$). Lower scores on abstractedness were also correlated with higher ratings of communication ($r = -.33$) and professional behaviour ($r = .20$). A significant positive relationship between the 16PF factor 'sensitivity' and professional behaviour was also revealed ($r = .19$). Additional results relating to academic performance are currently being analysed and will be presented.

Discussion and Conclusions: Our preliminary findings reveal that pre-admission levels of EI were positively associated with performance in a Year 1 history taking assessment, providing early evidence that valuing these non-cognitive abilities in selection may have benefit.

What determines students autonomous motivation to study? Exploring personal and environmental factors for strongest independent variables

AUTHOR(S):

- Łukasz Balcerzak, Department of Medical Education, Jagiellonian University Medical College, Poland (Presenter)
- Konrad Jabłoński, Department of Medical Education, Jagiellonian University Medical College
- Klaudiusz Bolt, Jagiellonian University Medical College
- Magdalena Bubel, Jagiellonian University Medical College
- Robert Kupis, Jagiellonian University Medical College
- Barbara Nosal, Jagiellonian University Medical College

ABSTRACT

Background: Motivation is becoming a major area of interest within the field of health professions' education as it has been proposed to have a crucial role for students' academic success and wellbeing and for patients' outcomes. The Self-Determination-Theory is a motivation theory that recently has been recognised to help understand processes in medical education. Understanding the factors related to autonomous motivation to study might help to develop better medical curricula.

Summary of Work: A cross-sectional study was conducted collecting data on demographics, type of motivation to study (Academic Motivation Scale - AMS) and perception of learning climate (Dundee Ready Educational Environment Measure - DREEM) from 1784 undergraduate (medical, dental, nursing, midwifery, physiotherapy, emergency medicine, electro-radiology, public health, dietetics) students at Jagiellonian University Medical College. Regression analysis was used to examine the effect of variables on Relative Autonomous Index (RAI), Autonomous Motivation (AM), Controlled Motivation (CM) and Amotivation (AMT).

Summary of Results: Using multiple linear regression analysis, we examined predictive factors of Relative Autonomous Index (RAI): field of study, year of study, GPA, full/part-time form of study, sex, being a member of student organization, relationship status, and DREEM score. The highest positive impact on RAI had DREEM score (beta value 0,56). Other significant positive factors included: field of study, membership in a student organization, part-time form of study. Subsequent regression analysis, examining elements of learning climate, revealed predictive factors for different types motivation. The strongest predictor of RAI and AM was the perception of teaching (beta value 0,55 and 0,45 respectively). CM was predicted by the perception of teaching (0,2) and perception of teachers (0,11). AMT was predicted by the perception of teaching (-0,51), social self-perception (-0,11) and perception of the atmosphere (-0,095).

Discussion and Conclusions: This study has shown that autonomous motivation to study in a health profession is mainly related with modifiable variables - the perception of educational environment, especially with the perception of teaching " and not with personal characteristics or variables that cannot be manipulated.

Take-home Messages: These findings enhance our understanding of motivation in medical education, highlighting the need to consider the educational environment as a potential factor influencing students autonomous motivation to study.

Interventions in a Clinical Teaching Unit to Stimulate Motivation

AUTHOR(S):

- Esther Hamoen, Leiden University Medical Center, the Netherlands (Presenter)
- Floris van Blankenstein, Leiden University Medical Center, the Netherlands
- Peter de Jong, Leiden University Medical Center, the Netherlands
- Argho Ray, Leiden University Medical Center, the Netherlands
- Marlies Reinders, Leiden University Medical Center, the Netherlands

ABSTRACT

Background: Clinical workplace learning takes place in a challenging and complex interprofessional learning environment. Distress in such a clinical environment can cause or be caused by low motivation of students and other healthcare professionals. According to Self-Determination Theory (SDT) three basic psychological needs stimulate intrinsic motivation: the need for autonomy, competence and relatedness. Here we describe several interventions in an Internal Medicine Clinical Teaching Unit (CTU) in order to improve this motivation.

Summary of Work: In January 2017 an Internal Medicine ward at LUMC has been transformed into a CTU for various healthcare professionals (nurses, interns, and physicians). Several interventions based on SDT, aimed to promote intrinsic motivation, were implemented. For example, prerounds and teaching visits for interns have been introduced to stimulate autonomy. Both sessions are observed and assessed to promote the feeling of competence. Competence is furthermore promoted by skills training to interns by nurses, clinical lessons for nurses provided by physicians and a multidisciplinary grand round for sharing knowledge. This grand round, peer feedback sessions and appointment of dedicated clinical teachers stimulate relatedness. In June 2018 an online questionnaire was conducted among healthcare professionals (70 respondents) in the CTU to evaluate what changes they experienced since the establishment of the CTU and what motivated them to learn.

Summary of Results: Qualitative data analysis shows that since the introduction of the CTU professionals experience more focus on teaching and learning, more interprofessional collaboration, improved approachability of colleagues, more team spirit and a less hierarchical, safer work climate. Interprofessional collaboration, team spirit and work climate were also mentioned as motivating for learning. Other important motivators for learning are: acquiring new knowledge and clinical skills, enthusiastic teachers and autonomy.

Discussion and Conclusions: Interprofessional collaboration and knowledge sharing seems to play an important role in promoting motivation for learning within the CTU. The factors that were mentioned as motivating for learning seem to fulfil a need for relatedness (team spirit, safe work climate), but also for competence (learning new knowledge and skills) and autonomy (prerounds).

Take-home Messages: Motivation to learn can successfully be improved by adapting the learning environment.

The relationship between medical student Conscientiousness Index scores and later clinical performance: a pilot study

AUTHOR(S):

- Marina Sawdon, University of Sunderland, UK (Presenter)
- John McLachlan, University of Central Lancashire, UK

ABSTRACT

Background: Performance by medical and other healthcare students while in education may provide a guide to their later clinical practice. Demonstrating that a metric has predictive validity would therefore allow targeted training to be directed to individuals who may cause concern during their education. It is known that cognitive ability has significant predictive validity for later clinical practice in a number of settings. However, there are currently no demonstrated measures of personality related performance with such validity.

Summary of Work: This study involves data captured since 2005 as part of the Conscientiousness Index (CI) project. Data on students' performance of routine tasks such as attendance and submission of assignments, was assembled to form a single score, known as the Conscientiousness Index. Positive, statistically significant correlations were previously observed with outcome performances such as examinations scores and independent staff ratings of professionalism. The process has since been repeated in other health care settings. The CI scores represent the predictor variable for this study and we are currently exploring the relationship of this data with several postgraduate performance outcome variables as contained in the UKMED database, in order to assess any predictive validity of the CI for future performance as a doctor.

Summary of Results: Preliminary analysis has shown statistically significant correlations between CI scores in years 1 and 2 of undergraduate medical education and several postgraduate performance variables; Foundation Programme application SJT scores ($Rho = .354$, $P < 0.001$, $n = 467$), PSA scores ($Rho = .339$, $P < 0.001$, $n = 390$), EPM decile ($Rho = .235$, $P < 0.001$, $n = 467$) and the likelihood of passing professional exams (MRCP) at first sit ($P < 0.038$, $n = 267$).

Discussion and Conclusions: Preliminary analysis has shown that student conscientiousness predicts later workplace performance. Further analysis is required such as data dichotomisation into high and low scoring individuals to fully appreciate the magnitude of the relationship. This will be presented at the meeting.

Take-home Messages: This research is very likely to open the way towards recognising factors during medical student training that might lead to performance issues at a professional, working level. This would potentially allow targeted remediation or improved selection.

Patterns of learning preferences: A Q-methodological study into medical student learning from tutorial groups

AUTHOR(S):

- Jan Willem Grijpma, VUmc, the Netherlands (Presenter)
- Anne de la Croix, VUmc, the Netherlands
- Anke Kleinveld, VUmc, the Netherlands
- Anton Horrevoets, VUmc, the Netherlands
- Martijn Meeter, Vrije Universiteit Amsterdam, the Netherlands
- Rashmi Kusurkar, VUmc, the Netherlands

ABSTRACT

Background: How students perceive their learning environment, and the degree to which it coincides with their preferences for teaching and learning, has been shown to influence outcomes like study success, motivation, retention, and satisfaction. With an increasingly diverse medical student population, we should be mindful of changes in the teaching and learning preferences of students. Learning to identify these preferences opens up the possibility of creating more effective and appealing education for all students. For this study, we were interested in 1) exploring where students differ in their learning preferences; and 2) to determine the bases of these differences.

Summary of Work: Q-methodology is a mixed-method research design used for the systematic study of subjectivity. To start, we generated a set of 54 statements on learning preferences from the literature. Then in an individual interview, first-year medical students rank ordered these statements from 'most agree' to 'most disagree'. Finally, the Q-sorts were analyzed using factor analysis. The factor solutions were evaluated, interpreted and finalized by three researchers on methodological, statistical, and qualitative criteria through consensus.

Summary of Results: A four-factor solution (i.e. profiles) was found to best fit the data collected from 52 students, and explained 52% of the variance. Students in profile 1 (N=15) can be summarized as 'learning from cases', students in factor 2 (N=8) as 'learning for assessments', students in factor 3 (N=10) as 'learning from peers', students in factor 4 (N=14) as 'learning for personal development'.

Discussion and Conclusions: The identified student profiles describe distinct patterns of preferences for learning in tutorial groups. Fundamental differences between the profiles relate to their preferred methods of learning, pedagogical and didactical strategies of tutor teaching, and degree of student-centeredness of the learning environment. The results also indicate aspects of teaching and learning that are valued by all students, like the importance of a safe learning environment, feedback and collaborative learning.

Take-home Messages: Medical students have distinct patterns of learning preferences that describe how students view their ideal learning environment. Identifying these preferences makes it possible to tailor the learning environment to different preferences.

Reinventing PBL at Maastricht University: Shared Philosophy, Diversified Practice

AUTHOR(S):

- Janneke Frambach, Maastricht University, the Netherlands (Presenter)
- Stella Wasenitz, Maastricht University, the Netherlands

ABSTRACT

Background: In the past fifty years, many medical schools implemented problem-based learning (PBL). Despite half a century of PBL research and practice, the debate on what PBL is and how to best implement it is as alive today as it was in the 1970s. Universities struggle with explaining the approach and sustaining their curricula. These struggles are also visible at Maastricht University, the second university worldwide that adopted PBL, commonly viewed as a pioneer in PBL practice, research and consultancy.

Summary of Work: Maastricht University initiated a reflective research project, named EDview, which asked: Where do we stand? How do our students and staff experience PBL? What can we learn from the PBL diversity that has developed across courses? Are we well equipped for the future? EDview aimed to establish a shared view on education at Maastricht University for the future, particularly regarding PBL. In several data collection phases, EDview held interviews and focus groups; reviewed literature; conducted a survey open to all students and staff; and held feedback sessions with a wide stakeholder selection.

Summary of Results: Survey respondents (n=1,743) were satisfied with PBL as the educational method. The qualitative data explained that this satisfaction, however, referred to the 'idea' and theory of PBL. Survey respondents were less satisfied about PBL in practice, and felt that the promise of PBL had not been fulfilled. Challenges were for example the 'seven steps' format, alignment with assessment, and tutorial group size. EDview observed a trend and need to define and approach PBL more broadly. A majority preferred the university being more creative and flexible about PBL, with room for variations and alternatives.

Discussion and Conclusions: For the future, Maastricht University does not take any PBL format as a starting point. Rather, its interpretation of PBL philosophy (constructive, collaborative, contextual, self-directed learning) serves as the basis of educational design, meeting diverse demands. The university views its PBL philosophy as a dynamic, shared framework that drives continuous debate about educational quality.

Take-home Messages: Universities facing similar struggles may initiate their own reflective journey to establish - or abandon - their PBL identity for the future.

Silence for the sake of peace. How speaking up for learning can enable interdisciplinary team processes for integrated education

AUTHOR(S):

- **Stephanie Meeuwissen, School of Health Professions Education, Maastricht University, the Netherlands (Presenter)**
- Wim Gijsselaers, School of Business & Economics, Maastricht University, the Netherlands
- Ineke Wolfhagen, School of Health Professions Education, Maastricht University, the Netherlands
- Mirjam oude Egbrink, School of Health Professions Education, Maastricht University, the Netherlands

ABSTRACT

Background: Integrated education forces teachers from different scientific and clinical disciplines to collaborate. Interdisciplinary teacher teamwork, necessary for the successful development of integrated education, has appeared to be not self-evident. In management sciences, it is shown that team performance increases with high-level team learning processes, ranging from sharing and co-construction to constructive conflict. In this study, we aimed to explore teachers' perspectives on what and how individual, team, and organizational factors influence interdisciplinary team learning processes.

Summary of Work: We conducted an exploratory study. 17 members of different interdisciplinary teacher teams in the Maastricht University undergraduate health profession programs were interviewed. Sensitizing concepts of team learning informed our template analysis. Data were collected in an iterative process, until template development was seen as sufficient.

Summary of Results: Perceived core influences on the level of the individual, the team, and the organisation were: 1) individual characteristics, skills and motivation, 2) teams' vision, decision-making and reflection, and 3) organizational communication, support and learning. Team learning was facilitated by creative, education-minded individuals who worked with shared task understanding and shared decision-making, within cultures allowing reflection, questioning and speaking-up. Continuous organizational communication and support, and attention for a sustainable workforce needs encouragement to overcome possible problems.

Discussion and Conclusions: This study shows both enabling and discouraging influences of interdisciplinary team learning and introduces some of the ways that teams can do to overcome them. If health professions education aims to change its traditional mono-disciplinary education and create conditions that are more favorable for the facilitation of successful interdisciplinary teams, team leaders should play a central role in shared decision-making and the creation of learning cultures in which people routinely reflect on team processes, dare to speak-up and question each other. The obtained knowledge can be used to improve current teams and facilitate new collaborations. Although the barriers traditionally built between disciplines are high, they certainly are not insurmountable.

Take-home Messages: Interdisciplinary teacher teamwork is multi-factorial; Team members should be encouraged to embrace student-centered education; Team leaders should focus on shared decision-making and developing a learning culture in which reflection, speaking up, and questioning another are key; Organizations should invest in continuous communication and support for learning.

How integrated are the Vertically Integrated Assessments (VIA) in medical education?

AUTHOR(S):

- Basia Diug, Monash University, Australia (Presenter)
- Nazmul Karim, Monash University, Australia
- Dragan Ilic, Monash University, Australia

ABSTRACT

Background: Vertical integration is increasingly being incorporated in medical education to prepare graduates better for clinical practice. Vertically integrated assessments (VIA) are designed to assess the integration of early clinical education, biomedical sciences and clinical responsibility levels for trainees. There is a paucity of literature to ascertain if the VIA is efficient.

Summary of Work: Aim/objectives: The aim of the present study is to assess the efficiency of VIA through comparison of learner's performance between VIA and non-VIA assessments. Methods Data on 1188 medical students enrolled from 2013 to 2017 were analysed using Blunt-Altman measure of agreement. The agreement between the assessment modality scores with-VIA and without-VIA were illustrated using a Bland-Altman plot; 95% limits of agreement for each comparison (average \pm 1.96 standard deviation of difference) were computed. The difference between the estimates was regressed on the average of the 2 estimates.

Summary of Results: The learner's performance scores with-VIA and without-VIA exhibited significant disagreement in both pre-clinical ($\beta = -8.9$; 95%CI -9.6, -8.3 $p < 0.01$) and clinical ($\beta = -34.3$; 95%CI -35.6, -33.0 $p < 0.01$) assessments, suggesting generalized underestimation without vertical integration. The disagreement is more apparent in students with the higher grades.

Discussion and Conclusions: This study finds significant discrimination between assessment modalities with and without vertical integration. The greater discrimination in the former implicates better performance differential of in high achievers. VIA is efficient in determining performance differential among medical students, the efficiency of VIA increases with increasing student grade.

Take-home Messages: There is a lack of literature surrounding the use of the VIA as an assessment despite its increasing usage in medical education. Our findings demonstrate that the VIA is an efficient means of determining student performance and can be used to differentiate between students.

Medical students learning in integrated curricula: A jigsaw puzzle

AUTHOR(S):

- Anne Franz, Charité-Universitätsmedizin Berlin, Germany (Presenter)
- Miriam Alexander, Charité-Universitätsmedizin Berlin, Germany
- Torsten Rollinger, Charité-Universitätsmedizin Berlin, Germany
- Hans Hellfried Wedenig, Charité-Universitätsmedizin Berlin, Germany
- Asja Maaz, Charité-Universitätsmedizin Berlin, Germany
- Harm Peters, Charité-Universitätsmedizin Berlin, Germany

ABSTRACT

Background: Many undergraduate medical programs have moved to an integrated curricular structure, yet key learning resources, such as textbooks, still follow a traditional discipline-based format. There is little empirical information and research, how medical students cope with this mismatch situation.

Summary of Work: We conducted a survey with medical students of the modular curriculum of medicine (MCM) at the Charité - Universitätsmedizin Berlin. The MCM represents a fully integrated, outcome-based undergraduate medical program. It is organized in 40 thematic modules, interdisciplinary taught by basic and clinical science disciplines. Students learning is guided by specific learning objectives for each teaching session. The survey asked the medical students for their current use of learning resources and their needs to better support their learning. Students could answer in a multiple answer format. The survey was conveyed online in 2018.

Summary of Results: A total of 1,147 medical students responded (response rate: 34%). Students' current learning in the integrated medical program is based on the fragmented use of various learning resources. Leading is the use of learning cards (80%), scripts provided by peer students (69%), own scripts (58%) and a commercially available online system centered around multiple choice questions from state examinations (67%). Text books were used by only 23%. For a better support of their learning in the integrated medical curriculum, students favored scripts for the teaching sessions (58%, for instance provided by session teachers), learning materials that provided feedback (51%, for instance test-enhanced learning systems) and learning cards (43%, for instance an online version).

Discussion and Conclusions: The currently existing learning resources lead to a fragment, jigsaw puzzle-like learning for medical students of an integrated medical curriculum. The study reveals the students' needs for better curriculum-alignment learning materials, the provision of short-loop feedback on learning status and systems that facilitate memorization of the knowledge base.

Take-home Messages: Learning materials and systems that match the learning in medical students from integrated programs represent an unrecognized and unmet need in undergraduate medical education.

Conversion to a Customized Learning Platform enables active, formative learning in large size classrooms: students' perceptions of the impact of online assessment using their own devices

AUTHOR(S):

- Debra Sibbald, University of Toronto, Canada (Presenter)

ABSTRACT

Background: The prevalence of personal mobile devices (phones, tablets, laptops) in health professional classes provides an opportunity for formative learning. Exploration of students' attitudes to a new environment for comprehensive digital pedagogy for teaching should be explored.

Summary of Work: In 2018 The University of Toronto launched Quercus as a new web-based learning platform to enhance teaching and foster interactivity with students. A pilot study in two therapeutics courses of 242 and 188 pharmacy students was conducted to evaluate the effectiveness of teaching via digital pedagogy using students' live access to personal (own) devices. Random polling tests were conducted throughout each session as prior or formative learning to test understanding and give feedback. 100% of responses were recorded weekly. Perceptions were elicited from web-based surveys, interviews, focus groups and observations for each cohort.

