

Figure S2. Weekly occurrence of spontaneous recurrent seizures (SRSs) in epileptic rats treated with sesame oil (VHL) or trilostane (TRI). All rats ($n = 24$) were recorded for one week (PRE-) before being treated with VHL ($n = 12$) or TRI ($n = 12$) in the following week. In (A) and (B), the number of stages (ST.) 0-3 SRSs is respectively reported for each rat treated with VHL or TRI. The number of ST. 4-5 SRSs for each rat belonging to both groups is shown in (C) and (D). The total number of SRSs for all the animals is illustrated in (E) and (F).