Summary of Results: Students in both cohorts reported that Quercus provides a safe and anonymous space for active, stimulating participation; they were able to maintain their concentration during the teaching sessions; it is an effective supportive pedagogy which helps them better understand subject matter. It allows instant feedback on knowledge gaps as the facilitator was able to summarize important issues. No major resistance or hurdles were encountered however speed of access for polling tests varied with locations.

Discussion and Conclusions: Positive perceptions focused on learning enhancements, including reinforcement and feedback as well as practical features such as fully engaged participation. Learning dynamics in large classrooms changed, solidifying and reinforcing retention in an enjoyable environment. Speed of access to quizzes with large numbers of synchronous users was identified as the primary limitation.

Take-home Messages: Polling on a comprehensive learning platform with personal devices is recommended by students as facilitative pedagogy. Students feel safe to participate actively in large size environments and appreciate instant feedback on their understanding. This effective all-inclusive learning space includes online polling without cost or participant restrictions of commercial digital or hand-held responses systems.

Using WhatsApp to enhance students' learning experience in the clinical environment

AUTHOR(S):

- Jennifer Thornton, The Rosie Hospital, Cambridge University Hospitals NHS Foundation Trust, UK (Presenter)
- Chivon Verger, The Rosie Hospital, Cambridge University Hospitals NHS Foundation Trust, UK
- Kathy Gallagher, The Rosie Hospital & Addenbrooke's Hospital, Cambridge University NHS Foundation Trust, UK
- Alison Wilson, The Rosie Hospital, Cambridge University Hospitals NHS Foundation Trust, UK
- Michelle Arora, The Rosie Hospital & Addenbrooke's Hospital, Cambridge University NHS Foundation Trust, UK
- Diana Wood, University of Cambridge School of Clinical Medicine, Cambridge University NHS Foundation Trust, UK

ABSTRACT

Background: 85% of adults now own and regularly use smartphones, and there are an increasing number of smartphone apps available to help facilitate delivery of clinical care and medical education. In particular, today's students are now finding it easier to use instant-messaging apps instead of emails to communicate. Many students find it challenging to identify and make the most of learning opportunities during clinical placements. This is exacerbated by increasing NHS workloads, rota-gaps, shift-patterns and clinical acuity.

Summary of Work: We developed a trainee-led 'Student-Buddy Programme' to facilitate students' time management and identification of learning opportunities on wards during maternal and child health attachments. Students volunteered to participate and provide contact details. Their allocated trainee 'buddies' WhatsApped them with the location and brief description of learning opportunities available, so they could attend if they were free.

Summary of Results: Forty students and thirty-eight trainees participated. Students valued having a named person to approach if other learning opportunities were cancelled 'when at a loose end'. The programme helped them 'feel less lost and more welcome' in busy and unfamiliar ward environments, providing structure to aid learning and gave 'a flavour of real life clinical medicine'. Students reported greater exposure to practical experiences and some reported to considering O&G or Paediatrics as a career. Trainees found the scheme helped organise teaching around their workload, especially when patients became unwell unpredictably.

Discussion and Conclusions: WhatsApp provided a quick, accessible and acceptable means of communication between students and trainee 'buddies'. The WhatsApp photo helped individuals recognise each other. Students valued immediate responses if their timetabled learning opportunities were unexpectedly cancelled. They also liked the safety of having an allocated person they could approach who they knew would be interested in teaching them. As with any other online technology platform, users must remember to maintain patient confidentiality and not include identifiable information when using WhatsApp.

Take-home Messages: WhatsApp is an effective tool for facilitating learning opportunities in busy clinical environments. The Student Buddy programme provides a welcoming educational environment for medical students, increases their engagement with clinical staff and improves clinical placement satisfaction rates.

The Rise of Apps in Medical Education

AUTHOR(S):

- **Rhianna Madden-Hansle, University College London Medical School, UK (Presenter)**
- Jenan Younis, University College London Medical School, UK
- Jack Ryan, University College London Medical School, UK
- Yulia Negreskul, University College London Medical School, UK
- Maira Vega-Poblete, University College London Medical School, UK
- Faye Gishen, University College London Medical School, UK

ABSTRACT

Background: Smartphone applications ('apps') are widely used by students in undergraduate medical education internationally as an adjunct to the learning. They enable easy access to a wide breadth of information. The aim was to explore the current usage of medical applications amongst final year medical students at University College London (UCL) and investigate the need for a university-specific medical education app for this cohort.

Summary of Work: A PubMed literature search was completed to inform medical education app use internationally by medical students. A validated questionnaire was identified and used. Final year medical students were asked to take part in an online anonymous survey based on the questionnaire identified. Questions asked included whether participants used medical education apps for learning purposes, which aspects of their learning such apps were utilised for, and limitations to usage. The data was analysed using Chi-squared test for categorical variables.

Summary of Results: 72 medical students participated. Survey responders were evenly distributed by gender ($p > 0.05$). The two main areas of usage were firstly question banks, followed by prescribing aids ($p < 0.001$) with question banks being significantly more popular ($p < 0.001$). A number of issues limiting the use of currently available medical apps were identified, namely format and layout (43%; $p < 0.001$), the content not meeting the learning needs (26%; $p < 0.01$) and concerns about becoming deskilled by using apps (11%; $p < 0.05$). 89% of responders expressed a need for a UCL-specific medical education app ($p < 0.001$) with the most popular features being practice questions (89%; $p < 0.001$), administrative information and timetables (73%; $p < 0.001$) and clinical skills resources (69%; $p < 0.001$).

Discussion and Conclusions: The results show that apps are widely used in medical education, mainly for accessing question banks and prescribing. Lack of perceived content appears to be the most common cause of dissatisfaction with currently available medical education apps. The majority of students expressed interest in a UCL-specific app, ideally containing a bank of UCL-style questions, suggesting that medical school bespoke education apps may serve as a valuable learning resource.

Take-home Messages: Medical school bespoke education apps may serve as a valuable learning resource, especially with content focused on assessment, such as a bank of medical school style questions.

Facebook: The new teacher for Generation-Z

AUTHOR(S):

- Shazia Irum, Shifa College of Medicine, Pakistan (Presenter)

ABSTRACT

Background: Social Media have made their way into mainstream of 21st Century's Internet Users, thereby becoming the most widely used means of communication. Institutions and faculties are increasingly adopting social networks, such as Facebook, Twitter and LinkedIn for educational activities. The impact of Social Media on academic performance and its possible usage as effective pedagogical tool is greatly being considered.

Summary of Work: A study of 2nd year undergraduate students at private medical college in Islamabad was aimed to obtain preliminary results regarding the improvement or otherwise, with usage of social media amongst 100 2nd year medical student. A quasi-experimental study design was used to find out the influence of Facebook on the academic performance of students. Facebook portal intervention was done in an already existing teaching program. Scores of the students before and after the intervention were compared using SPSS.

Summary of Results: The hypothesis was tested by applying paired sample t-test to the data and it shows a significant difference in the two scores. The mean score of the students was 70.40 ± 8.81 and 72.50 ± 8.15 in module 1 and 2 respectively. Perceptions of the students regarding use of facebook were collected, around half (48%) the students agreed that they were using Facebook for academic purposes, 85% of the students found it easy to learn via this medium. 70% students spent on an average more than an hour learning since the content was on Facebook. 85% students agreed that the process of finding material was quicker and more efficient. 79% students agreed that social media must be part of an academic program.

Discussion and Conclusions: The study concludes that usage of Facebook can be introduced as an adjunct to the main teaching strategies for improving students' academic performance.

Take-home Messages: Social networking sites can be used as an additional strategy, if properly designed and customized according to your context and students requirement.

#9P Short Communications - Interprofessional Education 3

Large-scale interprofessional assessment: a disciplinary focus

AUTHOR(S):

- **Annette Burgess, The University of Sydney, Australia (Presenter)**
- Chris Roberts, The University of Sydney, Australia
- Christie van Diggele, The University of Sydney, Australia
- Carl Schneider, The University of Sydney, Australia
- Gillian Nisbet, The University of Sydney, Australia
- Judith Werner, The University of Sydney, Australia
- Inam Haq, The University of Sydney, Australia

ABSTRACT

Background: The Health Collaboration Challenge (HCC) is a large-scale interprofessional learning activity held annually at the University of Sydney. In 2018, the HCC involved 1,674 health professional students from 11 health disciplines, including dentistry, oral health, nursing, pharmacy, occupational therapy, speech pathology, physiotherapy, dietetics, diagnostic radiography, medicine and exercise physiology. Students were required to collaborate in the production of a video and patient management plan based on a complex patient case. Our study sought to explore students' disciplinary perspectives of the opportunities provided for interprofessional learning within the HCC using a social constructivist lens.

Summary of Work: The HCC is a blended learning student-led activity consisting of two assessable components; a five-minute video and an abstract based on a complex patient case. Data collection included student questionnaires, assessment results, peer review results and focus groups. Data were analysed using descriptive statistics and thematic analysis.

Summary of Results: The assessment tasks provided numerous learning opportunities; including gaining perspectives of other disciplines; identifying one's role within a team; networking; the value of prior training in team-contribution; and leadership dynamics. Participants felt learning was enriched through the video-assessment activity and indicated they would benefit from additional IPL opportunities throughout their degrees.

Discussion and Conclusions: The HCC was acknowledged as a beneficial and worthwhile learning experience for health professional students. Perceived benefits included the development of role identification; perspective exploration; team leadership skills; negotiation skills; and the opportunity to network with other health professions. Although there are many challenges that exist within interprofessional activities, these associated benefits suggest that students would value a practical, longitudinal IPL program.

Take-home Messages: Although logistically challenging to implement, the Health Collaboration Challenge activities provide many associated benefits for students, and a foundation on which to build other interprofessional activities.

- Harm Peters, Charité - Universitätsmedizin Berlin, Dieter Scheffner Fachzentrum, Germany

ABSTRACT

Background: Participation of medical students in curriculum development has a tradition at the Charité - Universitätsmedizin Berlin. They are recognized as experts of their own curriculum, who can contribute complementary to quality of their educational program. Yet, little is known about student participation in the context of interprofessional curriculum development.

Summary of Work: In a qualitative study, we explore the perceptions and experiences of faculty members and students themselves on student participation in interprofessional course development. Two focus groups were conducted. One with faculty members (n=5) and one with students (n=5) who worked together during development of interprofessional education courses. The participants of the focus groups were interprofessional mixed from medicine, nursing, physical therapy and occupational therapy. They discussed about their perceptions and experiences in the interprofessional planning process. The focus groups were audio taped, transcribed and analysed thematically according to Kuckartz (2016).

Summary of Results: The quotes by faculty members and students indicate that the students contributed in complementary manner to process and results of interprofessional course design. Students contributed through bringing in an additional perspective and through their concrete work on courses and tutorials materials. Facilitating factors for students' participation were motivation for interprofessional education, clarity on tasks and students' autonomy and a low-hierarchy team atmosphere. Furthermore, students who participated gained knowledge, skills and changed attitude towards interprofessional collaboration.

Discussion and Conclusions: Student participation showed positive effects for process and results for in an interprofessional planning process and the students developed professionally during the process. We could identify a number of factors, which should be nurtured to facilitate this effect. Our experiences may stimulate other faculties to involve students in the development of interprofessional education more actively.

Take-home Messages: Participation of students yields positive effects on interprofessional course design. Facilitating factors should to be considered for a successful student participation in interprofessional projects.

Simulation as a tool for promoting Interprofessional Education (IPE)

AUTHOR(S):

- Paphan Musikawat, Maharaj Medical Education Centre, Thailand (Presenter)
- Nisakorn Jantawee, Nakhon Si Thammarat, Boromrajonani College of Nursing (BCN), Thailand
- Pongthorn Jantataeme, Maharaj Medical Education Centre, Thailand
- Panchanok Kaewkul, Maharaj Medical Education Centre, Thailand
- Yupin Muentip, Nakhon Si Thammarat, Boromrajonani College of Nursing (BCN), Thailand
- Chutima Rukbanglaem, Nakhon Si Thammarat, Boromrajonani College of Nursing (BCN), Thailand

ABSTRACT

Background: Training future healthcare providers together provides opportunities for them to gain interprofessional experience that is of need for being the part of the collaborative practice-ready healthcare workforce. IPE has been done in many institutes, however a little has been done in Thailand particular in clinical skills lab. Maharaj Medical Education Centre (MEC) and Nakhon Si Thammarat, Boromrajonani College of Nursing (BCN) have agreed to conduct IPE training programme as a pilot study. This was to enhance interprofessional experience of medical students and nursing students.

Summary of Work: In academic year 2018, Maharaj MEC and BCN worked together to provide IPE programme to medical students and nursing students. Thirty final year medical students and 129 third year nursing students attended the programme. Simulation was used as a tool for studying. It was arranged during weekend, mid academic year. There were three scenarios: Blunt abdominal injury; haemothorax; and CPR for adults. All students needed to perform pretest and posttest IEPS (Luecht et al.1990). In each scenario, global rating scale was also applied for evaluating students' profession-specific and interprofessional competencies. Two-month after 'the simulation', focus group interviews were done in those students and clinical teachers who taught them in clinical settings. This was to explore attitudes and other aspects being gained from the IPE.

Summary of Results: The results of paired T-Test showed the statistical significance of positive perception change. Focus group interviews revealed that 'simulation' could help them improve the perception of interprofessional healthcare team-working; knowledge; procedural and communication skills. Students' competencies, being assessed by staff, were met expectation.

Discussion and Conclusions: Students recognised the importance of IPE to promote working in a collaborative manner, which led to improve the quality of patient care and enhanced patient safety. However, it needed to have more variety of scenarios, more professions and more frequencies of practices. In conclusion, 'simulation' had a role in promoting IPE.

Take-home Messages: Simulation had a role in promoting IPE.

Lessons learnt from collaborative attempts across healthcare education programmes: Educator perspectives on developing meaningful interprofessional education interventions

AUTHOR(S):

- Joanna Matthan, Newcastle University, UK (Presenter)

ABSTRACT

Background: Interprofessional education (IPE) may well be the buzzword of the decade in medical education. A recommendation by most professional accrediting and regulatory bodies, institutions scramble to pull together collaborations across healthcare education programmes to meet the urgent need to demonstrate this mode of learning together across professions is embedded within respective curricula. IPE is widely believed to facilitate better understanding across professions, with the ultimate understanding that exposure and collaboration prior to joining the workforce may improve patient care and safety. Logistical challenges, however, may result in tokenistic attempts to placate regulators. Through looking at recent IPE intervention attempts, success factors were sought to plan and develop less tokenistic and more sustainable interventions.

Summary of Work: IPE interventions were analyzed to find common themes resulting in successful implementation. Interventions included (1) a periarrest simulation for final-year medical students accompanied by nursing and pharmacy peers, (2) a large-scale novel cross-institutional conference for medical and pharmacy students and (3) a small-scale cross-institutional intervention for medical, physician associate and pharmacy students, and (4) lecture-based preclinical IPE simulations with pharmacy and medical students.

Summary of Results: Successful interventions shared common features: they were piloted, had a theoretical underpinning to them, and received institutional level support with financial and administrative measures in place. Small-scale interventions without institutional level backing and logistical support were unsuccessful. Small-scale interventions, even those involving multiple programmes, but with institutional level support, staffing and other resources well thought out and planned in advance were more likely to succeed.

Discussion and Conclusions: The logistics of organising IPE interventions are not insurmountable. Institutional buy-in, sufficient staff, administrative support (including room bookings and student timetables), and financial resources must be secured prior to developing interventions. Piloting interventions allows a clearer understanding of the logistical challenges involved with implementing and embedding large-scale interventions across programmes.

Take-home Messages: 1. To succeed, IPE interventions require institutional level buy-in, with significant and sustained administrative investments in place; 2. Dedicated staff, with a grounding in the theoretical background, are more likely to make interventions succeed; 3. Small-scale interventions across multiple programmes are more likely to succeed than large-scale cross-institutional interventions.

Authentic interprofessional placements: how university staff understand and influence placement design

AUTHOR(S):

- Stacie Attrill, Flinders University, South Australia, Australia (Presenter)
- Chris Brebner, Flinders University, South Australia, Australia
- Paige Chewter, Flinders University, South Australia, Australia

ABSTRACT

Background: Interprofessional placements that enable students to develop related practice skills are critical to meet the needs and expectations of employers in many contemporary health workplaces. However, university staff often direct the design of placements to meet students' perceived interprofessional learning requirements, rather than patient needs or to enhance interprofessional work practices. This project identified how university staff's knowledge of interprofessional concepts influenced their design of placement activities for diverse health workplaces.

Summary of Work: Twenty-one university staff members from ten health professions who organise or teach students undertaking professional placements participated in a semi-structured interview. Interviews explored participants' understanding of interprofessional education and placements, how professional accreditation processes affect interprofessional training, and future interprofessional placement design. Interviews data were analysed using a Framework Matrix, and interpreted using Gidden's (1984) Structuration theory.

Summary of Results: Participants demonstrated a fixed, but incomplete understanding of interprofessional learning and the interface between this and professional accreditation requirements. Their knowledge of interprofessional learning, shaped by the university context, influenced and often limited their design of work-based interprofessional placements and the range of potential activities that students could engage with to accord with university priorities. Categories identified as structural placement barriers were typical of university constraints; including timetabling, whole of cohort experiences, perceived professional accreditation constraints and cost. In designing future placements, participants prioritised known university constructs, including using block placements; traditional clinical models and simulations. Participants did not identify placement designs that prioritised local work practices or activities germane to workplace settings.

Discussion and Conclusions: University staff knowledge about interprofessional concepts were structures that influenced and limited how they constructed placements. Their university-based understanding of interprofessional activities set cognitive boundaries that both informed and limited how interprofessional learning may relate to workplaces. This prioritised student learning needs over their participation in authentic interprofessional activities identified and prioritised by workplace staff.

Take-home Messages: How interprofessional concepts were understood by university staff were structures that informed how they designed placements. This understanding is likely to differ from interprofessional activities identified by health staff. As such, to ensure authentic student learning experiences that reflect interprofessional activities and priorities germane to health workplaces, university staff should co-design placements with industry.

An interprofessional curriculum co-constructed by healthcare students and teachers

AUTHOR(S):

- Sofia Perrotin, Faculté de Médecine Lyon Est, France (Presenter)
- Lucile Wahl, Faculté de Médecine Lyon Est, France

ABSTRACT

Background: Collaboration between health professionals has been promoted in France by the Hospital-Patients-Health-Territory Act since 2009. Effective interprofessional education (IPE) enables effective collaborative practice as stated by the World Health Organization, and as such should be part of future healthcare professionals' curriculum. Pan-Canadian Consortium for Inter Professionalism in Health published in 2010 a national repository of inter-professionalism competencies to encourage this practice. In Lyon, we are developing an IPE including pharmacy, nursing, social sciences, medicine, physiotherapy and speech therapy. To construct the most appropriate curriculum, we need to understand teachers' and students' objectives and how they expect to work together. Our primary aim will be to explore these objectives and expectations.

Summary of Work: A working group was set up in Lyon Est Faculty of Medicine since April 2018, to bring together teachers from the six health and social professions for the implementation of an IPE curriculum. Collaborative partnership between teachers during the construction of this curriculum should help to develop students' interprofessional competencies. To understand both teachers' and students' expectations, we organized a qualitative study with students focus groups and teachers interviews of each profession.

Summary of Results: Teachers interviews started in January 2019. Students focus groups are to be organized between February and March 2019. The various components of interprofessional competencies are expected to be discussed as well as the logistics requirements and the assessment modalities.

Discussion and Conclusions: An IPE curriculum should be built by a collaborative interprofessional team. Teachers and students from the different profession will take part in its development if they are involved since the beginning. Interprofessional collaboration in healthcare enables more efficient management through shared competencies, especially in a context of increasing complex medical care. Regarding the benefits of this curriculum, we expect increased collaboration for interprofessional-educated students. We hope this study will help future implementation of IPE curriculum in various local contexts.

Take-home Messages: An interprofessional curriculum co-constructed by students and teachers, and integrated early in students' training, could foster collaborative practice during studies and future professional life.

Constructing one day simulation, providing three level benefits. Is it possible?

AUTHOR(S):

- Alla Bronshtein, Tel Aviv University, Israel (Presenter)
- Ronny Tepper, Tel Aviv University, Israel
- Yael Gilboa, Tel Aviv University, Israel

ABSTRACT

Background: Simulation is becoming more commonly used for initial training purposes and for continuing professional development. The literature studies classification of simulation techniques, students and tutors satisfaction with simulation day and its outcomes. However, there is no comprehensive approach for constructing simulation day with multiple level benefits.

Summary of Work: We developed simulation day with three level benefit during genecology clerkship, providing: 1. Macro feedback at the department level by valid and reliable tutors questionnaire. 2. Tutors skills development by direct observation and feedback given by professional medical educator. 3. Students clinical skills development by simulation day, including multiple simulation experience, professional medical educator and tutors feedback. Simulation day development was based on John Kotter approach.

Simulation day influence and effectiveness was measured at all intervention levels by multiple valid and reliable tools at the end of the simulation day and at the end of the clerkship. 1. Students satisfaction and skill development was measured by Likert scale and open ended students questionnaires, combined with focus group interviews. 2. Tutors satisfaction and skills development was measured by Likert scale and open ended questionnaire, combined with open interviews. 3. Department influence was measured by curriculum text analyses, interviews with head of the clerkship and heads of clinical departments.

Summary of Results: Simulation day had significant influence at three levels. 1. Students reported high satisfaction, developed clinical approach and physical examination skills. These results deepened at the end of the clerkship. 2. Tutors reported high satisfaction with the simulation day, developed tutors skills, especially in providing feedback and conducted significant changes during remaining weeks of clerkship after simulation day. 3. At the department level changes were introduced into curriculum at the end of each year.

Discussion and Conclusions: Constructing simulation day with multiple level benefit achieves multiple outcomes at students, tutors and department levels. Thus, the approach is worth applying for simulation day at different clerkships.

Take-home Messages: Constructing simulation day with multiple level benefits may reduce human and financial resources invested in simulation development, however further research is needed.

Innovate, Integrate, Simulate! An innovative approach in cross-speciality simulation: results from an experimental teaching programme on psychiatric emergencies

AUTHOR(S):

- **Harriet Greenstone, Avon and Wiltshire Mental Health Partnership Trust, UK (Presenter)**
- Kate Seddon, Avon and Wiltshire Mental Health Partnership Trust, UK
- Rebecca Holman, Central and North West London Foundation Trust, UK
- Katie Wooding, Avon and Wiltshire Mental Health Partnership Trust, UK

ABSTRACT

Background: Use of simulation is well-established in teaching practice across a range of medical specialties. However, to date, simulation has not been fully integrated into teaching of psychiatry. With a growing call for parity of esteem between mental and physical health, the importance of training medics to provide holistic, integrated, high quality care has never been greater.

Summary of Work: We created an innovative and unique simulation teaching programme for Bristol medical students on psychiatric emergencies. Between August 2017 and January 2019, a three hour, one-off high fidelity simulation session was offered to undergraduate medical students on their Psychiatry placements in Bristol, Bath, Yeovil and Gloucester. Over sixty students attended sessions run by psychiatric trainees over an 18-month period. In-depth written feedback was gathered and results were analysed.

Summary of Results: Quantitative analysis showed that 100% of the students reported an increase in confidence in recognition and management of psychiatric emergencies following the sessions. Analysis of free-text comments showed two main themes, which were consistent across location, group size and facilitator. Firstly relating to the importance and relevance of 'psychiatry knowledge' across all settings, including acute medical settings such as A+E. Secondly the appreciation for the overlap between psychiatry and physical health, and the need to have a thorough understanding of how to manage a deteriorating patient, regardless of place of work.

Discussion and Conclusions: These results show the benefits of using simulation to teach psychiatry, not only in improving students' knowledge of psychiatric topics, but also in improving students' ability to integrate care between different specialties. This is important in developing students as well-rounded professionals with adaptable clinical skills, and develops students' abilities to take a person-centred and holistic approach towards patients.

Take-home Messages: 1. High fidelity simulation used in psychiatry is innovative but currently underused, despite our results showing excellent outcomes. 2. Simulation teaching improved undergraduate students' self-reported confidence in recognition and management of psychiatric emergencies. 3. Use of 'cross-speciality' simulation is well received by students and promotes integration of physical and mental health, as well as raising awareness amongst undergraduates about the need for psychiatry knowledge in acute settings.

Material Concepts: Integrating theory and practice during simulation-based training to support procedural skills retention and transfer

AUTHOR(S):

- Jeffrey Cheung, The Wilson Centre, Canada (Presenter)
- Kulamakan Kulasegaram, The Wilson Centre, Canada
- Nicole Woods, The Wilson Centre, Canada
- Ryan Brydges, The Wilson Centre, Canada

ABSTRACT

Background: Instruction that encourages trainees to integrate conceptual 'why' and procedural 'how' knowledge improves their transfer of procedural skills. For training away from the bedside and direct supervision, questions remain on how to represent the causal relationship between clinical concepts and procedural actions (e.g., how patient anatomy relates to inserting a needle). We varied the modality and level of interactivity when presenting these causal relationships during simulation-based lumbar puncture (LP) training and measured impacts on participants' retention and transfer.

Summary of Work: During a 1-hour session, we randomized 66 medical students to one of three instructional interventions: i) procedural-only video-based instruction, ii) integrated video-based instruction, and iii) integrated simulation-based instruction. One-week later, we tested participants' LP skill retention and transfer, and their conceptual knowledge on a written test.

Summary of Results: Simple mediation regression analyses revealed that participants receiving integrated instruction had superior LP retention and transfer skills via gains in conceptual knowledge (all $p < 0.01$). We found no significant performance differences between the integrated groups ($p > 0.01$). Participants receiving procedural-only instruction practiced significantly more LPs during training ($M = 2.36$) than participants receiving integrated video-based ($M = 1.82$) and simulation-based instruction ($M = 1.50$), $p < 0.05$.

Discussion and Conclusions: Trainees' ability to create cognitive connections between conceptual and procedural knowledge appears to improve when they interact with instructional materials highlighting the causal relationships between these knowledge types. Simulation experiences can be designed to make abstract clinical concepts visible using hands-on, interactive modules, which enhances trainees' conceptual knowledge, as well as, their skill retention and transfer. However, integrated instruction reduced participants' time to practice LP scenarios, which may have reduced the effectiveness of our efforts to promote such 'cognitive integration'. We suggest that more advanced trainees with baseline procedural proficiency may experience greater benefits from such integrated instruction.

Take-home Messages: Simulation presents a unique education modality for delivering instruction that helps trainees build cognitive connections between the theoretical concepts and procedural actions of clinical skills. Integrated instruction improved trainees' skill retention and transfer, despite reducing how many LPs they could practice. Simulation-based instructional approaches that facilitate cognitive integration may reduce the need for high-tech and high-cost simulations.

Teaching old dogs new tricks: Is simulation-based medical education only for novices?

AUTHOR(S):

- **Lisbeth Andreasen, Copenhagen Academy for Medical Education and Simulation, Denmark (Presenter)**
- Ann Tabor, Center for Fetal Medicine and Ultrasound, Rigshospitalet, Denmark
- Lone Nikoline Nørgaard, Center for Fetal Medicine and Ultrasound, Rigshospitalet, Denmark
- Charlotte Ringsted, Center for Health Sciences Education, Faculty of Health, Aarhus University, Denmark
- Puk Sandager, Institute for Clinical Medicine, Department of Obstetrics and Gynecology, Aarhus University Hospital, Denmark
- Martin Tolsgaard, Copenhagen Academy for Medical Education and Simulation, Denmark

ABSTRACT

Background: The majority of studies on simulation-based medical education (SBME) involve novice learners. Experienced clinicians may benefit from SBME, as numerous studies demonstrate inconsistent correlations between competence and clinical experience. Yet, according to expertise-reversal effect theory the structured format of SBME may have negative effects due to interaction with clinicians' prior knowledge. Moreover, experienced clinicians may perform too well for SBME to offer meaningful advancements in their clinical performance. We examined the effect of SBME and its interaction with learners' prior clinical experience on transfer of skills using ultrasonic fetal weight estimation.

Summary of Work: Medical doctors from Obstetric departments with different levels of clinical experience were randomized 1:1 to intervention or no training (controls). Participants estimated fetal weight by ultrasound in two pregnant women at term. Birth weights were compared to the estimated fetal weight. The intervention group trained using the virtual reality ultrasound simulator 'Scantrainer' from Medaphor (Cardiff, UK) in addition to their clinical training. The control group continued their clinical work as normal. All participants performed another two fetal weight scans after approximately 2.5 months. Participants in the intervention group were surveyed on their reactions toward the usability of the training format as well as metacognitive aspects of learning through simulation.

Summary of Results: The intervention group (n=36) reduced their diagnostic error by 31.9% (95% CI 6.9-50.1) (p=0.02), whereas the control group (n=34) did not (13.1% (95% CI, -17.9 " 55.9), p=0.45). This difference was significant (p=0.02). There was no effect of clinical experience (p=0.54) on the effect of the intervention. Experienced participants rated the usability of SMBE significantly lower than the inexperienced participants (p=0.014) and found that SMBE did not improve their conceptual understanding of ultrasound (p=0.001).

Discussion and Conclusions: SBME improved diagnostic accuracy of ultrasonic fetal weight estimation in at-term pregnancies. The amount of clinical experience had no influence on the effect of SBME in our study context. Even experienced clinicians, who demonstrated high initial diagnostic accuracy, were able to demonstrate clinically significant improvements.

Take-home Messages: Experienced clinicians can benefit from SMBE in spite of self-perceived lack of benefit.

Does one-on-one medication administration simulation improves nursing students' competencies in the clinical setting?

AUTHOR(S):

- Einat Kimhi, Ben-Gurion University of the Negev, Israel (Presenter)
- Rinat Avraham, Ben-Gurion University of the Negev, Israel
- Vlada Shor, Ben-Gurion University of the Negev, Israel

ABSTRACT

Background: One of the biggest faculty challenges in medication administration (MA) education and practice is to increase student competencies in the clinical setting. One-on-one simulation for MA may increase student involvement in each stage of the MA process and to better prepare him/her for MA in the clinical setting. The aim of this study was to examine the influence of one-on-one vs. grouped MA simulation on clinical setting MA.

Summary of Work: A quasi-experimental comparative study was performed with undergraduate nursing students from two subsequent academic years. Self-reported questionnaires estimated students preparedness to MA before and after the simulation. A faculty member assessed students performance during the simulation and in the clinical setting with a tool designed to evaluate MA. Pearson correlation and multivariate linear regression analyses were used to identify predictors of clinical setting MA.

Summary of Results: Among students that practice simulation alone (i.e. one-on-one simulation), clinical setting MA was significantly associated with students preparedness ($r = 0.36, p < 0.01$), faculty assessment of performance in the simulation ($r = 0.30, p < 0.01$), and previous experience with MA ($r = 0.22, p = 0.05$). In a multivariate linear regression model, post-simulation preparedness and MA performance during simulation were associated with higher MA performance in the clinical setting ($\beta = 0.24, p = 0.04, \beta = 0.21, p = 0.07$, respectively). No significant associations were found among students that practice simulation in groups.

Discussion and Conclusions: One-on-one MA simulation is associated with increased students preparedness to administer medication, and improves performance in the clinical setting. Therefore it should be considered in future curricula for undergraduate nursing students. Further study should be designed to examine the long term impact of one-on-one MA simulation on MA in the clinical setting, e.g. reduction of errors.

Take-home Messages: A simulation that resembles MA in the clinical setting (i.e. one-on-one simulation) enables better MA performance of the student.

Improving awareness of medication errors and prevention in nursing students

AUTHOR(S):

- Chia-Jung Chen, Taipei Medical University Hospital, Taiwan (Presenter)
- Shu-Yu Kuo, Taipei Medical University, Taiwan
- Sophia H. Hu, Taipei Medical University, Taiwan
- Hui-Wen Chen, Taipei Medical University, Taiwan

ABSTRACT

Background: Medication errors is common and preventable in health care setting. Nurses play an important role in correcting any potential errors by practicing six rights of medication administration. However safe medication administering often becomes challenge in real clinical scenario. The objective of this study is to evaluate the awareness and barrier of safe medication administration in nursing students.

Summary of Work: This study enrolled 93 nursing students of a four-year university in Taipei, Taiwan. A clinical simulation scenarios consisted of nine medication errors including wrong patient, wrong drugs, wrong dose, drug compatibility, and allergy related error was developed and carried out before and after safe medication administration class. Participants were expected to identify any errors by using the six right practice. A structured medication administration checklist was used by trained rater to assess student's medication administration skills. Students completed their reflection on barriers of medication administration after the clinical simulation class. Descriptive statistics and frequency analysis was conducted.

Summary of Results: The majority of students (93.9%) identified patients correctly using patient identifiers. The correct rate of error identification in dose, medication, allergies, drug compatibility were low (less than 40%) at baseline. After the class, scores of medication errors identification were significantly improved ($p < 0.01$). Students are aware that carefully reading of the drug labelling, speaking-up in any medication errors, further clarifying the drug dose with physicians or pharmacists are of importance to prevent medication error, instead of administering medication without clinical reasoning. Barriers of correctly identification of potential medication errors included wrong belief of 100% error-free prescribing or dispensing system, insufficient clinical experiences, and pressure of fast-paced work environment.

Discussion and Conclusions: Clinical simulation training is effective on improving awareness of safe medication administration in nursing students. Students tend to overlook the carefulness and clinical reasoning required for medication administration. Further simulation training addressing safe medication administration in real clinical situation like heavy workload is warranted.

Take-home Messages: Enhancing awareness of medication administration errors using clinical simulation scenarios is a helpful education strategy for optimal medication safety.

Using an innovative app based tool to enhance experiential learning and reflection

AUTHOR(S):

- **Christine Cook, GPEX, Australia (Presenter)**
- Taryn Elliott, GPEX, Australia
- Sumanta Ghosh, GPEX, Australia

ABSTRACT

Background: Experiential learning and reflective practice are both core elements of family medicine training. To master skills across the broad curricula required within family medicine, it is essential to have experienced a broad range of consultations during training. Evidence of this experience is often required to fulfil family medicine training requirements. Traditionally, collating this evidence has been time-consuming, difficult and not easily linked to reflection and learning goal development. This paper describes an online and app based system that makes this process simple, accessible and clearly linked with reflection and learning.

Summary of Work: GPEX, the training organisation in South Australia delivering the training and education to doctors (GP registrars) specialising in family medicine, developed an innovative app and online tool, GP Explore. This tool assists GP registrars, their supervisors and GPEX to better understand patient diversity and patient load. GP Explore provides: - a simple online or app based interface to enter de-identified patient data; - automatic generation of individualised graphs to show comparative patient diversity and load; - easy access to individual data summaries which can be manipulated by the user to interrogate their patient data; - a clear and integrated process for reflection and generation of learning goals; - reporting tools for the training provider to interrogate group level data.

Summary of Results: GP Explore was introduced to all GPEX GP Registrars in 2018 (n=316). 93% GP registrars completed GP Explore. On average, data entry took less than 30 seconds per patient record. Medical educators reported that 100% of GP registrars who used GP Explore identified gaps in their consulting. 89% of supervisors reported that GP Explore was useful to identify gaps in GP registrar patient diversity and inform learning opportunities.

Discussion and Conclusions: GP Explore has assisted GP registrars and practices to efficiently review and improve GP registrar experiential learning opportunities. In addition, it has provided benefits to the Training Organisation in regards to quality assurance, quality improvement and decision-making.

Take-home Messages: GP Explore is an effective, scalable, innovative app based tool which has demonstrated benefits for GP registrars, teaching practices and the training provider, showing potential for application across different contexts.

Evaluating the Impact of 'Next Generation GP': A national leadership programme for GP trainees and early career GPs

AUTHOR(S):

- Sarah Burns, St Mary's Surgery, UK (Presenter)
- Hannah Morgan, The Elms Practice, Elm Grove, UK
- Nishma Manek, UK
- Mohana Ratnapalan, Portsmouth Hospital NHS Trust, Southwick Hill Road, Cosham, UK
- Johnny Lyon-Maris, GP Education Unit, Southampton University Hospital Trust, UK
- Samantha Scallan, GP Education Unit, Southampton University Hospital Trust, UK

ABSTRACT

Background: Leadership is a key competency in the UK GP training curriculum. However, it is known that GP trainees can complete training without a clear understanding of the complex NHS system they will work within and lacking the skills to lead change effectively. 'Next Generation GP' is a national leadership programme for trainees and newly qualified GPs. It aims to: energise participants through contact with inspiring local and national leaders, facilitate their engagement in peer-networks, and empower participants with the skills and knowledge to lead change within their practice workplace and beyond.

Summary of Work: The 'Next Generation GP' programme comprises six evening sessions over 6 months; in each two leaders share their experience in an interactive workshop. Between February 2017 and December 2018, 428 participants took part in 7 courses running in 6 locations across the UK. All participants (n.428) completed a ten question pre- and post-course evaluation looking at their knowledge of and learning about leadership, as well as space for free text reflections.

Summary of Results: Responses were analysed pre- and post-session, within and between locality cohorts. Overall, participants reported improvement in: knowledge of the structure of primary care in the NHS and its relationship with wider healthcare services, leadership skills, greater confidence and motivation to take up leadership opportunities - many participants reported the intention to take up leadership roles in organisations such as clinical commissioning groups or local medical committees. Free text responses were grouped by theme, revealing four headline areas: 'inspiration,' 'conversations with leaders,' 'confidence,' and 'personal action /development.'

Discussion and Conclusions: Findings from the evaluation suggest that the 'Next Generation GP' programme is meeting a need for leadership education for GP trainees and newly qualified GPs at the point of transition to a complex and rapidly changing NHS. The programme actively promotes engagement in local leadership networks and roles both during training and in the early years post qualification. The evaluation findings will inform future developments such as virtual networking and follow up engagement activities.

Take-home Messages: 'Next Generation GP' is supporting trainees and recently qualified GPs to become the leaders of tomorrow.

GP Trainees' experience of learning opportunities and support mechanisms on the GP vocational training programme: A qualitative interview study

AUTHOR(S):

- **Nadia Fisher-Plum, University of Southampton, UK (Presenter)**
- Sally Curtis, University of Southampton, UK
- Geraldine Leydon, University of Southampton, UK
- Hazel Everitt, University of Southampton, UK

ABSTRACT

Background: General Practice (GP) plays an important role in the NHS and is currently facing unprecedented pressures with increasing workload and work force issues. Enabling GP Trainees to successfully complete their training and become independent practitioners is crucial to addressing these challenges. Understanding why some trainees do well and others do not can be a step towards achieving successful completion of training.

Summary of Work: This aim of this qualitative study was to explore GP Trainees experience of learning opportunities and support available during the three year vocational training programme in the Southampton GP Educational Unit by identifying highlights and difficulties in training. 15 interviews were undertaken with participants from four cohorts. These were audio-recorded and transcribed. Data were analysed and inductive thematic analysis was undertaken.

Summary of Results: Trainees identified several highlights including good rotations, protected time for teaching and supportive clinical supervisors. Feeling valued in their posts, passing exams and forming friendships with peers were also mentioned. Difficulties in training included busy rotations, long working hours, understaffed rotations and keeping up with training requirements. Most participants felt supported during their training. One interviewee experienced significant difficulty and required an extension of training. They reported challenges including communication difficulties, multiple exam failures and difficulty finding a consistent group of peers to revise with.

Discussion and Conclusions: Most trainees enjoyed their training experience, reporting the training programme prepared them to become independent practitioners and allowed them to develop professional relationships and to form friendships and support groups. Relationships with peers, trainers and programme directors were the main source of support. It was difficult to recruit participants who had experienced difficulty and this limited our ability to explore key challenges. These trainees may face challenges, which may impede the development of supportive relationships and this requires further exploration.

Take-home Messages: Most trainees successfully complete their GP training and find the experience positive. However there is a group of trainees who experience significant difficulty and are hard to reach. Finding ways of reaching this group is important in understanding and addressing key challenges they face.

A novel approach to fostering the development of scholarly competence: Capacity building in a distributed family medicine residency training program

AUTHOR(S):

- Joel Andersen, Northern Ontario School of Medicine, Canada (Presenter)
- Tim Dubé, McGill University, Canada

ABSTRACT

Background: Future physicians must develop research and scholarly competence as they prepare for practice in the 21st century. For Family Medicine programs in Canada, there is a requirement that residents are provided with formal learning opportunities to develop scholarly competence. However, there are notable similarities and differences in how research and scholarship is taught across residency training programs, including traditional instructional approaches such as didactic lectures and research block rotations. Furthermore, programs that are distributed across a large geography must consider novel approaches to curriculum delivery.

Summary of Work: At the Northern Ontario School of Medicine (NOSM) in Canada, the distributed community-engaged learning model partners learners and communities throughout a vast land covering 800,000 km². Family Medicine residents undertake clinical experiences across dozens of communities; therefore, it is imperative that they are provided with comparable research and scholarship opportunities. Resident feedback informed the renewal of the research curriculum and the instructional strategies. Further, faculty tutors in several communities were recruited to localize the teaching and supervision, foster the development of scholarly competence, and more closely align residents' projects with clinical and contextual needs of the community.

Summary of Results: The resulting changes to the program have led to a reduction in didactic teaching, increased access to helpful tools and resources through distributed online learning, and augmented the relevance of the research curriculum to clinical practice.

Discussion and Conclusions: Significant improvements were made in terms of both curriculum content and delivery. By leveraging NOSM's distributed model, it is possible to build research capacity among faculty tutors. It appears that increased resident engagement has been stimulated by the opportunities to address contextually relevant primary care research priorities.

Take-home Messages: It is important to consider the various perspectives when undertaking the renewal or the development of a research curriculum. Context matters and practice-informed projects that align with research interests of community-based faculty has the potential to better support residents in their scholarly activities.

Revealing tacit knowledge about facilitating reflection for teacher professionalization

AUTHOR(S):

- **Mario Veen, Erasmus Medical Centre, Rotterdam, the Netherlands (Presenter)**
- Marije van Braak, Erasmus Medical Centre, the Netherlands
- Esther Giroldi, Maastricht University, the Netherlands
- Pieter van den Berg, Erasmus Medical Centre, the Netherlands

ABSTRACT

Background: Reflection education is at the core of Exchange of Experiences-sessions (EoE) during the weekly day release of Dutch GP residents. During EoE, 8 to 15 residents collaboratively reflect on practice experiences. One or two teachers facilitate the process. Teachers and residents value the EoE-sessions highly. Yet, facilitating group reflection is a complex skill (Veen & de la Croix, 2016), especially for beginning teachers. Many best practices are tacit knowledge of experienced EoE-teachers, making them non-transferable and inaccessible to beginning teachers. This situation hinders teacher professionalization.

Summary of Work: We aimed to reveal the tacit knowledge (goals and strategies) behind facilitation of reflection. We collected curricular material on EoE that Dutch GP training institutes provide to their teachers and conducted video-stimulated interviews with 35 teachers. Teachers were stimulated to comment on their theories behind their actual, recorded practice. Using Template Analysis (King, 2012), we deduced an initial list of goals and strategies provided in the curricular material. We then used this initial coding template to code the teacher interviews for additional goals and strategies behind EoE-facilitation.

Summary of Results: The qualitative analysis revealed a rich diversity of facilitation guidelines. Goals behind EoE varied between institutes and teachers, e.g. 'learn to reflect versus learn to participate in group discussion. Similarly, strategies mentioned could conflict between institutes and teachers, e.g. 'give residents turns at talking' versus 'encourage resident's own initiative' to stimulate residents' independent reflection processes. Overall, teachers' reported goals and strategies only partially aligned with those in the curricular material.

Discussion and Conclusions: This inventory of goals and strategies reveals the tacit knowledge behind facilitating reflection during EoE. Its diversity, which might have been induced by the relative lack of formalized guidelines, highlights the complex job of facilitating reflection. Our analysis allowed us to connect the formal curriculum with practice, opening up possibilities to enhance the formal curriculum. Eventually, the tacit knowledge thus revealed can form the basis for teacher training rooted in practice.

Take-home Messages: Teachers' tacit knowledge behind reflection facilitation in GP training varies widely. Combined analysis of curricular materials and video-stimulated teacher interviews proved a powerful tool to reveal that knowledge for future teacher professionalization.

The hidden pervasiveness of therapeutics in the assessment of family medicine trainees' applied knowledge: an analysis of a year's SBA test statistics with lessons for training programmes

AUTHOR(S):

- Chris Elfes, Royal College of General Practitioners, England, UK (Presenter)
- MeiLing Denney, Royal College of General Practitioners, Scotland, UK
- Richard Wakeford, University of Cambridge, UK

ABSTRACT

Background: The applied knowledge test (AKT) of the mandatory MRCGP examinations for UK trainee family physicians comprises 200 items, mainly one-from-five SBAs. It is blueprinted onto a curriculum content specification and computer delivered three times a year. Passmarks are achieved using Angoff (plus measurement error estimate) and linear equating.

Summary of Work: We classified each of 600 items in the three 2017/18 AKT diets as: a) either blueprint-categorised as 'therapeutics' or expert-identified as 'therapeutics-dependent' (though otherwise blueprinted, e.g. 'cardiology'), hereinafter collectively 'therapeutics' items, or b) non-therapeutic items. We examined the 'therapeutics' and 'non-therapeutics' items' scores of all 3,987 candidates in these diets, classified by candidate attempt, gender, binary ethnicity (white, non-white), and degree source (UK/International).

Summary of Results: Although only an average of 2.5% of test items were actually blueprinted as 'therapeutics', 27.3% were identified as 'therapeutics-dependent'. Analyses based on all candidates showed the therapeutics items significantly harder than non-therapeutics (mean scores 70.2% and 73.3%, respectively, $p < 0.001$). First attempt candidates were 88.9% UK graduates, 66.2% female, and 54.6% white; significant score differences on both item groups favoured females, UK graduates and white candidates ($p < 0.001$); pass rates were 83.3% for UK graduates and 42.6% for international graduates, resulting in a changing candidate balance for subsequent attempts (e.g. 44.8% UK graduates on second attempt). Statistical explorations of performance by attempt showed that overall differences in difficulty between therapeutics and non-therapeutics items disappeared after the second attempt, though in the second attempt it was still substantial (mean difference 3.6%, $p < 0.001$). Differences favouring females, UK graduates and white candidates ceased after the first attempt.

Discussion and Conclusions: Questions requiring therapeutics knowledge represent a far more significant proportion of a carefully blueprinted general family medicine applied knowledge test than previously recognised - over a quarter of items. They are found harder than non-therapeutics items overall and by candidate sub-groups. Training programmes should place greater emphasis on therapeutics, particularly for candidates failing the AKT on first attempt.

Take-home Messages: Despite appearing relatively insignificant in a curriculum blueprint, applied therapeutics knowledge permeates a specialist family medicine knowledge test and performance on relevant items is comparatively poor.

The relationship between federal state budgets and the results of the second part of medical licensing exam in Germany

AUTHOR(S):

- Jana Jünger, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy (IMPP), Germany (Presenter)
- Oliver Klimanski, IMPP, Germany
- Richard Lux, IMPP, Germany
- Hossein Shahla, IMPP, Germany
- Eckard Nagel, Institut für Medizinmanagement und Gesundheitswissenschaften, Germany

ABSTRACT

Background: In Germany, about 11,000 students begin medical studies every year, which end with an examination at the end of the clinical part with different results between the universities. The studies are regarded as one of the most expensive educational programs in Germany with a total cost around €200,000/student. These costs are paid by the state, so the students don't have to pay tuition fees. However, the state grants to universities vary from €45 million to €185 million per year. The aim of the study was to analyze to what extent the federal state budget is an indicator for a successful result of the German medical licensing examination.

Summary of Work: With regard to the correlation of budget and examination results, the results of the clinical part of the medical study examination were chosen as the outcome parameter, as these are carried out in a standardised manner twice a year and thus permit excellent comparability of the candidates. Variables were gender, proportion of students with German citizenship, student career in the pre-clinical phase, school report and school leaving certificate due to differing medical faculty admission criteria (best school-leaving examination ratio, waiting times, selection procedures). As it was assumed that the amount of budget had a delayed effect on examination results (dependent variable), a 3-year delay was calculated for the correlation. The calculations also included the independent variables '€1,000 per student/year' and 'professor-student ratio'. Two time series were used for analysis: 2009-2011 and 2012-2014.

Summary of Results: The time series showed that the test results were significantly influenced by the selected variables. After adjustment, the effect was increased and the variable '€1,000 per student/year' is significant in the second time series (b-coefficient: .548). The variable professor-student-ratio has no significant influence. The explained sum of squares of the two time series can be attributed to approximately 7% respectively 20%.

Discussion and Conclusions: Even first results show that a higher budget generates better exam results than a lower one but the explained sum of squares is very small. The results can contribute to the discussion on the rational use of public funds in medical education.

Take-home Messages: Finally, public funding can influence the exam results.

Forging a new identity: experiences of, and perceived attitudes towards, Physicians Associates

AUTHOR(S):

- Megan Brown, Hull York Medical School, UK (Presenter)
- William Laughey, Hull York Medical School, UK
- Gabrielle Finn, Hull York Medical School, UK
- Martin Veysey, Hull York Medical School, UK

ABSTRACT

Background: Physician Associates (PAs) are relatively new within the UK, although the government aims to increase recruitment (BMA 2017), citing time and cost benefits (Drennan et al 2015). Given their emergent status, PAs are still defining their professional identity (PI), defined as ‘a representation of self ... resulting in an individual thinking, acting and feeling like a [PA]’ (Creuss et al 2014). New fields of practitioners often encounter prejudicial attitudes (Jackson 2017), with the attitudes one perceives from others affecting PI within adjacent professions (Creuss et al 2015). We explored student PA's experiences, including attitudes they encounter, to evaluate their needs as developing professionals.

Summary of Work: Two Hull York Medical School (HYMS) authors (MB, WL) conducted semi-structured interviews with 19 PA students at HYMS and University of Sheffield. Research was conducted in line with a general inductivist approach (Thomas, 2006). Interviews were transcribed verbatim and independently coded by two researchers inductively. All researchers conducted thematic analysis, using the thematic network approach (Attride-Stirling 2001). Themes concerning identity formation and role perception were explored, and links made to explain findings.

Summary of Results: Key negative themes identified were: mistaken identity, negative role perceptions and lacking political support. PAs were frequently referred to as medical students and encountered negativity from staff and patients, sometimes precipitating ‘identity crises’. Many also felt pressure to be role ambassadors, given the novelty of their profession. Key positive themes included recognizing supportive influences for identity development: continuity; autonomy; graduate status and clinical skills acquisition. Resilience was noted as indispensable.

Discussion and Conclusions: Identity dissonance was common due to poor access to PA role models and lacking identity support. Perceived attitudes towards students from staff were mixed with a recent increase in positivity, secondary to role familiarity. Yet, resistance and role ignorance persisted, proving destructive. In response to negativity, some students withdrew from learning, while others built resilience, highlighting how individuality determines how attitudes impact identity.

Take-home Messages: Perception of PAs is improving, yet students often initiate advances. Harmful influences and dissonance have propagated from a lack of focus on PA identity. Medical educators must provide support for student PA identity development to ensure career and, therefore, PA workforce success.

Adopting a Quality Improvement Framework to improve Undergraduate Medical Education

AUTHOR(S):

- Anum Pervez, Royal Free Hospital, UK (Presenter)
- Charlotte Pallett, Royal Free Hospital, UK
- Brian Craven, Royal Free Hospital, UK
- Momin Ahmed, Royal Free Hospital, UK
- Efthimia Karra, Royal Free Hospital, UK
- Paul Dilworth, Royal Free Hospital, UK

ABSTRACT

Background: Quality Improvement (QI) has been developed over the past few decades and has proven successful in many healthcare settings, from patient (and population) outcomes to organisational (and system) performance. The science of QI involves reviewing and implementing rapid change strategies through a systematic framework to deliver sustained improvement. The use of QI within the field of undergraduate teaching has remained unexplored with no evidence of it in the current literature. We have thus adopted a QI approach in the delivery of the Undergraduate Medical Education Programme in a major London Teaching Hospital.

Summary of Work: The main aim statement of our QI project ('how good, by when') was to improve student feedback to meet 95% positive experience over a twelve-week period. In order to implement the necessary rapid feedback cycles, we selected the two-week haematology rotation of 4th year medical students. We began by engaging our stakeholders, who included the Haematology department (Junior Doctors, Consultants and Specialist nurses), Undergraduate Teaching Department (Clinical Teaching Fellows, Administrative team, Sub Dean), a QI coach and the 4th year medical students. Using a nominal group technique, we developed our driver diagram to generate change ideas. We then implemented the changes through several PDSA cycles (Plan, Do, Study, Act).

Summary of Results: The following change ideas were implemented: redesign of the timetable, local departmental induction, immediate point of contact for students and end of rotation case presentations. During each PDSA cycle, we tested the impact of the intervention and redesigned further changes according to the student response. Overall, student experience significantly improved from 58% to (final results pending), demonstrated in a run chart.

Discussion and Conclusions: Effective and high quality Undergraduate teaching is essential in training the future workforce. We were able to demonstrate how the implementation of QI methodology (by stakeholder engagement and PDSA cycles) can achieve significant improvement in the student experience. This method can also be adopted in other areas within Undergraduate teaching.

Take-home Messages: The science laid out in the QI framework can be effectively used to improve student experience in the Undergraduate teaching programme.

Transition to academic autonomy of medical universities in Kazakhstan

AUTHOR(S):

- Viktor Riklefs, Karaganda Medical University, Kazakhstan (Presenter)
- Anar Turmukhambetova, Karaganda Medical University, Kazakhstan
- Alma Muratova, Karaganda Medical University, Kazakhstan
- Aliya Bukeyeva, Karaganda Medical University, Kazakhstan
- Aigul Munassipova, Karaganda Medical University, Kazakhstan

ABSTRACT

Background: Three Kazakhstan medical universities participate in Erasmus+ CBHE project Transition to university autonomy in Kazakhstan (TRUNAK). The partners from European Association of Universities (EUA) analysed the status of university autonomy in Kazakhstan and gave recommendations. The primary goal for the project is to develop the model of autonomy that suits the country and create the consulting group for sustainability of project results and providing assistance to other universities to transit to autonomy.

Summary of Work: Having analysed the survey results from several medical and non-medical universities in Kazakhstan, EUA experts gave recommendations for university to take much more active part in selecting its students, defining quantity and qualifications of its teaching staff, completely defining the contents of its educational programs. KSMU created a working group to analyse the feasibility of these recommendations and to create the model for autonomy.

Summary of Results: All medical universities in the country gathered for discussion of the future model of autonomy. The participants expressed significant concerns on feasibility of all recommendations for the current state of development of medical education in the country. The population in the country is not yet ready for free selection of students by universities, the content of educational programs needs to reflect national healthcare priorities, the universities do not yet feel confident to completely regulate qualifications and quantity of staff. Besides that, autonomy requires well-developed external and internal quality assurance system; the increased academic autonomy needs to be accompanied by staff development and training.

Discussion and Conclusions: While all medical Universities in Kazakhstan recognize the benefits of academic autonomy, they express serious concerns on feasibility of immediate autonomy. There needs to be elaborations on gradual and consistent approach to transformation. Academic autonomy goes hand in hand with quality assurance and responsibility. It is first necessary to set up those before adopting full academic autonomy.

Take-home Messages: The academic autonomy in countries with former direct governmental control is best achieved through collaborative efforts of universities participating in joint projects with universities where academic freedom and quality assurance has already become the inherent and inseparable part of educational process.

Nurse-scientists as advocates for nursing: identity development over a two year leadership programme in nursing research

AUTHOR(S):

- Manon Kluijtmans, University Medical Center Utrecht, the Netherlands (Presenter)
- Shaun Cardiff, Fontys, the Netherlands
- Thóra Hafsteinsdottir, University Medical Center Utrecht, the Netherlands
- Marieke Schuurmans, University Medical Center Utrecht, the Netherlands

ABSTRACT

Background: Clinician-scientists, such as nurse-scientists, are bi-directional (knowledge) brokers between care and research. By connecting these fields, they strengthen patient-orientation in research, and enhance clinical application of research and innovation in care. International concern exists about the low numbers among this important category of scientists. The 'Leadership and Mentoring in Nursing Research (LMNR)' programme was developed for postdoctoral nurse-scientists to stimulate research capacity within the nursing science field. Formation of an integrated professional identity is considered an important learning outcome of clinician-scientist programme's to enhance brokering and career resilience.

Summary of Work: We studied professional identity development over the course of a two-year leadership programme for nurse-scientists. Semi-structured interviews were conducted with the LMNR participants: first upon starting in 2016 (n=12: 25% male, age 43 [range 30-54] year), midterm in 2017 (n=11), and lastly after graduation in 2018 (n=10). Interviews were transcribed verbatim, thematically analysed and discussed using dialogical self theory. Results were member-checked.

Summary of Results: During the programme all participants were engaged in postdoctoral research (n=12), often combined with education (n=8), and less frequently with patient care (n=4), or policy and/or management (n=3). Over the course of the programme two participants stopped for personal reasons. Participants reported increased awareness of their different identity positions as a researcher and a nurse. Many then released this dichotomy for a new identity as 'scientist leader of and for nursing and nurses'. Their clinical identity expanded from being an active specialist clinician to becoming an active member of a wider community with trans-specialist interests. Fundamentally, there was a strong desire to retain a nurse identity. Participants maintained acceptance among nursing peers while strengthening (group) connection with nurse-scientist peers as they sought innovative ways of embedding themselves within the wider field of nursing, aiming to enable/lead (knowledge) brokerage between the worlds of (nursing) science and practice.

Discussion and Conclusions: The leadership programme strengthened and solidified a nurse-scientist leader identity. Although literature defines clinician-scientists as researchers active in direct care, our study indicates that clinical practice as 'hands-on care' is not necessarily a prerequisite for strong nurse-scientist identity.

Take-home Messages: Nurse-scientists can be strong advocates for nursing, even when no longer active in patient care themselves.

Teaching Medicine to a General Public: How to Assess If Your Audience Is Learning

AUTHOR(S):

- **Malgorzata Kaminska, University of Northern British Columbia, Northern Medical Program, Canada (Presenter)**
- Trina Fyfe, University of Northern British Columbia, Northern Medical Program, Canada
- Cirisse Stephen, University of British Columbia, Northern Medical Program, Canada
- Lisa Munro, University of Northern British Columbia, Northern Medical Program, Canada
- Sonya Kruger, University of Northern British Columbia, Northern Medical Program, Canada
- Lindsay Mathews, University of Northern British Columbia, Northern Medical Program, Canada

ABSTRACT

Background: Many public medical education programs, such as Mini Med Schools (MMS), frequently limit evaluations to self-reported learner satisfaction. An evaluation program is most helpful when it focuses on Kirkpatrick's hierarchy levels of learning and transfer. Instruments like retrospective pre/post surveys (RPPS) can assess interventions where a shift in learners' understanding can be expected, while script concordance tests (SCTs) can measure clinical reasoning skills in healthcare learners. Could RPPS and SCTs be used to evaluate MMS programs?

Summary of Work: We organized a MMS for the general public consisting of 2-hour weekly for 6 weeks lectures on basic science and biomedical topics, delivered by our medical faculty, and covering the same material as regular medical school lectures. RPPS and SCTs were administered to all participants at the end of each lecture.

Summary of Results: Of the 59 participants (<16 to 69 years old) 30% possessed a college education, 24% had less than a high school diploma, and 20% had a bachelor's degree or higher. RPPS showed an increase of at least 2 points on a 6-point Likert scale. The SCTs' Cohen d effect size between participants and experts was 2.81 (98% response rate), remaining unchanged with a repeat SCT administered 8 weeks post-MMS (47% response rate). The SCT instrument reliability index (Cronbach's alpha) was 0.69. 98% of participants found the assessments to be 'fun and useful'.

Discussion and Conclusions: The RPPS consistently showed a significant self-assessed increase in understanding of the material presented. The ability of our varied non-medical participants to apply their newfound medical knowledge in SCTs was within the effect size typical for medical students. The ability to apply this knowledge 2-3 months later was maintained over time. We are unaware of any other published quantitative data regarding knowledge increase, application, and retention in MMS participants. Most MMS intend to increase the public's health-related knowledge but seemingly only capture enjoyment-related data. Our project suggests that there are easy, reliable, and well-received ways to measure knowledge acquisition and application using RPPS and SCTs.

Take-home Messages: The use of RPPS and SCTs can be used to help guide and improve a MMS curriculum, thus ensuring that the intended knowledge is successfully transmitted.

ECFMG's 2023 Accreditation Requirement - Raising Medical School Standards Worldwide

AUTHOR(S):

- Lisa Cover, Educational Commission for Foreign Medical Graduates (ECFMG), USA (Presenter)
- John (Jack) Boulet, Foundation for Advancement of International Medical Education and Research (FAIMER), USA
- Christine Shiffer, Educational Commission for Foreign Medical Graduates (ECFMG), USA

ABSTRACT

ECFMG Certification is required for international medical graduates (IMGs) to enter U.S. graduate medical education and obtain an unrestricted medical license. Historically, ECFMG Certification has focused almost exclusively on evaluating individual graduates, not their medical schools. Several factors have motivated ECFMG to enhance its criteria to include ensuring the medical school meets international standards for medical education: 1) medical education quality and accreditation systems vary widely; 2) the explosive growth of medical schools compounds these issues; and 3) some questionable medical school business practices create challenges for students and tarnish the reputation of legitimate international medical schools.

Starting in 2023, applicants for ECFMG Certification must be a student or graduate from a medical school that is accredited by an accrediting agency recognized by the World Federation for Medical Education (WFME). WFME's recognition criteria, based on guidelines developed by the World Health Organization and WFME, provide flexibility for the development of accreditation standards that fit the context of a country's medical education system, while also ensuring that the schools being accredited by the agency meet rigorous quality measures.

A hands-on, how-to guide to the development of a medical education accreditation system

AUTHOR(S):

- Sarah Taber, Royal College of Physicians and Surgeons of Canada, Canada (Presenter)
- Tim Dalseg, Royal College of Physicians and Surgeons of Canada, Canada
- Tara Phillips, Royal College of Physicians and Surgeons of Canada, Canada
- Fedde Scheele, VU Medical Center, the Netherlands

ABSTRACT

Accreditation is a key feature of many medical education systems, helping to ensure that programs teach and assess learners according to applicable standards, provide optimal learning environments, and produce professionals who are competent to practice in challenging and evolving health care systems. There can be substantial variation among accreditation systems at the level of design and implementation. Little is known about the effectiveness of certain design considerations and their applicability to different contexts.

A “fit for purpose” framework for the operational design of medical education accreditation articulates design options as well as their contextual and practical implications. It assumes there is no single set of best practices in accreditation system development but, rather, an underlying set of design decisions.

The success of introducing a new or modified system of accreditation is determined not only by the system design but also by the methodology employed in its implementation, which must reflect both the scope and impact of the change and the inherently high-stakes nature of accreditation in many jurisdictions.

Using Accreditation as an Opportunity to Advance Education and Evaluation in Health Professions Education

AUTHOR(S):

- **Maryam Wagner, McGill University, Canada (Presenter)**
- Theresa Beesley, McGill University, Canada
- Carlos Gomez-Garibello, McGill University, Canada
- Mara Kontopoulos, McGill University, Canada
- Tina Russo, McGill University, Canada
- Patricia Wade, McGill University, Canada

ABSTRACT

One of the primary goals of all health profession faculties is to train learners to deliver the highest standard of healthcare. Achieving this goal is dependent on numerous factors including the quality of the curriculum and its delivery, principled assessment, as well as a continuous process of program evaluation to systematically collect information about the extent to which programs are achieving their goals. Typically, these educational facets have been seen distinct from accreditation processes, which are perceived to be obligatory and formulaic. Accreditation processes can be used as an opportunity to advance education (curriculum, assessment and teaching) and its evaluation to improve healthcare.

The presenter will discuss the relationship between accreditation, education and program evaluation in health professions education, how accreditation recommendations can be used to design educational initiatives, and identify ways in which the multiple stakeholders in health professions faculty can collaborate to advance health professions education.

Globalization in Medical Education: Promoting Reflexivity in Educational Practice

AUTHOR(S):

- Omar Selim, University of Toronto, Department of Surgery, Canada (Presenter)
- Ebbe Thinggaard, Copenhagen Academy for Medical Education and Simulation (CAMES), Denmark
- Robert Paul, University of Toronto - Institute of Health Policy, Management and Evaluation, Canada
- Rabia Khan, University of Toronto - Wilson Centre for Health Professions Education, Canada
- Tina Martimianakis, University of Toronto - Wilson Centre for Health Professions Education, Canada

ABSTRACT

Introduction: The WHO has identified a global shortage in health human resources. To address this shortage, health care leaders and educators are working to attract foreign trained health professionals to minimize the HHR gap (s). As with any solution to a problem there can be unintended consequences - in this case, it can be conflicts that arise between core educational concepts dependent upon where health professionals are educated. This is especially true when simulation methodologies are used in teaching as many assumptions are embedded regarding culture, context and what knowledge is most legitimate. This use of simulation to support HHR needs raises a number of important questions. How are we managing the changing diversity that comes from an ever-globalized world? Are we equipping medical educators to deal with and to navigate the complexities of globalization and its effects on education? What is our socio-political and ethical responsibility when engaging in medical education work across diverse cultures and national boundaries? In this round table discussion, we will discuss these challenges can arise, manifest and be understood using the context of a common clinical learning case, the simulation of a lumbar puncture or appendectomy. Attendees will be asked to discuss or debate the competencies (technical and otherwise) necessary to evaluate the learner and reflect on the universality of these competencies. A sample curriculum may be provided to assist in this exercise.

We intend to engage attendees with these issues in order to help them better appreciate the consequences of their day-to-day practices, particularly when they participate in cross-cultural and with cross-national pedagogy. Attendees will also consider how curricular content can be inclusive of diversity.

#9U Conference Workshop

9U (3331)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1600-1730

Location of Workshop: Room L8, Level 1

Where do I start? Devising questions, aims and objectives when writing systematic reviews in medical education. A BEME workshop

PRESENTER(S):

- Teresa Pawlikowska from (Royal College of Surgeons, Ireland)
- Sophie Park (University College London/Institute of Education)
- Elaine Alais Susanna Hill (University of Central Lancashire / Blackpool Victoria Hospital)
- Erica Smyth (Royal College of Surgeons, Ireland)

ABSTRACT

Background: Many health education systematic review reports are limited by a lack of clarity in stated goals or a mismatch between the actual aims of the work and the needs for synthesis in the field. As such issues are rarely related to the methodology or scope of the work itself, but merely planning, in this workshop, BEME will explore this vital stage of the review process for all potential authors of health education systematic review.

Who Should Attend? All those interested in writing any kind of systematic review and evidence synthesis in all fields of healthcare.

Structure of Workshop: Preliminary information will be sent to participants in advance to the workshop (video and other material). The workshop will start by a short introduction to the stages of the BEME review process, particularly when planning a review. Participants will review a sample of titles, backgrounds and conclusions from actual BEME reviews and identify potential areas of concern using a variety of tools, with a whole group debrief to identify key areas of focus when planning and how research questions were addressed in conclusions. Small groups will then work on a participant's concept a) to devise appropriate research questions b) to report conclusions based on initial questions, followed by a group discussion.

Intended Outcomes: To develop skills in:

- Devising specific aims for systematic review in healthcare, particularly considering those that give the best potential outcomes from the works
- Planning a coherent review from research question into the transference to practice.

Level: Introductory / for beginners

#9X Conference Workshop

9X (3224)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1600-1730

Location of Workshop: Room 0.96-97, Level 0

Integrating planetary health concepts into the educational curriculum

PRESENTER(S):

- Brett Duane, Trinity College Dublin, Ireland
- SanYuMay Tun, Imperial College, London, UK
- Richard Ayres, Peninsula Medical School, UK

ABSTRACT

Background: Public health focuses on the protection of health. Fundamental to this is a planet that sustains optimal health of all. System transformation in the living and working environment is required, based on recognition of the independency between planetary health and personal health. Health professionals are educated to advocate for health within their areas of expertise. The clinician has been quiet in this regard and there is an urgent need to raise awareness of this independency.

Organisational change is complex with action required in the international, national, regional and local area to influence change. Health professions need to work to influence national healthcare professional council agendas, develop models of sustainable clinical care (e.g. nephology, dentistry), work within their profession, develop peer to peer training and influence their own learning environment.

Who Should Attend? Public health educators Clinical teachers Clinical teaching fellows Curriculum developers Healthcare students

Structure of Workshop:

5 minutes: introduction and prior expertise

15 minutes: introduction to the concept of planetary health, its relationship to public health and the implications for health professions

15 minutes: interactive exercise relating planetary health to participants' own context, identifying learning needs

10 minutes: introduction to case studies where healthcare students have been taught about the bi-directional relationship between healthcare and the environment.

15 minutes: introduction to case studies including setting up national working groups, peer-to-peer learning, and how the healthcare curriculum was influenced both locally and nationally

30 minutes: whole group facilitated discussion on barriers and facilitators to achieving these aims

Intended Outcomes: Participants will:

- be introduced to the planetary health conceptual framework;
- relate this to their own context, identifying related learning needs for themselves/ their students;
- through critical appraisal of case examples, discuss how existing modules can be enhanced to include the core concepts of planetary health;
- through discussion of case examples, explore the role of health professions in influencing national and local changes to protect planetary health, and how this may be supported through education;
- develop strategies to lead/influence change within their institution

Level: No prior expertise required other than familiarity with the undergraduate learning environment

#9Y Conference Workshop

9Y (672)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1600-1730

Location of Workshop: Room 2.17, Level 2

Putting threshold concepts into practice in health professions education: changing the way we teach, research and design curricula

PRESENTER(S):

- Hilary Neve, University of Plymouth Peninsula Medical School, UK
- Sarah Meek, University of Glasgow, School of Medicine, UK
- Virginia Randall, Uniformed Services University of the Health Sciences, USA
- Ellie Hothersall, School of Medicine, University of Dundee, UK
- Andy Wearn, University of Auckland, Faculty of Medical and Health Sciences, New Zealand

ABSTRACT

Background: Threshold Concepts (Meyer & Land, 2003) have been studied across multiple disciplines and there is growing interest within the health professions (Neve et al, 2015). Threshold concepts (TCs) are transformative and troublesome. Getting to grips with TCs can change the way we view education, but grasping their meaning and how they differ from core concepts can be difficult (Davies & Mangan 2005). Indeed TCs may themselves even be a threshold concept. This interactive workshop will be led by educators who have grappled with, researched and published work on TCs and who regularly use the ideas in practice. All are members of the international TCs in Health Network (CATCH). The workshop will build on Ray Land's keynote talk by deepening participants' understanding of the TC framework and exploring its relevance to research, teaching and curriculum development.

Who Should Attend? Anyone who loves pedagogic ideas and is intrigued to look at their education work from a new perspective.

Structure of Workshop: This interactive workshop will involve pairwork, brainstorming, small group activities and electronic voting. Following introductions and a brief revisit of TCs, participants will reflect on their own personal experiences of troublesome learning, the liminal space and threshold crossing. Supported by brief presentations about research methodologies and findings and TCs communities of practice, participants will analyse student language using the TC Framework and consider how noticing such language can be useful to teachers, learners and scholars. They will also participate in a form of Transactional Curriculum Inquiry (Cousin, 2009), exploring threshold concepts relevant to their own settings.

Intended Outcomes: By the end of the workshop, participants will:

- Have a deeper understanding of threshold concepts and relevant research findings.
- Be able to use the TC Framework to analyse learner language and understand the benefits of this
- Have identified ways to support learners through the liminal space and across thresholds
- Be aware of a range of approaches for identifying possible TCs and considered TCs relevant to their own setting
- Have identified ways to apply these ideas in their own practice
- Know where to find more information or support

Level: Suitable for any level

#9Z Conference Workshop

9Z (553)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1600-1730

Location of Workshop: Room 2.44, Level 2

How to create a Quality Culture - not a Quality Straightjacket

PRESENTER(S):

- Renee Stalmeijer, Maastricht University - School of Health Professions Education, The Netherlands
- Jill Whittingham, Maastricht University - School of Health Professions Education, The Netherlands
- Guy Bendermacher, Maastricht University - School of Health Professions Education, The Netherlands
- Pia Strand, Faculty of Medicine, Centre for Teaching and Learning, Sweden
- Diana Dolmans, Maastricht University - School of Health Professions Education, The Netherlands

ABSTRACT

Background: Health professions education programs are tasked with designing curricula to effectively and efficiently equip their graduates with the required competences and life-long learning skills needed for today's fast-paced, knowledge intensive society. Continuous monitoring and improving of educational quality is essential to attain these goals. Quality assurance is multi-faceted and requires the engagement of various stakeholders and tailored evaluation procedures. Worldwide, institutions invest time and effort in building and maintaining systems of internal quality assurance; i.e., through student evaluations, educational expert committees and faculty development. However, the presence of systems and information does not naturally result in continuous improvement of educational quality. Quality assurance systems have been described as treading on a fine line between being experienced as "policing" faculty behaviour (putting too much emphasis on control and accountability) instead of stimulating faculty and administrators to continuously improve their education. The challenge therefore is to collaboratively achieve a quality culture in which all stakeholders experience ownership and meaningful involvement in continuous improvement of education.

Who Should Attend? Students with governing roles, Educators, Department managers, Educational Leaders, Administrators

Structure of Workshop: After a general introduction into the relevant concepts related to internal quality assurance and quality culture, the workshop provides the opportunity to share experiences, discuss different approaches that are used to engage academic staff and students to become an active part in the quality assurance process and long-term development of a quality culture. We will work with several, activating workshop techniques like case discussion, buzz groups, replying to (online) propositions, and group work.

Intended Outcomes: During the workshop, participants will start to collectively define building blocks necessary for creating an effective quality culture within their own organisation through addressing questions such as:

- What is the aim of quality assurance within our organisation - monitoring versus improving?
- Which quality assurance practices are currently in place? What are best practices?
- What do we mean when we say 'quality culture'?
- How can we stimulate a quality culture?

Level: Introductory/Intermediate

#9AA Conference Workshop

9AA (1764)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1600-1730

Location of Workshop: Room 2.61, Level 2

Case Based Blended Learning (CBBL) - a strategy to foster the transfer of declarative to procedural knowledge or more?

PRESENTER(S):

- Sebastian Ertl, Medical University Vienna, Austria
- Tamara Seitz, Dept. for Internal Medicine, General Hospital Vienna, Austria
- Monika Himmelbauer, Medical University Vienna, Austria
- Henriette Løffler-Stastka, Medical University Vienna, Austria

ABSTRACT

Background: The close connection of theory and practice is a common aim of Case Based Learning courses, as is the development and fostering of the transfer from declarative to procedural knowledge. This transfer-learning in medical education has been highly advocated in the 2010 Lancet report.

Who Should Attend?

Persons, who are interested in didactic considerations to foster international, multidisciplinary team work and new eLearning methods.

Teachers, researchers, and advanced students, who are interested in understanding the teaching and training of procedural knowledge and clinical practice.

Structure of Workshop: The aim of the first study is to show how procedural knowledge, measured as student's competence performing three procedural clinical reasoning skills could be improved by a case based blended curricular element, consisting of eLearning cases with interactive questioning format and clinical training seminars with standardized patients. The aim of the second paper is to show, how a case-based, e-learning system influences the learning effectiveness and grades among medical students at the medical university of Vienna. This study was designed to measure and quantify the potential of e-learning as a new teaching technique. The third paper reports the students' satisfaction and acceptance of the implemented case-based eLearning program in the fields of psychiatry, microbiology and laboratory medicine and orthopedic surgery pointing on the value of autonomous motivation and affective involvement fostering efficient learning styles. Fourth, the clinical case/standardized patients (SP) - based training seminars and the importance of the quality of the SP's roleplay and feedback are presented as one part of the didactic efficiency. Another important aim while fostering procedural knowledge is the development of metacognitive reflecting functioning in clinical practice. Possibilities of implementation are shown in the fifth paper. Last, an international comparison of case-based eLearning methods (Basel, Vienna), including the comparison of distant learning and blended learning (Vienna, London) is presented. In general, an insight into procedural skills training, its interdependence with learning surroundings and autonomous motivation, with a focus on international, multidisciplinary teamwork and new eLearning methods is given.

Intended Outcomes: Get insight into procedural skills training, its interdependence with learning surroundings and autonomous motivation.

Level: All

#9BB Conference Workshop

9BB (2147)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1600-1730

Location of Workshop: Room 2.83, Level 2

Experience based learning: helping patients co-participate actively with students and clinicians in workplace education

PRESENTER(S):

- Tim Dornan, Queen's University Belfast, UK
- Grainne Kearney, Queens University Belfast, UK
- Hannah Gillespie, Queens University Belfast, UK
- Helen Monaghan, Queens University Belfast, UK
- Richard Conn, Queens University Belfast, UK
- Deirdre Bennett, University College Cork, Ireland

ABSTRACT

Background: Medical education for the future, it has been proposed, should be 'patient-focused in purpose and democratic in organisation'. The 'staunchly individualistic hero-doctor' should no longer be the ideal(1). This workshop helps participants realise this vision. It presents a novel pedagogy that guides the workplace learning of students who are not yet licensed to practice. Experience Based Learning (ExBL) is the product of programmatic research, two systematic reviews of 291 articles reporting 'best evidence', and experiential evidence provided by two panels: clinician-educators from 17 countries in five continents; and a team of students, residents, and educators, members of which will facilitate this workshop. Students become doctors, according to ExBL, by co-participating in practice with patients and clinician-educators. 'Real patient learning' (RPL) and the identity and capability of a doctor result from students reflecting on interactions with patients. Conditions of support foster ExBL.

Who Should Attend? Clinician-educators who wish to optimise patients participation in medical students workplace learning and prepare students for patient-centred practice

Structure of Workshop:

- Faculty from 5 countries will interact with participants throughout the session, facilitating discussion and sharing insights
- After participants have introduced themselves, facilitators will explain ExBL and highlight ways clinicians can encourage patients to be active agents in students' learning
- Participants will work in small groups to analyse factors that help and hinder ExBL in their locality
- A snowball method will optimise interaction and sharing of perspectives between participants
- All stakeholders will contribute their perspectives to a plenary session

Intended Outcomes:

- Develop a practical understanding of ExBL including the following:
 - The concept of supported participation in practice
 - Ways of promoting patients' and students' co-participation
 - Techniques to help students reflect on real patient experience
 - An understanding of how identity and a broad range of capabilities result from clinical workplace learning

Level: Intermediate to advanced

#9CC Conference Workshop

9CC (195)

Date of Workshop: Tuesday, 27 August 2019

Time of Workshop: 1600-1730

Location of Workshop: Room 2.95, Level 2

Assessing Assessment. Best practice approaches in assessment from ASPIRE assessment award winners

PRESENTER(S):

- Debra Klamen, Southern Illinois University School of Medicine, USA
- Anna Cianciolo, Southern Illinois University School of Medicine, USA
- Heeyoung Han, Southern Illinois University School of Medicine, USA

ABSTRACT

Background: There are only 5 ASPIRE assessment award winners. Faculty from SIUom, one of those 5, will discuss what is meant by assessment excellence and present its key ingredients. Participants will discuss challenges and innovations in effective practical assessment, and facilitators will present examples of from their own institution. Participants will gain an understanding of what is needed to excel in the area of assessment, including an understanding of the specific elements that need to be developed, and tips/suggestions for how those elements might be implemented. Tips for writing an effective ASPIRE application in the area of assessment will be given as well, if participants are interested. Depending on the size of the group of participants and the interests, we are prepared to focus on specific areas of interest with participants by dividing the group into smaller, more specific working groups.

Who Should Attend? Attendees from medical schools looking to improve their assessment processes at their schools. Schools looking to apply for an ASPIRE award in assessment as well.

Structure of Workshop:

- Introductions of speakers and topic, needs assessment of level of learners - 10 minutes
- Short presentations (powerpoint) of the 5 critical elements of an ASPIRE assessment award as an infrastructure to focus discussions - 5 minutes/topic x 5 topics =25 minutes
- After each short presentation, large and/or small working groups will be broken out and asked to fill out worksheets and discuss them. Worksheets will consist of space to jot down thoughts at each prompt, then used to share participants thoughts and ideas. In addition there will be space for jotting down others good ideas as well as ones own reflection on program needs. Worksheet time - 10 minutes/topic X 5 topics = 50 minutes.
- Wrap-up - 5 minutes

Intended Outcomes: At completion of the workshop participants will be able to:

- 1) Appreciate the key ingredients of assessment in an institution exhibiting excellence
- 2) Identify challenges and best practices from their and other institutions
- 3) Understand what convincing evidence is needed for a successful ASPIRE application
- 4) Better prepare for the ASPIRE application writing process through improving assessment processes at their home institutions

Level: All levels welcome

Perceptions and Attitudes of Medical Students and Faculty Towards Internet and Facebook Addiction

AUTHOR(S):

- Devanuj Duara, SSR Medical College, Belle Rive, Mauritius (Presenter)
- Aishwarya Gaur, SSR Medical College, Mauritius
- Ishan Vijayvargiya, SSR Medical College, Mauritius
- Kamesh Waran, SSR Medical College, Mauritius
- Dr Namrata Chhabra, SSR Medical College, Mauritius

ABSTRACT

Background: Internet addiction is becoming an emerging psychological problem worldwide. Use of internet and social networking websites has gained substantial interest among medical students and academicians. Several studies have reported association of internet over usage with signs and symptoms of depression, anxiety, low self-esteem and procrastination. To assess the prevalence, perceptions and attitude of medical students and faculty towards Internet and Facebook addiction.

Summary of Work: A cross-sectional survey including 235 students of all study levels and 21 faculty members was carried out using online validated semi-structured questionnaire; focus group discussions and in-depth interviews. The addiction was based on the number of times subjects agreed with the stipulated signs of overuse in the Internet and Facebook addiction tests.

Summary of Results: Overall Internet addiction was detected among 44.4% students and 39.6% faculty members. The major symptoms of internet addiction identified were: spending more time on internet than even realized (26% students and 40% faculty); isolating from family or friends (17% students); becoming defensive about time spent online (10% students and 5% faculty); facing difficulty in completing tasks due to excess time spent online (17% students and 5% faculty) and euphoric feeling when involved with internet activities (16% students and 15% students). The study revealed considerable impact of Internet and Facebook overuse on the social life and mental health. The implications of internet addiction observed were: anxiety, irritation, sleep deprivation, social isolation, decreased productivity and time mismanagement. Despite realizing implications of over usage, 44.6% students and 65% of faculty had never tried to overcome Internet addiction. Majority of the students and faculty admitted that they used Facebook when they had nothing else to do. Majority of the students and faculty had never tried to cut down the time spent on Facebook.

Discussion and Conclusions: Medical students and faculty are at increased risk of Internet addiction. Strategies to develop awareness of Internet addiction and provision of cognitive behaviour therapy of those found with Internet addiction are needed at the institutional level to encourage a balanced relationship between Internet and social media use versus academics and social life especially amongst medical students.

Take-home Messages: Medical students and faculty are at increased risk of Internet addiction.

Training: an effective intervention to enhance physicians' confidence in dealing with their workplace violence after violence aggression

AUTHOR(S):

- Jeng-Cheng Wu, Taipei Medical University Hospital, Taiwan (Presenter)
- Fu-Li Chen, Fu Jen Catholic University, Taiwan

ABSTRACT

Background: Workplace violence (WPV) is a global issue to healthcare workers occupational safety and health. To eliminate the impact from WPV, healthcare workers' confidence in dealing with WPV was studied to effective buffer the negative outcome from both the violence aggression and the fear of that. We explored the enhancement on physicians' confidence in dealing with WPV after violence aggression by training intervention.

Summary of Work: A cross-sectional, self-administered questionnaire were distributed to 401 physicians in four hospitals in Taiwan. The measurements included five major constructs: demographic characteristics (age, gender, affiliated department), recent experience of WPV in the past 3 months, confidence in dealing with WPV, attendance at WPV training courses in the past 3 months and associated organizational factors (safety climate and organizational support). Total 189 physicians were adequately completed. 78 respondents experienced WPV recently were assigned as the 'Victim group'; 102 respondents without experience of WPV were assigned as the 'Non-victim group'. The association between recent attendance at training courses and physicians confidence in dealing their WPV was investigated after adjusting their demographic characteristics and organizational factors in the multiple liner regression model.

Summary of Results: The respondents mean age was 43.31 years and 74.3% were male. There is no significant difference of physicians confidence between victim and non-victim group. In the multiple liner regression model, physicians recent attendance at training courses is a significant predictor ($\beta=0.579$, $p=0.037$) to their confidence in dealing with WPV in the victim group (perceived organizational support was another significant predictor), but not significant in the non-victim group (physicians affiliated department and perceived safety climate were significant predictors).

Discussion and Conclusions: Attendance at training courses for dealing WPV is significantly promoting physicians' confidence in dealing WPV after adjustment for confounding factors in the victim group. Training strategies with interactive small group workshop is suggested, because it not only ameliorate physicians' interpersonal skill but also provide better support from trained, skilled colleagues and both protected them from the risk and related sequel of WPV.

Take-home Messages: Attendance at training courses for dealing WPV is an effective intervention to enhance physicians confidence in dealing their WPV after violence aggression, and rehabilitate victims from the negative consequence after events.

Location of Presentation: Foyer B, Level 2

What does Emergency Physicians' construction of their professional identities tell us about burnout and resilience?

AUTHOR(S):

- Nothando Nkambule, Chang Gung University, Chang Gung Medical Education Research Centre (CG-MERC), Taiwan (Presenter)
- Yu-Che Chang, Chang Gung Memorial Hospital, Linkou, Taiwan
- Lynn Monrouxe, Chang Gung Medical Education Research Center, Taiwan
- Hsu-Min Tseng, Chang Gung University, Taiwan
- Chung-Hsien Chaou, Chang Gung Memorial Hospital, Linkou, Taiwan
- Cheng-Ting Hsiao, Chang Gung Memorial Hospital, Chiayi, Taiwan

ABSTRACT

Background: The nature of emergency medicine (EM) environments puts emergency physicians (EPs) at high risk of poor well-being and burnout. This study aims to explore EPs' narratives of professional identities (PIs), analyzing them to understand more about EPs' burnout and resilience, providing invaluable insight into how EPs can be supported.

Summary of Work: Following an initial analysis of semi-structured interview study conducted on 25 EPs (6 residents, 19 attending), conveniently sampled across branches of a hospital group in Taiwan, we conducted secondary analysis. Using discourse analysis, two distinct thematic narratives were identified around burnout and resilience. Using redemption narratives EPs described how they moved from a burned-out to a resilient state.

Summary of Results: EPs self-identified as burned-out or resilient. The burned-out EPs narrated themselves as 'ruminators', 'control freaks' and 'unsung heroes'. The resilient EPs narrated themselves as 'eager beavers' dedicated to their jobs, 'pressure-endurers', 'delegators' and 'shape shifters'; withstanding uncertainties of the EM environment, delegating work to others and flexible to change.

Discussion and Conclusions: Redemption narratives allowed EPs to portray themselves and ascribe meaning to their experience differently in their burnout recounts compared to their resilient recounts. Redemption narratives revealed that EPs transitioning from a burned-out to resilient state were mainly portrayed as identity negotiators, negotiating between current professional identities, quintessential identities narratives and future identities. This allowed for construction of a positive identity of EPs as 'overcomers', 'consulters' and 'comrades', seeking help to overcome challenges and drawing strength from being part of the EM team. We identified potential benefits of different constructions of the self in buffering work-related stress and depersonalization. This study is unique in that it addresses burnout, resilience and PI in an extreme work environment, like the EM, with acute demands, high uncertainty and stress. Results can be generalized to similar specialties.

Take-home Messages: Professional identities are multifaceted. Drawing on how EPs recount their identities when narrating work experiences we can gain insight into how they construct work-related stress, how they narrate coping with their stress, and how we might support a resilient workforce.

Cyberbullying among medical students: A study of medical students' experiences about this phenomenon

AUTHOR(S):

- Tipsuda Tangsriwong, Buddhachinaraj Hospital, Thailand (Presenter)
- Thipsumon Tangsiwong, Buddhachinaraj Hospital, Thailand

ABSTRACT

Background: Access to the internet has rapidly increased in recent year due to the developing of technology; however, these developments have generated user-induced risks, including cyberbullying, defined as aggression that is intentionally and repeatedly carried out in an electronic context where a power imbalance exists between the perpetrator and victim. To date, there have been few studies created in universities, higher education or working environments. Therefore, the objective of this study focuses on raising awareness of this continuing trend of cyberbullying among medical students.

Summary of Work: A qualitative cross-sectional study, using questionnaires was conducted in January 2019, to evaluate the technology habits, awareness of cyberbullying, and their experiences about this phenomenon among medical students.

Summary of Results: A total of 125 participants (45 men and 80 women), of which 29.6% were fourth-year, 37.6% were fifth-year, and 32.8% were sixth-year students. The students preferred to engage with social networking sites including Facebook (36.0%), Line (31.2%), Twitter (19.2%), and Instagram (13.6%), the results also showed that 90.4% of them spent more than two hours every day on social media. Two-thirds of the students could define the term cyberbullying, but the rest could not. This study revealed that 28% of students are involved in cyberbullying; with a 6.4% victimization rate, and a 0.8% perpetration rate, while the overlapping perpetration and victimization rate was 20.8%. No significant gender or time spent on social media was associated with increased cyberbullying experiences. The prevalence of bystanders was 80%; and witnessed the behaviors listed, such as sending mean or threatening messages (49.2%), fake statue (22.1%), and spreading lies and rumors (15.3%). The students were concerned about the results of cyberbullying as an impact on their psychological health and the violation of personal rights.

Discussion and Conclusions: There is a general agreement regarding the reduction of cyberbullying behavior in higher education. It would be interesting to understand the prevalence, the impact of it on mental health among medical students, and the motives should be further explored.

Take-home Messages: Anti-bullying programs are most effective when directed at specific students at risk.

Workplace incivility, self-efficacy, and medical student burnout: A JD-R perspective

AUTHOR(S):

- Thripura Hariharan, Macquarie University, Australia (Presenter)
- Barbara Griffin, Macquarie University, Australia

ABSTRACT

Background: This study adopted the Job Demands-Resources (JD-R) model of burnout (Bakker & Demerouti, 2007; Demerouti et al., 2001) to test the extent to which workplace incivility (a demand) and self-efficacy (a resource) predicted burnout amongst medical students. We also sought to identify if two primary motivations to study medicine (i.e., high value for status and high value for service) moderated the influence of these predictors.

Summary of Work: Design: Cross-sectional analysis of data obtained from a broader longitudinal cohort study over five years. Method: Participants were 97 medical students. Values were assessed in the first year of medical school while burnout and incivility were assessed in the final (5th) year of study, with all variables measured with validated scales. Moderated regression analyses were conducted to assess the direct and moderated effects of these variables on burnout.

Summary of Results: The experience of workplace incivility was associated with higher burnout. Contrary to expectations, this relationship was stronger amongst medical students who placed a lower value on status. Value for service did not impact this relationship. As predicted, self-efficacy was associated with lower burnout. However, neither status nor service values affected this relationship.

Discussion and Conclusions: The findings of this study support the JD-R model, reiterating that both demands and resources affect burnout. Even though valuing medicine for its status appeared to diminish the impact of incivility on burnout, understanding the extent to which these effects remain the same as a medical student transitions into hospital-based practice is important. Incivility may even have the reverse effect in practicing doctors who value status, compared to its effect during the student period when there is no real 'status'.

Take-home Messages: Obtaining a clearer picture on the various workplace and person-specific factors that influence burnout across the medical career pathway can better inform interventions to address what is increasingly recognised as a serious problem globally.

How students prepare for OSCE and how their stress points compare

AUTHOR(S):

- **Mika Laitinen, University of Helsinki, Finland (Presenter)**
- Teemu Masalin, University of Helsinki, Finland
- Maarit Raukola, University of Helsinki, Finland

ABSTRACT

Background: All medical students must pass an Objective Structured Clinical Examination (OSCE) before graduating at the University of Helsinki Faculty of Medicine. During the OSCE, candidates go through a series of stations in which they examine and treat standardized patients. In this work we studied how the students prepared for OSCE and if the preparation affects to the experienced stress during OSCE.

Summary of Work: The data were collected with a voluntary structured online questionnaire which students (n=73) answered anonymously during the OSCE day in November 2018. Students self-evaluated their stress levels during OSCE in Likert Scale. For preparing the OSCE, students had an open-ended question and five premade categories: 1) by reading national online medical database 'Terveysportti', 2) by reading acute care manual, 3) by reading course notes, 4) by practicing hands-on procedures and skills in the skills lab alone, and 5) by practicing hands-on procedures and skills in the skills lab together with fellow students.

Summary of Results: In generally students found the OSCE stressful (4,15 in Likert scale) even though most of them (97,3 %) prepared beforehand. The most common way to prepare was to read national medical database (83,6 %), acute care manual (60,3 %) or course notes (52,1%). Practicing hands-on skills was less popular, with 26 % practicing with fellow students and only 2,7% practicing alone. A minor group (5,5 %) prepared to OSCE by working as a trainee in local hospitals or health centers. The students who prepared only by reading had lower stress points (4,12) than those who read and practiced skills (4,37). Those who prepared for the OSCE only by working as a trainee had lowest stress points (3,25).

Discussion and Conclusions: Students prepare for the OSCE by reading and practicing, many preferring practicing with classmates. However, the preparation method itself does not seem to correlate directly to the experienced stress points. Interestingly, students who worked as a trainee had lower stress points.

Take-home Messages: It is important to create opportunities for students to practice and prepare for OSCE. The main challenge is to try to ease the stress during OSCE.

ABSTRACT

Background: Resiliency in medical students is a crucial key to their success in their continuance as a physician. Yet, many schools still lack the capability to cultivate student's resiliency. For curricular improvement, we examined various factors influences on medical students' resiliency.

Summary of Work: Students were chosen through snowball-sampling method, probing on high resilient characters among their classmates. They were then separated into two focus group discussions. A sample of 14 preclinical year and 14 clinical year medical students were asked to identify factors and strategies for enhancing resilience separately. Through a consensus thematic analysis, three researchers independently performed qualitative analysis on the audio records and field notes to identify themes. Comparison of each group's themes was then examined to identify any similarities and differences.

Summary of Results: Themes from preclinical year medical students' group suggested that resilience was built through external factors such as 'repeated exposure to challenges' or 'enhance by family/friends' support' and hence linked 'experience' and 'social environment' as the key to favorable resilience. However, clinical year medical students' group suggested 'Personal attitude', 'Mindset' and 'Self-expectation' as key to resilience.

Discussion and Conclusions: Some common and many distinct factors suggested as a major influence on medical students' resilience were identified. Preclinical year students valued external support and more participation in clinical settings. In contrast, clinical year students valued increased individualism and mindset in their resilience. As medical schools strive to enhance resilience and to diminish potential student burnouts, they should balance individually-tailored as well as system-wide programs to best meet the needs of their students and faculty. Giving diverse experiences and emphasizing on the role of advisors are favored more on preclinical year medical students. Meanwhile, self-reflection and further exploration into individual's need are more influential in clinical year medical students.

Take-home Messages: Resilience is valued differently by preclinical and clinical year medical students. Hence, to strive to enhance resilience, an individually-tailored approach must be considered.

A longitudinal view of the Impacts of Hurricane Irma and displacement on the academic performance of medical students

AUTHOR(S):

- Colin Michie, American University of the Caribbean Medical School, Sint Maarten, Netherlands Antilles (Presenter)
- Julie Taylor, American University of the Caribbean Medical School, UK
- Rinker Scott, American University of the Caribbean Medical School, Sint Maarten, Netherlands Antilles
- Kamyar Jafari, American University of the Caribbean Medical School, Sint Maarten, Netherlands Antilles
- Kimberley Kirkland, American University of the Caribbean Medical School, USA
- Bill Behrns, American University of the Caribbean Medical School, USA

ABSTRACT

Background: In 2017, hurricane Irma severely damaged the island of Sint Maarten, including the campus of American University of the Caribbean School of Medicine (AUC). Students were initially evacuated to the USA. At the end of September, medical sciences courses recommenced in Preston, UK with new curriculum delivery, timetabling and assessment systems. Students and faculty experienced challenges in their temporary school and living environments. Students were taught in evenings and weekends by AUC faculty. Counselling, interventional and responsive psychological supports were provided in Chicago and Preston. Students returned to the campus in Sint Maarten over the following two semesters.

Summary of Work: Measures of student attrition, academic and health outcomes were compiled from semesters prior to and a year following the hurricane.

Summary of Results: No mortality, serious injuries or mental health disorders requiring hospitalization were recorded following the hurricane on campus (700 students, faculty and family) or the move to Preston (673 students). Comparisons with the September 2016 semester (with a school population of 759) showed small changes. Attrition initially increased (2 students to 5; 3 returned in later semesters); more courses were dropped (31 in comparison to 46); academic dismissals increased (3 students to 5). However, the numbers of students achieving grades of >87% rose (97 students to 118). Subsequent tracking of those who achieved high grades in Preston demonstrated a return to previous outcomes within 2 semesters of the hurricane. Those who dropped courses did not display significant differences to those who had dropped courses in 2016.

Discussion and Conclusions: Medical students manifested with mild levels of both impairment and enhancement in their performance in academic assessments after Hurricane Irma. These coping strategies did not persist.

Take-home Messages: Recognise variations among students in coping strategies following natural disasters. 2 Appraise this as a relatively short-lived phenomenon. 3 Employ and apply this information, both anticipated outcomes and timelines, when medical students are involved in a natural disaster.

Difference of nurse educator teaching efficacy in clinical education and educational role stress

AUTHOR(S):

- Sujin Shin, Ewha Womans University, Korea (Presenter)
- Youngmi Kang, Kyung Hee University, Korea
- Eunhee Hwang, Wonkwang University, Korea
- Jeonghyun Kim, Ewha Womans University, Korea

ABSTRACT

Background: Teaching efficacy of clinical nurse educators is an important factor that affects the quality of clinical nursing education. Nurse educators who have a high level of teaching efficacy may contribute to enhance nursing students and new graduate nurses' competency. The purpose of this study was to investigate the characteristics of nurse educators with high level of teaching efficacy and educational role stress.

Summary of Work: This study used a cross-sectional design. A convenient sample of 364 nurse educators was recruited from sixteen hospitals in South Korea. Self-reported questionnaires consisting of the teaching efficacy scale, the clinical educational competency scale and the potential work-related stressors survey were used to measure teaching efficacy, clinical educational competency and educational role stress. Data were analyzed using descriptive statistics, chi-squared test and analysis of variance with Tukey's post hoc comparison.

Summary of Results: Sixty nine participants were high level of teaching efficacy group, 153 were average teaching efficacy group, and 142 were low teaching efficacy group. The participants with a higher level of teaching efficacy were those who were older than 40 ($\chi^2=29.382$, $p<.001$), have received a doctoral degree or more ($\chi^2=29.490$, $p<.001$), have more than 10 years of clinical experience ($\chi^2=17.392$, $p=.002$), have received clinical education ($\chi^2=13.551$, $p=.001$), have completed preceptor education program ($\chi^2=9.272$, $p=.010$), and have completed continuing education related to clinical nursing education ($\chi^2=6.393$, $p=.041$). Significant differences in the subscale scores for clinical educational competency were found among the three groups; assessment and intervention ($F=59.874$, $p<.001$), communication ($F=37.202$, $p<.001$), critical thinking ($F=53.522$, $p<.001$), caring relationship ($F=31.736$, $p<.001$), patient education ($F=59.678$, $p<.001$), management ($F=42.244$, $p<.001$), leadership ($F=47.137$, $p<.001$), and knowledge integration capabilities ($F=60.885$, $p<.001$). However, there was no significant difference in educational role stress among the three groups.

Discussion and Conclusions: Based on the results, nurse educators with high level of teaching efficacy are more likely to continue their clinical teaching from programs that strengthen their clinical teaching competency. Therefore, it is recommended that nursing administrators focuses on enhancing clinical teaching competency.

Take-home Messages: To ensure a higher level of teaching efficacy, it is important to develop a competency-based nursing curriculum, which will ultimately lead to the development of a clinical teaching competency.

We should hearten our students to aim at the current WHO recommendations through the whole spectrum of physical activity

AUTHOR(S):

- David Hupin, University Hospital of Saint-Etienne, France (Presenter)
- Nathalie Barth, University of Saint-Etienne, France
- Amandine Baudot, University Hospital of Saint-Etienne, France
- Antoine Guyot, Faculty of Medicine, Saint-Etienne, France
- Kelig Noel, University Hospital of Saint-Etienne, France
- Frédéric Riche, University Hospital of Saint-Etienne, France

ABSTRACT

Background: Studies from Paffenbarger et al. in the 1980s have stimulated a significant interest in understanding the relationship between physical activity (PA) and influences on length of life of Harvard alumni. Since then, some researchers followed this 20th century visionary with new cohort studies, which have shown that physical inactivity at work or during leisure time is a major risk factor for morbidity and premature mortality. Transition to professional life is an important turning point in life of previously active people with sports activities at school. Indeed, preserving a minimal dose of PA might lead to significant health benefits. However, many aspects of these relationships are still poorly studied in youngsters, and especially the impact of associated sedentary behaviour (SB). A key question is the following: if one is inactive and have a SB during university studies, will one always have a sedentary and inactive lifestyle? If yes, what will this imply to one's health? If not, what is the eventual health benefits?

Summary of Work: The aim of this research was to describe self-reported PA and SB within a sample of medical students from faculty of medicine of Saint-Etienne, France, before designing a cohort study. We examined PA and SB for relations to other life-style characteristics. PA and SB of everyday life were assessed between April and June 2018 using the e-Adult Physical Activity Questionnaire (e-APAQ).

Summary of Results: Out of the 3000 medical students of Saint-Etienne University, the e-APAQ has been currently completed for 500 (17%) of them, aged 18 to 32.

Interestingly, being sedentary at university was associated with more SB outside of university; while on the contrary, being active at university (internship in hospital) was associated with more leisure PA outside of university.

Discussion and Conclusions: We propose to promote even a low intensity of PA, which corresponds in practice to advising students to get up regularly from the chair and walk a few minutes after a long sitting time, at the break or between two lessons.

Take-home Messages: We should hearten our students to aim at the current WHO recommendations!

Creating awareness of patient counselling in the clinical setting among medical students in Oman: a five-year study

AUTHOR(S):

- Buthaina Baqir, Sultan Qaboos University, Oman (Presenter)
- Ken Masters, Sultan Qaboos University, Oman

ABSTRACT

Background: Counselling skills are essential skills for a medical doctor. Until 2014, at SQU, CoMHS, medical students were taught few counselling skills on an ad hoc basis late in their clinical training. In 2014, a counselling sub-course, consisting primarily of small-group workshops, was designed for pre-clerkship students. The aim was to expose students to the principles of counselling so that 1) they may be open to receiving counselling from a counsellor, and 2) that they may be able to utilise the counselling skills that they have learnt to enable more effective medical practice. The course has been run five times (2014-2018). Aims: To assess students' perceptions of the value of the course, including the skills learnt and attitudes towards counselling.

Summary of Work: One Lecture, one 2-hour workshop, 12-14 students per workshop built into the respiratory rotation. Over the five-year period (2014-2018), a total of 442 students (70% female; 29% male; 1% not indicated) completed a three-question evaluation form, Likert Scale (strongly disagree to strongly agree). An additional question for further comments was included. Data were evaluated through MS-Excel.

Summary of Results: A total of 442 students (100% response rate) completed the evaluation. Of these, 409 (93%) answered Agree or Strongly Agree on finding the workshop valuable; 424 (96%) on learning new counselling skills, and 425 (96%) on the belief that they would use the counselling skills with their patients. Qualitative comments also strongly supported the need for these workshops and skills.

Discussion and Conclusions: Although doctors need counselling skills, and these skills should be taught in depth during their training, it is possible to create a short intervention immediately prior to their clinical training so that they have an awareness and appreciation of the need for these skills. Further research in the clinical years may be able to determine the long-term impact of such an intervention.

Take-home Messages: This five-year study has shown that medical students' exposure to counselling training in their pre-clinical years is received positively.

Teaching Cardiac Auscultation using AusCue

AUTHOR(S):

- Jieying Lee, National University of Singapore, Singapore (Presenter)
- Jo-Hanan Lau, National University of Singapore, Singapore
- S Thameem Dheen, National University of Singapore, Singapore
- Boon Huat Bay, National University of Singapore, Singapore
- Ching-Chiuan Yen, National University of Singapore, Singapore
- Dinesh Kumar Srinivasan, National University of Singapore, Singapore

ABSTRACT

Background: Cardiac auscultation provides insights into the diagnosis of patients with various types of heart diseases. However, students have to be exposed with a variety of cardiac conditions in order to achieve competence in auscultation. Hence, we aim to design a more experiential learning experience specifically for students to practice cardiac auscultation skills, so as to overcome the limited availability and accessibility of patients with conditions and costly simulators.

Summary of Work: A collaborative group of industrial design students, medical students and teaching faculty were put together to iterate and design a learning model that is functionally accurate and content relevant. The design is focused on providing environment to learn as a group with or without an instructor, having tactile and visual landmarks to locate the auscultation areas, and greater accessibility of the model. The design process spanned over 11 weeks and the result of the effort is an interactive prototype named 'AusCue'.

Summary of Results: AusCue has interactive auscultation sites on a light weight plastic torso (that cost less than USD\$150) with anatomical landmarks for palpation. It is easy to set up and portable. When the stethoscope bell is placed within the correct area, the indicator on the stethoscope turns green and lights up red if it is incorrectly placed. Further, students can lift up the shirt to read the instructions on the auscultation areas. The model plays the heart sounds over a speaker, which is audible to the group and will encourage discussion between medical students and faculty. The initial feedback from medical students and faculty are positive and encouraging. More than 90% of the respondents who tried AusCue finds it easy to use.

Discussion and Conclusions: The features of this model include learning by doing, playing sounds through speakers to encourage discussion, and increased accessibility are potentially instructional design features for future simulators. Further studies and iterations could be done to improve the learning experience of cardiac auscultation training.

Take-home Messages: With increased accessibility to an interactive cardiac auscultation model, students will have more opportunities to learn experientially and apply their knowledge into clinical practice.

How to teach future doctors? Continuing development of teachers' pedagogic skills in relation to the learning outcomes

AUTHOR(S):

- Zsuzsanna Varga, University of Pécs Medical School, Department of Behavioural Sciences, Baranya, Hungary (Presenter)
- Zsuzsanna Pótfó, University of Pécs Medical School, Department of Behavioural Sciences, Baranya, Hungary
- László Czopf, University of Pécs Medical School, 1st Department of Internal Medicine, Baranya, Hungary
- Zsuzsanna Füzesi, University of Pécs Medical School, Department of Behavioural Sciences, Baranya, Hungary

ABSTRACT

Background: The quality of medical education is a key factor in terms of the global changes in medical education and the fact that doctors have to teach tomorrow's doctors. To have a detailed view we aimed to examine the attitudes of lecturers and students towards the learning outcomes of the medical programme and the pedagogic skills acquired by lecturers.

Summary of Work: Data collection through self-reported questionnaire in online form in the four Hungarian higher education institutions offering medical education was carried out in November 2017. Altogether 1943 questionnaires (students: 1505, lecturers: 439) were processed and for data analysis crosstabs, Chi-squares, Anova tests, Gap analysis matrices were performed. Furthermore, in-depth interviews are in progress to complete our research.

Summary of Results: We used GAP matrices to represent the correspondences of the satisfaction and importance of factors of the learning outcomes and pedagogic skills. Out of the 25 learning outcomes respondents rated only one (the knowledge of historical overview of the medical disciplines) less important, than its satisfaction rate. In all other factors the respondents rated the factors very important, but they are not satisfied with their delivery. In terms of pedagogic skills we concluded that teachers have still rated professional knowledge as the most important factor as opposed to the students who would mostly prefer further development of teachers in organization of the learning and teaching process.

Discussion and Conclusions: The lack of concordance between perceptions of the learning outcomes and pedagogic skills among lecturers and students may have serious impact on professional development and teaching medical students and transformation of medical education.

Take-home Messages: There were perceptual differences in the opinions of lecturers and students regarding learning outcomes and pedagogic skills. The study resulted in the necessity (more from the side of the students) of transition and paradigm shift in medical education from profession to practice and patient oriented teaching methods.

Skill to Habit. There is a gap in clinical resuscitation training

AUTHOR(S):

- Yuh-Feng Lin, Taipei Medical University Shuang Ho Hospital, Taiwan (Presenter)
- Jiann Ruey Ong, Taipei Medical University Shuang Ho Hospital, Taiwan
- Sheau Wen Kan, Taipei Medical University Shuang Ho Hospital, Taiwan
- Hon-Ping Ma, Taipei Medical University Shuang Ho Hospital, Taiwan
- Pei Hsing Hsieh, Taipei Medical University Shuang Ho Hospital, Taiwan

ABSTRACT

Background: Advanced cardiovascular life support (ACLS) is a fundamental skill for emergency department (ED) staffs. They are qualified and licensed through regular ACLS course every two years. They are said to be competent during the resuscitation. Is that the truth ?

Summary of Work: 6 emergency physicians and 16 nurses were enrolled. They all have valid ACLS certification. Participants were asked to document their confidence of performance on resuscitation before the study. Then the participants performance on resuscitation are compared in 2 phases: 1. Simulation phase: Simulated ACLS megacode scenario in simulation lab. 2. Clinical phase: Videotaping the real resuscitation cases involving the participants in ED. The performance between two phases were compared by 1. Qualitative parameters: using standard ACLS megacode testing checklists; 2. Quantitative parameters: using chest compression fraction (CCF), frequency (f) and length (t) of interruptions on chest compression.

Summary of Results: All participants stated confidence in their performance before the study. Qualitative data such as score in checklist and objective judgement on the performance were comparable between two phases. However, quantitative data of CCF, f and t were far better in simulation lab than clinical practice.

Discussion and Conclusions: Resuscitation during cardiac arrest is time-critical, fast-changing, complex, and error-prone process. ED staffs are trained regularly to achieve consistency and competency in workplace. However, resuscitation quality varies widely between systems and locations, thus learning from a real situation instead of simulation or lecture is crucial. In this study, the participants showed confidence on their performance and their qualitative parameters on the checklist score are good in both phases of study. But objective perceptions tend to overestimate the real life performance. Acquired the skill not necessary equal to adapt the skill into the daily practice habit especially during a critical resuscitation process. Regular training emphasis on the algorithm and correctness of the resuscitation but not on the quantitative quality. The chest compression fraction, frequency and length of interruption on chest compression were significantly worse in the clinical practice.

Take-home Messages: There is a significant gap between trained clinical skill to daily practice habit during resuscitation. Measures and steps should be taken to improve this transformations.

Establishment of a Rural Pathology Teaching Museum

AUTHOR(S):

- Linda Ferrington, University of New South Wales, Australia (Presenter)
- Julianne Weatherley, University of New South Wales, Australia
- Srajan Singh, University of New South Wales, Australia
- Aiveen Bannan, University of New South Wales, Australia
- S. Lesley Forster, University of New South Wales, Australia

ABSTRACT

Background: Pathology teaching traditionally incorporates didactic lectures, tutorials, and practical classes studying microscopic specimens, frequently including virtual microscopy. Gross pathology pots via medical school museums have long been used to teach pathology, and learning in this environment is well received by students, affording enhanced learning capacity, possibly due to opportunities for small-group learning not afforded by web-based pathology teaching. At the University of New South Wales Rural Clinical School, Port Macquarie, provision of pathology specimens was under-developed and lacked information about the displayed specimens, resulting in under-use by students who therefore missed out on the valuable advantages of these specimens in their learning.

Summary of Work: We aimed to establish a rural pathology museum which involved the cataloguing and classification of specimens and design and production of materials to support them, for example posters incorporating high resolution images and clinical information about the specimens. We also aimed to introduce a blended learning approach by producing high quality film of the specimens, allowing us to incorporate technology and digital media to produce virtual tutorials alongside digitized imaging of the pathology specimens for further study.

Summary of Results: We created a searchable catalogue which students can use to support their learning. All specimens are supported by a template incorporating relevant images and clinical information, including appropriate clinical scenarios and relevant questions to stimulate learning. This enables us to fully integrate clinical teaching with pathology teaching. We have developed a novel procedure and modified equipment for filming the pathology specimens, resulting in the production of very high-quality images which will be distributed initially on the University network, but which we hope to make available for use in other institutions.

Discussion and Conclusions: These resources will create improved opportunities for students in regional locations where these pathology specimens are not readily available. Our next steps involve utilizing the pathology museum alongside our traditional teaching methods and evaluating this multidisciplinary approach by surveying students to evaluate their learning experiences.

Take-home Messages: This project will enhance the learning experience by integrating media and technology with more traditional learning and will allow students to learn this material in a flexible way which is engaging and supports multiple learning styles.

The Clinical Care Improvement Training Program: Linking Healthcare Providers' Education to Patient Outcomes

AUTHOR(S):

- Shireen Suliman, Hamad Medical Corporation, Qatar (Presenter)
- Reham Hassan, Hamad Medical Corporation, Qatar
- Khawla Athamneh, Hamad Medical Corporation, Qatar
- Sikandar Aftab, Hamad Medical Corporation, Qatar
- Aisha Al Adab, Hamad Medical Corporation, Qatar
- Nawal Al-Tamimi, Hamad Medical Corporation, Qatar

ABSTRACT

Background: Sepsis is a life-threatening organ dysfunction caused by dysregulated host response to infection. It is estimated to affect more than 30 million patients with, potentially, five million deaths every year worldwide. Initiatives for early recognition, more timely management and prevention are required.

Summary of Work: The Clinical Care Improvement Training Program (CCITP) has been established as a formal curriculum with a purpose to strengthen knowledge and skills of Quality Improvement (QI) principles to health care providers across Hamad Medical Corporation (HMC), a large Joint Commission International accredited group of tertiary hospitals in the State of Qatar and the Primary Health Care Centres (PHCC). Running in two 5-months cycles a year, the program consists of five learning modules that are delivered in a blended format. In addition, participants from all aspects of medicine receive training by highly skilled faculty; work collaboratively in groups to apply their knowledge in designing and implementing QI projects.

Summary of Results: From 2016-2018 and as part of the corporate vision, 37 quality improvement initiatives targeting sepsis were conducted across HMC and PHCC in Qatar during cycles 9, 10 and 11. Those initiatives were not only clinical with primary focus on the acute care of sepsis, but were also on the prevention at both patient and community level. This was reflected on the Qatar National Patient Safety Collaborative data report released in November 2018; reduction in sepsis mortality to less than 3%, 74% compliance with Rapid Response Team or equivalent alerts that were appropriately escalated, increase in percent compliance with the complete Sepsis Six Care Bundle to 47%, 76% of patients administered IV antibiotics within 60 minutes of time zero, and a 100% of vital signs documented in reporting facilities.

Discussion and Conclusions: Developing standardized continuous professional development initiatives under a common theme would result in improvement in patient care and outcome. CCITP stands as a successful Qatar Council for Healthcare Practitioners' accredited curriculum that develops the connection between education and patient care/outcome.

Take-home Messages: Educating healthcare providers in QI is the corner stone in improving patient care and outcome.

Teaching medical students about substance use disorder in Saudi Arabia

AUTHOR(S):

- Basma Alharthy, KAU, Saudi Arabia (Presenter)

ABSTRACT

Background: Patients presenting with substance use is common. Physicians need to be trained with skills and knowledge enable to identify substance use and help prevent further complications especially in comorbidities.

Summary of Work: To review the literature on Saudi medical students knowledge of substance use.

Summary of Results: Most of the literature found address various substance use among medical students. There is however no clear indication of how the curricula in medical schools in Saudi includes specific training or skills to address substance use through out the medical students training years. Evidence of developed curricula addressing substance misuse disorder can be found in countries like USA, Australia and the UK.

Discussion and Conclusions: There is growing evidence of the problem of substance use in the population. This indicates the importance of ensuring that future physicians have the right tools and skills to identify any relevant problems and know how to manage cases with substance use. There is no data reflecting how medical curricula have been designed to address this problem. International best practice can be utilised as a guide to help include training at different stages of the curricula to ensure that the students by the end of their training have the basic skills to identify substance use and misuse disorder and how to manage these cases including where best to refer the patients for the best treatment outcome.

Take-home Messages: Medical students need to develop skills to identify and manage substance use during their training. Introducing teaching hours specifically for training the students at various stages of their time in medical school and ensuring that the curricula covers the major current drugs abused is important to ensure future physicians are able to manage challenging cases with substance use. This can be achieved by utilising current international curricula and tailor according to the need a modified curricula.

Piloting 'ABC of the critically ill patient': experiences from Kigali, Rwanda

AUTHOR(S):

- Larissa Latif, NHS Greater Glasgow & Clyde, UK (Presenter)

ABSTRACT

Background: Newly-graduated junior doctors in Rwanda undertake two years of compulsory service in district hospitals, often as the only doctor in a remote and resource-poor area. They serve a large population who - due to time, cost or distance - may present in extremis. In their final undergraduate year, medical students at the University of Rwanda complete an Acute Care block, comprising didactic teaching in Anaesthesia, Critical Care and Emergency Medicine followed by one month clerkship i.e. shadowing. Despite this period of clinical exposure, specialty trainees describe their immediate postgraduate years as an extremely steep learning curve.

Summary of Work: A one-day course - 'ABC of the critically ill patient' - was delivered to final year medical undergraduates. This included introductory talks, practical workshops ('Airway and breathing', 'Circulation and fluid management'), and case-based discussions, where students talked through the management of simulated cases in small groups with a facilitator. The clinical scenarios were developed in conjunction with Rwandan Anaesthesia registrars to ensure relevance to the environment and available resources. Qualitative and quantitative feedback was collected using short answer questions and a 5-point Likert scale.

Summary of Results: All 21 students undergoing their acute care clerkship attended the course. Feedback received was extremely positive: on the Likert scale, the vast majority of responses either 'Agreed' or 'Strongly Agreed' with statements such as 'I learned something new' and 'I feel confident I can use the skills I learned today in practice'. Qualitative feedback indicated that students found the case-based discussions particularly useful and several students requested that further teaching sessions be delivered in the same format. One student wrote 'I wish to have many more days like this if possible'.

Discussion and Conclusions: Small group sessions with an emphasis on student interaction and application of knowledge to clinical scenarios were a popular addition to undergraduate education in this resource-poor setting. It is hoped that these learning approaches could 'bridge the gap' between didactic teaching and clinical service.

Take-home Messages: Undergraduate medical education in resource-poor settings tends to be delivered via traditional methods. The experiences described indicate an appetite among students for novel approaches.

Evaluating the use of 360-videos in Medical Education: A Situational Awareness Case Study

AUTHOR(S):

- Aiknaath Jain, University of Leeds, UK (Presenter)
- Vania Dimitrova, University of Leeds, UK
- Alison Ledger, University of Leeds, UK

ABSTRACT

Background: Virtual reality could provide opportunities to revolutionise medical education. This work focuses on the 360-video - an innovative and affordable technology that offers viewers a full 360-degree field of vision, when using a Head Mounted Display (HMD). Although 360-degree videos are thought to be more engaging than the traditional 2D-video format, there is a paucity of evidence to recommend their use and no defined methodology to evaluate their effectiveness comparative to the 2D-video format.

Therefore, the aim of this study was to develop a methodology for evaluating 360-degree videos for informal learning of situational awareness by comparing it with the 2D-video format.

Summary of Work: The literature regarding evaluating virtual reality devices as a learning tool was reviewed. Three broad evaluation areas were identified: Cognitive Effects, Usability and Affective Aspects. Selected instruments were combined into an evaluation methodology and a small user trial involving 20 medical students was performed. The data was analysed using non-parametric statistical testing. The methodology was evaluated through a reflective journal and post-experiment semi-structured interviews with the participants.

Summary of Results: Participants who used the HMD scored better ($p < 0.02$) in the cognitive test and perceived it to have a greater educational value than the 2D-video ($p < 0.05$). However, participants found that the computer was easier to use ($p < 0.02$), as well as significantly less effortful and frustrating ($p < 0.02$). In-situ measuring devices corroborated these findings. The researcher found that taking observations was difficult and imprecise. Videoing participants using the devices should be considered. The participants did not report any technical or logistical problems. However, some experienced difficulty with the emotion and usability surveys. Alternative options for both were explored.

Discussion and Conclusions: The methodology detected significant differences between the formats in all the evaluation areas. Furthermore, the in-situ data collection tools provided valuable insights into user-experiences and should be reapplied.

Take-home Messages: The methodology was well-received by the researcher and by the participants. It is recommended that this study is repeated with a larger cohort and with different medical education scenarios (e.g. building rapport, breaking bad news, mental health awareness), to inform implementation decisions in medical education.

Multimedia-Assisted Learning in Orthopaedic Clinical Skills

AUTHOR(S):

- Jirachat Sakuljumjai, University of Phayao, Thailand (Presenter)

ABSTRACT

Background: Flipped Classroom, is a popular teaching model which was developed recent years, reverses the traditional learning environment by delivering instructional content outside the classroom. This study aimed to evaluate the effectiveness of the flipped classroom model for teaching orthopaedic clinical skills by comparing multimedia-assisted learning and traditional structured skills training.

Summary of Work: Twenty 5th year medical students were randomized into two groups: a structured skills training (SS) group and a multimedia-assisted (MA) group. The SS group was taught short arm cast procedures by orthopaedic staffs. The MA group watched a short arm cast video. After that, both groups attended a casting workshop and received feedback after the workshop. The short arm cast examination results and student satisfaction were evaluated.

Summary of Results: Students in both groups were able to perform short arm casting quite well. Mean scores were 82.9 and 87.65 for the SS group and the MA group, respectively. The t' test results showed no significant difference between the two groups (p value = 0.237). Student satisfaction scores were 83.6 and 84 for the SS group and the MA group, respectively. There was no significant difference between the two groups (p value = 0.695).

Discussion and Conclusions: Flipped classroom has been gaining popularity as a replacement for traditional lectures, but its use in clinical skills teaching is relatively new. We evaluated the efficacy of multimedia-assisted learning compared to structured skill training and found no significant differences between the two methods. Students using multimedia-assisted learning mentioned that a great benefit is that they were able watch the video as many times as they wanted, thus helping them more fully absorb the steps involved in the procedure. Conclusion: Multimedia-assisted learning in clinical skills teaching is an effective model. It can help medical students to learn appropriate methods for performing procedures and allows them to review procedures as needed in their daily practice.

Take-home Messages: Multimedia-assisted learning in clinical skills teaching is effective and should be applied in other fields of medical education.

Video-assisted standardization teaching method as an effective strategy for young faculties to deliver nutrition consultation skills to PGY dietitian

AUTHOR(S):

- Hsu Chen Lin, Tri-Service General Hospital, Taipei, Taiwan (Presenter)
- Lin Chien Chan, Tri-Service General Hospital, Taipei, Taiwan

ABSTRACT

Background: The way of educating nutrition consultation skills to post graduate year (PGY) dietitians varies among instructor dietitians, leading to uneven qualities of teaching outcome and patient care. To provide a teaching guide for young faculties and improve their teaching skills, we established video-assisted standardization teaching method, which comprised of essential components of the educating consultation skills, to young faculties and evaluated the outcome of the program.

Summary of Work: We established a teaching evaluation scoring system for young faculties, and nutrition consultation skills scoring system for PGY dietitians, respectively. According to the evaluation scoring system, we made a video which demonstrated the essential components of the teaching skills to young faculties. Before and after the video demonstration, the young faculties taught nutrition consultation skills to PGY dietitians. Nutrition consultation to patients was performed by PGY dietitians after they received training from young faculties. Both of the teaching and consultation activities were evaluated by two senior instructors. Questionnaires regarding satisfaction, learning attitude, and self-efficacy of young faculties and PGY were obtained before and after the curriculum. Paired-t test was used to evaluate the outcome of the curriculum.

Summary of Results: There were 10 young faculties and 8 PGY dietitians recruited in the study. After video demonstration, the teaching skills, learning attitude, and self-efficacy were significantly improved in young faculties ($p < 0.05$). Moreover, the PGY who received the education from young faculties undergone video demonstration significantly improved their nutrition consultation skills as well as the learning attitude and self-efficacy ($p < 0.05$). Both young faculties and PGY dietitians highly satisfied the curriculum.

Discussion and Conclusions: It is no doubt that the nutrition consultation skills need to be well educated to PGY dietitians, which remains a great challenge for young faculties. Use of video-assisted demonstration of standard and essential components of the teaching skills could be a promising strategy for young faculties to train PGY dietitians, which further promotes the quality of patient care. Such video-assisted program provide flexibility which is easy to learn for dietitians who have heavy clinical workload.

Take-home Messages: Video-assisted demonstration of standard and essential components of the teaching nutrition consultation skills could be a promising strategy for young faculties.

Medical students' preferences for working with people with dementia: a systematic review

AUTHOR(S):

- Molly Hebditch, Brighton and Sussex Medical School, UK (Presenter)
- Stephanie Daley, Brighton and Sussex Medical School, UK
- James Scott, Brighton and Sussex Medical School, UK
- Gina Sherlock, Brighton and Sussex Medical School, UK

ABSTRACT

Background: A current issue in workforce planning is ensuring future doctors are both competent and willing to work with older adults with complex needs. This includes Dementia care; which is widely recognised as a priority. Yet research suggests that working with older people is unattractive to undergraduate medical students. However how medical students view a career working with people with dementia is not well understood, in either related specialities (e.g. geriatric medicine) or generalist areas, and no systematic reviews have been conducted on this topic.

Summary of Work: The aim of this mixed methods systematic review is to explore the factors related to medical student preferences' for working with older people and people with dementia. The study protocol is registered on PROSPERO [CRD42018104647]. Searches were conducted on five databases (MEDLINE, PsycINFO, CINAHL, BNI, ERIC) in September 2018. Screening, data extraction and quality appraisal were conducted by two independent reviewers.

Summary of Results: 1,024 papers were screened (139 full texts) and 66 papers were included for a narrative synthesis. This poster will present the factors that have been found associated with student preferences for working with older people and specifically, people with dementia.

Discussion and Conclusions: Research looking at preferences associated with working with patients with dementia is limited; while there is a growing literature looking at interventions, knowledge and attitudes within dementia education, preferences for working with this patient group is less explored. Planned future work following this review, as part of a PhD study, is to be conducted to help conceptualise and build a framework for understanding preferences for working with people with dementia.

Take-home Messages: - Dementia care is a priority area for improvement, and understanding preferences for working with this patient group is imperative. - This study will synthesize and present the key factors that have been explored for why working with older people is unpopular, and; - Highlights that there is a paucity of research exploring how medical students view working with people with dementia, within related specialties and generally.

Impact of participation in research projects by medical students on their academic performance

AUTHOR(S):

- Fahad Azam, Shifa College of Medicine, Shifa Tameer-e-Millat University, Pakistan (Presenter)
- Abida Shaheen, Shifa College of Medicine, Shifa Tameer-e-Millat University, Pakistan
- Nismat Javed, Shifa College of Medicine, Shifa Tameer-e-Millat University, Pakistan

ABSTRACT

Background: Medical doctors are expected to conduct various researches according to the specific needs of their respective specialties and for this purpose there is growing consensus on exposing medical students to research from early years of medical education. We conducted a study to evaluate the effect of conducting research by undergraduate medical students on their summative scores.

Summary of Work: A research program was initiated by the faculty of Shifa College of Medicine and third year medical students were invited to voluntarily participate in this research program. Most students came up with their own research ideas while some topics were provided by the faculty. A maximum of four students were placed in each group. Many students chose to get enrolled in more than one research groups. Twenty one percent of students participated in this program.

Summary of Results: Prior to enrollment in this program, only two students had previously conducted medical research. A total of twenty one students got enrolled in different research programs. Fifteen students were interested but were unable to initiate any research due to pressure of studies. Sixty four students did not show any interest in joining this voluntary program. The mean score of students who were enrolled in the research program was 79.44 ± 9.06 in summative assessment in first module of third year and was significantly higher than the summative scores of students who did not show any interest in the research program. The p-value for t-test was significant (p-value=0.004).

Discussion and Conclusions: The results illustrate the fact that conducting research results in significant improvement in academic learning of the students as it stimulates learners to critically analyze theoretical knowledge. This thought process is crucial in processing complex concepts related to application of knowledge. Conducting basic and clinical medical research had a positive impact on the academic performance of the undergraduate medical students.

Take-home Messages: Conducting research is a healthy activity for medical students at an early stage and prepares them to apply class room knowledge practically in clinical setting.

Study on the influence of undergraduate tutorial system on early scientific research ability cultivation of eight-year M.D. program students in China

AUTHOR(S):

- Chi Yuan, West China Hospital, Sichuan University, China (Presenter)
- Hongyu Jin, Department of Liver Surgery, Liver Transplantation Center, West China Hospital, Sichuan University, China
- Chuan Zuo, Department of Rheumatology and Immunology, West China Hospital, Sichuan University, China
- Rui Zeng, Department of Cardiovascular Diseases, West China Hospital, Sichuan University, China

ABSTRACT

Background: Students from Eight-year M.D. Program are strictly selected from high school via the College Entrance Examination of China. However, the early stage scientific research training is somewhat ignored in the curriculum. Undergraduate tutorial system aims to provide personalized guidance in scientific research ability and innovative thinking for undergraduate students by pairing teachers and students. Despite that the system has run in West China School of Medicine, Sichuan University for a decade, it is still in the trial and exploration period. Therefore, we launch this study to explore the influence of undergraduate tutorial system on early scientific research ability of eight-year M.D. program students and put forward practical and effective optimization schemes.

Summary of Work: From December 2017 to November 2018, a total of 70 cross-grade eight-year M.D. program students from West China School of Medicine, Sichuan University were selected as the survey samples. They were investigated by paper and online questionnaires, along with face-to-face interviews. A result analysis was conducted.

Summary of Results: The survey results showed that many students (51.43%, 36/70) had received guidance from tutors, most of which communicated with teachers face to face (80.33%, 30/36) or online (80.56%, 29/36). Some students (34.29%, 24/70) received no enlightenment in scientific research from undergraduate tutors. 26 students (37.14%, 26/70) were not satisfied with current undergraduate tutorial system, while 41 students (58.57%, 41/70) thought this system was very important for the early scientific research ability training of eight-year M.D. program students.

Discussion and Conclusions: This investigation uncovered existing problems in the cultivation of early scientific research ability in eight-year M.D. students under undergraduate tutorial system. For example, guidance provided by undergraduate tutors lacks scientific research training and differs greatly from what eight-year M.D. program students want to receive. Besides, effective supervision and management system to quantify the achievements and failures of this cultivation also requires improvement. Therefore, we put forward feasible solutions in distribution of tutors, supervision, feedback and guidance mode.

Take-home Messages: Eight-year M.D. program students in China have a high demand for early scientific research training, while the current undergraduate tutorial system is limited to help. It is urgent to put forward practical and effective optimization schemes.

Student-led development of a checklist to measure usefulness of educational apps for just-in-time learning

AUTHOR(S):

- Grace Tylee, University of Otago, New Zealand (Presenter)
- Tehmina Gladman, University of Otago, New Zealand
- Sarah Rennie, University of Otago, New Zealand
- Steve Gallagher, University of Otago, New Zealand
- Rebecca Grainger, University of Otago, New Zealand

ABSTRACT

Background: Mobile applications (apps) have potential to support 'just-in-time learning' in clinical practice. While numerous measures are available to assess general quality of education apps; there is no instrument in the literature for evaluation of app usefulness for meeting medical students just-in-time learning needs. This study aimed to develop an evidence-based and student-led checklist for rating the usefulness of apps for just-in-time learning, and evaluate it using apps for learning clinical skills of history and examination.

Summary of Work: All terms and criteria for evaluation of quality of mobile apps for education were identified from the literature. Conceptually similar terms were grouped into unique items based on definitions from the literature. Medical students (years 2-4) participated in a student-led focus group using modified nominal group technique to determine items to include in a checklist of app usefulness for just-in-time learning.
